What happened next he never rightly knew. His car took the corner well enough. But then, instead of proceeding upon its appointed way, it slewed right round. Philip promptly spun his wheel over to the left, but all in vain. Next moment his car was squarely across the road; for the car behind, instead of following its leader round the bend, had pursued a straight course, pushing the tail of Philip's long chassis before it. Philip could feel his back-tires sliding sideways over the smooth asphalt. He felt utterly helpless. The brake could do no more. It was not designed to prevent cars from running away laterally.

Suddenly the skidding ceased, and Philip's car began to careen giddily over to the left. Then, without warning, it turned completely upside-down. The other car, like a victor who sets his foot upon the neck of the vanquished, mounted proudly upon the wreck of its prostrate preserver, and there poised itself—stationary at last.

Philip, unable to free himself, went over with his car. 'I rather fancy the old man must have been putting his oar in again,' he said to himself as the road rose suddenly up to meet him.

So the Meldrum Automatic Electro-Magnetic Brake was proved. When they examined the

car afterwards, it was found that though the brake-shoes were scorched and damaged beyond recall, the brake itself was in perfect order. The other car was hardly injured. Its occupants were unhurt. But Philip did not know this. He had ceased to take any active interest in the proceedings.

Only for one brief moment during the subsequent twenty-four hours did he exhibit any sign of intelligence at all. This was when he woke up on his way back to London. He found himself lying in a smooth-running closed vehicle of some kind. The light was uncertain, and his vision was somewhat obscured by bandages; but he was dimly conscious that some one was sitting beside him—close beside him. He made an inarticulate sound. Instantly the figure stirred, and a face came very close to his.

Philip surveyed the face gravely, and remarked, 'Hallo, Pegs!'

Then everything became blank again.

(Continued on page 392.)

SPANISH HONDURAS.

By E. W. PERRY.

N those good old days when Spain, the evermerciful and tender, employed sword and lash and cross to make good Indians of the millions who dwelt in the New World, three comparatively short and easy roads across this continent were used for carrying to the open pockets of the mother-country the riches of these Pacific shores, that have never been pacific since the white man first saw them. Of these highways, the shortest was that across fever-infested Panama. A second road, not so short, was where the tides of the great South Sea rushed through to the Atlantic until the bottom of the strait rose to dam the flood and make the lakes of Nicaragua serve as part of a highway for races then in the womb of distant ages. A third such interoceanic road ran due south across Honduras, from Puerto Caballos on the Caribbean Sea to the waters of the Gulf of

In time certain Dutchmen, Englishmen, and Frenchmen became active and diligent, possibly somewhat bold on occasion, in cruising the Spanish Main, seeking what treasures of silver and gold, señoritas and pearls, or other prizes passing ships, especially Spanish craft, might be persuaded to contribute to the cause. Spain and her sons in the Western World came to imagine that these gentry of the high seas asked too heavy tolls from those who had had the bother of collecting from Peruvian and Mexican, from Quiché and other races, along these shores.

Puerto Caballos, at the north end of the great Camino Real of La Provincia de Guatemala, of which Honduras was part, offered too open a welcome to undesirable visitors; therefore a new terminus a few miles to the westward was chosen. A new road was made from the snug bay of Omoa, straight over the mountains, to join the old highway some thirty miles from the abandoned port. He who cares to ride over that road from Omoa will still find, to his discomfort, parts of its pavement of big blocks of stone.

To discourage visits from the uninvited, the Crown ordered the erection of a strong fort at Omoa. That order was given in 1751, and the work was so rushed (?) that the Castillo de San Fernando was completed in 1795. It stands to-day in fair condition, a monument to Spanish dominion and to the honour of the masons and the power of the guns of a hundred and twenty

years ago. In time the profession of piracy became rather unpopular; its profits may have seemed unequal to its risks, or perhaps to the gains of such trading as may still be seen along these shores. At all events, most of those who followed piracy in the old days gave it up, perchance because meddling men of war followed them too closely and too often. So the roads southward across the isthmus became comparatively safe. Traffic left the great highway of Honduras for the short and easy route across Panamá. Americans built a railway there, and thus robbed Honduras of whatever remained of her interoceanic trade. Honduras dreamed of recovering part at least of that traffic. I am not sure that no such vain imaginings lurk in Hondureño minds to-day, notwithstanding that

the Panamá Canal will soon be open, and kill all reasonable hope of profitable competition by any such road. At any rate, the building of a railway was begun in 1867 at Puerto Cortés, the old Puerto Caballos, in hope of recovering that carrying traffic. When it was made as far as Pimienta, some fifty-two miles south, the work was abandoned, and the railway was left to the management of the republic. So were bonded debts to the amount of four million one hundred and sixty-three thousand nine hundred and seventy-five pounds, created seemingly to pay for the building of the road from ocean to ocean. At times this railway has been leased to private persons at one thousand pounds per annum. It was taken over by the Government early in February 1912, and in the first six months thereafter its net earnings were equal to seven thousand and forty-six pounds sterling. As this was about five thousand one hundred and ninety-seven pounds more than the lessee had paid, and as he seems to have had no just right to use the road, the act of the Government appears fully justified. To-day a passenger may land on the pier at Puerto Cortés, climb aboard a semi-weekly—or is it a tri-weekly? train, and in about half a day climb down at Pimienta, which is at the south end of the track, and which is also the terminus of a number of other tracks. A good saddle-mule may travel over one or other of these trails at the rate of from eight to fifteen Spanish leagues a day; so his day's journey may be from twenty-one to thirtynine English miles, instead of the twenty-four to forty-five miles the traveller here commonly But the day's travel seems long enough, especially if one is five or six days on end in the saddle, as when he comes to the national capital. For the roads here are-- Yet one who remembers what the roads were a quarter of a century ago, and knows what they are in other Latin-American republics, may well laugh at the grumbling of the tenderfoot of to-day. On the road between Pimienta and Comayagua, long the national capital of this republic, were many miles where one's mule had to pick its way carefully and slowly—how slowly!—between rounded boulders of spongy black scoria hardly far enough apart to let the poor beast's feet touch the ground. We scrambled up steeps covered with loose flakes of stone, to scramble down again a little farther Now these boulders are put aside, and the steeper parts are avoided by detours. At one place we climbed a stair carved in the rock; to-day a wagon may climb that hill with something like ease. On one trip over these roads, years ago, the then mayor of an American city was with me. After we had been one day out he exclaimed, 'These little mules are great! Why, I could ride this one up the steps of our capitol!' A day or two later he cried, 'This is a great mule! Why, I could ride her up the sides of our capitol!

Honduras has done creditable work to make her roads good. Despite her many revolutions and other difficulties, she has made a number of wagon-roads which would pass in many other countries as quite good indeed. One of her highways is ninety-two miles long; it is wide, and most of it is smooth enough for the automobiles which run over it. Much of it is carved in the rounded hills of siliceous sandstone called telpetate, and its bridges of solid masonry are well built. Even now automobiles carry passengers from the edge of the Gulf of Fonseca to Tegucigalpa in half a day.

A generation ago the traveller had to depend on the people living on his way for food and for lodging. If he was unacquainted with their ways, he would probably suppose they meant it when they said they had nothing to eat; but in time he learned that these folk would share with him whatever food they happened to have, or could get, in a land where people take no heed for the morrow, because each new day has brought enough, and there is no reason for fearing that each day ahead will not bring plenty if one goes about the matter in the right way.

After dark we rode up to the only pretence of a house we had seen for two days. To our inquiries as to food the man of the house declared,

'No, señores; there is nothing.'

'But, amigo, can't you get a fish from this river? Haven't you any eggs? Not a plátano?'

'No, señores. The tigers [pumas] ate our pigs; the tiger-cats [ocelotl] killed our chickens.

There is nothing.

This with a brawling river before the house. in the midst of a great virgin forest where we had seen no man for two days or more, but had seen wild turkeys and pheasants, peccaries, agoutis, deer, iguanas, and monkeys enough to feed abundantly four times our number.

'Who is that groaning? What is the matter?'

I asked.

'It is my wife, señor. She has the calentura.' 'Well, then, I have quinine. We will cure her.' Two minutes later the man was taking quinine

to the woman, two lads were on their way with flaming pine-torches to spear a fish, a well-grown girl was bringing a bunch of ripe platanos down the notched pole that was the stair from the loft, an old woman was patting wet meal into flat cakes, while a girl of a dozen years or so brought from the darkness the ham of a wild pig.

One day a girl of eight or ten was taking a loaf from an oven beside the road at the edge of a town not many miles from here. Just then my mule stepped from the carpet of grass to the sun-baked roadway. Instantly, without a glance to see who was coming, that heiress to the heredity of all the ages pushed the bread into the oven, put her back against the door, then looked

up.
'How do you do, my little friend? Can I get something to eat at your house?'

'No, señor; there is nothing.'

'But, little daughter, not even a bit of bread ?'

'No, señor; there is none.'

Her eyes twinkled; then we laughed, and she took the bread from the oven. To me her instant, involuntary concealing of the loaf spoke plainly, not of design, but of instinct born who knows how many centuries before that child saw light?—born in the days when the strong hand took whatever seemed worth taking from these people; when it was prudent to hide all one had as soon as a stranger drew near, and then hide one's self in the bush.

The traveller is likely to lodge in houses with adobe walls that are thick and high, and coated with snowy plaster, which is whitewashed once a year, if not oftener. Within these walls are usually two rooms, the larger of which is the sala, or reception-room; the other, the dormitory for all the family. Between the floor of flat bricks and the roof of concave tiles may be a ceiling of wood or of cotton-cloth, or there may be none. A broad door opens upon a wide, paved corridor or veranda, and directly across the reception-room is another door opening upon another The dormitory may or may not have a veranda. door other than the one which connects it with the sala. Some of these rooms have, in these modern days, windows without glass and with close wooden shutters. Ventilation may be effected through the crevices between the tiles of the roof, or not at all. For furniture, the dormitory may have bedsteads of wood without mattresses. Some of the beds are of rawhide stretched over, and securely nailed to, the frame, and are as soft and warm as a drumhead. Other beds are of small cords which form a net, and are cooler than the rawhide ones, but not, on the whole, much more comfortable. In place of such beds, cots of canvas nailed to cross-legged frames are coming into quite common use. If the voyager has plenty of blankets, some to fold and use as a mattress, and one or more to cover him, he may get through the night without dreaming that he is lying on an iceberg. But the nights are always cool in this country.

If the traveller should be curious about the kitchen in which his food is to be prepared——But he had better not be.

The population of the republic was five hundred and fifty-three thousand four hundred and forty-six in 1910. Schools have been established in nearly every village and town in Honduras, for the people generally are determined that their children shall learn to read, to write, and to calculate, if no more. In the year 1912 they established one hundred and eighty new schools, thus making the whole number of schools eight hundred and ninety, with thirty-nine thousand seven hundred and three enrolled pupils. Naturally they have higher-grade schools in the national capital, in some of which mechanics are

trained; in others girls learn to make cigars, or to manufacture hats which the world calls Panamá hats, but which the natives know by the name of *jipijapi* (which please call he-pe-ha-pe) or junco sombreros. Improved methods of agriculture are taught in a few special schools.

Honduras greatly needs development of her agriculture, as does the whole of Central America, for that matter; for in the main the ways of the farmer here are those of the days of the first of the Pharaohs, perhaps of times long before that. Worse than the antiquated methods are the frequent armed uprisings which prevent the planting or the harvesting of food. It is a fact that, with all their advantages of soil and climate, these republics have rarely grown food enough to supply their own needs. They manufacture nothing for export, and their lumber trade is small.

Honduras exported during the year 1912 products valued at seven million seven hundred thousand four hundred and forty-six dollars silver, or about six hundred and thirty-two thousand nine hundred and thirty-five pounds sterling. In the same period she bought from other countries goods valued at about twenty-five thousand four hundred and fifteen pounds more than the value put on the things sold. Adverse balances such as this have been the rule in Central America, and this means a gradual impoverishment. Yet Honduras has much fertile land, despite the fact that a great central area is a mass of rounded hills of telpetate—a friable, siliceous sandstone which can furnish little, if any, plant-food. Through this mass rise peaks and ranges of primitive rock, with limestone in places. Great forests once stood on these hills, and now furnish soil on which bananas and many other fruits, vegetables, cacao, corn, beans, rice, coffee, cotton, tobacco, and other crops might be richly raised.

If any other land has a more healthful and delightful climate than that of Honduras, its name is not on any map I have seen. Here the temperature is equable and mild, as it is regulated by the two great bodies of warm water which are near every spot in the land. When the north is enjoying its summer the sun lifts big loads of moisture from the North Atlantic, to drop it on the mountains and valleys of Central America. It gives more to Panamá and Costa Rica, less to northern Guatemala and Mexico, than to Honduras and Nicaragua; but always there is enough, yet seldom too much, here.

President Wilson lately announced that the United States will lend its influence to support the recognised Governments of Latin-America, and cannot regard with a friendly feeling those who may, from personal ambition, attempt to disturb the peace of any of these countries, particularly those of Central America. This declaration relieved the nervous tension which was caused by the death, on 21st March 1913, of

General Manuel Bonilla, president of the republic. The announcement inspired a sense of security and a strong hope and belief that this country will now enjoy a long period of peace. Little more will be required to give the people prosperity. Bonilla's death suddenly stopped action on a proposal to construct the Honduras inter-oceanic railway, projected sixty years ago; but

before this the National Assembly had approved of a grant of right-of-way and franchises for the Pan-American or Intercontinental Railway which is to be built along the plain bordering the Gulf of Fonseca. These works, and protection by the United States against insurrection, invasion, or rebellion, should make Honduras richer, more comfortable, and happier than she has ever been.

TROOPER 13,846.

CHAPTER III.

IT was while walking back to barracks that Devereux encountered Captain Marchand.

'That is you, Devereux ?' said Marchand.

Devereux saluted. 'I'm No. 13,846 of the Legion, my captain,' he replied.

'For the next few minutes you are Devereux. Why did you save me to-day? Good God, man, you must have hated me!'

Devereux made a little gesture. 'You married her husband. That is why I saved you.'

A smile lit up Contain a saved you.'

A smile lit up Captain Marchand's face. 'You're a queer fellow, Devereux,' he said. 'Quixotism like that is beyond me.'

Perhaps Devereux was thinking of what he had just seen, and wondering whether the woman was worth it.

'You don't still love Grace, do you?' Captain Marchand looked at him keenly, and for a moment the two men measured one another.

'That is beside the question,' said Devereux. 'At least I have honour, or I should have let you be killed to-day. Not another man would have raised his finger to save you.'

The remark gave Captain Marchand much food for reflection as he walked home. He entered the drawing-room to find Madge seated 'Grace out?' he asked. reading.

'Yes; she has gone to the Cercle.'

'Not by herself surely?'

'No; Lieutenant Villevois went with her.'

'Oh, Villevois? A harmless, amiable young ass.' Marchand laughed. 'I wonder why he volunteered for the Legion.'

Madge looked at her brother-in-law, and a momentary gleam of pity lit up her eyes. She knew only too well why the lieutenant had left Paris and come to Sidi-bel-Abbès only a few weeks after Captain Marchand and his wife; but loyalty to her sister prevented her from telling the man who stood before her.

Captain Marchand flung himself down in a chair. 'What a strange place this world is! To-day, Madge, I stood face to face with death, yet here I am.

'How?' Madge looked alarmed.

'One of the légionnaires got cafard, and he would have killed me, only another légionnaire sprang upon him. Who do you think it was?'

Something in the captain's voice made Madge look up. She knew intuitively the name of the légionnaire, though she asked the question.

'A man named Devereux. You knew him in

England of course?

'Of course,' responded Madge.

'One of the pluckiest deeds I ever saw. légionnaire with cafard is no easy task. It took half-a-dozen men to hold him.

'Tell me about it,' said Madge. She strove to speak unconcernedly. A feeling of pride surged through her-of pride and thankfulness that she had saved Dick for this.

Captain Marchand was not a good raconteur. He spoke disjointedly; nevertheless it was wel-

come to the girl. Her eyes shone.

Early next morning she went to the Legion's cemetery. Devereux was there, bent double over his work. He did not look up until he heard her voice. 'Dick!' she said.

His eyes lighted up.

Madge held his hand. 'I am so proud of you, Dick!' she said.

'Who told you?' 'Captain Marchand.'

Devereux looked surprised. 'Captain Marchand! Was Grace there?

'No; she had gone to the Cercle.'

'With Lieutenant Villevois? interposed Devereux.

Why do you ask ?' 'Yes.

'I walked to the bungalow yesterday, and I climbed the fence and hid in the grounds. Grace was standing in the drawing-room with Lieutenant Villevois.'

It was evident he had left something unsaid.

'I know,' said Madge slowly. 'She is playing with fire, but she only laughs at me. She looks upon me as a child.

Devereux turned sharply toward her. 'There is more womanliness in your little finger than in the whole of her body. She would not have done for any man what you did for me that

night.'

Madge's eyes softened. 'That is why I am so glad you saved Leon's life.' She paused. 'Tell me,' she went on—and her voice was wonderfully soft-'why did you go to the bungalow last night?'

For a moment Devereux hesitated. 'Life in the Legion is not altogether pleasant,' he said at last, 'and since you have come I have known a little kindness. So'---He broke off.

'You came for more? Poor Dick!' linked her arm in his. 'I wish you would let

me see more of you.

Devereux laughed bitterly. 'It would not be

wise. I'm a légionnaire.'
'Nonsense!' Madge laughed. She was with the man she loved—how much she had yet to learn.

Devereux looked down upon her fresh young face, laughingly turned up to his. With the sight a load of care dropped from his shoulders. He forgot he was a légionnaire, forgot everything, save one—a great truth that had suddenly forced itself upon him. 'God bless you, dear!' he said. Then a moment later, 'Madge, you have spoken to your sister?'

'Yes.'

'Then you can do no more. She will get burnt, as all women do who play with fire. is the price we mortals have to pay for folly. When the time comes I shall be near. I can do more than you can.'

'Thank you, Dick. Why are you doing all

this?

'Because I cared for Grace once,' said Devereux,

'and because she is your sister.'

Madge thought over these words as she walked home. She reached the bungalow to find her sister on the veranda.

'Madge,' said the elder sister, 'come here. I have something so amusing to tell you.'

'What?' Madge stood before her, the personification of healthy English girlhood.

'Lieutenant Villevois has asked me to go away with him.'

'Grace!'

'Don't look so shocked. I haven't done it yet.'

Madge looked severely upon her sister. you don't stop this foolish flirtation I shall tell Leon.'

The smile faded from her sister's face. 'You dare not do any such thing! Madge, you wouldn't be so foolish—so wicked?'

'I shall if you are so foolish on your part.'

'It is nothing, simply pour passer le temps. Leon shouldn't have brought me here. shouldn't leave me so much alone.

Madge looked away. There was pity and contempt on her face. Her hand, resting on the veranda-rail, suddenly gripped it until her knuckles showed white beneath the skin. 'You know Dick is in the Legion. You sent him here. Did you play with him pour passer le temps?'

'Dick joined the Legion because of me?'

'Yes, because he loved you so much.'

Grace sighed. 'Poor Dick!' she said, 'I did behave abominably to him. I must speak to him some day, and ask him to forgive me.' She little guessed how soon they were to meet, and under what circumstances.

'I shouldn't, if I were you,' said Madge.

'Why not?'

'Because you may find Dick has changed. Three years in the Legion would change most men, and Dick did not leave England thinking too kindly of you.'

CHAPTER IV.

DEVEREUX lay on his bed during siesta, and smiled. There was much to amuse him in Sidi-bel-Abbès, even as there was much to interest. He was thinking at the moment of a short conversation he had had a couple of hours before with Madame Marchand; she had come extending the warm hand of patronage, and she had left looking upon him as an enigma. He was thankful, too, that the scales had fallen from his eyes. For three years he had worshipped her as the lady of his dreams, and that morning had shown his idol to be of common clay.

It was hot outside; a pitiless sun poured down upon the sand. Around him the men lay contorted and gasping from the heat. There was a silence in the room, the silence of weary men.

Devereux's eyes closed, and his brain was busy. It was no light task he had set himself -the saving of Madame Marchand-for it is not easy to save a woman who deliberately thrusts herself in the path of danger; moreover, the means at his disposal were limited, since he was only a légionnaire.

He was still thinking about it when the corporal swung into the room. 'Débout, légionnaires / Débout /' he shouted. Siesta was over.

The eleventh company, to which Devereux belonged, were sent for a long march that afternoon, and it was dark before they returned. The long hours of monotonous physical exertion, swinging across the sand at a uniform rate of nearly five miles an hour, until one became an aching automaton, gave Devereux the opportunity he needed. By the time they had swung into the streets of Sidi-bel-Abbès again his plan was perfected.

Devereux hurriedly changed at the barracks, and walked through the town in the direction of the Street of Seven Delights. Diving down an alley, he entered an old Moorish courtyard. Gathered round the three sides were men-Arabs mostly—smoking narghiles; while scantily clothed Arabian girls passed from one to the other with cups of strong tea. An old grayhaired man smiled at Devereux as at an old Though it was forbidden ground to the friend. Legion, Devereux had been there before. was much that was interesting in the old Moorish house, and much that made him forget.

The trooper flung himself down on a gaudy yellow mat, and lay back with half-closed eyes. During the three years he had been in the Legion he had learned Arabic. At the far end hung a fine brocade cloth, woven with many colours, which separated the court from a room beyond. Devereux had chosen a mat near this. Apparently he sat idly, almost somnolently, sipping his tea like those around him. He rolled a cigarette and smoked it slowly. Through the clouds of the vaporous smoke he watched those around. He had come to seek one man.

Presently the curtain moved, and a group of women appeared—twenty or more. Most of them were southern Arabs, little more than children; others, from the whiteness of the skin which showed in the folds of the burnous, were English or French women. One of the girls picked up a torch and commenced to dance in the middle of the room—a wild nautch-dance, with the torch making curves of flame about her head. Murmurs of applause greeted her when she had finished.

Suddenly a little sigh escaped Devereux.

A figure had entered the courtyard, and, though his features were hidden beneath a hat low-drawn over his forehead, Devereux had little difficulty in recognising him. It was Lieutenant Villevois! The new-comer nodded to the proprietor, and crossed the courtyard to where the woman was lying. She rose at his approach, and, putting her arms around his neck, kissed him wildly, passionately. For a few moments he stood talking to her, her arms still about him, as she pleaded with him in soft, passionate tones; then he drew aside the curtain and passed into the room beyond.

Devereux strained his ears to listen; he even drew himself nearer to the curtain, so that he might catch every word. He was so near that only a few inches separated him from the woman who had caressed Villevois. She drew herself

away with an air of repugnance.

At other times the action would have amused Devereux. Now it escaped his notice. From behind the curtain came the sound of soft voices, so soft as to be almost indistinct. One he recognised as the voice of Lieutenant Villevois.

'Yes,' the lieutenant was saying, 'the eleventh are going for a long march on the 15th. They will be away for three days at least.'

'The 15th?' said another voice. 'That is the second day after Ramadan.'

Devereux waited to hear more; but the voices dropped, and the rest of the conversation was lost in the jingle of the ornaments on a girl who had just come forward to dence

who had just come forward to dance.

. . .

Devereux rose and walked out into the street and back to the barracks. He went to bed early that night. The day's marching had wearied him; nevertheless he dropped off to sleep, feeling that he had done a good day's work, and that fate had played into his hands.

For a week the *légionnaire* spent his leisure hours in the vicinity of the bungalow. Once only were his efforts rewarded. He was strolling in the bushes, when he felt a light touch on his arm, and turned sharply to find Madge looking into his face.

'I thought you would be here, Dick,' she said.

'You did not see me from the house?' he asked anxiously.

'No,' she answered. 'Why?'

Dick laughed gaily. 'It would mean a couple of years or more in the penal settlement,' he answered; 'and I could not do much to help you then.'

The girl took his arm. 'Don't, Dick!' she said. For a moment she hesitated. There was a question to which she longed to know the answer, with all the longing of a woman's heart. 'Dick,' she asked suddenly, 'you don't care for

Grace now, do you?'

'Care for her?' Devereux laughed softly.
'No. I don't hate her, but my feelings are little better. I am doing this because she was to have been my wife, and I want to save her from herself if I can. Besides, I have promised you.'

'I know.' The grip on his arm tightened a

little

For a few moments the two stood in silence. There was much they had to say, yet neither could speak.

'Has Lieutenant Villevois been here lately?'

asked Devereux.

'Not for three days now. Leon is nearly

always at home.'

'I understand.' Devereux did understand to the farthest inch, and he was wondering how he could ever have cared for that woman. He was about to ask another question, when a white-clad figure appeared on the verands.

'Madge, are you there?' called her sister.

The girl gave Devereux's arm a little squeeze—she was singularly unsophisticated—then she disappeared.

'Good gracious, child! where have you been?'

asked Grace petulantly.

'For a walk through the grounds,' answered

Madge.

'What a mad thing to do! Come inside and talk to me, child. Play, or do something. I am tired of my own company.' Grace shivered. 'I feel nervous, as if something were going to happen.'

Madge looked closely at her sister. 'There is

thunder in the air,' she said.

It was the last day of Ramadan. Devereux was standing before Captain Marchand.

'You say you heard this in Ben Radi's cafe?'

queried the captain.

'Yes,' answered Devereux.

'Who was it?'

'I can't tell you that; you would not believe me if I did.'

For a moment the two men looked at one another. 'Do you know what it would mean if I went to the colonel with your story?'

'A month's imprisonment for me; but it would mean also the annihilation of the Legion. Sidi-bel-Abbès would fall.'

Captain Marchand nodded. 'On the second day after Ramadan—the day after to-morrow—I will see that we do not march north. I can explain to the colonel; he is a wise man, and will not ask too many questions.'

It was the following evening that Devereux saw Captain Marchand again. He was walking near the Place Sadi Carnot. Devereux saluted him gravely. The next moment he was running toward the bungalow. There was danger that night; he felt it; he knew it. Captain Marchand was supposed to be marching out with the eleventh company. He had come back unexpectedly. In half-an-hour he would be at the bungalow.

The Legion makes good athletes of its men. The eternal march, march, trains them to a point of efficiency that nothing else could. Beads of perspiration were running down the *légoinnaire's* face when he reached the bungalow. One glance was sufficient. There, in the drawing-room, sat Madame Marchand and Lieutenant Villevois. His arm was about her, his face close to hers, as he said something to her in low tones.

The next moment Devereux stood on the veranda.

Madame Marchand rose to her feet with a scream.

Lieutenant Villevois surveyed him insolently. 'What does this mean?' he said. 'You are a légionnaire. Your number?'

'No. 13,846, my lieutenant.' Devereux turned to Madame Marchand. 'I have not a moment to lose, madame. Captain Marchand is on his way back now.'

'My husband?' Madame Marchand went white to the lips. Then she recovered herself. 'I knew he was coming back to-night. What objections should he have to my entertaining friends. I trust all légionnaires are not inflicted with the same curiosity—cafard, it is called, is it not?'

'No, madame, it is not,' responded Devereux sharply. 'In England, where I come from, it is called honour.'

Lieutenant Villevois took a quick step forward. The next second he had drawn his sword.

Devereux watched him. There was no sign of fear on his face. His eyes wandered to Madame Marchand. A word from her could have saved him; but she remained silent, sacrificing him now, as she had sacrificed him once before.

'No. 13,846,' said Villevois, 'to-morrow I

shall report you to your colonel. I give you one minute, or I shall report a dead man.'

Devereux ignored him. He turned again to Madame Marchand, and for the first time for over three years called her by her Christian name. 'Grace,' he said, 'has my appeal failed?'

For a moment Madame Marchand hesitated. The door opened, and Captain Marchand entered. He stared at the trio in amazement—at Devereux, at his white-faced wife, and at Lieutenant Villevois, who stood with drawn sword.

'I am afraid I do not understand,' he said,

speaking slowly.

'This man of your company chose to break in here and insult Madame Marchand,' said Villevois. 'It was fortunate I was here.'

'You came here?' Captain Marchand looked at Devereux, who drew himself up.

'Yes, my captain,' he replied.

'Why did you come?' Vague suspicions were forming in Captain Marchand's mind. This man had loved his wife once. Perhaps he did now. Rage showed itself on the captain's face. 'Why did you come?' he repeated.

Devereux shrugged his shoulders. 'Perhaps it was a touch of the cafard,' he said. 'Madame

was good enough to say so.'

'You will go to barracks, and consider yourself under arrest. To-morrow I will report you to your colonel.'

Devereux staggered for a second. He knew what that would mean. His eyes sought Madame Marchand's face for the second time that evening. A word from her would have saved him, but she stood there calm, motionless, relentless.

'Mr Devereux came to-night because I asked him to,' said a voice. In the doorway stood Madge. The eyes of all four were fixed upon her as she crossed the room and came to Devereux's side.

'You asked him to come to-night?' Madame Marchand found her voice. 'You must be mad! A common légionnaire! It is an insult to me.'

'He may be a légionnaire. You were engaged to him once,' said Madge hotly. 'I asked Mr Devereux to come because we were old friends in England. We are friends now.'

'This is not England, Madge,' said Captain Marchand.

'No,' said Madge. 'In England men are men.' She looked at Lieutenant Villevois as she spoke. 'Leon, you said you would report Mr Devereux to the colonel. For my sake I must ask you not to. It was my fault, since Mr Devereux came to please me.'

Captain Marchand hesitated.

'You will report him, my captain?' interposed Lieutenant Villevois. 'The man must be mad. He insulted your wife grossly.'

Madge surveyed him. There was utter contempt in her face. She felt that the moment had come when her own sister must be sacrificed

to save this man. 'In what way did Mr Devereux insult madame?' she asked gently.

Instinctively she drew nearer to Devereux as she spoke. A faint scent from her clothes rose and spread toward Devereux's nostrils. A soft desert wind had arisen and blew past the window with a gentle soughing. And still those within the room waited in silence.

It was Devereux who broke it. madame an apology,' he said. 'I made a mistake an error. We are all liable to that.

Captain Marchand watched him. 'You can

go back to barracks now,' he said.

Devereux saluted, 'Yes, my captain.' He walked quickly through the grounds, until the sound of footsteps made him pause. He turned. Madge stood before him. She was breathless from her run.

'Child,' said Devereux, 'you shouldn't have come.'

'Child!' Madge stamped her foot. 'Why

does every one look upon me as a child? Leon said I was a child, and did not understand.'

Devereux laid a hand on her shoulder. 'No,' he said gently, 'you are not a child; you are a woman—a woman whom some man will take to himself one day, and he will be a lucky man, Madge.'

For a second Madge looked at him, and there was that in her eyes which sent the blood wildly coursing through his veins. He broke away suddenly, passionately, as a man who is afraid. 'Good-night, Madge,' he said.

The girl stood watching him; she saw him break through the bushes, saw the bushes quiver, heard him vault the fence. Then there was silence, and she stood in the silence, a smile on her face—the smile of a woman who understands, and is happy. Then she walked slowly back to the house.

(Continued on page 398.)

SEVENTEEN YEARS AMONGST QUEENSLAND BLACKS.

PART II.

'WHEN we got to the hill we spread our nets and commenced work, and while we were hunting the old women went down as spies to look for the white men. They soon came back, and I made out from their report that there was a large hut, and that they had seen red and white blankets hanging on stockyard fences, and heard a dog bark, and the bleating of an old sheep which was tied up to a tree. I wanted to go and see for myself; but the man I was living with was not willing to permit this unless somebody was with me; so he made his gin go with me.

'When we got clear of the hill, going down in the direction of the hut, we saw the sheep feeding, and the sight so frightened the gin, who had never seen such animals before, that she ran away. I went farther on, and came to a waterhole, where I washed to make myself as white as possible. Going on still farther, I came to the sheep-pens, and saw the blankets and the sheep the gin had spoken of. Then I stood behind the yard for some minutes, trying to think what I should say. Presently I took courage, and got on the fence out of the way of the dogs, and called out loud, "What cheer, shipmates?" When the men heard me, one of them came out and saw me there, naked, and neither white nor Looking surprised, he went into the hut black. and spoke to his mate. I understood him to say, "Come out, Bill; here's a red or yellow man sitting on the rails, naked. He's not a black Bring the gun." But, being dreadfully afraid they would use the gun, I said, "Do not shoot me. I am a British subject, a shipwrecked sailor." One of the men was named Hatch; the other, Wilson, had been a sailor. They told me to come round the stockyard, and met me halfway. They cross-questioned me, and I told them when and where I was wrecked. They asked me if I knew what day and date it was. I told them I did not; then they told me it was Sunday, 25th January 1863. They reckoned back to 1846, when I was lost, and told me it was seventeen years, and asked me if I thought it was so long. I said, "No, nor half so long."

'After talking some time, they took me into the hut and gave me a piece of bread, asking me if I knew what it was. I told them it was made of flour. I tried to eat a piece, but was so overjoyed that it stuck in my throat. However, I was not hungry, for we had caught twenty small gray wallabies during the day. I had some tea, and again they asked me if I knew what it was. I replied that I did, but that it was too sweet, as I had not been accustomed to sugar; so they added some water. After I had been in the hut for some time they told me to look out and tell them what I saw.

'I saw a large flock of sheep, with their third companion—a Scotsman named Creek—coming home. They wanted to give me some clothes; but I told them I had better go back just as I was to the natives, who were on the hills in the distance, where we had been hunting all day, and tell them to go away toward the sea-coast; then I would return in the morning. This they agreed to, and instructed me to tell them that "if they did not interfere with us we would not interfere with them." They also told me that if I did not come back in the morning they would conclude I had told them a lie, and they would put the black trackers on our trail, and shoot us.

When I left the sheep-run I went back to the blacks, who surrounded me and asked me about the white people. I told them if they went near they would be killed, and that the white men had come to take their land. So, believing me, and bowing at once to the force of might, they told me to ask the white men to leave them all the ground to the north of the Burdekin, and to let them fish in the river; also, to leave them the low grounds where they live, to get the roots. They asked me what I intended to do. I told them I was going to stay that night; but in the morning I must go back, or they would track us up there and shoot us all. Next morning they all came round me again and asked me if I would come back in a few days. I told them no. I should be away quite three or four moons. They then said, "You will forget us altogether." when I was coming away the man I was living with wept, and so did his gin and several of the other gins and men. It was a wild, touching The remembrance of their past kindness came full upon me and quite overpowered me. There was a short struggle between the feeling of love I had for my old friends and companions and the desire once more to lead a civilised life which can be better imagined than described.

'I then left them and came on to the hut. The men were glad to see me, and took me down to the water-hole, washed me with soap, and gave me some clothes. I remained a fortnight in case the natives should come to me, but none of them ever came in sight.

'I then gave myself up to Mr Meyers, who left me in the charge of Mr Salting, of Hiffling cattlestation, until the return of the commissioner's orderly from the Fanning River, who accompanied me safely into Port Denison. I experienced great kindness from Mr W. H. Thomas and Mr P. Somers, who gave me clothes and collected a subscription for me in my necessity.

Murrells became a freeholder at Port Denison and a general favourite with the inhabitants. His personal appearance was somewhat striking. Exposure to a tropical sun had made his skin very dark. At intervals for some years he suffered from large rheumatic swellings in various parts of his body. This malady carried him off, as recorded in the Port Denison Times thus:

'It is our mournful duty to record the death of the pioneer white man in the north, James Murrells, from rheumatism, ending in inflammation and fever. During his last illness he was unceasingly attended by Dr W. S. Smith. Jimmy was devotedly attached to his wife and child, and his only care seemed to be how they should be provided for in future. He was a general favourite throughout the district, and when his death became known in the town the flags of all the ships in harbour and at the various stores in town were lowered to half-mast. During the reading of the solemn and beautiful service of

the Church of England by the Rev. E. Griffiths many an eye glistened with unbidden tears as some act of kindness by the departed was recalled.'

James Murrells was not an old man, being only forty-one years of age; but he was prematurely aged by the troubles and hardships he had encountered during his adventurous life. Could the Mount Elliott blacks have learned that their pale-faced brother was dead, what howling and woe there would have been!

James Murrells described the aboriginal tribe he had been living with so long as a vastly superior race physically and in general appearance to any he had seen in the more southern part of the continent. Nevertheless, they are treacherous, jealous, and exceedingly cunning. They are not black, but more of the colour of half-castes. When born they are nearly white, but when they are three days old the gins rub charcoal into their skins to make them black and shining. They have sunken eyes, broad flat noses—which are flattened by their parents in infancy-and very large, broad mouths. The infants are suckled for a very long time, even till they are old enough to get their own food. Murrells had seen a child sucking at the breast with its next younger brother or sister. women have very few children, seldom exceeding four, and very seldom more than one at a time. He knew of about four cases of twins. He also remembered that when a boy and a girl were born, the father killed the boy and spared the girl to save the trouble of bringing both up, for these blacks are very lazy. The women go into the swamps to gather food the day after their confinement, as though nothing had happened.

The men have several wives—in some instances as many as eight or nine—and this causes war, single combats, and feuds; they steal the women, and frequently lend or sell them for a time for a slight consideration. It was Murrells's early knowledge of this that made him very careful. They never stay long in one locality; when the food in one place is exhausted they travel to another. In the wet and cold season they put up small, temporary gunyahs for shelter, but in no particular order. They live in tribes, each tribe speaking a different dialect, which can hardly be called a different language. James Murrells could speak eight of the dialects. They have no regular chiefs, and the strongest man is the best. They get food by fishing, hunting, digging in the earth for roots, or gathering fruit. They eat anything, even sharks and alligators, besides shell-fish and fish of all kinds, kangaroos, rats, wallabies, snakes, grubs, snails, and all sorts of creeping things, as well

as wild duck, geese, and turkeys.

Murrells gives us native names, descriptions, and places of habitat of hundreds of edible roots. He continues: 'There is plenty of the honey of wild bees in the hollows of trees.

matives eat honeycombs, bees and all, if they are hungry. There is plenty to eat if they are not too lazy to fetch it. Human flesh cannot be considered part of their food, though they sometimes eat it. They eat the bodies of young men slain in battle or killed by accident, and also of young women and children, but never those of their enemies. They cut their enemies up in strips, dry them, and distribute the pieces through the tribe, by which means they think their enemies' strength is added to their own, and that they will be lucky in hunting and fishing.

'They have no written language whatever, and very little tradition. The language is very guttural in sound and extremely limited in power of expression. Of course they have no means of teaching their language but by imitation and memory, assisted by their wants. different animals are arranged according to the size of their feet; hence sheep have the same name as the wallabies (cargoon). All kinds of sailing-ships have the same name as their canoes, because they float on the water (woolgoora). The heavenly bodies are named differently. sun is ingin, which they think is a body of fire because of its warmth, and especially since they saw us light a rag with a burning-glass. The moon (werboon-burra), they say, is a human being like themselves, and comes down on the earth, and they sometimes meet it in some of their fishing excursions. They believe that one tribe throws it up, and it gradually rises and then comes down again, when another tribe catches it to save it from hurting itself. They accordingly think there is a new sun and moon every day and night.'

About six years before Murrells's restoration there was a total eclipse of the sun, the only one he saw, about four o'clock in the afternoon. He asked an old man what it meant, and he told him his son had hid it (the sun) to frighten another of his tribe. But they were very uneasy during its continuance; they picked up a piece of grass and bit it, making a mumbling noise till the eclipse was over. They are very frightened of thunder (teegoora) and lightning (timulba). They have no knowledge of how they came into existence; they think they live and die like dogs, but there is a kind of innate fear of death, and they have some thought that they will jump up white-fellows.

'They told me that their forefathers witnessed a great flood, and nearly all were drowned; only those who got on a very high mountain—Bibbiringda, which is inland of the north bay of Cape Cleveland—were saved.' He understood them to refer to the flood mentioned in Scripture, especially as they say only a few were allowed to go up.

'They can only count five: woggin, 1; boobray, 2; goodjoo, 3; munwool, 4; murgai, 5. For any number beyond these they put up their

ten fingers together, beyond that again the ten fingers of another person, and so on for three or four persons, till they come to a moon. When they make reference to fish, roots, or things in general, they commonly say "a few" or "plenty." They measure time by moons and wet and dry seasons. The language is very irregular, and it seems to be totally impossible to systematise it in any way."

Here follow about one hundred of the prin-

cipal words in native and English.

The natives easily obtain fire by friction. The wood used is that of the black fig after it has rotted and become almost powder with age. The ceremony of making the lads young men takes place about once every six years. Murrells remembered four different occasions when there were great meetings for the above purpose while he was with them. 'For eight or nine months immediately previous the lads have to go into the bush to provide wholly for themselves, during which time they are never allowed to see a female; this is to test their fitness to take a wife. If they do accidentally see a female they think they will waste away. After the nine months are over they are brought into the camp, and cane rings are put on their arms and tightened very much, so as to stop the circulation of the blood. Their arms swell very much, which puts them in great agony. They are then left in that torture all night, and their cries are terrible. To keep their fingers from contracting and thus deforming them, they sit with their hands and fingers spread out on the ground, with their heels tightly pressed on them.

'In the morning they are brought out in the presence of their mothers, sisters, and relatives; and just above and below the marks of the cane rings on their arms small incisions are made to let the blood flow, which is simply to prevent While this is being done their inflammation. mothers and relations are crying and cutting themselves from head to foot with sharp stones in token of joy at seeing them. When the swelling has somewhat subsided they retire to places previously provided for them to sleep under, with boughs to shade them from the sun, as of course they could get no sleep during the Whilst they are sleeping the old gins go night. into the swamps and get roots to make cakes for them when they get up in the evening. The men get all the spears the young men have been carrying with them during the nine months they have been away, and fix them in the earth on a clear space in a semicircle, fastening the spears head to head with grass festoons.

'In the evening, all being ready, the young men wake up, generally about eighty in number, and are all seated under a festoon in a reclining position. Then their sisters or female cousins lie with their heads on their swollen arms to press down the swollen and cut places. While they are lying there a lot of cakes are thrown up and

scrambled for by the lookers-on who had gone

through the ceremony before them.

'In the morning they are taken into the bush again and dressed up with shells and the down of birds stuck on their heads, painted, and made to look to the best advantage. They are then brought back to choose and take their sweethearts, and the whole ceremony closes with a grand corroboree.

'After this is over there is a good deal of quarrelling and fighting among them. steal the wives of the old and weak men, and daughters from their parents, which leads to fighting, and often extends to two tribes, and then there is a war, which, however, is not very sanguinary. They often get some terrible blows, and sometimes one is killed; but they cannot keep this up many hours, for they are forced to go and get supplies of food in the swamps. They seldom renew the conflict.

'They are very strict in their relationships. When girls are about ten years old they are not allowed to sleep with their brothers at the same fire; as families they are very distinct. They burn their dead, and carry the remains tied up in a sheet of bark for about twelve months; but when tired of this they throw them into a waterhole. Their tomahawks (bulgoo) are made of stone, though latterly they have got a good deal of iron from wrecks.

'There is a very fine flax grown there which they use in making fishing and hunting nets,

and very good mesh nets too.'

Murrells's description of the country was inviting and most interesting. He described the country about Mount Elliott, where he mostly lived, to be well grassed and watered. At the top of the mountain there is a never-failing spring of beautiful water which finds its way down both sides. The waters are frequented by alligators, and dozens of his companions fell victims to these animals. He also described the snakes as very venomous, and said the natives had no antidote against their bite. He had been scared by an alligator and bitten by a whip-snake, from both of which he had a narrow escape.

The process of extinction is gradually but surely going on amongst the aborigines. The tribe Murrells was living with were far less numerous than when he first went among them. with the wars, fights, destruction by the settlers and black police, and natural deterioration in the people themselves, they were fast disappear-While he was with the natives he suffered a great deal from rheumatism, which had left its mark upon him, so that he was so reduced in strength that he felt he would not have lived much longer if he had not come away from his nomadic associates.

I happened to be talking to Dr W. S. Smith, when he pointed out Jimmy. Those who knew Port Denison in the sixties will remember

the kind-hearted, if somewhat rough-spoken, Dr Smith, a man of herculean proportions, who always dressed in a suit of white flannels.

I much enjoyed chats with Jimmy. One day we had taken a long walk to the sea-coast by way of Salisbury Plains, where some members of his old tribe were fishing. It was amusing to see him casting his eyes on the gum-trees as we walked, looking for wild honey. The conversation between us referred to the kind of hair grown by the aborigines. As he pointed out, there were some with hair almost straight if it were combed out, others had curly hair, but none had kinky or negroid hair. I was glad to hear him corroborate my own observation on this matter, and have often wondered why Australian blacks are referred to as 'niggers.' In no sense do they merit this distasteful term.

THE END.

MAYTIME.

Do you wonder of what I'm thinking as I play you your favourite tune?

of your golden curls, boy, or your eyes like

blue stars of June.

Tired? Well, nestle near me in this corner, and listen the while I play,
And think of God's beautiful growing things, for
we are nearing the heart of May.

Only to-day, in a golden dawning, there came sweetest of wild sounds rioting by;
They were birds' voices softly cooing and calling, young things answering ready to fly.
Green little blades of grass were upspringing, rustled by tiniest feet that come and go,
With a morning wind spothing and tenderly touching

With a morning wind soothing and tenderly touching pale emerald leaves, and murmuring low.

Down in the old Hall gardens, just waking, a daffodil nodded her graceful head, And valley lilies scented the air as they welcomed

two shy little field-mice leaving their bed.
The fresh green smell of the sap seemed to mingle

with earth-scents from near and far,
As over the tree-tops I watched her coming roseate dawn reaching to morning star.

And I listened till waking world filled me with wonder, and divine hands reached right down to my heart,

Though I smiled at two velvety swallows wooing, fluttering together, then drifting apart; white winged butterfly came to my window, a bee flew joyously over the way;

For he knew it was Maytime, and nearing to haytime, and this just his first spring day.

So now you know where my thoughts were wandering as I played softly the same old tune, For the breath of a new-born spring had touched

me, with its promise of golden June.

Sleep on, little head with the gold curls shining;
there's nought to disturb save glad birds on

the wing; Sometime you'll have day dreams, and earth's nearer to heaven when you've fallen in love with a radiant spring!

E. A. HENTY (MRS EDWARD STARKEY).

THE MAKING OF MICHEL

A STORY OF THE OLD NORTH-WEST.

By ROBERT MACHRAY.

CHAPTER I .- MICHEL RUNS AWAY.

THE sun was sinking to the clear, frosty line of the horizon as a picturesque procession of dog-trains, drawing toboggans laden with furs, halted in front of the Manitoba House, a roadside tavern on the eastern edge of Baie St Paul. With tongues thrust out, and breathing hard, the 'husky' dogs squatted on the snow-covered ground, while the men of the party gathered round Pierre Delorme, their leader.

After spending the winter in the far Saskatchewan, these hunters and trappers, French-Canadians with a dash of Indian blood in them, and locally known as Métis, were returning to Winnipeg—the new town rising beside Fort Garry, from which they were now some forty miles distant—with their spoils late in March. They were dark, swarthy fellows, mostly young; their frames were lean and tough, their souls were the simple souls of children, but their passions were the hot passions of men.

'Shall we camp here?' asked Pierre of his band, with a twinkle in his black eyes. 'You'd like to, sure; but we might do two or three miles more before turning in for the night, eh?'

He glanced at the faces around him; they were fixed wistfully on the Manitoba House and its windows warm with sunset. In his heart he felt that they should make these two or three miles. But the place, which was kept by one of their own race, an old-time coureur des bois, was tempting, with its promise of comfort and good cheer.

'It's whatever you say, Pierre,' remarked his second in command. The others said nothing in words, but they looked at the tavern longingly.

While Delorme was hesitating there stole from the building a strain of music—a familiar air, played enchantingly on a violin. That settled the question.

'Yes,' said Pierre, 'we'll camp here.'

For some moments, however, he and his comrades stood listening; the atmosphere seemed void of sound save of the beguiling melody. Then one man lifted up his voice, and then another, until all were singing lustily, yet with an undernote of pathos, the chorus of the tune:

A-lou-et-te, gen-til a-lou-et-te, A-lou-et-te, je te plu-mer-ai. No. 182.—Vol. IV. Suddenly the door of the Manitoba House was thrown open, and Jules Barras, the proprietor, stood on the threshold and roared a welcome. 'Hallo, boys! Come in!' he shouted. 'Come right in!'

'Yes, yes, Jules, when we've fixed up the camp,' answered Pierre with a joyous laugh.

After camp was made, Pierre charged his men before entering the tavern to take few drinks, as they had to be off early next morning. 'We must not stay long,' said he, warningly.

But there, in a corner of the bar-room, sat fate in the form of Alphonse Caron, with his fiddle to his chin, and gaily he greeted them, with a smile and a flourish of his bow. Amid a babel of talk, merrily round went the whisky; and them Alphonse, tuning up, asked what was their fancy. He gave them one or two songs of Old France and some of the rolling chansons of the voyageurs; and they joined with a will in the choruses, the music, with its memories, tugging at their heart-strings. Oh, but it was fine! Next, drinks again, followed by a suggestion from Pierre that it was time to go.

'Not yet! not yet!' said his men. 'In a few

'Well, well!' said Pierre assentingly.

'Why don't you have a jig?' came from Jules, behind his bar. He knew what he was about. In that country, at that period, a jig meant the 'Red River Jig,' a dance peculiar to the North-West, in great favour with its people, and always a highly inflaming affair. Glad cries acclaimed the proposal.

'Yes, Jules,' said François Lepine, a young trapper.—'Play us a jig, Alphonse.—Eh, Pierre?' Delorme frowned slightly; but the fiddler,

ready to oblige, forthwith began a lively measure without waiting for his permission.

'Well, just one,' said Pierre, and, with a grin, was the first to take the floor. Gaston Bernardin, a long, supple hunter, sprang into position opposite. The others quickly joined in. Presently the room was in a whirl; dust rose like a cloud; and, as the crafty Jules had foreseen, thirst struck hard at every throat.

Now, the special feature of the 'Red River Jig's erved.]

MAY 23, 1914.

[All Rights Reserved.]

is that it is not a dance of partners but of rivals. It is a dancing duel, in which each contestant strives to tire out his vis-à-vis. Generally it is a genial, friendly competition; but there have been occasions when jealousy changes the jest into earnest. There are grim tales of dancers dropping dead! Women sometimes take part, but it is par excellence a dance of men.

For a quarter of an hour all went well. There is no reason why the jig should ever stop so long as there are men to dance and a fiddler to play for them. But Pierre made a sign to Alphonse, and the music ceased. Thereupon every one lined up at the bar before the beaming Jules, and merrily round went the whisky again.

'We must be going,' said Pierre after a while. 'It's early yet,' protested Jules, and persuasively he pushed an open box of cigars toward 'Help yourself, my friend,' he added in a cordial tone.

'Well, well,' said Pierre, with indecision in his voice and his fingers stretching out for the

cigar-box.

'Let's have another jig,' said François Lepine, who had asked for the first.—'What do you say, boys?'

'Yes, yes,' they answered gleefully, but they

looked doubtingly at their leader.

'Why not, Pierre?' inquired Jules, and, without waiting for a reply, nodded to the fiddler. Delorme, who now had a cigar between his lips, shook his head, but Alphonse commenced playing

'All right, then,' conceded Pierre, lighting up and puffing out the smoke luxuriously. 'But

just this one more!'

'Come on!' François called out, beginning the steps. A skilful performer, light as a feather and active as a squirrel, he had figured conspicuously in the previous dance. 'Come on!' he shouted. His face was a trifle flushed, and Jules's whisky was more than a trifle in his head. Antoine Norbert stood up to him, laughing, and at it they went, their moccasined feet timing pit-a-pat, pit-a-pat softly on the floor. A second and a third couple formed up; while Pierre, tranquilly smoking Jules's cigar, and the others looked on. At last one dancer after another confessed defeat and dropped out, and François alone was left, invincible and still unsatisfied.

Come on! come on, boys!' he shouted, circling the now empty space. He paused when no one accepted this gage of battle, and he rested his eyes on Michel Macmannus, a young trapper like himself, but with Irish as well as French and Indian blood in his veins.

'Michel,' cried François, 'come on! Let's see who's the better man!'

But Macmannus turned silently away.

'Come on, Michel!' persisted François. you afraid of me?'

'Afraid? No!' said Macmannus, swinging round and facing him.

'Then come on and dance!' François added sneeringly, when Michel did not move, 'You are afraid. You know I'm the better man!'

Without a word Michel got into position, and Alphonse swept the strings of his fiddle with its bow.

'I'll dance you for a dollar-for five dollars, Michel Macmannus, jeered François.

'For anything you like,' said Michel, ominously quiet.

'For drinks all round?'

'If you please, François Lepine.'

Gazing at each other heedfully, François and Michel set to work, the one making the moves and the other duplicating them like a shadow. Not a step did François dance but it was reproduced by Michel.

Among the trappers and hunters who composed Pierre Delorme's party there subsisted a fine spirit of camaraderie, born of hardships and dangers shared in the wilderness; but between these two was bad blood, its cause being that ancient and eternal fount of strife—a woman. Both were in love with pretty Toinette, the daughter of Pierre, and the rest were well aware of the fact.

Toinette was believed to favour Francois, but was not engaged to him; he made no secret, however, of his expectation to marry her in the coming summer. Michel had not abandoned hope, but it was no wonder that his rival's taunts He would show him who was the angered him. better man! As for Toinette, whose good looks made her the belle of St Boniface, the French-Canadian village opposite Winnipeg, she was but a maid of seventeen, and had shown herself sweetly saucy to both lovers; more so, it was thought, to François.

All this, then, lay in the minds of the other men as they formed a ring and watched the varying phases of this duel. Never had they seen such a jig, so determined, so prolonged; the tale of it is still told by people now old, but who then were young. Alphonse played till his arm ached. Pierre, his cigar gone out, pulled nervously at his beard and tried to intervene; but he might as well have spoken to the winds.

And then! How it happened no one could tell, but François stumbled when he and Michel were near each other. Trying to regain his balance, he almost fell—would, in fact, have fallen had not Michel caught him and held him up. With a passionate imprecation, François pushed Michel from him with so fierce a fling that the latter, taken completely by surprise, was driven hard against the men looking on.

Straightening himself by an effort, Michel glared at François and rushed at him; but François, whipping out his hunting-knife, seized one of Michel's hands, and stabbed at him with all his might. Michel, however, succeeded in parrying the blow, grasped and held François's wrist, drew his own knife, and drove it into the other's heart. François shrieked, spun round, fell on the floor, gasped—and died. All was over in one frantic minute!

The men looking on saw and hardly understood; then they gave vent to their feelings of dismay and horror in abrupt ejaculations.

Pierre, his face gone white, stepped forward, knelt down, and bent over the body. 'François is dead!' he exclaimed, rising and gazing at Michel accusingly. 'Michel Macmannus,' he said in harsh tones, 'you have killed him. It's murder!'

'It's not,' Michel answered vehemently. 'He drew his knife and struck at me first, meaning to kill me. It was he or I.' He turned from Pierre and appealed to the others. 'Was it not so?' he asked.

'It's true,' said Alphonse the fiddler. 'We all saw him draw first, Pierre; but Michel was too strong and quick for him. It was a fight; it was not murder.'

The rest murmured approval, but Delorme shook his fist at Michel.

'Michel Macmannus,' said he, 'you have murdered François, and you shall answer for what you have done.'

'I killed him in self-defence. He would have killed me if he could,' said Michel hotly. 'You have no right to call it murder!'

Pierre looked at the body on the floor, and then at Michel. For a few seconds he was silent; at length he spoke.

'And Toinette—what of her, Michel Macmannus?' he asked. 'What will she say? She loved him. With my consent they were to be married. And here he lies, dead by your hand. What will she say to you, Michel Macmannus? My poor Toinette!'

'Toinette!' muttered Michel. 'Toinette!'

All the passion went out of his face. He had forgotten her in those terrible moments. White to the lips went Michel, and his heart was water.

'She loved him,' said Delorme mercilessly.
'And I have to take his dead body to her,
Michel. Oh! it will be the end of her. My poor
Toinette!'

Michel stood dumb and stricken. The room was in a hush.

'She loved him,' Pierre repeated relentlessly, 'and you have taken his life.'

'Toinette! Toinette!' whispered Michel chokingly. 'Oh,' he cried, throwing up his head, 'I cannot bear it!' And, crying this distractedly, he rushed madly out into the open air, the others making way for him. Like a man possessed, he rushed on and on; and when Delorme and the rest came out to see what had become of him, he had disappeared in the dark-

'Michel! Michel!' they shouted, but there was no response.

'He has fled,' said Pierre wildly.

From Toinette,' added Alphonse the fiddler.

'It is the thought of her that has unmanned him and made him run away. He feels that he cannot face her. That's how it is.'

'He shall pay for what he's done this night,' said Pierre.

Two days later Delorme, with his men and dog-trains, arrived in Winnipeg, bringing the body of François Lepine, and telling how he had been slain by Michel Macmannus, who had fled, whither no man knew. Toinette listened to the sorrowful story, and shed some tears, but said very little.

'The girl's heart is broken,' said Pierre to Marie, his wife and Toinette's mother. 'She

will never get over it.'

But Marie, who was wise in the ways of girls, and especially of her own daughter, had her doubts. To her it seemed that Toinette's grief did not go very deep, and she had always wondered for which of her two lovers Toinette had cared.

'Where is Michel?' she asked herself. For Gaston Bernardin, who was her sister's son, had told her the tale of the killing, and of Michel's flight, with the interpretation Alphonse the fiddler had put upon it.

CHAPTER II .- MICHEL RETURNS.

MURMURING frenziedly the name of Toinette, Michel Macmannus ran on and on through the darkness of the night; but after a time his feet fell unconsciously, yet naturally, into that steady trot which the trapper, accustomed to the movement of dog-trains, can keep up hour after hour with scarcely a halt. He travelled along the eastern trail till dawn, and then headed south across the Assiniboine for the American frontier. Getting a meal and a rest here and there on the way, he reached the boundary, and passed it early in the afternoon of the next day.

But, pursued, haunted, and obsessed by the thought of Toinette and the misery he had brought upon her, on and on he went, striving to place as long a distance as possible between her and himself. The miles, however, made no difference, and he could not escape from Toinette; everywhere he saw her beautiful eyes and face dulled and shadowed by melancholy and despair. He had to work to live; but work brought no respite. Some weeks after the killing of François Lepine he found employment in a sawmill at Grand Forks in Dakota, piling lumber, and tried in hard toil to forget, but with no success. He wanted—he longed to hear of her, since forgetfulness could not be his; if the strenuous labour did not give it to him, the strain on his body at least steadied his mind somewhat. Time passed, and then he wrote to his mother, a widow, who lived in St Boniface, not far from the Delormes, and sent her part of his wages. He asked her

to tell him of the girl, the idea of whom had become a torture ceaseless and terrible, and he awaited her reply in a fever of anxiety, counting one by one the leaden-footed days.

It was from Père Cloutier, the kindly priest who had known him from his childhood, that

the answer came, if answer it could be called.
'My dear son,' wrote Father Cloutier, in a fine spidery hand, 'you must return here at once. Your mother is well, and is glad to know where you are. She thanks you for the welcome money; but she begs you to come back—she implores you, my son. People are ever prone to think evil, particularly of a man who, they say, has run away. It is spread throughout the settlement that you murdered François Lepine, and that that is why you are not here. For myself, I cannot believe it; nor does your mother. But a warrant for your arrest on that charge has been issued by the Attorney-General of the province. You must return and stand your trial like a man, else your mother will never be able to hold up her head again. My dear son, come back at once. It is your bounden duty to her—and to yourself.'

Not one word about Toinette! But his duty, plain as the sun in a cloudless noontide.

So people were saying he was a murderer, and bowing down his mother with sorrow! It was an intolerable thing. He did not fear to stand his trial; indeed, he had not even thought of it. What had daunted him had not been that; it had been Toinette and her broken heart. From them it was that he had run away. He had a sufficient answer to the charge of murder; he had killed François, but after provocation and in self-defence. Yet it might look as if he had run away because he was afraid to meet it. His mother called on him to return; otherwise she would be for ever shamed.

But there was Toinette! Why had Father Cloutier said nothing about her? Michel pondered this in his simple soul heavily. Did the priest mean that he must not think of her, but only of his mother and her supreme need? And Michel wrestled with himself and his dark fear of Toinette, and in that struggle a man was made.

'I shall go back,' Michel at length decided. 'I must face Toinette, however bitter it will be. I suppose I was—I am—a coward,' he said to himself. 'I should not have run away, but I was afraid of her and the misery I caused her.' He was afraid still, but his mind was made up; he shrank from meeting Toinette as from some frightful ordeal, but he wrote to Père Cloutier that he was returning, and he gave notice at the aa.wmill.

Within a few days he recrossed the frontier, and at the small town on its Manitoba side he surrendered himself to the local deputy-sheriff, who incontinently clapped him into jail, and, to his intense surprise and consternation, loaded him with irons as if he were indeed a murderer.

'Why do you chain me like this?' asked Michel indignantly. 'I did not murder François Lepine.'

Folks say you did,' was the stern reply. 'Why did you run away if you were not guilty? That don't look to me like innocence. Guess you did murder Lepine. Anyway, judge and jury will settle your business in Winnipeg shortly. Jim Consedine, the sheriff, will be here by the steamboat to-morrow, as it happens, and he'll take you up there next trip.'

'I have given myself up voluntarily,' protested

'That's what beats me. Why in thunder did you do it?'

'Because I'm not guilty.' 'Then why run away at all?'

Michel was silent. How could he speak of Toinette and his dread of her to this man, who would never understand? And a new fear fell upon him. Did people really believe he was guilty? Was that Pierre's doing? Pierre had called the killing murder. And his running away-how was it to be explained? Was Pierre saying it was a proof of his guilt-Pierre, implacable because of Toinette?

The steamboat came, and the sheriff with it. On its return two days later from higher up the river he took Michel aboard. Railways had not then penetrated north of the international line, and communication was either by stage or steamer. The vessel which conveyed Michel to Winnipeg was of the usual river type—a sternwheel, flat-bottomed structure with two decks, the upper with staterooms for passengers, and the lower for freight. It was on the lower deck

that Jim Consedine kept Michel—and himself.
Michel was in irons. He had told the sheriff the story of the killing of François, and had urged his plea that it had been done in selfdefence; but Jim Consedine was not sympathetic, having heard such tales before from prisoners accused of murder. His impression was that Michel had committed the crime with which he was charged. He took good care, therefore, not to remove Michel's handcuffs; but he did loosen to some extent the fetters about his feet, so that Michel could move his legs more or less freely.

'I don't want to be harder on you than is necessary,' said the sheriff; 'but I reckon you won't try to swim off with those things on you to cramp your style.' And he smiled grimly.

'I shall not try,' said Michel. 'You forget that I gave myself up of my own free will."

'Well, well,' said Consedine equably, 'that's all right; but I've got to keep you tight now you're in my hands.'

The sheriff was not there for argument. But he was not adamant, and when he pulled from his vest-pocket a cigar for his own smoking he offered Michel another, and Michel took it gratefully, and felt somewhat comforted; he had been growing sullen and savage in his chains, but Consedine's simple act of kindness made him human again. The vessel steamed on for several hours, and the sheriff and his captive exchanged a few words now and again; they took their food together, and so the time passed.

Suddenly, as they were nearing Winnipeg, they heard a great splash in the water near the bow of the steamer, followed instantly by the shrill, piercing cry of a woman from the upper

deck.

'What's that?' exclaimed the sheriff, rising to his feet quickly. He had been sitting with Michel in the stern.

'Some one overboard, I think,' said Michel.

Again came that shrill, piercing cry from the upper deck; but it was now accompanied by other voices.

'Come with me and let's see what's amiss,' said Consedine to Michel. 'It's a child—in the water—fallen overboard!' he went on excitedly, as they moved forward together. 'That would be the mother we heard.'

A tiny girl, sinking, sinking, floated toward them.

'She's not much more than a baby,' said the sheriff pitifully. 'And she's out of reach and I can't swim. I'd do no good. She'll drown.'

'No, she won't,' said Michel, his eyes glittering.
'I can swim. You leave her to me, sheriff.'

'Leave her to you! What can you do with

those irons on you?'

But Michel had already dropped over the side of the vessel. 'Get out the skiff quick,' he cried to Consedine. 'Guess I can hold the child till you come along with it.'

'You'll drown too, you fool!' said the sheriff. But he changed his mind when he saw Michel catch the child with his hands, bound though they were, and fasten his teeth into her clothes, treading water with his feet the while. 'Perhaps he can do it,' said the sheriff to himself, and he

rushed off to unship the skiff.

Meanwhile the engines had been stopped and reversed. Men came running down the steps from the upper deck, and helped Consedine. Soon the skiff was launched, but Michel and the child in the meantime had fallen far astern. The mother of the little girl came down and watched them, wringing her hands and sobbing bitterly. But after some moments of suspense she saw the skiff, in which were Consedine and another man, pick up the child and then Michel.

'Saved!' ran the joyful cry throughout the

vessel.

'I could not have held out much longer, the pull of those leg-irons of yours was so tremendous,' said Michel to the sheriff, once he was in the skiff. 'The child is all right, I think.'

'Guess so,' said Consedine, whose first care had been for her. 'She's all right. But I don't know how you held out at all, Michel,' the sheriff went on. 'Finest thing I ever saw in my life! Didn't think you'd do it, with those things on

you. Splendid! Michel Macmannus, you're a man, anyway!'

Michel's magnificent deed of heroism had been witnessed by all on board the steamer, and they cheered him wildly as the skiff came near. Most of them had already heard who he was—a man charged with murder, and, it was said, most probably guilty. But they cheered him again and again; their warm Western hearts were fired with enthusiasm.

Jim Consedine joined in the applause—later, and in his own way. It was he that placed the child, who appeared little the worse for her immersion, in her mother's arms. 'Here's your baby, Mrs Bronson, safe and sound,' said he.

With tears of joy and gratitude the mother thanked Michel, and a proud man he was that minute. 'You a murderer?' said she. 'Never!' she added, with all a woman's illogical logic, which is of the heart rather than of the mind.

'Madam, I'll tell you the truth,' said Michel, his face aglow. 'I did kill a man, but it was in

self-defence; it was no murder!'

'I am sure of it,' said she. 'And if you took a life, have you not saved another? I'll tell my husband all about you'——

'Yes, madam,' said Michel simply. The mother had stopped speaking to kiss her child. After thanking him again, she went up the steps to the upper deck with her little girl.

'Something ought to be done for the man,' said one of the crowd which still surrounded

Michel.

It was then that the sheriff came out strongly. 'Something shall be done,' he said, and he removed the irons from Michel's hands and legs, amidst general applause.

'Michel Macmannus,' said he, 'I trust you. You are a man! You're not the kind that commits a murder. Mrs Bronson's dead right! But you'll have to go through with the trial.'

'I want to,' said Michel. 'What else did I

give myself up for?'

'Quite so,' said Jim Consedine with a grin. Then he laughed outright, a great, hearty laugh, so that Michel wondered. 'Did you know who that lady was?' the sheriff asked him.

'No; I never saw her before.'

'And you won't know her husband, the child's father?'

'No, I don't.'

'He's called the Honourable Tom Bronson. Does that tell you anything, Michel?' Michel shook his head; and Consedine resumed: 'I guessed it didn't. He's the Attorney-General of Manitoba, and my own boss. Your case is in his hands. See? Reckon it will be in pretty friendly hands now, eh? I believe now that you're not guilty, and I bet he'll think the same. See?'

Attorney-General was but a vague term to Michel, the trapper of the wilderness; but he recalled that Father Cloutier had said in his

letter that it was this personage who had issued the warrant for his (Michel's) arrest.

'Guess you'll come out all right enough, Michel,' said the man in the crowd who had

spoken before.

And so it came to pass. The Honourable Tom Bronson had a long conversation with Michel the day after he was imprisoned in Winnipeg, and was told the whole story of the killing of François, along with the reason why Michel had run away. The trial took place, and Michel was acquitted. The evidence of his comrades, and even of Pierre under the fire of cross-examination, showed that the killing of François Lepine was no murder.

But the Honourable Tom Bronson's gratitude to the rescuer of his child was not satisfied with helping all he could to this result. He had thought of Michel and Toinette; he made some inquiries about the girl, and doubted whether her heart was broken. He sent for Pierre, and talked the matter over with him, mentioning that it was his intention to give Michel a position that would enable him to marry, and saying that he was a splendid fellow, simple, but with a core of gold.

'You must let him have your Toinette,' declared the great man. 'He loves her. He ran away

because he loved her.'

'Let Michel go and ask her,' said Pierre, yielding after a time. But he added, 'I don't know that she cared for François as much as I imagined. And he is dead, and Michel is alive.'

'A wonderfully wise observation, Pierre,' said the Honourable Tom Bronson, with a grave air

of understanding.

'Well, let him ask her,' said Pierre finally.

And pretty Toinette did not say 'No' to
Michel Macmannus. 'It was you I loved,' said

she.

'That's what I thought all the time,' said Marie, her mother, to Pierre; though how she could say that was a mystery to him.

AN UNSOLVED MYSTERY.

By WILLIAM J. GALLAGHER.

THROUGH the speeding mass of men and women who thread our streets, by broad thoroughfares and narrow and tortuous turnings, one seems to see the image of an unexpressed thought, a suppressed desire, an unformulated quest. If language was given us to conceal our thoughts, the looks we wear also endeavour to hide what is uppermost in our mind. The busy rush, the hasty greeting, the expressed resolve to do such and such a task, hides another thought. Below the mere work of life there is a 'castle in the air' in each mind, and that represents the true character of the person. This is so deep and so concealed that it will for ever remain a mystery to the average crowd. There are 'mysteries' which the daily newspapers have got hold of—at least a portion of such mystery; but this other that walks the street, concealed under hat, cap, or bonnet, who shall fathom it? And yet that very thought which passes, concealed, is moulding history, is making the character of the drama, is solving the eugenics and the sanitation of the age, is widening streets, is removing 'the slums'—is, indeed, the whole of life in embryo. Just occasionally the quick-sighted may perceive the tense brow, the knitted forehead; as a certain point in the determination is reached the eyes glow for a moment, and look 'far away.' We have all, at times, seen that 'far-off' expression. Then the mask is put on again, for the face must wear the 'business look.' Behind comes a bicycle; in front and to each side are wagons and motors and everything to avoid—it is so hard to exist at all in the streets—and the thought, as it was for that tense moment, is locked up; locked, perchance, until the quiet

sanctum of one's room is reached—perhaps locked up for ever. The sadness of it! One may even forget one's castle intended to be built with such scrupulous care, such beauty. Its pillars were to be of silver and gold; its cornices were to be of all manner of precious and glittering gems. Alas for the genius that, to save himself from the oncoming of a wheel, turned away from the splendid dream, and perchance became for ever an ordinary unit in the great mass of unsentimental mankind! Traces remain, we will suppose; but the splendid edifice was never built.

A mystery! Are you fond of unravelling such? Where did that splendid dream exactly die down? What was the particular impediment that began the 'crushing-out' process, and left the golden butterfly, saddest of sights, wingless, a mere crawling insect? Such revolutions, such terrible mysteries, are happening daily, hourly, weekly, momentarily, on our streets. There are lost treasures which no man may regain, vast as those splendid treasures of the lost Incas, about which so much has been written from time to time. The horror of lost thought! Try to think of it! In a minor sense, in the midst of rush and traffic, one is for ever brought face to face with it. You are talking, perhaps, with a friend, running over old family connections, recounting the names of those you knew in youthful days. As you speak, for a time each name, and the abode of its owner, come before you in a quick mental flash! Then suddenly you have forgotten. A puzzled look is on the brow, and enters the eyes. 'What was the -в.' Ah, name of So-and-so? She knew the Sit is gone! Just in this way splendid lines of

poetry, splendid turns of rare and rich description, come to you on the street, and pass. At night you do remember the golden and rich archæological or literary fields you meant to traverse; you do know somewhat of the method in which you intended to cast the description; but the golden moment' never returns; the 'silver bowl' is 'broken at the fountain.'

The present writer, sitting in the Reference Department of a public library, in the town of his whilom habitation, had got thus far when a friend called. He waved him 'off.' Thoughts were much too dear and too secret to be disturbed; but no, that friend would talk, and the writer has been able to put in the fact by way of illustration. But, oh, what treasures were lost-founts of imaginationduring those few 'gossipy' moments! Dear friends, please do keep away from the student's den! If you have any love for the artistry of words, if you have any conception of how 'golden' is 'silence,' leave the 'lion in his lair,' leave the author to bridge over the vast chasms of thought with new thoughts, let him work his rare gift into chaplets of amaranthine sweetness and rounded form. The gift is not yours perhaps, and the atmosphere he is creating is more than worlds to you. Have you ever got up in the morning 'seedy,' so to speak, unrefreshed after a night of more or less broken sleep, and gone to the newspapers or magazines afterwards, finding the rare and precious thought which compensated you for all the weariness, the want of natural rest? Yes, you have! Such thoughts are being born somewhere in the crowd that passes—in every town and village, hourly, daily, and weekly! The great poem is being evolved, built up of grass and trees, flowers, men and women; built of the look in a child's eyes, of the pathos in some toiler's face. The cause of that sad look which the dreamer seizes is a vast mystery; the evolution of a smile or a tear is a greater puzzle than the fate of some missing steamer which left port gaily, but which never returned, and was never heard of again! The daily happenings, the accidents, the crimes, formulated in mind or at this moment taking place; the advent of the 'psychological moment' -these are mysteries as strange as anything recorded on the printed page, events which make us stare in wonderment, which make our bosoms heave with true human sympathy; for man is so gregarious, and nothing can happen to any unit without in some degree affecting the race.

That 'missing' man or woman! appeals to the human crowd! What speculations, what tender feelings, what an upheaval of general human emotions! The sadness of 'might-have-beens' strikes us here, the sadness of the Raven's 'Nevermore' in the great effort of Edgar Allan Poe! To stand on the seashore, and to think of the wonderful things which the mighty deep contains; to know that, save for the rush of the mighty breaker and the sight of the lesser 'rollers that dissolve in pearls' along the shore, nothing of the mysterious and hidden thought can ever come to us-this is surely a sad lesson as to our limitations. But even here there is the great law of compensation at work, as it is everywhere throughout the universe. Just because we do not know we draw imaginary pictures; and these are so grand, and have sometimes been so nigh the truth, that fiction's page has afterwards proved to be the fact. Over and over again have the exact facts almost tallied with the dreamer's structure of thought. It was so in the case of Stevenson's Treasure Island: it was so in the creations of some of H. Rider Haggard's works. We assume no psychological knowledge as to these facts; nor will we treat of what is called the far-reaching will, a kind of telepathy with worlds unseen, which some discuss at present. All we do know is that conjecture itself is grand; that the 'solutions, which may not be solutions at all in any real sense, have a beauty of their own; they are the work of that ceaselessly working and wonderful mind of man which is greater than even it thinks, which has such reserves of power, such vast latitudes of fancy and romance, from which to draw. Truly the 'well' of knowledge is 'deep,' but the mind will ever bring up some-

thing worth having.

There are many mysteries, all as yet unsolved. By what peculiar mental process does a man fail to remember, the while he holds it, the pen in his hand; searching all the while for it, as if it was lost; never relaxing his grasp on the article the whereabouts of which is so bewildering? By what strange process does he come to sober fact, and know that he holds it; know, too, before he has once dropped it or put it aside? Or that poem-arrangement, verse after verse, in mind? He loses the exact structure, but its leading thought is remembered. Without much grief for that which he cannot recollect, he builds up a new 'tower of beauty.' Is it better; is it equal to the first idea? We are inclined to believe the first conception the true, pure idea. But from the very fact of what has 'gone' for ever he gets something which can be used, and which a keen-sighted man would almost perceive in the new creation, something that enriches, as pin-manufacturers are enriched by the loss of pins, and mustard-manufacturers by the amount of condiment we leave unused and wasted on our plates! Then is waste or wreckage of thought by distractions, gain? In some cases. There are gems lost for ever, no doubt; but as in the case of losing the beloved object which was the very soul of our existence, it is better to have 'loved and lost than never to have loved at all; and, in like manner, it is better to have had a dream, the exact form of which has perished, but the very loss of which has made us think. The worst of it is that the thought cannot return in the same form; the occasional rose of October or December cannot be the same as June's roses! But the former is a rose. We must be content with the treasure which has remained.

Another mystery comes up to us at this moment: why should we have written of this subject at all? It is really a subject about Nothing, because the thing lost, the thing which is a mystery beyond knowledge, cannot be said to exist. This reasoning would, however, kill all poetry, all the beauty which delights children, and sometimes their elders. The fact of the

mystery itself—the mystery as a great forcehas been present with us as we wrote. And the mystery also is greater as we think how or when we shall end; there is so much to say. The world is largely made up of mysteries; and it is now a mystery to us whether we should continue indefinitely or put the pen away. But there! We have lost the thread of what we were about to say. Some one has entered the room; thought has retired. Will this subject engross us to-morrow? Alas for the 'unfinished' window in 'Aladdin's Tower'!

KNIGHT ON WHEELS.

BOOK III. - OMNIA VINCIT.

CHAPTER XXII. - THE BIG THING.

* NINE o'clock, sir.'

The pert young housemaid entered Philip's bedroom, deposited a basin of hot water beside his bed, drew up the blinds, surveyed Tite Street, Chelsea, in a disparaging fashion, and announced that it was a nice day for the ducks.

Philip, gathering from this observation that the weather was inclined to be inclement, replied sleepily but politely that rain made little or no difference to his plans at present.

'I dare say,' retorted the housemaid; 'but it's my afternoon out. And, please, sir, she added, recollecting herself, 'Miss Margaret wants to know if you are ready for your breakfast.'
'Thank you,' said Philip. 'In a very few

minutes.

When the housemaid had departed he sat up in bed as completely as splints and bandages would permit, and prepared for breakfast. Then he lay back and waited, with his eyes fixed unwinkingly upon the door.

Presently there was a rattle of silver and crockery outside, accompanied by a cheerfully whistled tune, and breakfast entered upon a tray. Behind the tray came Peggy Falconer, who had been Philip's hostess now for the best part of three weeks.

Peggy greeted her patient with a maternal smile, and inquired, 'Slept well?'

'Very well, thank you.

'Leg troublesome?

'No. It seems to be joining up in first-class style now.'

'Concussion all gone?'

Philip knuckled his head vigorously all over, to show that his skull was once more free from

'In that case,' announced Peggy, 'I may possibly let you have some letters to read. I shall wait until the doctor has seen you.

Philip, who had no desire whatever to receive

letters—nor would have, until fate separated him again from Miss Peggy Falconer—thanked his hostess meekly, and proceeded to decapitate

'Do you feel strong enough to receive a visitor

to-day?' continued Peggy. 'Who? Tim?

'I didn't mean Tim, though I haven't the slightest doubt that he will call,' said Peggy with an enigmatic smile. 'This is a new visitor -Miss Leslie. She used to be mother's greatest friend, and—and she has always been very good to me. I should like you to know her.'

At this point the conversation was interrupted

by a roar from the foot of the stairs.

'That is dad,' explained Peggy, quite needlessly.

Montagu Falconer invariably adopted this method of announcing his readiness for breakfast. A commotion upon the ground-floor merely signified to Philip the intelligence that it was about half-past nine, or half-past one, or eight in the evening.

'I am afraid I am keeping you,' he said.

'Quite right,' assented Peggy, 'you are. Eat up your breakfast, like a good little boy, and perhaps I will come and see you again later.' And she sped out of the room and down the stair to quell a bread-riot. A woman with two men on her hands is indeed a busy person.

Philip munched his breakfast in utter content. He was convalescent now, though the first week or so had been a bad time. He was only intermittently conscious, and his injuries had combined to render sleep a nightmare and wakefulness a throbbing torment. But he would have gone through it all again, and yet again, cheerfully, provided he could have remained in the hands of his present nurse. In the dim and distant past he had recollections of another attendant—a deft and capable lady in a blue-andwhite uniform; but she had disappeared long ago (friction with the master of the house being the cause), and his whole illness and recovery were summed up to Philip in the single word

Peggy.

For the Big Thing had happened. Philip was in love. His long-expected Lady had come to him at last—or, rather, come back to him after an interval of years—grown up into a slim, elfin, brown-eyed piece of Dresden china. She had gathered him up, crushed and broken, from the middle of a Surrey highway, and had conveyed him straight to her home in Chelsea, to be nursed and mothered back into coherent existence. This, be it noted, in the face of a strongly worded and most enthusiastic eulogy (from her parent) of the public hospitals of the Metropolis.

But Peggy had been quite firm. 'Dad,' she said, 'I don't think you quite realise that he has

saved your life.'

'If he has,' said Montagu Falconer magnifi-

cently, 'he shall be suitably rewarded.'

Peggy eyed her progenitor dispassionately. 'If you are thinking of tipping him half-asovereign,' she said, 'I advise you not to. I happen to know him. Now don't be a silly old curmudgeon, but go and see if the ambulance is coming.'

Montagu obeyed, grumbling. There were only two women of his acquaintance who did not fear him, and Peggy was one. In fact, Peggy feared nothing except spiders and the revelation of her own feelings.

H.

'And how is the tibia of Theophilus this morning?'

Timothy, entering the room like a gust of ozone, sat down heavily by the patient's bedside, and slapped the counterpane heartily.

'Just making both ends meet,' replied the owner of the tibia, shrinking nervously towards the wall.

'Good!' said Timothy. 'And is it well with the solar plexus?'

'Try again,' said Philip.

Timothy paused, thoughtfully. 'I was under the impression that it was the solar plexus,' he said in a troubled voice. 'I know it was a heavenly body of some kind. Ah, I have it! The semilunar cartilage! How is the semilunar cartilage this morning?'

Philip reported favourably.

'Cavities in the cranium now permanent, I gather?' continued Tim sympathetically. 'Prospect of ultimate mental weakness confirmed. What? Never mind! I'll get my late boss to provide you with a permanent post under Government.'

'My skull,' replied the patient mildly, 'is all right, except when you make such an infernal noise.'

Timothy was contrite at once. 'Noise? Tuttut! Am I making a noise? This will never

do. Nervous and irritable patient—eh? Must be kept quiet. I see. We will get some tanbark down outside. Street Cries Prohibited / and so on. But how are you getting along generally, old thing? How are all your organs? Fairly crescendo, I trust.'

'Leave my organs alone, curse you!' growled

the invalid.

'Certainly,' said Timothy soothingly. 'Organs and Street Cries Prohibited! We'll have a notice to that effect pinned up on your bedroom door. It will please Falconer. By the way, how is—er, Miss Falconer this morning?'

Thereafter the conversation pursued a line far remote from Philip's health. Needless to say, the impressionable Timothy had fallen an instantaneous victim to Peggy. Striding about the room, absently munching some grapes which he had brought as a present for Philip, Timothy embarked upon a whole-hearted panegyric of his present adored one, heedless of the fact that the same panegyric had been delivered, mutatis mutandis, to the same audience by the same rhapsodist many times before. Philip lay back and listened contentedly—nay, approvingly. He experienced no feeling of jealousy. No man, he considered, could know Peggy Falconer without loving her, so why blame Timothy?

'Have you noticed the neat little way she puts her head on one side, and smiles right up at you, when she wants something done that you don't want to do?' inquired the infatuated

youth.

'What sort of thing?' asked Philip, glad to

discuss Peggy in any aspect.

'Oh, going away, and things like that,' said Timothy naïvely. 'And her complexion, and her arms—my word! Have you seen her in evening kit? Fancy your knowing her when you were kids! I suppose you were great pals?'

'I dare say,' admitted the reticent Philip.

'Only in a childish sort of way, though, I suppose?' pursued Timothy, with a touch of anxiety.

Before his suspicions could be allayed there came a vigorous but rhythmic tattoo played upon the tiny brass knocker of the door.

Tum-ti-tum-ti-tiddle-i-um, Tum-ti-tum-ti-tum-tum!
Officers' Wives getting pudding and pies,
Soldiers' Wives get skilly!

it said. This was Peggy's regulation way of announcing to her patient that she was about to enter the room. When her hands were full she whistled it. Philip knew every beat of it by heart.

After the usual brief interval the door opened, and Peggy entered, to announce to Timothy, with her head upon one side in the manner which he had just described with so much tenderness and enthusiasm, that it was time for him to depart. 'I have another visitor,' she

The new-comer proved to be a gigantic Scotswoman, of forty or more, with humorous blue eyes and a slow, comprehending smile.

'This is Miss Leslie, Philip,' announced Peggy.

'Mr Rendle, I want to show you our front-

door.'

III.

Miss Leslie sat down in the chair vacated by Timothy, and remarked, in a soft Highland drawl, 'It is very shocking being left alone with a young man like this.'

She smiled, and Philip's heart warmed to her at once. He felt instinctively that Miss Leslie was going to be a less bewildering companion than Miss Babs Duncombe, for

instance.

'My only excuse for my unmaidenly conduct,' continued the visitor, 'is that I am a very old friend of Peggy's. I have known her ever since she was so high.' She indicated Peggy's infant stature by a gesture.

'So have I,' said Philip proudly. 'Did you

know?

No, Miss Leslie did not know. Peggy had not told her; so Philip, with wonderful fluency for him, explained the circumstances under which he had first entered the house of Falconer.

Miss Leslie chuckled. 'It would be a fine ploy for Montagu,' she said, 'scarifying a little boy. But I am glad you met Peggy's mother, if only for five minutes.'

'She was very kind to me during those five

minutes,' remarked Philip.

'She was my greatest friend,' said Miss Leslie simply. 'But she has been dead for seven years now. I suppose you knew that?'

Philip nodded. Peggy had told him.

So the conversation proceeded comfortably, understandingly. Jean Leslie was one of those women in whose presence a man can put his soul into carpet-slippers. It was not necessary to select light topics or invent small-talk for her benefit. She appeared to know all about Philip, and the brake, and the accident. She also gave

Philip a good deal of fresh information about

Peggy and her father.

'I had hoped,' she said, 'that when Montagu was made an A.R.A. he would become less of a bear. But he is just the same. Success has come to him too late, poor body. He is as morose and pernickety and feckless as ever. Peggy is hard put to it sometimes.'

'I expect you help her a good deal,' remarked

Philip, with sudden intuition.

Miss Leslie smiled grimly. 'Yes,' she said, 'I put my oar in occasionally. Montagu dislikes me, I am sorry to say. He is not afraid of Peggy, nor she of him, for that matter; but she is too soft with him. So whenever I see her overdriven I just step in and get myself disliked a little more. But he usually comes to me when he is in trouble, for all that. I am the only person who has any patience with him.'

After that they talked about London, and Philip's work, and the future of automobilism. Miss Leslie apparently saw nothing either 'pathetic' or 'quaint' or 'tragic' in a man liking to talk about what interested him. At any rate, she drew him out and lured him on. For all her spinsterhood, Jean Leslie knew something of masculine nature. She knew that the shortest way to the heart of that self-centred creature Man is to let him talk about himself and his work and his ambitions. So Philip discoursed, with all his shyness and reticence thawed out of him, upon subjects which must have made his visitor's head ache, but which won her heart none the less. That is the way of a woman. She values the post of confidante so highly that she will endure a man's most uninteresting confidences with joy, because of the real compliment implied by their bestowal. 'I am a silly, sentimental old wife,' she mused to herself afterwards; 'but it warmed my heart to have that boy turning to me for advice on things I knew nothing about. It would be good for him too. He would never talk like that to Peggy; he would be afraid of wearying her. I do not matter.'

(Continued on page 404.)

RATS.

By E. K. VENNER.

WHEN a certain prisoner in the Bastille saw a rat come out of a hole in the wall of his cell and gravely turn a somersault, he gave it a welcome such as seldom falls to a member of the rat tribe, for he felt sure it must be the friend and pupil of a former prisoner that had come to transfer its affection to him. That was very well for a man in his situation, but in the outside world the acrobatic feats of the rat meet with little appreciation. It doesn't turn somersaults, it is true; but it runs up and down walls with equal facility, its hindlegs working at right

angles in a remarkable way to aid its descent. And these up-and-down displays are never for mere practice, but are generally fraught with a deadly purpose which leaves many registered vows of vengeance behind it. I remember, as a case in point, the fate of a favourite dove. She hung in her wicker cage from the roof of a greenhouse, and was apparently absolutely out of harm's way from every point of view. But we overlooked the uplook of a rat, with the result that, one morning, in the place of the dove on the perch, there was a mutilated body on the

RATS. 395

floor of the cage, which told its tale with a dreadful plainness. A rat had run up the wall, jumped off on to the cage, torn its way through the wickerwork, and then ruthlessly slaughtered a friend of many years' standing. For sheer repulsiveness this deed would be hard to beat; though it was perhaps equalled by a rat that was discovered sitting on a bullfinch's nest, out of which it had eaten the young.

It is, therefore, no wonder that, with such a record of cruelty and destruction behind it, the appearance of a rat should set people looking round for the likeliest stick or stone within reach, and that there should be an organised movement to prevent its escape, if possible. The 'There excitement of the moment is intense. he goes! He's run under that tub! Now then, look out!' and so on. There is an electric current in the situation which runs through even the most phlegmatic and inert individuals. One such I have in my mind, when a rat was discovered in a pigsty. He had appeared up to that moment to have no sporting instincts whatever; but that discovery also discovered him, with a stick in his hand, watching an exit from the sty with an intentness that would have done credit to a well-trained terrier.

He did not, however, come so near the real thing as a blacksmith once did. We were drawing a woodstack with ferrets for rats, and were on the point of stationing a dog at the principal run, which led to a drain. It was at this juncture that the blacksmith came on the scene. He said we shouldn't want a dog, and that he would guarantee to catch any rat that came out that way. He therefore crouched down, a motionless figure, over the hole into the drain. Presently there was a rustle in the stack, and a gray streak flashed down the run to the city of refuge. But, quick though the fugitive was, the blacksmith was quicker. There was a lightning grab, and the next moment the hapless rodent's head was in the blacksmith's mouth and nearly bitten off by a set of serviceable teeth. It was not a pleasant sight; but though no one could have dreamt of the method of its capture, the rat was caught, as this human

terrier promised.

But I doubt whether even the extraordinary ratting talents here displayed would have been of any avail in the case of a certain colony of rats I once came across, for the simple reason that they remained for the most part invisible, and defied the combined efforts of dogs, men, and ferrets to get them out, as well as proving superior to every trap and poison that could be thought of. The nearest attempt to bring one to the surface was made by a ferret that, after considerable prospecting, disappeared down a much-used hole. Presently there were sounds of scuffling underneath, and we prepared for eventualities. A neighbouring farmer, with a gun, gave it as his opinion that a 'regular old

warrior' would be out in a moment; and it seemed as though his prediction were likely to be verified, as the scuffling came nearer and nearer the surface. But it was not the 'regular old warrior' that at last appeared, but the ferret coming out of the hole backward in a very depressed state of mind. It had good reason to be, for its appearance presented anything but the results of a peaceful interview; in fact, it had to be promptly taken home for very necessary repairs, leaving the 'old warrior' below, the master of the situation.

The same farmer, who lived close at hand, certainly managed to account for one incautious member of this colony by poison; but as the defunct rodent was promptly found and eaten by one of his pigs, who as promptly died from the effects of the poison, he lost considerably more than he gained in this transaction.

Another scion of this stock took up its quarters in a well, whence it was wont to ascend into an adjoining scullery. Its medium of ascent was the connecting-rod of the scullery-pump, which was a very long one. As it came up this it would give involuntary notice of its approach, the pump-handle beginning to move up and down in the most uncanny manner, which, together with the noise, might easily have caused the house to be called haunted, especially as the pump could be heard working in the middle of the night. Often have I waited as the pump-handle began to work, hoping to give the climber a greeting with an air-gun; but I was only once able to get a snapshot at it, and then it was like shooting at a shadow.

This horde of rats, in fact, got quite a reputation in the neighbourhood for their cunning, and the vendors of sundry traps and poisons, for which the rats had no use, declared themselves at their wits'-end as to what to recommend next. One, indeed, as a last resource, tried to think of the name and address of a man who, it seemed, like the Pied Piper of Hamelin, possessed a wonderful power of drawing rats from their strongholds. It was not a natural power, but arose, my informant told me, from some preparation the rat-extractor used, always with unfailing success. However, the name of this wonderful person never transpired, and we had to imagine the effect of his powers on the rats in question.

He would have had a much easier task than the one set him here in dealing with a rat that once took up its quarters in a church organ. There are endless possibilities in an organ for a rat that is musical enough to take advantage of them, and this rat appreciated to the full the queer spaces and angles which abounded in the instrument. It was also not at all averse to showing itself outside on occasions. One of these occasions sealed its doom. It was a Lent week-day service, and a large congregation had assembled to hear a famous

preacher. His fame had apparently reached the interior of the organ, for no sooner did he ascend the pulpit than the rat suddenly appeared in the stall he had just vacated. I was sitting in the choir opposite, and watched it run up into the seat and then on to the desk itself. It was a huge specimen, with a very dilapidated coat, which considerably added to its unattractiveness. I must confess to a constitutional horror of rats, and the thought of a possible visit to me in my seat made me keep my eyes on it in a kind of fearful fascination. However, the intruder had other views; for, after a thorough examination of the preacher's stall, and after sitting up on its hindlegs and looking inquisitively about, it disappeared from view, and the next moment was in the middle of the chancel-steps, in full view of the horrified congregation. There are moments of enforced silence so tense with feeling as to be absolutely painful. This was one of these moments. One felt that screams and exclamations were being stifled by terrific efforts, and that sporting instincts were meeting with heroic suppression. But the twofold task of dividing attention between the rat and the preacher was plainly hopeless. The rat was in full possession of the moment, and no preacher could ever hope to receive the frenzied attention which was accorded to the horrid intruder as it coolly surveved the scene from the chancel-steps. it glided down into the nave and into the midst of the congregation. It is greatly to their credit that they kept their seats after this; but frantic silent signals to the verger in all directions bore eloquent testimony to the state of their feelings; though, of course, he was quite helpless. Fortunately the sermon was not a long one, but it is safe to say that no sermon ever came to an end with a greater feeling of relief. A professional ratter was at once sent for after the service, and a trap set by him behind the organ caught this ecclesiastically minded rodent two mornings later.

This ratter had, I believe, a most lucrative practice on the vessels in some adjoining docks, where there was always plenty of scope for his talents; for his department seems to require just as much attention as it did in the days of sail. Rats have no objection to modern improvements; in fact, many of them suit their requirements admirably. The large discs fixed on mooring-ropes are, it is true, efficacious in turning back those passengers who use this favourite way of embarkation; but there are other ways of taking a passage of which such undesirables are not slow to take advantage.

There was a certain crack liner which once had quite an undue share of them—so much so that they would sometimes climb down the blue curtains of some of the berths and flop down on the pillows of the horrified occupants. They got, in fact, to be such a nuisance that very drastic measures had to be taken against them.

I happened to be looking over this vessel some time afterwards, and was assured that these measures had been entirely successful, and that the passengers could now sleep quietly in their berths.

But the most objectionable feature about imported rats is not, after all, inconvenience to passengers or destruction of property, but the possibility of plague infection. It is an established fact that in this respect the rat is a serious menace to communities. As a plague-carrier he is second to none. Plague, it was pointed out by an expert on the subject, is a rat disease, and man could avoid it with ease were it not for the rat.

It will be remembered that this fact was brought before the public in a very prominent way by the recent plague scare in Suffolk. In the adjoining county notices were displayed warning people against touching dead rats with their naked hands, and suggesting several ways of dealing with them. This very unpleasant aspect of the rat was instrumental in forming numerous rat-clubs, with very satisfactory results, for the Ishmael of the fields and barns is much less in evidence about here than it used to be.

This fact, which establishes the rat as a plague-carrier, has a horrid suggestiveness when it is recollected that it is used as an article of diet, and by no means exclusively in times of stress and siege. There have not been wanting people, and not in China either, who claimed that a rat-pie is a dish fit to set before a king. I remember reading of some family where such a dish was always regarded as a particular treat. On one occasion the children, in the absence of their elders, being left to select their own luncheon, at once decided on their favourite They were, however, considerably delicacy. taken aback by an unexpected visit from their grandmother, and by the thought that there was nothing else to set before her. What was to be done? After a hasty consultation, it was decided to have the pie and say nothing about its contents. They accordingly regaled their unfortunate grandmother at luncheon with a nameless pie, which the old lady ate with avidity under the impression that she was partaking of an excellent preparation of veal and ham. I forget whether the awful secret of the pie was ever revealed, and, if so, whether it was followed by But the spectacle of the disastrous results. unsuspecting and confiding old lady sharing a rat-pie with her grandchildren, and highly commending it, must have been an inimitable one. I think it was claimed that the rats were barn fed, and that it was their diet of grain which made them such excellent eating. The neighbouring farmers could probably have borne painful testimony as to the diet in question; for, it has been noticed, 'the havor that an army of rats will work among corn-ricks is almost inRATS. 897

credible; while they carry on their depredations with so much secrecy that an unpractised eye would think the stacks to be sound and unharmed.'

As to the number of young birds—ducklings in particular—and eggs that are destroyed by the same depredators yearly, the county's total bill must be a very considerable one. It is wonderful how rats will not only eat eggs but carry them bodily off to their lairs. I once witnessed a highly diverting illustration of this. I was standing on the banks of a stream, when my attention was attracted by a rat rolling a hen's egg down the slope below me to the water. It exercised the greatest care in this, steadying the egg when the descent was steepest, and generally showing a wonderful knowledge of the ways of eggs in that situation. All went well until it had nearly got the egg to its destination, the mouth of a drain which opened into the But, alas! at the last moment its excellently laid scheme went agley. The progress of the egg was suddenly obstructed by a horrid stone, on which the cherished oval promptly smashed, its contents running down the bank into the stream in what must have been to the rat a heart-rending cascade. I almost found it in my heart to be sorry for the animal in this grievous calamity, as, after gazing ruefully for a moment at the wreckage of its hopes, it disappeared into the drain in a very depressed state of mind.

This stream was the favourite haunt of waterrats, or rather water-voles, miniature beavers in all but the tail, and most harmless, inoffensive little animals. It is almost impossible to walk along the banks of a stream for any distance without noticing eddies suddenly spreading out from the bank and perhaps being carried along the edge for some yards, and then extending out into the stream as a small dark object makes its way to the other side. The slightest sign of alarm, and there is a beautiful dive, the remainder of the journey being marked by a line of silver bubbles, till a disturbance in the water at the opposite bank announces that the goal is reached. But no one examining the place of departure has ever found that the swimmer had left a dinner of fish behind it. For, in fact, it has been almost conclusively proved that it is a strict vegetarian, living on various aquatic plants and roots. But, unfortunately for itself, it has often to suffer for the crimes of the brown rat, whose capacity for mischief and destruction is as much in evidence by the waterside as elsewhere. It is an expert swimmer, and for this reason alone is often mistaken for the water-vole. It is also by no means averse to trying its luck at

angling, frequently with considerable success. Richard Jefferies, for instance, mentions a lake which he said was swarming with roach, which were preyed on at spawning-time not by the water-rat, he is careful to point out, but by the house or drain rat. He said that there were always a few of these about the lake, where they grew to enormous size. He convicted them of destroying the roach in great numbers by noticing that the sand was strewn with dead fish opposite, and leading up to, their holes-which also proved that they caught and killed many more than they could eat, or even had time to carry away. He further says that he has shot at these great rascals when they were swimming fifty yards from the shore, and he strongly suspected them of visiting the nests of moorhens and other waterfowl with felonious purpose.

The size of these rats here noticed would seem to point to the conclusion that certain conditions and environment are especially favourable to ratgrowth. It has been pointed out, for instance, in an interesting article, that in Australia, where rats are becoming as great a plague as rabbits, they are not only greatly increasing in numbers, but also growing to enormous size. In this case, however, it would seem that they are less bold and ferocious than their kinsfolk over the seas. The atmosphere of sewers, again, seems to be especially productive of great size, for there, as is well known, the largest, and in this instance the boldest and most ferocious, specimens are to be encountered.

It is curious that, in spite of their size and ferocity, the professional rat-catcher should make as little account of them in his methods for their circumvention as he would of mice. He would seem, from accounts of his underground operations, to have a kind of magnetic influence on his victims, and to exercise a fearful fascination which leaves them trembling and powerless before him. These methods were vividly illustrated by the related experience of a neophyte who accompanied a Paris rat-catcher in one of his subterranean journeys along the city sewers. This functionary, like all his tribe, made no more of catching the sewer monsters than a shrimper would of catching shrimps. The flashing of the light which revealed the startled quarry was hardly quicker than the transfer of the astonished rodent into a kind of cage hung on the ratter's back, and so to the next victim. In addition to the cage, the ratter was hung in all directions with sundry other receptacles for his prey, which were all quite full by the time he reached the surface. The captures were all destined for coursing, and, sold for, say, sixpencea head, would realise quite a respectable sum.

TROOPER 13,846.

CHAPTER V.

IT was just before siesta that Devereux was called into Captain Marchand's room, a barely furnished apartment, typical of the Legion.

Captain Marchand stood before a plain wood

table.

Devereux saluted.

'Devereux,' said Captain Marchand,' you were at my house last night. For what purpose?'

'I went,' said Devereux slowly, 'because I made a mistake.'

'And the mistake?'

'I cannot tell you, my captain.'

Captain Marchand spoke dispassionately, yet beneath the mask Devereux read the fire that consumed the man—the fire of jealousy, passion, and misunderstanding. 'You understand that I can send you to the penal settlement for seven years as a result of last night?'

'Yes, my captain.'

'Then tell me the mistake you made. What prompted you to go?'

'I cannot, my captain.'

'Remember, seven years in the penal settlement. And, before God, you shall go there unless you tell me!' For the first time Captain Marchand lost control of himself. His eyes blazed.

'I am under arrest, then, my captain. I saved your life, and you send me to my death. I am not pleading for mercy. I do not expect it—do not want it from you; but I ask one thing. Tonight we go for a march. You will give me these few hours?'

For a moment Captain Marchand hesitated.

'You will not attempt to escape?'

Devereux laughed a trifle bitterly. 'To the desert? No, my captain. Besides, the Legion has not killed all my sense of honour.'

'I apologise.' Captain Marchand took a step forward. 'Devereux, tell me everything.'

'I made a mistake. We can all make mistakes.'

'You will not tell me?'

'No, my captain. I am free?'

'Until we enter Sidi-bel-Abbès again.'

Devereux saluted. His brain was working rapidly as he walked across the barrack-yard. He had six hours—six hours in which there was much to be done, two lives to save.

It was at the entrance to the barracks that he met Lieutenant Villevois, as he had expected. He stopped before the lieutenant with a salute. 'I should like a few words with you, Lieutenant Villevois,' he said.

The lieutenant looked at him disdainfully. 'You are not in my company,' he said. 'Ah, you are the ruffian who was thrown out of Captain Marchand's house last night?'

'I am the man who left Captain Marchand's house of my own free will last night, and I am going to ask you now, Lieutenant Villevois, not to enter it again.'

'You tell me what to do—you, a common légionnaire? Give me your number. I shall

report you to your captain.'

'I should not, since it is Captain Marchand.' Devereux spoke quietly, dispassionately. 'Lieutenant Villevois, for a few moments we will forget we are officer and *légionnaire*. I ask you not to go to Captain Marchand's again. I was engaged to Madame Marchand once.'

You?'

'Yes. Consequently I have an interest in Madame Marchand's life. You understand?'

'Still, I do not take orders from you.' Lieu-

tenant Villevois laughed.

Devereux shrugged his shoulders. He knew he was making an enemy, one who could make his life in the Legion unbearable; but still he was saving a woman's honour. 'I was in the Ben Radi's café the other night,' he said, 'and I saw you enter. I also heard what you said when you sold the Legion.' He turned slowly on his heel and walked away.

Lieutenant Villevois stood rooted to the spot, watching him walk across the barracks and out of the gate. His face had gone white, and a look of mingled fear and hatred narrowed his

eyes. 'Sacré!' he muttered.

Devereux walked sharply along the road which led to the open country. The streets were deserted save for an occasional légionnaire, and clusters of Arabs freed from the observances of Ramadan. The Arabs regarded him closely. He was one of the regiment they hated and feared. A caravan, fresh from the desert, the camels laden with bales of merchandise, passed him, but he took no notice. His mind was filled with other thoughts. His objective was Captain Marchand's bungalow, and this time he walked straight up the path and inquired for Miss Madge Lawrence.

Nevertheless it was Madame Marchand he saw first. She started in surprise. 'You have come again, Dick?' she said.

'Yes; I have come to see your sister.'

Madame Marchand was not a clever woman, but married life had given her a certain cunning. She saw it was wise to propitiate this man. 'Dick,' she said, 'you made a great mistake last night.'

'A great mistake!' Devereux bowed.

'It looked unusual, foolish perhaps; but Lieutenant Villevois and I are such old friends. We knew each other in Paris.'

Devereux looked at her; then he said quietly,

'Yes, I made a great mistake last night, and as a result of that mistake your husband will send me to the penal settlement for seven years.

'What?' Madame Marchand looked at him, 'To the penal settlement for horror-struck.

seven years?

'Of course I could save myself, but it would

be at your expense.

Madame Marchand took a step forward. would have laid a hand on his shoulder had not Devereux drawn back sharply. 'You wouldn't do that, Dick?' she said pleadingly. She looked frightened. She had played with fire, and, now that the moment had come when she might burn

herself, was afraid.

'No,' said Devereux, 'I shall not save myself at your expense, because we were engaged to each other once, and I value a woman's honour above everything else on this earth.' He looked so singularly handsome in his uniform, poor though it was—a man to admire—that Madame Marchand began to wonder whether she had not made a mistake. The look of terror died from her face. She was about to speak, when the door opened and Madge entered.

Madame Marchand watched them both, and in the look that passed between them she learned many things. She walked toward the door with a laugh. 'I will leave you two together,' she said.

For a moment they stood in silence; then Devereux stepped forward and took the girl's two hands in his. 'I can't stop more than a few minutes; but I wanted to thank you for last night.'

'It was nothing,' replied the girl. 'Nothing in comparison with what you have done for Grace.'

'I have done all that for you, not for your sister. Lieutenant Villevois will not come here again.'

'No?' A look of relief swept over the girl's 'You are sure?'

'Yes, because I have blackmailed him.'

'You blackmailed him ?'

'Yes. To save your sister I opened the door of a cupboard that he thought securely locked.

'I see,' said Madge thoughtfully.

you, Dick.'

With a little gesture she slipped her arm through his and led him to the window. For a few moments they both looked out in silence. Before them lay stretched Sidi-bel-Abbès, and beyond the sand of the desert—Sidi-bel-Abbès, with all that it meant to both.

Suddenly Devereux turned away. He had accomplished his mission. At the long French windows he turned. If ever they met again, seven years would have passed—seven years of He walked back, and caught the Hell for him girl in his arms. 'Madge!' he said. His lips sought hers, and clung to them. Then he disengaged her. The next moment he had gone.

It was near the barracks that he encountered Captain Marchand. A salute, a curt nod in

response, and the two men went their ways as though nothing had happened between them a few hours before.

The day had been overpoweringly hot and Rumours which had travelled across tiring. miles of sand were distressing.

Captain Marchand felt at variance with the whole world. Jealousy and passion gnawed at his very fibres, the mad jealousy of a man who loves passionately. He flung himself down in a chair in the drawing-room, and threw his képi on to a side-table with a gesture of anger.

'You are Madge looked up with a smile.

tired, Leon?' she said.

For the first time he noticed her. He crossed and stood before her chair. 'Ah, Madge, I wanted to see you alone. Why did Devereux come here last night?'

'Did I not tell you?'

'And that was not true. You are shielding some one. Why did he come?'

'Have you asked him?'

'Yes; and he would not tell me. He refused.' 'Which shows that what I said is true. He kept silence to shield me.'

He kept silence for no such purpose. You are hiding something from me. He has refused

to tell me, so you shall.'

He spoke angrily, his hands clenched. The girl looked at his passion-distorted face, yet there was no fear on her own. 'If he has refused to tell you, I cannot but do the same, since it is not my secret.'

Captain Marchand turned away with a bitter laugh. 'I cannot make you pay for your silence;

but, by Heaven, he shall pay for his!'
Madge leaped to her feet. 'What are you going to do to him?' She faced her brother-inlaw, her eyes as flashing as his.

Captain Marchand watched her. His was not a cruel nature; but recent events had made him hard, and wild to know the truth even though it wrecked his happiness. 'To-night we go for a long march, and when we return he will be And it will mean the placed under arrest. penal settlement if he is convicted.

'And he will be-because he is a légionnaire. Does he know this?'

'Yes.

For a moment a soft look crossed the girl's face. She understood the passion of his kiss that morning. He was going to what meant a certain death in order to save her sister.

'And you would do this to a man who saved

your life?' she said vehemently.

Captain Marchand shrugged his shoulders. A woman is cruel when fighting for her happiness, a man relentless. 'I had to do it,' he 'I do not know for what purpose he was He would not tell me. And once the Legion gets out of hand '-

'And if I tell Madge laughed scornfully.

you the reason he came?'

'He shall go free.'

She nodded. 'You shall know when you come back from the march.' Then she walked slowly toward the door.

'Tell me now,' pleaded her brother-in-law.

'You shall know—when you come back.'
She shut the door and walked up the one small flight of stairs to find her sister, and there

was a hard look on her face.

Madame Marchand was in her room. There was a fête in the Jardin Public, and she was busy in the hands of her maid. She looked up pettishly as her sister entered. 'How you startled me! Why, what is the matter, child?' she went on, as she saw the look on the girl's face.

'I want to speak to you; but it can stay

until we have a few moments alone.'

'You had better speak now. I hope it is nothing serious.—Marie, you can leave until I ring for you.'

'Yes, madame.'

'Well?' A sense that something unpleasant was about to transpire made Madame Marchand wheel round in her chair and face her sister.

'You know why Dick came the other night?'
Madame Marchand shrugged her shoulders.
'Goodness only knows what perversion of his mind prompted him. Surely, child, you are not going to trouble me with that?'

Madge looked her sister straight in the face. 'You know the reason he came as well as I do. Because he was once engaged to you, his sense of honour, quixotic as I dare say it may appear to you, makes him want to save you from yourself.'

'I did not ask for Légionnaire 13,846's interference, neither do I want it.' Her hand strayed toward the bell as she spoke. Another second, and she would have summoned her maid.

'Stop!' cried her sister. She came a step nearer. 'Leon gave Dick the alternative. Either Dick was to tell him why he had come that night, or he would have to stand his trial, which means seven years in the penal settlement.'

'Yes?' Madame Marchand's lips became dry.
'And Dick refused to speak—to save you!'
There was a moment's silence. 'Why did you tell me this?'

'Because you must tell Leon.'

'I tell him!' Madame Marchand laughed nervously. 'Don't be so absurd, child.'

'You would rather Dick went to the penal settlement, and died there. It means death!'

'I did not ask Dick to come here that night. If he was so foolish, so interfering, he must pay the price of his own folly.'

'Then you refuse to tell Leon?'

'Of course I do. It is unnecessary—absurd.'
'If you don't tell him, I shall.' Madge spoke

'If you don't tell him, I shall.' Madge spoke slowly.

'What?' Madame Marchand rose and faced her sister. 'You would not dare!'

Despite her sister's temper, Madge detected

another emotion, and she pitied her, even as she despised her. 'I am not going to see Dick sacrificed so that you may satisfy your love for excitement. Leon asked me to tell him the truth to-night, and I told him I would when he returned from the march. But I have given you the chance first.'

'And if I don't tell him, you will?'

'Yes, to save Dick.' Madge met her sister's gaze unflinchingly.

'Why do you take such an interest in Dick?

What is he to you?

Madge drew herself up. She had only a few precious moments to remember, but they made her a proud woman. 'Because,' she said, 'I look upon Dick as the best man I have ever met.'

Madame Marchand laughed, but the laugh died on her lips almost as soon as it had risen. Instinctively both women turned toward the window. From the barracks came a single buglecall. Though they had never heard it before, they both knew what it meant. Aux armes / Aux armes / It was the call to arms.

(Continued on page 409.)

THE STAR OF HOPE.

THE gloaming gray
Of life is fast descending,
The light is waning, and the night draws near,
That soon the way,
Along which I am wending,
Will coldly wrap in shadows dark and drear.

None knows the path Through which my course must labour, Though countless thousands passed that way before; For no one hath

Returned to tell his neighbour Of how he fared to reach the viewless shore.

Mere flesh and blood,
Though ne'er so stout and daring,
Can not prevail in death's dark hour of gloom;
Nor Jordan's flood
Can cross without despairing
To brave the billows of impending doom.

Yet though we grope
Through life, in measure, blindly,
And fear the furrows of the frowning foam,
The Star of Hope,
That beckons calm and kindly,

Will guide the way to our eternal Home.

That sacred star
Of Christ, through paths full dreary,
Will cheer the soul, how sore soe'er the plight,
To wage the war

That all must wage, though weary, At last to land where all blooms fair and bright.

Therein to dwell
With Him who died to save us,
And rose again, as we shall also rise
All hale and well

From sins that now deprave us, No more to wail with worldly cares and sighs. JOHN MACGREGOR.

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, Yesterday.

MULTITUDES of men and women have lately taken the different roads that lead from all parts of the world to Rome, and they have lingered there seeing and wonderingvaguely wondering in the case of many of them. It would not be unfair to judge any of these people for their powers of feeling, their sensibility, and their imagination by what they say they think of Rome on their return. Ask a friend who has just been there what he feels about it, and consider the answer carefully; but see that he speaks sincerely. I should like to have the opportunity of reading some essays sent to a competition that might be organised on such lines as these, limited to persons who had previously passed a test in matters of general education, common-sense, and a certain elevation of thought. There would be so many different Romes described; and we should see some strange effects, the results of different powers of observation, varying degrees of imagination, and curious variations of temperament brought to bear on precisely the same subject. Had one the powers of an autocrat in such matters, it should be made a law to forbid at least half the people of the kind who visit Rome in these days ever to go that way. It is not fair to Rome, or to any one. These are the people who, having been to Rome, come home to say that they have felt a little disappointed. They had heard much of Rome, had read much about it, and had steeped their minds in its history and romance as described in the books of fact, and given with a little more of the dramatic touch in Elizabethan Now when they went there they had found only ruins which, somehow, were not so fine as they had pictured them; St Peter's in a place on the far side of the Tiber from the hotel at which they stayed; and a very modern city abounding in Italians, with a fair number of British, Americans, and Germans among them. They had heard no spirits in the air singing to them of the glory that was past; as they had looked from the Palatine Hill over the site of the Circus Maximus, with chimneyed factories beside it now, they had had difficulty in imagining chariots swinging madly round the corners in the races; when they had tried to think of Nero as having been real they had

failed; lions and Christians did not come up in the vision of their minds when they stood in the Colosseum; and they could not think of Cæsar in his toga striding down toward the Forum. Unhappy Rome! you have disappointed them! Abiding memories with them are the number of picture palaces, the paucity of clocks, the cleanness of the streets, and the general decorum of a city that is well laid out and probably much more conveniently disposed than it was two thousand years ago. Among many dull, gray remembrances there will sparkle like a gem the fact that a she-wolf is caged for all to see on the Capitoline Hill—such a she-wolf as suckled Romulus and Remus.

* * *

It is the truth, as any one may discover upon inquiry among his company of friends, that a great proportion of the people who visit Rome thus declare themselves as disappointed! It is a serious matter. There is such a great Rome, a city of the most intense fascination for nearly every one of sensibility, for every different kind of taste and thought, that it seems a pity that any of us should ever be without a Rome to please us when Rome herself would accommodate so well. As a hundred artists would paint a hundred different pictures of the same scene, so might a hundred people see so many kinds of Rome. Rodin once said of the artistic way that you 'just looked at Nature, and the rest happened according to your tempera-ment.' That is the way with the visitor to Rome. Perhaps the materialism of the time hinders many very modern people from gathering such a proper appreciation of it as they might otherwise do. I am sure also that the average modern visitor does not approach this amazing city in the right way, which is not with a guide-book in hand, but with a spirit open and ready for the romance of reality. Guide-books are the curse of modern Rome, and there are more of them concerning her than for any other city; and in the circumstances of the case it follows that the detail is more intricate, more elaborate, more confusing. A poor traveller who makes this pilgrimage to the proudest spot on earth, having anticipated it for so many years, stumbles through the ruins while his eyes are pressed close down to printed pages that are a

No. 183.—Vol. IV. [All Rights Reserved.] MAY 30, 1914.

mass of figures with B.C. and A.D. sprinkled freely among them, and measurements and numbers in a fearful complexity. These guide-book facts and figures convey little meaning at the time, but it is felt to be a duty to read them, the most imperative duty of its kind; and so the eyes are occasionally lifted to look at the places that are being dealt with, and down they fall again quickly to the book. With a little moan from the heart one more 'sight' is wearily done, and a week of sight-seeing in Rome is such a torture to a willing mind as is not easily to be Decidedly these guide-books are understood. the curse of Rome. Certainly one should know the essential facts; but he who visits the city should read his subject in the manner of a schoolboy a little while before, and in Rome he should have nothing but a guide-book with a list of things to see and the broad meaning of each of them told in twenty words. For the rest he should look and think and feel, and look again and feel the more, and wait for his temperament to find its own way through that piled-up mass of history and past glory, and then the picture would be filled in for him with the most marvellous details that imagination could present. There would be heard the crash of armies, the blowing of trumpets. Emperors in glittering golden pomp would come in great processions; on the holidays in Roman sunlight there would be magnificent colours; we should see the people lounge in splendid luxury at the baths of Caracalla, and Roman matrons would have grace and charm and look superb in the dignity of womanhood at its best. should hear orations in the Senate; we should have a vision of the time when things were being done, when Rome was being made continually greater and richer, her artists at work, craftsmen beating on their anvils, sculptors chiselling at their marble, and all others decorating and making beautiful. It is when the receptive spirit thus responds to Rome that we know at last why it is called the Eternal Would we not rather see a sprightly youngster caper through the Forum, get up on to a rostrum there, and fling up his arms in a mimicking way, that he might tell his friends some time later that he himself had stood where Antony had declared he came to bury Cæsar and not to praise him, than see a pedagogue stumbling through the Palace of the Vestal Virgins or along the Via Sacra with weary eyes always on a book? These books have ruined hundreds of thousands of pilgrimages to Rome, and they have turned what should have been a time of thrills and a feast of imagination into the dull, heavy boredom of a vain effort to learn and understand the contents of such a catalogue of goods as a busy auctioneer might prepare.

The worst of this failure is that Rome, without her like in the world to-day, even as before,

fails to be understood for the lessons she can teach. There may be no Cæsars now in Rome, but only Italians struggling toward the light of a new greatness which in their modern unity they believe they will achieve; and the religious atmosphere may be more subdued, though all the churches stand to tell of the wonder and majesty of papal greatness in the past. But something of the spirit of ancient Rome continually rises like a vapour from the ruins, and has permeated succeeding Romes through all the ages. This city is not like any other in the world. It is alive; it has a spirit, a soul, in the sense that no other has. Old and fine cities where great life has been lived, places from which the world has been shaped, are never things of wood and stone, with bits of iron for fastening and binding. That which has held so much throbbing life, which has seen the lives of men come and go for centuries upon its soil, cannot be without some life itself, though different from the blood-life of crawling things. It takes the life it gives, and it gathers life from the long succession of generations. It is a greater, grander life, dispassionate, invincible, unshakable, eternal. Only a little of that imagination of which I have written is needed to convince one who thinks of London and Paris and of Rome, that the idea that these cities are things of mere wood and stone and modern machinery is absurd. They have a living spirit, the peculiar quality of life that belongs to the great city where everything in it has lived deeply and intensely. If the old great cities enjoyed this peculiar essence of life, why then should not the new ones, which in some modern aspects are finer, make the same effect upon the spirit? But what is it that seems most lacking in New York or Chicago? The fact that these cities have no souls, that life has not been given to them by millions of millions of dead human ancestors, who in dying have given their spirit to the stones. I admire New York, and like it; but for all the speed of the life of the people in it, for all that the city rushes and whirls for every hour of the twentyfour, that the overhead railway cars rumble along their galleries through the night, that the hydraulic riveting of the iron frames of the new buildings is really ceaseless, the city has never yet had life. Boston has indeed germinated, and I have found no other city in the United States that has. But think how real and great and strong is the life of some of the cities of the Old World, even though their work and accomplishment now are not a hundredth part of that of the American cities. Why, Toledo still lives. What a tremendous existence there has been in those cobble-stones and in all those crumbling ruins in the heart of Spain! But of all the cities that have had life and still have it, none is comparable with Rome. It has lived the fullest; it has been the master-city; its heart has

beat and its spirit has soared through all the ages; and there is that about it that suggests eternity, the immense and the infinite that is beyond the control of man, and is a possession of the Creator. That is Rome. It is truly the caput mundi; and if in a certain sense it may be sleeping now, it will not sleep for ever. There are some men of a special vitality and spirit who in their careers are never entirely vincible, no matter what misfortunes they may suffer. Great men of finance and commerce, who have let imagination free in enormous enterprise, have fallen with a crash, have been nominally penniless, and, worse than that, have seemed utterly and completely done for; yet they have continued to live in great halls, to entertain as lavishly as before, to spend as freely. Their optimism and resource are unabated. And. lo! soon they are at the summit again. It is the same with cities. They have their different eras and peoples. One set of generations will try them, and go down; another set will try them later, and depart; all will get their greatness from the cities, and they will give their lives back to the stones, and the city is richer, greater for the succession, more bountiful for the next adventurers in life. How full, then, is Rome with life to-day, the essence of life of that astounding past! As we look and contemplate it seems as if her soil must burst with the life it holds. That is how some of us would look on Rome, and thus we see indeed the Eternal City, that which will never die. We see with an absolute faith and reality the supernatural in Rome, a veritable Jove of cities. Regarding Rome in this way, we feel a conviction, an instinct, that her time must come again, that once more she will become the great centre of the world, the living heart. The great subject for speculation is under what agency and through what influences she will do so. The Italians have seized upon the idea, and feel that their possession of Rome as the capital for their United Italy is a magnificent omen, and that they are destined to be one of the greatest nations of the world. To be the capital of Italy, however great, cannot be the ultimate triumph. In an age when ideas are so expansive the future destiny of Rome must be very magnificent. She may for a prelude be the capital of a big Italy with an empire; but in speculating upon her chances there inevitably rises in the mind that idea which is sure to materialise as time proceeds, which first wars and then the fears of wars will suggest, and next a saner Socialism than is preached now, and last an abandonment of frontiers and a combination of a continent, the United States of Europe; and Rome may be a super-capital then.

* * *

And in the meantime how great is the majesty of this city; how magnificent it is; what lessons

there are in it, and among its old architectural works and its relics complete and incomplete, for the construction of other cities! At the present time, in Britain and elsewhere, much thought and study is being given to the subject of town planning, as it is called. When everywhere old slums are being destroyed and inconvenient thoroughfares reconstructed, and new towns are growing up in many places and need training in their growth, it is well that a science of town making and engineering should be properly recognised. The ancient cities grew largely of themselves; but in some ways they did not grow very well, and they took many hundreds of years to shape themselves to human convenience. Now we do better than that. Rome is a city that never could be spoiled, never would be, because the life in its stones is a continual force, and a dignity is preserved always. It might seem to be nearly impossible for the up-to-date conveniences, as we call them, to be attached in full measure to a place like Rome, and harmony be still preserved with the medieval city and the ancient one. Yet it has been done, and so even modern Rome is a pattern for all. It is the most compact city of importance that one can call to mind. Even New York, with its perfect parallels, rectangles, and geometrical figures, is no better in this respect. Rome is not a large city, as go the standards of the world; with its less than half a million people it is smaller in population even than Madrid, only half as big again as Edinburgh. But it is far bigger than that in its works, possessions, and necessary equipment, and for a city of its size it is marvellously convenient and easy to move in. There are no taxi-cabs in Rome, and they are not needed now any more than Julius Cæsar needed them; nor are there any underground railways. The perfect tramcar service and the cheap, if rickety, horse-carriages are sufficient for the requirements of most people, and the traveller finds that even by walking nearly all his needs are served. The newer streets, if modern in their style, have an excellent dignity. The Via Nazionale, for example, is one of the finest of its kind. It is for the most part straight, and along a slope, and one can just see from the top of it, on the Piazza delle Terme, the summit of the new and magnificent white marble monument to United Italy by the side of the Capitol down below. The shops are good; they are well fitted, and their frontages have something of Parisian neatness about them. In Rome I saw only one electric sky-sign, and that was away in a corner of the Piazza Venezia, where few people would notice it, and it was but a small and hardly offensive thing. They do not encourage these horrors of the night as in London, Paris, and New York. In Rome you will see few ugly hoardings of They also are not coloured advertisements.

encouraged. Discords are kept out of the scene, and what has been made in the ages for the beauty and adornment of this city has still its good effect.

* * *

They are making a new capital of Australia, and in different parts of the world they are planning and reconstructing cities, with the object of making bold and pleasing effects such as shall give dignity to the place; always dignity, for a city without dignity is as poor as a man Were we lords of these new without pride. communities, should we not send our engineers and architects and designers to Rome for a long season, with no books and no orders for particular studies with plans and figures? They should be left to wonder and absorb, and then they should reproduce from their quickened spirits. Only in Rome has the ascending grandeur of stone steps been fully realised. There is nothing like these stone staircases of the city, their compelling, their quite thrilling effect. flight of shallow steps that leads up to the Capitol is fine; the series of one hundred and twenty-four marble steps erected near by in the fourteenth century, with the church of Santa Maria in Araceli at the top of them, is sublime. Rienzi formally inaugurated those steps; Rienzi's bleeding body was dragged down them from top to bottom, with his head smashed more at every step. Only in Rome have they known the full effect to be gained from fountains and falling water; it is worth a journey of a thousand miles only to see the fountains of Rome. The Roman Empire was reared and garnished by the splendid imagination of its founders, who saw power and possession far beyond the thoughts and ideas of other people. In the same way the beauties of Rome stand for an imagination applied sometimes to simple objects with magnificent results. If so much is to be said of the outward things of Rome, there is infinitely more of the delicate treasures of interior decoration that are still preserved. The artistic riches of this city are beyond realisation even by those who have seen. One who loves art and has lived with it and studied it from childhood to his ripest years can still in thought no more realise the art possessions of Rome than he can think precisely and with appreciation of the meaning of two millions of separate entities. And yet we hear again that some who take one of those roads to Rome are disappointed with what they see!

A KNIGHT ON WHEELS.

CHAPTER XXIII.-THE INARTICULATE KNIGHT.

I.

PHILIP departed from Tite Street, Chelsea, without having invited Peggy to go with him. Getting married, except in the case of the very young, is not such a simple business as it appears. The difficulty lies in the fact that a man's conception of the proper method of wooing is diametrically opposed to that of a maid; and, since the maid has the final word in the matter, it stands to reason that the campaign must ultimately be conducted upon her lines and not her swain's. Hence Romeo usually finds himself compelled, at the very outset, to abandon a great many preconceived and cherished theories, and adapt himself to entirely unfamiliar conditions of warfare; and he usually suffers a good deal in the process.

On paper, the contest should be of the most one-sided description; for the defending force—as represented by the lady—is at liberty to choose its own ground and precipitate or ward off an assault as it pleases, while the invader has to manœuvre clumsily and self-consciously in the open. He marches and countermarches, feeling sometimes tender, sometimes fierce, not seldom ridiculous, but never, never, never sure of his ground. Truly it is a one-sided business—on paper. But woman has no regard for paper. Under the operation of a mysterious but merciful

law of nature, it is her habit, having placed herself in an absolutely impregnable position, to abandon her defences without warning or explanation—not infrequently at the moment when the dispirited lover at her gates is upon the point of striking camp and beating a melancholy retreat—and marching out, bag and baggage, into the arms of her dazed and incredulous opponent.

But Philip, being unversed in the feminine instinct of self-defence, did not know this. To him, from a distance, Love had appeared as a Palace Beautiful standing on the summit of a hill; a fairy fabric of gleaming minarets, slender lines, and soft curves; a haven greatly to be desired by a lonely pilgrim. Now that he had scaled the height and reached his destination, he found nothing but frowning battlements and blank walls. In other words, he had overlooked the difference between arrival and admission. To sum up the situation in the language which would undoubtedly have been employed by that master of terse phraseology, Mr Timothy Rendle, Philip was 'up against it.'

There is nothing quite so impregnable as the reserve of a nice-minded girl. The coquette and the sentimental miss are easy game; there is never any doubt as to what they expect of a man; and man, being man, sees to it that they

are not disappointed. But to make successful love to a girl who is neither of these things calls for some powers of intuition and a thick skin. It is the latter priceless qualification which usually pulls a man through. Philip possessed rather less than the average male equipment of intuition, and his skin was deplorably thin. Peggy meant so much to him that he shrank from putting everything to the touch at once. Like all persons who have put all their eggs in one basket, he feared his fate too much. So he temporised; he hung back, and waited. Peggy had ever given him an opening he would have set his teeth and plunged into it, blindly and ponderously; but she never did. She was always kind, always cheerful, always the best of companions; but she kept steadily to the surface of things, and appeared to be entirely oblivious to the existence of the suppressed volcano which sighed and rumbled beneath her feet.

Philip became acquainted, too, with the minor troubles of the love-lorn. If a letter lay on Peggy's plate at breakfast, he speculated gloomily as to the sex of the sender. He sat through conversations in the course of which his Lady appeared to make a point of addressing every one present but himself. He saw what Mr Kipling calls 'Christian kisses' wasted upon other girls and unresponsive babies. He would pass from the brief rapture of having his invitation to a drive in the Park accepted to the prolonged bitterness of having to take the drive in company with a third party, casually co-opted into the expedition by Peggy at the last moment. He purchased little gifts, and kept them for days, not venturing to offer them for fear of a rebuff. Once or twice he embarked upon carefully prepared conversational openings of an intimate character, only to have these same caught up, tossed about, and set aside with unfeeling frivolity by the lady to whom they were addressed. He sometimes wondered what had become of the Pegs he had once known—the wistful, dreamy, confiding little girl with whom he had discussed all things in heaven and earth under the wintry skies of Hampstead Heath. Mental myopia is a common characteristic of young men in Philip's condition.

So he departed from Tite Street without having delivered himself, and returned to his own place. And yet not even that. For the garret in Wigmore Street was no more. One day during his convalescence he had desired certain books and papers, so Peggy and Miss Leslie made an expedition to fetch them. They drove up to the door of the house, and, having ascended to the fourth floor, let themselves into Philip's retreat with his latch-key.

'It is terribly thrilling,' observed the romantic Miss Leslie, 'to find yourself alone in a man's

Peggy said nothing, but looked round the dusty sitting-room with wondering eyes. She

thought of her own private den at home, with its pretty curtains, soft cushions, fresh flowers, and the thousand useless but companionable knick-knacks that make a woman's room look cosy. This gaunt, pictureless, carpetless eyrie made her shiver. There was not even a grate in the fire-place—only a rusty gas-stove.

'Mercy on us!' exclaimed Miss Leslie. 'Can the man not afford a cover for the table! And

where does he sit if a visitor comes?'

She disappeared into Philip's bedroom, and returned dragging a portmanteau. 'The only chair in there has a leg missing,' she mentioned. 'Take the arm-chair, child.'

Peggy obeyed, and Miss Leslie, seating herself cautiously upon the portmanteau, inquired, 'How long has the creature been living here?'

'Two or three years, I think.'

- 'Has he no friends?' continued Miss Leslie scathingly.
 - 'I don't know, I am sure.'
 - 'No mother, of course?'

'No.'

Miss Leslie nodded. 'I have always maintained,' she observed, 'that there ought to be a law appointing women inspectors to go round and look after the rooms of young men that live alone in London. Their motives would be misunderstood, of course; but it would be worth while, all the same. Is there a servant-body of any kind in this place?'

'He says that a woman comes in every morn-

ing and tidies up.'

'I should like to meet her,' said Miss Leslie grimly. 'I expect she could a tale unfold. Where does he get his food, and how does he eat it? Off the floor?'

'I don't know,' said Peggy, who had sat very silent through this tirade. 'I—I had no idea it

was as bad as this.'

They invaded the tiny pantry. Here they found a teapot, together with a cup and saucer, two plates, a knife, a fork, and a spoon. There was also a small frying-pan and a tarnished cruetstand. A very dingy dishcloth hung upon a nail at the back of the door. There were receptacles which had evidently at one time contained tea, sugar, and salt, but they were empty. The lady who tidied up had seen to that. The place was dusty, and smelt of mice.

'And he told me only yesterday that he was very happy here!' remarked Miss Leslie. 'Poor,

poor body!'

They returned to the sitting-room, and having selected the necessary books from a heap upon the floor, turned to go. But Miss Leslie's attention was arrested by something upon the mantelpiece.

'Bless me,' she exclaimed, 'what's that?'
'That' was the Meldrum Carburettor—the
original model—the solitary ornament of the

apartment.

'He invented it, I think,' said Peggy. 'Didn't he tell you about it?'

'He did,' replied Miss Leslie—'several times. This place gives me Well, let us be stepping.

the creepies.'

She marched out of the room and began to descend the staircase. Peggy was following her, when suddenly her eye was caught by a gleam of colour at her feet. It was a pink carnation, one of a small bunch which Philip had given to her. He had bought them in the street during his first outing in a bath-chair, and after keeping them for three days had taken the flowers in one hand and his courage in the other and made the presentation. They were slightly faded, a fact upon which their recipient had not failed to comment. Indeed, she had accused the donor, to his great distress, of having bought them second-hand. Well, here was one of the bunch lying upon the dusty floor. Peggy had dislodged it from her belt. She picked it up, and gazed thoughtfully about the room. Then she tiptoed across to the mantelpiece, and proceeded to ornament the Meldrum Carburettor with a floral device. Next she ran guiltily downstairs after Miss Leslie.

'Philip,' inquired Miss Falconer of her patient that evening, 'how much money have you got?'

Philip ruminated. 'I don't quite know,' he said. 'How much do you want?

'I want enough to find decent rooms for you

to live in. Can you afford it?'

'I suppose so. I don't spend half my income at present. My father left me a good deal, and I have my salary as well. But what is the matter with my present abode?'

'It is poky and dirty and unfurnished, and quite impossible,' said Peggy with finality. 'You

must move into something better.'

'The rooms suited me well enough,' objected Philip. 'I got through a good lot of work there. Besides, they were handy for Oxford Street.'

'Nevertheless, you will leave them,' announced

Philip glowed comfortably. He liked being ordered about by his Lady. It showed that she took more than a passing interest in him, he

'If I do,' he said cunningly, 'will you come and see me there sometimes? Tea, or something? You could bring Miss Leslie, he added.

'Mayhap,' replied Peggy indulgently. listen. I have a plan. I think you and Tim Rendle ought to take rooms together. At present he is in a very stupid, expensive set of chambers in Park Place, wasting a lot of money and getting into bad habits. You could club together and take a lovely little flat, say in Knightsbridge, and have a proper servant and Will you? Philip, what are you decent meals. frowning about?'

Philip's little glow of happiness had died away as suddenly as it came. That Peggy should make plans for his future was gratifying enough. But to be urged by one's Best Beloved to set up a permanent bachelor establishment is not an unmixed delight. Such a recommendation points in the wrong direction. Philip would have been better pleased had Peggy advised him to take a real house somewhere.

Besides, the mention of Timothy had spoiled everything. Not that Philip was jealous, but Timothy's inclusion in the scheme had shorn the situation of its romance at a single blow. For one foolish moment Philip had imagined that Peggy's concern for his welfare and comfort had their roots in deep soil; but now the whole enterprise stood revealed for what it was-a mere feminine plot, a piece of maternal officious-Timothy and Philip were to be put into chambers together; Timothy to brighten up that dull dog Philip, and Philip to act as a check upon that irresponsible young idiot Timothy. Hence the ungracious frown. But his spoken objections took a different line.

'Knightsbridge is a long way from Oxford

Street,' he said.

'I know,' replied Peggy calmly. 'That is why I chose it.'

'Tim would rather interfere with my work,'

Philip continued.

'I know,' repeated Peggy. 'That is why I cose him / He will be a nice distraction.'
'He will,' growled Philip. chose him /

Suddenly Peggy flared up. 'Philip,' she asked hotly, 'why are you so cross? Don't you like Timothy?'

'Yes, of course I do; but'-

'And wouldn't it be pleasant to have his company?

'Yes, rather! But'-

But what?

Philip reddened. 'I don't know,' he said helplessly. But he knew well enough, and so did Peggy

'Then don't be a baby,' she said severely. 'It is not very nice of you, considering that I am only trying to make you comfortable and '-

But Philip was already doing penance. 'Peggy,' he burst out—he called her Peggy because she called him Philip; they had never returned to 'Pegs' and 'Phil,' although she sometimes addressed him as 'Theophilus'—'I am a brute! Forgive me!

Peggy relented, and smiled. 'No, you are not a brute,' she said; 'you are just a child. However, since you are an invalid, I forgive you. But you must not be sulky when people take trouble on your behalf. You are getting a big boy now, you know! Say "Thank you," nicely!

Thank you,' said Philip, obediently.

'That is much better,' remarked Peggy approv-'But tell me, why don't you want to settle down in nice, comfy rooms with Tim?'

Philip hesitated, and his throat went dry. Was this his opening—at last? 'I don't want to settle down-in that way,' he said hoarsely.

'Peggy, I'---

'Shall I tell you why?' interposed Peggy. 'Because you are far too much wrapped up in your work. You work too hard. You think of nothing but Oxford Street, and—and carburettors, and things. I want you—I mean, you ought to go about more, and see people, and enjoy yourself, and have a lot of friends.'

'I don't want'—— declared Philip rebelliously.
'Think how interesting and amusing you could be if you went about and met more people,' con-

tinued Peggy.

She got home that time.

Philip winced. 'I'm a dull dog, I know,' he said

'No, you are not,' said Peggy; 'so don't be foolish.' Then, softening again, for she had averted the danger, she continued gently, 'All I meant was that it would do you good to have a little more leisure and distraction. "All work and no play," you know! Now, will you look about for nice rooms when you get well—for yourself and Tim?'

'Yes, if you will help,' replied Philip with

great valour.

'Of course I will,' said Peggy heartily; 'but not if you are going to be cross with me.'

Philip assured her that she need never again have any fears upon that score. And he was as good as his word.

(Continued on page 423.)

HERRIN'-LASSIES.

By A. G. SHIELL.

F one were asked straight off, 'What about Yarmouth?' he would no doubt make answer, 'Why, it's the place the bloaters' (in broad Norfolk the 'blouters') 'come from, and the most democratic of all our seaside resorts.' On the other hand, were he suddenly set down upon its quay he might fancy himself at Amsterdam, while parts could be taken for bits of Delft or Schiedam. There is, however, a season of the year, the autumn, when Yarmouth is neither English nor Dutch, and fifteen thousand, more rather than less, of Scottish fisherfolk settle on the left bank of the Yare. Of that number, four to five thousand are women. From the isles and coasts of the mainland they come-the Outer Hebrides, Skye, (rounding Cape Wrath) the Orkneys and Shetlands, along the shores of the Moray Firth, past Buckie, down by Peterhead and Stonehaven, to 'the golden fringe of Fife.' Gaelic is the mother-tongue of about one-half of the women, though they are acquainted with English as well; but it would be incorrect to suppose that Gaelic in speech necessarily implies Gaelic in race, for to the Highlander the Outer Hebrides, where that language is exclusively used, are known as Innse Gall, 'the Islands of the Strangers,' from the Norsemen, by whom they were conquered. All the way from far Inverness the girls are taken to, and brought back from, Yarmouth in great 'specials.' For them the Scottish railway companies put on no worn-out rolling stock, but their very best corridor trains, so gala the lassies come, and gala they go back again.

I had the luck to arrive in Yarmouth during the week of the greatest herring-catch in all its piscatorial annals. Up to then the season had been comparatively a blank, when, all at once, 'the manna of the seas' was being landed literally in millions. On Monday the 13th of October no fewer than thirty-five millions of herrings were

put ashore at Yarmouth, where, in the streets, they were sold four for a penny; while on the same day at Lowestoft the catch amounted to forty millions. A single steam-drifter, The Girl Eva, of Yarmouth, had a 'shot' of three hundred thousand herrings, the harvest of one night, which sold for three hundred and fortyfive pounds; and several other boats came in nearly as well fished. No wonder, therefore, that the word 'herring' is cognate with the German word Heer ('a host' or 'army'), or that in the sixteenth and seventeenth centuries the Clupea harengus was named the gold-mine of Holland, enabling the Dutch both to raise their tribute to Spain and to build their protective The gold-mine is now being worked by Let us hope it will be long before it ourselves. is worked out.

Never before have I witnessed a scene of such animation and activity. All the way from Southtown Bridge to the mouth of the Yare, a distance of over two miles, the river was packed with craft to transport the 'pickles' to Continental ports. On the Gorlestone side they lay four-deep, broadside on; and on the Yarmouth side the drifters were ranged, nose to shore, as close together as herrings in their own holds. On the fish-wharf was a perpetual clangour of hand-bells, summoning to the various auctions. Herrings lay in heaps everywhere, herrings were being loaded into open railway trucks, the ground underfoot was like a salt-marsh, and all about were mounds, or rather little mountains, of new white casks to receive the silver tribute of the deep. No sooner was a drifter emptied than it backed out to make way for another, its hold filled to the brim, the contents being swung out by its own crane in single baskets called 'marns,' which in turn were emptied into 'swills,' large kidney-shaped wicker baskets with a cross handle in the middle. swill contains five hundred herrings, and two

swills go to a cran. Borough carts and lorries were in attendance, and hurried off with the full swills to the curing-sheds, large brick erections, roofed and open at the sides, against which are ranged, running their entire length, wooden troughs or 'farlings,' on a slant, from six to eight feet wide, with a ledge on the inside about a foot high. Behind stand the herrin'lassies or 'gutters' in files. The troughs are never empty, for they are continually replenished with the contents of fresh swills from the constantly arriving carts. Armed with a small-bladed knife with stiff haft, the 'gut-knife,' a girl seizes a herring with the left hand, the other holding the knife, and with incredible rapidity and seemingly with one movement deprives the herring of its gut and gills, tossing it, according to grade, without ever turning her head, into one or other of three baskets behind her, for matties or fat-herrings, mediums, or shotten or spent—that is, spawned.

The celerity and unerring precision are simply marvellous, the result of generations of transmitted aptitude. A Yarmouth man who had been all his life in the trade told me a Scotch girl was the equal of any two Yarmouth ones. The girls are divided into 'crews' of three, two gutters and one packer; packing being quite as skilful as gutting, though it is said to be more fatiguing. The herrings are put into the barrels by scoopfuls, swiftly arranged head to tail around the circumference, the centre being then filled in, and each layer receiving its appropriate baptism of salt. The members of the crews are paid from eight to ten shillings a week each 'sure,' and eightpence extra per barrel amongst them, the individual earnings sometimes amounting to as much as three pounds to three pounds ten shillings in a week.

At one o'clock they knock off for dinner, and it is a sight to see them trooping along by scores, linked together. What sturdy bare arms, what swinging gait, all with their heads uncovered, as caller as herrings and as jolly as sand-boys! Over short petticoats they wear oil-skirts with bib and cross-bands, and are shod in Baltic wellingtons. When, as I afterwards observed on a day of dismal downpour at Lowestoft, sou'westers are superimposed, the ensemble forms the most telling get-up it is possible to imagine. For the chief part the girls are comely, with the comeliness of youth and health; while a few might be considered even beautiful. One in especial I noticed, a mere slip of a thing, young and tall, with the démarche of a princess, and a wealth of glorious Norse hair, yellow as sands kissed by the wave and glinted on by the sun. Straight out of some Valhalla of the sea-gods might have stepped this Brunnhilde of the herring-troughs.

On the South Denes is a rest-house, a tidily kept little châlet, run on economic lines, where two devoted ladies, Miss Davidson and Mrs

Bannerman, minister to the comfort of the girls, having on occasions as many as three or four hundred in to dinner. They were having nice sustaining Scotch broth, and dainty slices of buttered bread, with jam, and warming cocoa.

Thence I proceeded to where that well-known delicacy, the 'blouter,' was being prepared, an operation—as demanding but little dexterity disdained of the Scotch girls. The herrings destined to be blouterised are first washed in a huge vat, then run through the gills on to a rod four or five feet long called a 'speet'—a form of the word 'spit,' no doubt—and hung up horizontally in high, dark lofts with smouldering 'billets' of oak upon the floor. Others are placed in the 'red-house,' and fumigated with powdered oak wood, a mixture resembling French coffee in appearance, and sometimes in taste; wherefrom, after treatment of from three to four weeks, they emerge in the shape of our old familiar friend who so frequently is drawn across the trail.

'Kippering' is a process slightly different, and there the Scotch girls again come to the fore. Facing a narrow shelf-table against the wall of the shed, they quickly, with knives razor-sharp, slit the herring down the back, and with one whisk of the blade jerk the milt or roe into separate baskets. After washing and salting, the herrings are attached by the gills to squared strips of wood four or five feet long with turned-up nails—'tenter balks'—and suspended in lofts with slow-burning little heaps of hard-wood (oak or beech) shavings, which give out a dense and acrid smoke.

From the washing-tubs a slimy, yellowy-white fat is skimmed, put into casks, and sent to the oil-refiners, just as the piles of herring-guts are employed for fertilisers, so that no part of the little fish is wasted, if that is any consolation to it.

Another class of girls are the 'beatsters,' so called—those who mend the fishing-nets. They come almost exclusively from 'the kingdom of Fife,' and carry on their work in dry, clean rooms, for which reason perhaps they did not present the same look of robust health which characterises their sisters engaged in the less delicate processes in the open air.

On Sunday, in the Mariners' Chapel, I attended two services for the Scottish fishers. The minister has to be bilingual, English and Gaelic. In the morning a mixed congregation of men and women sang hymns with heartiness and strong, clear voices; while men rose casually and offered up prayers. After the sermon, practical Christianity following on theoretical, there was a service of 'hand-dressing' in the vestry, where were the two ladies whom I have mentioned, with others. My compassion had been aroused by observing that every girl without exception had both hands bandaged, which I attributed to

cuts. I discovered, however, that the bandages are chiefly worn to enable the slimy and slippery herring to be more readily grasped, 'to mak' sikkar,' and as a protection against the brine, which in the case of delicate skins is apt to produce nasty festering sores; though, of course, cuts do occur.

In the afternoon the service was in Gaelic, and the lassies who attended it were all bareheaded, dressed in black, with shawls over their shoulders. Save the minister, I was the only man present. Curiously enough, the Gael will sing no hymns, nothing less inspired than the lays of the Psalmist. The minister, in high falsetto voice, gave out two lines at a time, which the women repeated in similar tones—a wild, weird wail, like the cry of the stormy petrel over Hebridean seas.

Wherever I went I found nothing but good words for the Scottish 'herrin'-lassies,' as laborious, well-conducted, civil-spoken, and happy of disposition.

But weel may the boatie row, And lucky be her part; And lightsome be the lassie's care That yields an honest heart.

The herring-fishing of last season at Yarmouth and Lowestoft established a record for each place. The total catch amounted to no fewer than one thousand three hundred and fifty-nine million seven hundred and twenty-six thousand herrings, to which the former place contributed eight hundred and twenty-three thousand six hundred and fifty-three crans, and the latter five hundred and thirty-six thousand and seventy-three crans, the gross value thereof being, at least, one million three hundred and fifty-nine thousand seven hundred and twenty-six pounds. Those awful figures—for indeed they are nothing less—raise misgivings whether this unlimited destruction of fish can go on indefinitely, and whether—unless protective or restrictive measures are adoptedthe silver fish that lays the golden eggs will not be slowly but surely exterminated.

TROOPER 13,846.

CHAPTER VI.

SIDI-BEL-ABBES at nightfall. From the rear came the lights of the city itself; in front the semi-darkness of the desert. The Legion swung out of the barracks into the crowded streets beyond. There was excitement on the face of every man. It might only be another forced march, but individually and collectively the Legion hoped for more. They felt that something of deeper import than wearying kilomètres of dry and dusty sand lay ahead of them. For days the Echo d'Oran had contained vague rumours of an Arab rising. The cry 'Aux armes /' had come suddenly. Sergeants and corporals had rushed through the barracks, the welcome cry upon their lips, 'Faites le sac / Faites le sac /' Like wildfire it had spread from the canteen to the Jardin Public. Légionnaires were rushing everywhere like schoolboys, collecting their scanty belongings. At last there was to be fighting.

All Sidi-bel-Abbès turned out to watch them depart. A crowd of Arabs thronged the roads. From the gardens of the bungalows the Europeans wished them 'God speed.' The men stepped out to the crashing music of their band playing a march like which there is none other.

Devereux marched in the front rank; he was a favourite with his colonel, since he could march. The lights of the city died away, and they tramped through semi-darkness. The music of the band had long since ceased to send the blood coursing through their veins. Now there was only the steady tramp, tramp of feet upon hard sand to break the silence.

A feeling of thankfulness surged through Devereux. He still had a few hours' more freedom, and in those hours many things might happen. The court-martial that was to follow upon his return, the years at the penal settlement, seemed miles away. So far they did not trouble him, since they appeared unreal.

He smiled suddenly. At the head of the regiment rode two men, side by side—Captain Marchand and Lieutenant Villevois.

The men in the ranks behind were laughing and talking. A feeling of good spirits had seized the Legion. They were going to fight; each man felt the certainty of it. Once Captain Marchand turned round in the saddle, and their eyes met.

The Legion had marched for seventy-two hours. Sidi-bel-Abbès lay nearly one hundred and fifty miles away. All around, on every side as far as eye could see, lay sand—golden unbroken sand—reflecting the sun's rays until it was painful. The less strong men dragged as they marched; the songs had died in their throats. A spirit of unrest, almost rebellion, seized upon them. When not too tired to speak, they grumbled.

Devereux tramped on with the dogged determination which had won his officers' respect. The two gaunt figures still rode at their head, silent, almost morose. The days had told upon Lieutenant Villevois; his eyes were bloodshot; his face looked haggard and wan. He stared fitfully from side to side as he rode; at other times his head drooped dejectedly.

'Halte / Campez /' suddenly came the command.

In a few moments the tents were pitched, for the *légionnaire* is quick in his work. In half-an-hour, dog-tired and weary, the camp was asleep, save those who stood guard.

Devereux was one of those on guard. He stood motionless, a solitary figure against the skyline. Resting on his rifle, he looked around. A full moon had risen. For miles the sand was bathed with a soft light. In the distance a cluster of rocks stood out black against the skyline. He was aroused suddenly. A figure had appeared at the entrance to one of the tents, gesticulating and talking rapidly to himself. 'No, no, nom de Dieu / no; I will not sell the Legion.' He paused for a moment. Devereux hurried forward to awaken him, when he was arrested by a second figure, only a few yards behind the lieutenant, watching his every movement.

Lieutenant Villevois was speaking again. 'Yes, yes, they are marching south. The orders were altered at the last moment. South on 15th September.'

The second figure strode forward and laid a hand on the lieutenant's shoulder. 'You had better go back to your tent,' he said. 'You will want all your strength to-morrow.'

The lieutenant awoke with a start. He looked around dazedly. 'Where am I?' he said. Then he remembered, and laughed sheepishly. 'It is an old habit,' he said.

'Ah, an old habit!' responded Captain Marchand. He watched him back to his tent, then came and joined Devereux.

'So it is Villevois who has been selling the Legion—Villevois whom you have been shielding! You're a funny fellow, Devereux.'

Devereux made no reply.

'So he told them we should be marching south! There will be trouble for the Legion this journey.'

Devereux's eyes were fixed upon the cluster of rocks. 'Aux armes!' he cried suddenly. 'Aux armes!'

In a moment the camp was awake. There was the sound of hurrying footsteps, of excited voices. Men sprang to their rifles. Too late! Like a black-and-white cloud there swept from the shelter of the rocks an army of Arab horsemen. Like a whirlwind they rushed upon the camp, their hoarse cry of battle rising on the wind: 'La Illaha 'llahu / La Illaha illa 'llahu /' It gathered in force and vehemence each second.

Captain Marchand had barely time to rally his men before the Arabs were upon them.

'La Illaha illa 'llahu!' The Legion are good fighters, but the onrush was irresistible, and they were taken completely by surprise. Lieutenant Villevois was killed in the first moment.

With a grim determination, the Legion rallied round their flag, taking what shelter they could behind their baggage-wagons and the bodies of their fallen comrades.

Volley after volley they poured into the white-robed figures, a wild fanatical crowd, splendid in their fearlessness of death. Devereux was kneeling behind a fallen horse. He had dragged Captain Marchand beside him. With about eighty légionnaires, they were separated from the main body. Captain Marchand was directing the firing. 'They are fine soldiers,' he said to Devereux with a smile. The next second he rolled over with a choking sigh, and fell at Devereux's feet.

Devereux picked him up and propped him against the animal at the side farthest from the fighting.

The next légionnaire to Devereux was little more than a recruit. It was his first fight, and the long march had destroyed his nerve. He staggered to his feet. 'Captain Marchand is dead!' he shrieked. Even as he shouted he fell back, a dozen bullets in his body. The Legion knew they were leaderless, and wavered. Another moment and they would have broken.

Devereux picked up Captain Marchand's sword from where it had fallen, and leaped to his feet. 'Charge, comrades!' he shouted. He rushed toward the main body. A hundred bullets sped past; an Arab tried to stop him, and was cut to the ground. Hatless, his hair blew in the wind. The light of battle was in his eyes. 'Charge!' he shouted again. To a man the Legion responded. A new leader had risen, some one they could follow. He rallied the men around him—five hundred desperate fellows. There was the gleam of bayonets as he led them forward. With a mad rush they flung themselves upon the Arabs; man met man; steel met steel.

Devereux himself bore a charmed life. He courted death, since it meant freedom from the punishment which lay before him when he reached Sidi-bel-Abbès again. But death passed him by. It chose others, those who stood along-side even, leaving him for another fate.

For a couple of hours the Legion fought with the wildness of despair, and each second their numbers became less. The moon shone upon a field of slain. Arab and white lay side by side upon the sands. The wounded muttered and cursed in half-a-dozen different tongues. It is so wherever the Legion fights.

It takes little to turn the tide of battle. A feeling of hopelessness, of waging war against some unnatural force, took possession of the Arabs. Seized by a sudden panic, one which was uncontrollable, they broke and fled. Vainly one of their number tried to rally them. Their flag had fallen, and lay trampled under foot. Their leader was shot. Even the impunity with which Devereux courted death had played its-

part. A wildly increasing terror defeated them when they might have won.

Devereux watched them gallop away; then he looked at the shambles around him, and shuddered. The men who had fought with him stood dazedly at their posts, some with dripping swords in their hands, others clutching their rifles, all oblivious of everything save that the enemy had gone, and that they were tired. Some stumbled and fell asleep, regardless that they had fallen across the body of a dead comrade.

A légionnaire touched Devereux on the arm. His eyes were heavy and leaden. 'The captain would like to speak to you,' he said.

Devereux followed him to where Captain

Marchand lay.

The captain's face was ashen. 'Well done, légionnaire /' he gasped. Then he gripped Devereux's hand with his dying strength. 'Tell me,' he said, 'why did you go to my house that night?'

'It was a mistake,' responded Devereux. 'A

horrible mistake on my part.'

'Thank God!' Captain Marchand's head fell back. But there was a smile on his face; and, seeing it, Devereux knew that there are some lies which are as sinless as the truth.

He walked back to the main body. A dozen of the *légionnaires*, older and tougher men, awaited him. They were mostly Germans. 'You have led us to victory. But for you we should be lying dead in the sand,' they said. 'You will lead us back to Sidi-bel-Abbès!'

Devereux saw them through a mist. For the first time he realised he was wounded. 'Yes,' he said, 'I will lead you back.' Then he

pitched forward.

Twenty-four hours later all that was left of the eleventh company of the Legion formed into fours and commenced their march home. Their dead lay roughly buried where they had fallen. A rude cross marked the spot. A hundred and fifty miles lay between them and Sidi-bel-Abbès, and they commenced their march, a ragged, torn remnant of the men who had started. Nearly half of them were wounded, grim determination and fear of death upon the desert alone keeping them on their feet.

Devereux took them by easy stages, husbanding what strength remained to them, lest they

should be attacked again.

It was on the eighth day that they sighted Sidi-bel-Abbès. Devereux saw it with a feeling of thankfulness.

It was evening when they entered the gates. Heavy-footed, they marched through the crowds which gathered in the streets. The *légionnaires*' song, sung by their comrades in welcome, even failed to rouse them.

Nearer the barracks a cluster of Europeans

had gathered to see their return. Words of pity sprang to their lips and tears gathered in the eyes of some of the women as they saw the pitiable condition of the men.

A hand clutched Devereux's arm. Turning, he saw Madge. Though tears were in her eyes, her whole face was glorious with thankfulness. 'Thank God you have come back alive, Dick!' she said. She walked beside him for a little way. 'Where is Leon?' she said.

'He is out there,' responded Devereux. 'I could not save him, but he never knew. I lied so that he might die happy.'

'And Lieutenant Villevois?'

'He is there too.' Devereux spoke dazedly. He looked at Madge with a wan smile. Then he stumbled and fell forward at her feet. He felt her arms about him, and looked up into her face. He heard her whisper his name; then there came darkness.

Next day all Sidi-bel-Abbès knew what had happened out in the desert—of the chance that had come to the English légionnaire, and how

he had taken it.

Madge heard it from the lips of a man who had been present. She crept up the stairs to the room in which Devereux lay sleeping. She smiled as she stood by the side of his bed. Softly she murmured his name.

Presently he opened his eyes. For a moment he looked around; then his eyes fell on her.

'Madge!' he said-'Madge!'

She fell on her knees by his side. 'Dick, I'm so proud of you! All Sidi-bel-Abbès is talking about you to-day—of what you did out in the desert.'

Devereux smiled. 'To-day I am a hero; to-morrow—a légionnaire with five centimes a day.'

'No,' said Madge. 'When the doctor was here to-day he said you would never be fit for service again. They will discharge you as unfit, if you so wish.'

What!'—Devereux's eyes gleamed—'I shall be free to go back to England and start afresh?'

'If you want to.'

Devereux seized her hand. 'Madge dear, will you come with me? You saved my life years ago, do you remember? Will you save what is left of it now?'

Madge bent and kissed him. 'Yes, dear,' she

said; 'I am yours if you want me.'

A figure stood in the doorway—the figure of a woman who had learned a bitter lesson. 'Dick,' said Madame Marchand, coming to the bedside, 'I want to thank you. Madge has told me you let my husband die believing in me.' For a moment her hand rested on Devereux's. Then she walked slowly out of the room again, and left them alone together.

THE END.

LITTLE MEMORIES OF PERSIA.

By G. W. THOMSON.

ON my way to the East in 1888 I spent an afternoon at Venice with Sir Austen Layard, the excavator of Nineveh, who gave me a melancholy account of Persian misrule. He mentioned that while he was residing in the province of Khuzistan, the Persian Government, when pressed for money, became so cruel that he had known annual taxes collected three times in the course of one year, and when the inhabitants were unable to pay, he had seen men and women stripped naked in the streets and severely beaten.

I found Persia an extraordinary country. From any prominent point as far as the eye could reach the greater part of the land appeared a wild waste, with here and there little cases of cultivation. There were no trees except in the northern provinces and round a few towns and villages. Ruined buildings, the remains of former greatness, were to be found thickly scattered in every direction.

The most wonderful sight I saw in Persia was the Shah's museum. The precious stones—diamonds, emeralds, rubies, and sapphires—the pearls, and the collections of ancient armour, gold dishes, and exquisite enamels are probably unrivalled. These things proved a dream of beauty and colour never to be forgotten. One large case contained different orders, all blazing with diamonds, bestowed by foreign potentates on the Shah. There was a golden globe, the various countries—except Persia, which was in diamonds—outlined in rubies, the sea represented by emeralds. Then there was the famous Peacock Throne, which had been brought from India, encrusted with jewels.

If titles can make a man great, the Shah Nasr-ed-Din had no excuse for not being in the front rank. He was called the Shah-in-Shah (King of Kings), the Zil Allah (Shadow of God), the Kibleh Alem (Centre of the Universe), the Sublime Sovereign whose Splendour is that of the Firmament, the Leader of Armies as numerous as the Stars, the Footpath of Heaven, the Source of Sanctity, the Well of Science, and by many other equally grandiloquent appellations. The water in which he washed was considered sacred, and was eagerly sought for as a cure for all complaints.

The Shah was proud of his army, without, so far as I could see, very much reason. The ranks were full of beardless boys and tottering, white-headed old men. I have seen a regiment marching through Teheran, not one man keeping step with his neighbour. Once I noticed a quarrel between an officer and a common soldier while on the march. The latter stepped out of the ranks and gave his superior a good beating.

The regiment was in rags; indeed it was rare to find a soldier in Persia who was owner of a complete uniform.

The command of regiments was sometimes conferred on children. I remember one little boy of ten years of age who was a Field-Marshal. But, young or old, on a battlefield a Persian officer could always be depended on to run away. This peculiarity was not confined to the officers. On one occasion a Hamadan regiment took to their heels at the sound of their own signal-gun!

I had the honour of two interviews with his Majesty. He struck me as being like Edmund Yates the novelist, who in those days was a well-known figure in London. The Shah was of middle height, and had a dark complexion, thick moustache, and black eyes and hair. On one occasion he was wearing spectacles with He spoke rapidly, and generally horn rims. rather impatiently. On both occasions he was simply dressed. He wore an ordinary high hat of Astrakhan lambskin without any ornament, close-fitting gray trousers, and a coat of sombre silk brocade. His chief characteristics were a childish passion for novelty, great enjoyment of jokes, and fondness for animals. He was presented with a collapsible rubber boat, and sent half-a-dozen of his highest officers for a row on the lake in the royal gardens. Meanwhile he had secretly ordered the valve to be opened, and the boat collapsed in the middle of the lake, leaving the courtiers floundering in the water, while his Majesty stood grinning on the shore. He was particularly fond of cats. One of his favourites fell asleep on the coat-tails of a nobleman, who cut off his skirt rather than disturb the slumbers of the cat. Another of these pets had-not through the efforts of Mr Lloyd George —an old-age pension of three hundred pounds a year settled on it. While I was in Teheran the Shah built a palace for one of his cats; that animal used to be driven about in a golden coach, attended by footmen in imposing uniforms. One day, tired of so much grandeur, it jumped from its carriage and disappeared. The Shah married one of his wives for the simple reason that she had been kind to his favourite cat. He didn't confine his affection to one class of animal. A lioness in the royal menagerie gave birth to cubs. The Shah was so anxious about the health of the mother that he had telegraph wires connected with a temporary office opposite the cage of the lioness, so as to obtain as quickly as possible the latest bulletin. He discharged an unsympathetic clerk who had telegraphed, 'The beast is doing well,' on the ground that the real beast was not the lioness, but the man who could call the noble creature by such an ignominious name. Knowing that she was fond of animals, the Shah offered two cubs to my wife. I am thankful she declined the gift. In a small house in London young lions would be inconvenient pets! One had to be very careful in speaking to his Majesty. 'May I be your sacrifice, Asylum of the Universe!' was the fashion in which he was addressed even by subjects of the highest rank. To an ordinary man the common salutation was, 'May your nose be fat!' The Shah had sixty wives. Their indoor costume

consisted of a chemise of tinselled silk gauze or gold-embroidered muslin under a short jacket; the skirts were also short, and very much puffed out. The fact is that the Shah, during one of his visits to Europe, was so delighted with the dress of the ballet-dancers at the Opera in Paris that he decreed that their somewhat light and breezy attire was to be the indoor dress of the ladies of the Court. As most of his wives were old and fat, the effect of this costume was not altogether pleasing.

THE MONTH: SCIENCE AND ARTS.

AN ELECTRIC HOT AND COLD AIR PRODUCER.

AN electric tool has been devised for the purpose of accelerating the process of drying. In appearance it somewhat resembles a revolver, and is about the same size. The heating element is inserted in the barrel when hot air is required, and the stock contains a very small but powerful electric motor which drives a rapidly revolving fan, the whole mechanism being so designed that oiling and attention are unnecessary. length of flexible wire extending from the handle to a plug is connected to an electric lamp socket or coupled up to an accumulator, and directly the switch is moved an intense current of hot or cold air is generated and projected in a continuous stream until the drying is effected. applications of the apparatus are practically unlimited, as it can be used whenever a current of hot or cold air is required. For medical purposes it is invaluable, especially for vibratory massage.

A MOVING-PICTURE TARGET.

Some months ago an interesting application of the kinematograph to rifle-practice was described in the 'Month;' but a new development has been introduced, in which the initial cost of the installation is reduced, and the system is very simple in operation. It is expressly intended, like all similar systems, for low-powered shooting, animated photography having technical limita-The screen is of steel, with a specially prepared surface in order to enable the projected pictures to stand out brilliantly and clearly. The bullets are of special manufacture, with an explosive head, so that when they strike the screen a bright flash is emitted. By this means both the rifleman and the marker are able to determine the value of the shot. The pictures are projected at the normal speed of sixteen per second; and, unlike another appliance, the movement of the projector is not arrested at the moment of discharge, neither is there an indicator at the firing-point. The impact flash, and that alone, affords indication of the value of the shot; consequently the representation is as close to actual conditions as can be contrived mechanically. If squad firing is practised—and this is quite possible—it is easy to ascertain individual values, because for such practice each man is given bullets with a differently coloured flash. Of course the scope of the kinematograph target is restricted very severely; but it cultivates that nimbleness in aiming and firing which is desired so much under present-day conditions. The one objection is that the range is limited, so that the target is not likely to supersede the ordinary long-range target. However, it offers a welcome variation in the shooting-gallery; instead of firing at bottles, dancing eggs, or mechanically moving animals, the marksman aims at a pictorial representation of an actual scene, which ensures realism and fascination. This latest form of target threatens the existence of the ordinary type of shooting-gallery, and there is no doubt that it will become popular at holiday-resorts.

AN ELECTRIC LOCK.

An electric lock has been invented which indicates when it is being tampered with. The mechanical details are so arranged that it is impossible to pick the lock without causing an alarm to be sounded. If anything except the proper key is used, the slightest pressure upon the central pin of the lock closes an electric circuit; and even with a key of non-insulating material the alarm is given. The alarm can also be set to give warning whether the lock is being opened from the outside or the inside, and the latch likewise can be made to give the alarm. The burglar may search for the wires, but this will be vain, because the circuit is completed by way of the hinges, so that there are no visible wires he can cut. This ingenious lock is the invention of a Frenchman, but it is also produced in this country.

GARDENING BY THE SQUARE YARD.

Considerable progress has been made with what the French call intensive cultivation, although the idea is by no means new, having been practised long since by south of England market-gardeners; but the amateur has hitherto been thwarted in realising his ambitions, as the cost of the cloches has been prohibitive. An appliance has now been introduced which meets the needs of the amateur. Although the use of this cloche is not intensive culture within the strict meaning of the term, it enables produce to be raised well in advance of the season, and that, after all, is the main idea of forced cultivation. This latest development comprises a A-shaped tent cloche of two panes of glass, disposed within a light and small wire frame, and is easy to handle. The continuous cloche, as it is called, possesses many advantages over the bell-shaped article. The seeds may be sown in the open ground in the usual manner, and then it is only necessary to cover them with the Λ -shaped glass tent from one end of the row to the other. It is a very simple arrangement; the effects of bad weather, the depredations of birds and slugs, as well as other enemies, being prevented. Thus the seed is sown within a miniature greenhouse, because every ray of sunshine is caught and induced to perform useful work in the propagation and growth of the seedling, which is also protected from late frosts. The seeds may be sown weeks ahead of the time usually recognised as suitable for open sowing, so that early vegetables can be obtained with the minimum of risk. The continuous cloche is made in lengths of fourteen inches and in three sizes. The smallest is two and three-quarter inches wide by two inches in height; the largest is eleven inches wide by seven inches high. The experiments carried out have aroused considerable interest. As the air circulates freely within the cloche, there is no risk of young seedlings rotting off because of the moisture due to condensation on the inner surface of the glass. In the south of England the cloche has been adopted extensively by the large as well as the small growers.

PEAT-COKE.

The Germans are indefatigable in their efforts to turn waste products to commercial advantage. The utilisation of the extensive peat-bogs in that country has been a difficult task, and has therefore been somewhat restricted. The general practice was to excavate the peat and expose it to the sun and air to drive off moisture. The turf was then used as fuel for the generation of electricity; but the freight to convenient centres was a serious handicap. Electric stations have now been erected in the vicinity of the sources of supply, and the current transmitted to distant points. At Elizabeth-Fehn, in the grand-duchy of Oldenburg, a new system has been adopted which converts the peat into coke, and a plant has been erected on the moor for that purpose. Thirty tons of peat yield nine tons of coke, with gas and tar as by-products. Ovens of special design have been erected, and also powerful machines for dredging the peat. The dredgers are operated by electricity generated from the gas given off by the peat, and the gas is also used to heat the ovens; consequently the plant may be described as self-supporting. Peat-coke is a valuable commodity, as it is adapted to metallurgical operations, and also for use as fuel for smiths' fires; it is, too, particularly useful as a substitute for charcoal in the production of high-grade iron and steel. The by-products are valuable, comprising creosote-oil, gas-oil, paraffin, pitch, sulphuric acid, and ammonia.

RLECTRIC CASSEROLES.

The vogue of casserole cooking—referred to here in 1913 in connection with Marion H. Neil's book entitled How to Cook in Casserole Dishes—has not been allowed to pass unnoticed by those interested in electric cooking. Recently a full range of casseroles adapted to electricity has been placed on the market, and these will doubtless make a wide appeal, especially as electric cooking is advancing in popularity. The electric attachment forms the lower part of the vessel; in fact, it is a unit in itself, but varying according to requirements. The utensils adapted to this form of cooking are more expensive than those used with gas and coal fires, but the enhanced cost is more than counterbalanced by the longer life of the dishes, so that in the longrun they are more economical. Further, the consumption of electricity is low.

FOG-SIGNALS FOR STEAMSHIPS.

While enveloped in a dense fog, the accurate determination of the direction whence a signal comes is one of the greatest difficulties of the navi-In order to mitigate the evil and enable the mariner to ascertain exactly the direction of sound, a Scottish inventor has devised a special localisable sound-signal and receiving apparatus. This device does not displace the ordinary siren, but is supplementary thereto, and is intended to be sounded immediately after the siren upon the approach of another vessel. The apparatus is of ingenious design, and the direction of a vessel sounding it can be located to a single degree. At the second or third blast the course of the vessel can at once be ascertained from the difference, if any, in the bearings; consequently it is possible to determine without any uncertainty the presence or absence of danger. The apparatus emits a loud and distinctive hissing sound, the producer—which somewhat resembles graduated cones slipped within one another, and mounted upon a common axis—being fitted to a branch from the steam-pipe which blows the ordinary siren, and operated by an ordinary stop-valve and lever. One striking advantage of this signal is that it is scarcely, if at all, returnable by an aerial echo, with the result that when heard it may be taken as proceeding direct from its source. The receiver comprises a concave reflector, to which ear-pieces are attached. This reflector is mounted upon a pedestal and indicator plate; though it is removable, so that it can be stowed away when not required. When a navigator

hears the signal he immediately adjusts the earpieces, and then by means of a suitable attachment swings the reflector through a few points of the compass covering the direction from which the signal is coming, and the peculiar hissing sound will be heard through a small arc. By means of the ear-pieces, which eliminate all sound except that which proceeds through the ear-tubes, and which consequently must be the hissing sound. the latter will not be heard at all unless the reflector is pointing in the direction whence the sound proceeds, and in a few moments the point of maximum intensity will be discovered. The signalling system works upon much the same lines as the submarine signal, where a telephone receiver enables the navigator to determine whence the sound is coming through the water. The mariner is thus enabled to decide with great accuracy the position and travelling direction of another vessel relative to his own course, and can act accordingly. A moderate rolling or pitching of the vessel does not interfere with the use of the instrument; and in small vessels this drawback may be overcome by detaching the reflector and holding it in the hand. However, seeing that as a rule a deadcalm prevails during dense fog, this is not often necessary.

BUILDING A MANUFACTURING CITY.

Much is said and written about the phenomenal birth and growth of cities in the New World; but how many realise the fact that here and there in the homeland similar wonders are taking place? We know that garden cities are springing up; but in the main these are purely for residential purposes, and are generally offshoots of prosperous suburbs. Probably the most romantic story in this connection is that of Trafford Park, which within a few years has developed into the industrial heart of the city of Manchester. In 1882 a stately Hall, surrounded by rolling lawns and wide, winding drives; to-day a bustling hive of activity, to which a hundred industries of all sorts and descriptions contribute. Trafford Park was born of the Manchester Ship Canal, that ambitious project whereby Manchester strove to become a With the subsequent expansion of commercialism, a rural retreat in close proximity to the city could no longer exist. Industry coveted the open expanse, and industry had The seat and grounds were purchased, to be run as a commercial enterprise. It was an astute move, inasmuch as the site is convenient for railway communication and water transport. The acquisition of the one thousand one hundred and eighty-three acres provided the teeming manufacturing areas of the district with more elbow-room. Its situation was attractive; it is in immediate touch with all the ports of the world, convenient to all corners of the kingdom by rail, and is contiguous to a population of

over nine millions. Manufacturing interests appreciated these advantages, with the result that about one-half of the total acreage has been occupied by factories for a variety of industries. The Park is gridironed with its own railway system connecting every factory with the docks and trunk lines of the country, and some idea of the activity of the bare two square miles may be gathered from the fact that during 1913 more than a million tons of freight were handled. In 1897 the rateable value was two thousand eight hundred and sixty-nine pounds; in 1912 it was one hundred thousand pounds. The land is disposed of on a novel system, and rates are very low. Railway transit in the Park is on the flat system—sixpence per ton any distance—which is just sufficient to defray the standing charges. Direct communication is offered by canal and railway to all the manufacturing points of the country, so that the raw materials may be brought from the mines direct to the factories. Wells give an abundance of water, and there is also a supplementary supply from the Manchester Corporation. Although the area is largely devoted to manufacturing, there are seven hundred dwellings on the estate available for those who desire to live close to their work, while fifty thousand employes are within tramway distance. Firms taking land on the estate are assisted in the erection of one-storied buildings, if desired; while the organisation has erected a series of onestoried fireproof structures, known as 'hives,' which are let in sections at inclusive rentals, and are suitable for small factories, distributing depots, &c. In fact, every inducement is offered for industrial settlement at Trafford Park.

LIQUORICE-JUICE.

Amongst the ordinary public there is an impression that liquorice comes from Spain; in fact, it is commonly called 'Spanish,' or 'Black Spanish.' Reference to the records at the Statistical Office, Custom House, London, shows how misleading this idea is. Here we find that for 1912 liquorice-juice imports into the United Kingdom from countries where liquorice is grown were as follows: Asia Minor, twenty-four thousand seven hundred and twenty-eight hundredweight; Italy, six thousand two hundred and fifty-three hundredweight; Spain, forty-six hundredweight. It will thus be seen that the imports from Spain are of quite a negligible quantity, whilst by far the largest quantities come from Asia Minor. The Anatolian liquorice-root of Asia Minor is wonderfully rich in Glycyrrhizine. This substance, with its somewhat difficult Greek name, is the essential constituent of liquorice, from which it derives its beneficial properties and peculiar flavour. It is only of late years that the general public has awakened to the excellent qualities of liquorice; and probably the late Dr George S. Keith, M.D., the well-known Edinburgh physician, has done more than any

other to bring its benefits forward. Writing in his little book, Fads of an Old Physician, he says: 'Liquorice, as a remedy, has hitherto been very little known. . . . For relieving the symptoms caused by acrid matters in the stomach I know nothing equal to it. . . . It certainly relieves, often in a remarkable way, the innumerable pains and discomforts, mental and bodily, which arise from irritation of the gastric nerves, as local pain of the stomach or bowels, headache, sleeplessness, lowness of spirits, or irritability and general misery.' The action of Glycyrrhizine in the stomach has not yet been scientifically explained. There is no doubt, however, it possesses some natural properties which counteract the acid residues, rendering them harmless. Hence the liquorice-juice containing the highest percentage of Glycyrrhizine would appear to be the most desirable.

THE NEWEST HOUSEKEEPING.

Mr Ebenezer Howard, founder of the Garden City Movement, has advocated 'The Newest Housekeeping' as an opportunity for women. His proposal is co-operative housekeeping so extended as to be available for people of all classes. In a paragraph printed at page 473 of our 1911 volume, on 'Co-operative Kitchens,' some of the limitations of the system were set down; in another paragraph on 'The Elimination of the Kitchen, at page 144 of our 1912 volume, the methods adopted at the Brent Garden Village, Finchley; Queen Anne's Mansions, London; and on Ruislip Manor Estate, near Harrowon-the-Hill, were indicated. Mr Howard suggests as the scene of his operations such a garden city as Letchworth. He proposes that fifty (or more) houses and a number of flats of various sizes should be built round a central space of about an acre. Each house would have its own small flower-garden, which would give immediate access to an allotment ground of about six or eight acres, to be let out in suitable portions to such tenants as evinced the inclination and the ability to make use of them. Here vegetables would be raised by an intensive system of culture; and poultry might profitably be reared. In the central square would be placed a common kitchen for the preparation of the principal meal of the day; each dwelling would also have its own pantry, fitted with gas-stove and sink, where light meals could be prepared. In addition to a crèche with sheltered playground, there would also be found in each central square a laundry and workrooms, fitted up with the most up-to-date appliances, and provided with motor-power. The rents of the dwellings of from two to six rooms would be about one shilling and eightpence per room per diem, including rates. Besides this, a weekly sum of half-a-crown would be charged per cottage to cover the expense of the co-operative kitchen; but Mr Howard considers that at least one-half of this sum will be saved to the tenant in rent and fuel. There are several instances of a similar scheme having been tried in Manchester in a roomy house with a separate wing, or suite of rooms, for each family, with a central diningroom and service-rooms for the use of all. larger scheme, embracing many families, has been started, where a four-storied rectangular building will have the ground around it occupied by tennis-courts protected by a glass roof. Round these courts will be a wide colonnade, from which will open the dining, reading, and recreation rooms, billiard-rooms, racket-court, swimming-bath, and various public-rooms. The first and second floors will contain the family suites; the servants' rooms will be on the top floor. The idea is to give heating, including hot water, and full domestic service to each occupant. A total of thirty-three servants will be at the service of the community.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-oard be sent to the Editor, 339 High Street, Edinburgh.

A SUMMER GARDEN.

I know a dell where roses dwell,
And sunbeams kiss the trees;
Where gently sways the lily-bell,
Wooed by the tender breeze;
Where stately pine-trees whisper low
To silver birches fair,
And soft yet clear the skylark's song
Thrills through the fragrant air.

There columbine and eglantine
And sweet carnations grow,
And near the idly trailing vine
The passion-flowers aglow;
There wanton shadows madly dance
Upon the velvet grass,
And mock the dial as it marks
How swift the bright hours pass.

At eventide the fairies glide
Where silver moonbeams stray,
While tired blossoms meekly hide
Their eyes till break of day;
The magic of the night-wind's sigh
Sweeps through the dusky grove,
And joyously the nightingale
Sings to his gentle love.

1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'2nd. For its return in case of ineligibility, postage-stamps

2nd. For its return in case of ineligibility, postage-stam should accompany every manuscript.

3rd. To secure their safe return if ineligible, ALL MANU-SCRIFTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.

4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

THE SLEEPY PEON.

By G. TREVOR ROLLER.

PART I.

IT was a very lovely sunny morning in the plaza—nothing out of the ordinary for Mexico, but very pleasant. This was not the plaza where the bandstand and the flowers are (the one in front of the church), but the one close by where the poorer people, the peons, on a Sunday sold whatever they had to sell—anything from a bunch of bananas to an obsolete muzzle-loading scatter-gun. This particular day was a Sunday.

Ramon Garcia had a stall in a good position in the plaza, from which he sold fruit and vegetables, and his wife had a corner of it. Her wares consisted of wonderful plates made of wood, enamelled and hand-painted with roses and other flowers. They were really hand-painted, for the Mexican Indian uses his fingers and thumbs as brushes in painting these plates and dishes, the flowers always red on a blue background, cheerful and interesting. Also, she sold earthenware pots for cooking, cocoa-nut fibre saddlecloths, webbing girths, a variety of high-crowned hats, strips of lace (probably made in England), wooden spoons, and many other things.

The chief attraction, however, to their combined emporium was Juanita Garcia, their We do not mean that she was for sale like the rest of the goods. No; she was the decoy. The attraction lay in her beauty. Many peons, cowboys, and young rancheros came to the stall to buy; and they loitered, and found excuse for their loitering, in bargaining for a handful of aquacottes or a melon which they did not want. It is an old decoy; but Ramon ran it for all it was worth—many pesos—every Sunday. On this particular day of rest, and marketing, Juanita was leaning against a corner of the family stall. She had taken some pains in the leaning process, and we cannot blame her, for she looked most charming.

An Indian girl of sixteen is generally well worth a look. Juanita was sixteen, and a peer among her rivals. She was not very tall, but slender, and subtly built; her face oval, with a dimple here and there; her skin fresh and clear, and a most engaging brown, painted with a flush on her cheeks by Nature's paint-brush; her lips very red, but otherwise quite beyond description; eyes brown, round, and inquiring; black hair parted in the middle, and falling in great plaits over each

shoulder. Her dress was—well, it did not consist of much material, but sufficient—a little white shirt, very short-sleeved and low-necked, bordered with small embroidered flowers, and not tucked into her pleated blue stuff skirt, which was bound round her waist with a red sash. Below the skirt six bold inches of ankle, and then two very small, very brown, and very mobile bare feet. In her mouth she held the stalk of a rose, with the thorns plucked off. As men passed her and politely said, 'Buenas dias, señorita,' she would smile, showing two perfect rows of little teeth clenching the green stalk of the flower, her long black eyelashes would come down on her cheeks, and sometimes she would blush.

It was all very engaging and very alluring, and soon there was a regular buzz round Ramon's stall. A lot of joking went on; everybody chaffed everybody else; Juanita gave as good as she was given. Many asked her if she would ge to the bull-fight with them that afternoon. No; she would only go to a bull-fight with the jeft politico or the town commandant—no one beneath that. But everybody knew she would go selling dulce and refreshing sweet drinks for throats parched with shouting. She was offered cigarettes; they were accepted, and placed on the stall behind her for mañana ('to-morrow'); but long befor to-morrow Ramon would have smoked them.

So the fun and the marketing went on; everybody had a smart thing to say, and said it sometimes over and over again until rewarded by a laugh; but among the crowd of jolly wooing purchasers stood one man who neither said smart things nor laughed at them. This man was Domingo, a peon, clad in white shirt, narrowankled white trousers, sandals on his feet, broadbrimmed high-crowned hat, and the inevitable red blanket folded lengthways and slung over his left shoulder. He was not a sinister figure, but merely a sleepy one. His face was not so bad to look at-rather full, with large, dreamy eyes, and a drooping, contented, sleepy look. He stood, his hands behind his back, and gazed at Juanita, and loved her with all the power of his sleepy soul. He knew she would speak to him soon, not from any conceit on his part, but because she loved to tease him; he was the only man among the many men she knew who never

JUNE 6, 1914.

got angry at her chaff. So he waited sleepily. Presently she smiled at him. He took a stolid step nearer, lifted his hat an inch or two, and said, 'Buenas dias, señorita,' and no more. After a pause, she asked him if he was not marketing for his mother.

'She buys for herself,' said Domingo.

'Then won't you buy something for your novio?'* asked Juanita. She was beginning to tease.

Domingo looked her straight in the face, and, without any emotion, said sleepily, 'My novio would not accept any present from my hands, as

well you know, señorita.'

Juanita wriggled her little toes in the sandthings were getting too personal—glanced up under her lashes, and harked back in the conversation. 'Your mother is old,' she said. 'Why do you let her go to market? Why do you not do what is to be done yourself? It is all cigarettes on the shady side of the street with you, Domingo. Yes, Domingo by name and Domingo by nature.'

This last piece of information may be better understood when we explain that Domingo is

the Spanish for Sunday.

Domingo sleepily lowered his eyes. 'I have not smoked a cigarette to-day, señorita, either on the shady or the sunny side of the street,' he said.

'And well I know why,' she flashed. 'You have no money to buy cigarettes. You have not worked this last week.'

'Truly,' said Domingo.

Juanita dropped the rose out of her mouth and deftly caught it in her hand. She was warming up. 'Yes,' she went on, 'last Sunday you told me you were off to the hot country to work in the mines. You did not go. On Monday a fool Americano gave you fifty centavos for holding his horse—I heard of it—so you lay about and slept, I suppose.'

'Or drank the fifty centavos away in Tecela,' cut in an amused bystander, for they all loved to join in the Sunday roast of poor honest Domingo,

who never lost his temper.

Domingo looked at the man and slowly shook 'No, señor,' he said, 'I am not a his head. drunkard. Why should I drink away fifty centavos?'

'Why, indeed,' caught up Juanita, 'when fifty centavos can buy cigarettes and food which will give you that comfortable feeling which promotes

This raised a general laugh, and Domingo slowly smiled. Then, as if with a great effort, he framed a compliment. 'The mines are a long way from the stall of my friend Don Ramon Garcia,' he said.

Juanita pouted the indescribable lips and twiddled her toes again.

'And next week?' she questioned.

'Mañana,' said Domingo gravely, 'I go to the packing-house beyond the town to inquire of the English señors who buy and look after the cattle whether they require my services to help them mind the cattle.'

This was greeted with a roar of laughter.

'That will suit you well,' remarked Juanita. 'You can sit on the kraal-fence and watch the cattle sleep.'

'Ah!' said Domingo in a sleepy voice, 'perhaps.'

Another roar went up, for many of these men worked at the big Anglo-American packing-house three miles out of the town, where beef and pork were manufactured from the raw material, and personally knew what running about in the hot sun and hard work fell to the lot of a cattledriver in the kraals. When the laughter died down, Juanita began to ill-treat the poor fellow still further.

'I hear that with those cattle one has to be very quick sometimes,' she mused-- very quick and brave. They have most wild cattle in those kraals.' Then, as if appealing to her audience, 'Can one imagine Don Domingo being very quick or much of a bravo?

Domingo shrugged his shoulders goodnaturedly. 'Who knows?' he said. He could not have said anything better, for it set Juanita thinking. Perhaps there was something, after all, in this sleepy, good-natured peon. Who knows! None of them knew much about him; he was quiet, never thrusting himself into public notice. Therefore they had come to look upon him as merely a butt for their chaff.

Juanita felt sorry for what she had said, and tried to make amends. 'I hope your work will be pleasing to you, Domingo.

Thank you, señorita.

'I hope you will be well recompensed, Domingo.

'Thank you for your felicitations, señorita.'

Whereupon an embarrassing silence fell upon the two; they were isolated now, the others being engrossed in an animated conversation about the bulls to be fought that afternoon. Domingo shuffled his sandals. Juanita twiddled her little toes. She dropped her eyes and put the rosestalk back in her mouth.

And Miguel,' said Domingo, 'where is he?'

Miguel was her little brother, whom she never let go far out of her sight. Now, Miguel loved Domingo, and every Sunday would ride round the stalls in the plaza on the placid peon's strong shoulders. It was nice of Domingo to ask for Miguel, and yet there was such a chance for him to say other things, exciting things; although if he had he would only have been snubbed. However, it was annoying of him.

So she said, meaning to frighten him, 'He is

very ill!'

An extraordinary change came over Domingo; a look of fear shadowed his face, and slowly gave

^{*} Sweetheart.

place to one of anger. 'Then why are you here. señorita?' he said almost fiercely. It was not the fierceness, but the rapidity with which he said it, that upset Juanita's balance.

'No, no,' she said hurriedly, 'not very illnothing. He hurt his foot last night while play-'Alone?' asked Domingo anxiously. It is a long way here, so he is at home.'

'My aunt is with him,'Juanita reassured him. 'Poor little one!' said Domingo. 'I shall go

to him. He would like to play perhaps. A dios, señorita!' And, without another word, he turned his back and slowly walked away through the crowded square.

Juanita watched him. An elderly female relative of hers, who had heard what had sent him away so abruptly, said, 'There goes a good man!'

Juanita bit her lip, watched the retreating back sauntering slowly along, and very reluctantly said, 'Yes.'

Next morning early Domingo appeared at the patio gate of the packing-house, and in his turn asked for work, and got it. All that day he worked in the krasls under the two English cattlemen. He made himself conspicuous neither by his dexterity in the art of cattle-driving nor by any lack of it.

There are times when a nimble peon can quickly come to the notice of his boss in the kraals by doing the right thing at the right moment: turning a wild steer with a crack over the nose, and running the risk of being horned; shutting a gate at the right moment; remembering which bunch has been weighed and which has not. It is a showy occupation, but Domingo never managed to get in any gallery-play. Yet, on the other hand, he made no glaring mistakes; and they are easy to make. Sometimes the wrong gate is opened and the cattle are mixed; sometimes a bunch is weighed twice over; then a gate may be accidentally left open, and the cattle escape all over the alleyways. All these things mean extra work and hard swearing. The bosses do the swearing, and the unfortunate peon is marked, and if he makes many blunders he finds that his services are not required the next week. However, Domingo was simply not noticed.

The next day, alas! proved unfortunate for He did nothing outrageous, but missed one or two opportunities of being useful at the right moment, merely because, in his lazy way, he was not keeping his eyes open. Then twice he got in the way of one of the cattlemen as he was running out of the weighing-shed. That was how Domingo achieved notoriety, for that night the younger Englishman said to the other, 'That sleepy beggar 's no use; he 's always getting in the way.

'I noticed,' said the boss. 'We will shift him to another department next week.'

'I think he tries,' said the younger man; 'but he's such a Weary Willy.'

That was how Domingo got the name of Weary Willy. An obliging half-caste explained to the other kraal peons what Weary Willy meant, and the name stuck for three days; and then the name was changed, and with it the whole of Domingo's life.

On the Thursday night about three hundred head of cattle arrived by rail from the north, wild, train-maddened beasts that had given much trouble through the night to the two cattlemen whose duty it was to look after the unloading. They had been weighed, and were waiting in the kraals, ready to go to the slaughter-house.

The Englishmen were sitting on a fence, smok-

ing and taking a well-earned rest.

Weary Willy,' said the younger of the two, 'will get killed if we have many more bunches like these coming in; he was within an ace of getting put down twice this morning.

'Oh, he won't be here long enough for that,' 'I don't want an inquest in smiled the boss.

this department.'

'Well,' said the other, 'when you turn out that lot in No. 1, I should ask him to take a seat -on the fence—if I were you.'

The boss turned and looked at the cattle in

kraal No. 1. 'Why?' he asked.

'There's a fair devil in there,' continued the younger man, 'a proper "bravo," and no error. Had the lot of us on the fence this morning when you were at the office.'

'He'll have cooled by now,' said the boss, knocking out the ashes of his pipe. He then called up some of the boys, and they went into No. 1 to drive the cattle out. They formed a ring round them at the opposite end from the gate, and started driving with extraordinary cries which in Mexico are supposed to soothe, frighten, or enrage the cattle according to the tone used. They began with the soothing variety, and drove the cattle slowly toward the gate; then, as they checked and started to mill back, the frightening tone was turned on.

The boss was in the middle of the drive, Domingo directly on his right, and his assistant on the left of the half-circle of yelling peons. The boss turned to pick up his stick, which he had dropped, and, as he turned, a big red steer shot out of the bunch, saw the bending form straight in front, and went at it. Somebody shouted, 'Look out!' in English. The boss turned, tripped, and fell. Then the unlooked-for happened. Domingo, the sleepy Weary Willy, who never seemed to think of doing a thing until it was too late, stepped slowly and lazily between the prostrate man and the steer. His red blanket fluttered in his hands right in the brute's face. The steer propped back on its hocks, then made a sort of side-plunge at the blanket. Domingo very gracefully, and without any apparent hurry, stepped to his right. The steer landed, with a grunt and a scatter of dust, beyond him. This had given the Englishman time to get up, and now was their cue to get to the fence; but Domingo never moved; he kept his sleepy eyes on the steer, his feet together, and smiled a sweet, contented smile.

Everybody yelled at once to the effect that he was to get to the fence. The two bosses were handling their thick sticks, expecting a tragedy. Now, not even a trained bull-fighter will tackle a steer with the cape, for a steer is not like a bull; it doesn't make a blind rush head down, but comes on active hoofs, horns up, turning and twisting after you like a dog. Domingo knew that; but this was his day, and he was going to have it.

The steer shook its head, then trotted straight at him. Several peons and the two Englishmen started to the rescue, shouting; but they stopped, for the steer jumped, Domingo side-stepped, and the steer tore the blanket with its horns; then, in stopping, slipped up on its side, regained its footing, and attacked again. Domingo now had his blanket in one hand, waved it in the mad brute's face, and stepped to its flank. The steer shot by and let drive with its hind-hoofs. Domingo bent his body away, without moving his feet, as neatly as any bull-fighter of Spain. The steer turned. Domingo lazily changed the blanket to his left hand, and turned the steer the other way. The onlookers stood aghast. This was as good as any cape-work they had ever seen in a ring, and it was Domingo-Domingo the useless Weary Willy-who gave the show.

But it was not to last much longer. Two or three more passes, and the steer had had enough of it, and crowded back into the bunch. Domingo slowly folded his blanket, and the onlookers cheered and laughed in relief. The boss came up to him and patted him on the back, saying something about there always being work open for him.

It was all very pleasing, but his cup was full when he happened to see perched up on the kraal-rails a little slim figure clapping her hands in a frenzy of joy. It was Juanita, who had come out to the packing-house to sell fruit during the men's dinner-hour. She was clapping him, for she had seen that, after all, he was brave and quick, not always sleepy. She must think something of him to clap like that. 'Good!' thought Domingo.

They drove the cattle up the alley and into the killing-beds, and the red steer ended its story there. When the dinner-hour came Domingo made his way to the aquacotte-tree, beneath which he knew he would find Juanita.

Directly she saw him she hailed him. 'Ola torrero' she called, and his name changed again for the second time in a week. Torrero means 'bull-fighter.'

Everybody seemed glad to see him. A peon near seized a mouth-organ from a child beside him and vamped out the tune that is always played when a bull-fighter makes a good kill.

Everybody chaffed and flattered him, and always Juanita's eyes were on him, and her smile ready when he turned her way.

For Domingo, that afternoon fled, but his

triumphs were not done with yet.

His boss sent for him after work. 'Domingo,' he said, 'I am going on a long journey to-morrow, and I have no mozo; the man who looks after my horses here cannot be trusted on the road. Could I trust you?'

'Si, señor.'

'Do you understand horses, Domingo?'

'Si, señor.'

'And the mountain roads?'

'Si, señor.'

'I start to-morrow. You would like to become my mozo, Domingo?'

'Si, señor,' said Domingo, his heart beating with pride.

So it was settled. He was given money to buy clothes befitting his new station in lifecloth trousers, boots, a charro hat, and, above all, spurs. He was to start next morning! What news to tell Juanita! He was no longer a common peon, but a mozo; the body-servant, groom, and guide to the English señor. He even hurried back to the town and made his purchases. It was characteristic of him that he did this before going to see Juanita; it was also characteristic of him that he did not wait to put on his finery before visiting her. He was in a hurry, and it never crossed his slow mind that he would create a sensation if he came rigged out in the clothes of his new calling. He left his bundle with his mother, and started for Juanita's mud-walled home. His quickest way lay through the coffee plantation that ran right up to the house; in fact, the mud wall of the Garcia patio or garden on one side was the boundary fence of the plantation. When Domingo reached the wall, and looked over, he saw a sight he did not like. There was Juanita, her back toward him, talking over the wall to a young ranchero sitting on his horse in the road. Juanita was laughing. Domingo had no wish to play spy. After all, there was nothing in Juanita's talking to whom she liked. He would get over the wall and show himself. He put his sandalled foot in a crevice and raised himself. At that moment the ranchero leant over to Juanita, his laughing lips athirst for kisses. Domingo gave a start, the sandal slipped, and he fell back into a coffee-bush. He never heard the stinging smack the too ardent youngster got for his pains; he only heard a gay laugh and the sound of a horse galloping down the dusty lane. He slowly got up; he meant to go; he thought he knew enough.

But Juanita had turned. She was rubbing one little hand against her leg. Catching a glimpse of his hat, she ran to the wall to see him slinking away.

'Domingo! Domingo!' she called, 'why are you going?' Her little heart was beating. He

should be coming toward her, not going away. She did not understand.

Domingo slowly stopped and turned. 'I am going, señorita, because I am not wanted herenot now,' he murmured.

'Oh, but you are, Domingo!' and she laughed

Then for a second time that day he surprised her. This even-tempered Domingo, who was so safe to chaff, showed her another side of his character. He came close to the wall and looked up at her, his sleepy eyes no longer sleepy, but blazing and bloodshot.

'Because,' he said between his teeth, 'the charo has gone; you have done with his kisses for to-night, and you can find time to play with Domingo!'

Quick to defend herself, Juanita cried, 'He never kissed me! I struck his face.'

'I slipped from the wall. I did not see that;'

and Domingo drew back, relenting.

But Juanita had a temper. She was innocent, and because of her innocence she would punish this man who thought she made her kisses cheap. 'So you were looking, eh, señor? You thought to spy on this Indian girl? And why? What have her kisses to do with you, eh? If she kissed every charo that came down the road, is it aught to do with you? I do not like a spy, Don Domingo. Because you played in the kraals to-day, you think to have possession of me.

Domingo tried to cut in, but she would not

listen. Her hot Southern temper was up, and she meant to hurt.

'But,' she ran on, 'for all your showing off in the kraals, I do not want you for a novio. You are a peon, Domingo; and for a lover I want something better than a peon.'

'But, señorita' began Domingo.

And again she cut him short. 'Go your way, Don Domingo,' she cried; 'you are a fool—a worthless fool; and I am a fool also for ever having smiled at you—you, who are only a worthless peon.'

Domingo turned, not slowly this time, but with a jerk, and walked away into the plantation.

She watched him go; then, as the leaves closed round him, and he never looked back, a lump came in Juanita's throat, and she called his name; but he was running, and he could not hear her. She called louder, but the only answer was the crashing of bushes as he broke through them. It was dark now, and in the distance dogs were barking at the man who ran through the bushes. Two tears trickled down Juanita's cheeks; they found the dimples, and fell out of them on to her little white shirt. She rubbed her hand on her leg; it still smarted. Then she smiled.

'Oh the poor one!' she said under her breath. 'Oh the poor one! I was so unkind! But to-morrow I shall smile you back again. Very cruel I was, but I can make up for it all, caro mio.'

ROMANCE OF THE ORANGE INDUSTRY.

By JAMES H. YOUNG.

NO better criterion of the remarkable development of the orange industry is to be found than the extraordinary cheapness at which this most popular of fruits is everywhere sold to-We use the word extraordinary advisedly, for oranges were not always to be bought at two or three for a penny! In the days of Cromwell, for instance, the price was regarded as prohibitive even when the Protector himself hankered for the fruit. The story goes that Cromwell, eager for an orange with his roast-veal, asked for one. In vain. His consort scorned the thought of such extravagance. 'Oranges are oranges now,' exclaimed the Lady Elizabeth. 'Crab oranges cost a groat; and, for my part, I never intend to give it.

Authorities differ with regard to the original home of the orange. In the opinion of many, Hindustan has a good claim to this distinction, and there can be no doubt that from a very early period the orange has been cultivated there. From Hindustan it seems to have been carried into western Asia by the Arabs, probably before the ninth century, toward the close of which the bitter orange appears to have been popular among the people.

Through the agency of the same race it ultimately spread to Africa and Spain, and perhaps to Sicily, following everywhere the tide of the Mohammedan conquest and civilisation. Whether it is really indigenous to Hindustan or not is, however, a matter of opinion, for there are other authorities who regard the Burmese peninsula and southern China as the original habitat of the orange. The point, after all, is of no material importance at the present day, and a dissertation here on the original home of the orange is the very least of the present writer's intentions.

By the twelfth century it was extensively cultivated in all the Levant countries, and the returning soldiers of the Cross brought it from Palestine to Italy and Provence. A considerable time elapsed before it began to be grown in Europe, which appears to have been due to the enterprise of the Genoese merchants of the fifteenth century, who must have found it then growing abundantly in the Levant.

To trace the introduction of the orange into many countries where it has become naturalised is neither desirable nor necessary; suffice it to say that it is now cultivated in almost every part of the world where the climate is warm enough, the measure of success being greatest in the sunnier or subtropical climates.

In the south of England oranges can be grown in the open air, with a shelter of boards or matting in winter, and trained against a south wall. Not only so, but they attain to a large size, and are of very good quality. The enormous importation of the fruit, however, renders orange cultivation in Britain unnecessary; and, generally speaking, only small plants are to be seen in greenhouses or conservatories as mere objects of interest.

Britain receives its principal supplies from the Azores, Malta, Sicily, Spain, Portugal, Jamaica, the Syrian coast, the Bahamas, Florida, and last, but by no means least, Southern California. Orange cultivation has also been attempted successfully in several parts of Australia, especially in New South Wales, where the orange groves near Parramatta yield an abundant supply. Excellent oranges have been exported thence to Britain at remunerative rates. The orangeries of Queensland and South Australia likewise produce well—a remark which similarly applies to many of the Pacific islands, where the fruit has long been cultivated.

Of the various countries mentioned, probably Southern California has by far the most reason to congratulate itself on its progress in developing the orange industry. As a matter of fact, the growth of the industry in Southern California is one of the marvels of the country, and a romance of business which is really only in its infancy. In a recent season, for example, some thirty thousand carloads—that is, about eight million eight hundred and sixty thousand boxes of oranges-were picked, prepared for the market, packed, and despatched to all parts of the world between 1st February and 1st June. This prolific harvest is estimated to be worth to the growers, in round figures, not less than one million five hundred thousand pounds. More amazing still is it to learn that this flourishing industry has actually been built up within the last thirty years. In the early eighties of last century there was less than three thousand pounds of aggregate capital invested in orange groves in this thriving state, whereas to-day it amounts to not far short of twelve million pounds! This capital embraces money spent on land, trees, irrigation devices, agricultural implements, the fertilising of groves, packing-houses, and other paraphernalia essential to the complete success of such a vast business.

Harvesting the golden crop is an occupation of much interest; the gathering of the fruit, curing and other processes, packing, and despatching, all being done within the period already stated. It is a truly exhibitanting sight which one witnesses in this semi-tropical clime when the orange harvest begins. Every little valley along the foot of the sierras is agog with bustle and activity, and the great trains of fruit-cars that start daily on their long journey across the continent to market tell how the harvest is progressing.

The orange groves echo with the hum and harmony of happy workers, the rural roads are busy with horses and wagons conveying fruit to the packers all day long, an army of men and boys are hammering together thousands of pine boxes, and the big barn-like packing-houses about each railway station are veritable hives of human industry.

A gang of men under an overseer takes possession of a grove when picking operations are about to begin, two or three men being appointed to a tree. The difficulty of gathering the fruit from the high trees is overcome by the use of long step-ladders which enable the pickers to reach the topmost branches. With thick gloves covering their hands, the workers exercise great care when cutting the oranges from the tree, each one being deftly severed with a sharp knife; to pull the fruit instead of cutting it tends to break the skin, when decay will soon set in. Each picker has a convenient receptacle, in the shape of a big bag slung over his shoulders, into which the golden fruit is dropped. In some groves, it may be mentioned, the hand-knife has been superseded by different types of machines. Thus one patent is a knife on a long pole, which is connected with a canvas tube. Cut in this way, the orange drops into a chute, and by an arrangement of traps drops from one to another, and eventually into a box uninjured. Picking by hand is still, however, the more popular method.

The general impression is that, now that the orange is gathered, it is immediately packed and despatched to market. Well, there is certainly no time lost in getting it there; but matters do not move quite so swiftly as all that. An orange requires a deal of grooming before it reaches the hand of the consumer. First of all the great wagon-loads of boxes are carefully tallied to find whether any fruit from the pickers in the grove is missing. Then the dust-stained travellers are placed on one side in immense trays for curing, a process which occupies three days. Fresh from the tree, an orange is still very much alive, with the oil-cells expanded and the mystery of growth not yet suspended; but when it is cut off from the sap-supply a change takes place. The skin draws closer to the pulp and gives off moisture that would cause sweating if the fruit were packed at once.

The next stage is 'the order of the bath.' By the bushel the new oranges are dumped into a long, narrow tank of water, at one end of which is a big wheel with a tire of soft bristles. The wheel revolves in such a way that the lower edge works in connection with another set of brushes in a smaller tank, and the oranges, after bobbing about in the big tank, pass between the wet brushes and come out bright and clean.

Spread out on long slanting racks, the oranges are now allowed to dry in the sun—a sun-bath, as the devotees of that particular cult would term it. They look quite tempting now, but the standard of excellence is not yet. In single file they are next brushed by being passed over a belt that runs between revolving wheels. This improves them wonderfully, giving them a smooth

and glistening appearance.

From the belt they drop into an elevator that lifts them to the sorting-table, where they hustle and hurry each other in their haste to get past the keen eyes of the sorter. There is much method in the sorting. The sorting-table has a gentle pitch, and the divided stream pours single file upon two narrow tracks of moving ropes which gradually diverge. The smallest oranges fall through first, the next size farther on, and the next slip into bins below, graded in a dozen sizes, from those that run three hundred and sixty to the box to the great ones which only run eighty to the box.

Then comes the packing. A deftness of hand is essential for this, which may explain why the packers are almost wholly women and girls. The oranges having been classified according to quality and size, the packers now wrap each one in tissue-paper, and then pack them into boxes, the closing of which is the final touch prior to their despatch to the world's markets.

Californian oranges have long been regarded by the great fruit merchants of Covent Garden as among the best produced, and not without very good reason. Some of the varieties have attained a world-wide popularity. The Washing-

ton Navel, for instance, is a delicious fruit, and commands the top price. It is a large, juicy, seedless orange, with a peculiar mark, and came originally from Brazil. This variety was first produced in California at Riversdale, a place famous for its large orange groves, fully a quarter of a century ago. Then there is the Mediterranean, the Sweet St Michael, the Valencia, the Tangerine, the Malta, the Ruby—to mention only a few of the other varieties—all well known to buyers and sellers of the popular fruit.

Surprising as it may appear, there are over a hundred different kinds of oranges grown in Southern California, these all being produced in what is known as the 'fruit belt,' an immense tract of country embracing some seven counties. It is no exaggeration to say that in the area mentioned there are no fewer than thirty million

orange-trees bearing fruit.

A young tree is in its fourth year before it begins to bear fruit, and then only to the extent of a dozen or two. There is a steady annual increase until the tree is twenty years of age, by which time its productiveness may be anything from two thousand to two thousand five hundred oranges per annum. Some trees are even more fruitful, and a tree twenty feet high, and occupying little more than twelve feet in diameter, will yield a crop of from three to four thousand oranges yearly. California, indeed, boasts a tree that for a number of years in succession has produced a harvest of ten thousand oranges, and all good-sized oranges, too.

Orange-trees attain to an age of from one hundred to one hundred and fifty years; and as few of the trees now in California are over thirty years old, there is certainly a long life before them, as well as a bright outlook for the increasingly prosperous industry of orange-growing.

A KNIGHT ON WHEELS.

By Ian Hay, Author of *The Right Stuff, A Man's Man, Happy-go-Lucky*, &c. Chapter XXIV.—Mainly Commercial.

I.

As soon as Philip's bodily mechanism would permit, flat-hunting expeditions were organised, and eventually resulted in the leasing of an appartement near Albert Gate. The rooms stood high up, overlooking the Park, and were described by the agent and Timothy as 'a lovely little bachelor suite' and 'a self-contained monkey-house' respectively.

Furnishing followed. One fine morning a party, consisting of Peggy, Miss Leslie, Philip, and Timothy, set out to purchase household equipment of every kind. It was a disastrous expedition. All four were in a mood for enjoyment, and their high spirits—as very often happens when the young of the two sexes com-

bine to transact business jointly—took the form of helpless, speechless, and unseemly laughter. If a majestic shopwalker, addressing the party as a whole, inquired what he might have the pleasure of showing to them, every one waited for some one else to reply; then, after a pause, every one replied at once. An untimely explosion followed, and the party turned on its heel, and hurried, panic-stricken, into the street.

Timothy was at the bottom of the trouble. He began the day by marching into Harrods' and ordering a funeral; repudiating the contract, after ten minutes of ghoulish detail, upon the plea of having suddenly remembered that the deceased had expressed a desire to be buried at

sea, and asking instead to be directed to the

Canadian canoe department.

Later, he conducted his followers to the establishment of an extremely select and most expensive bootmaker in Bond Street. The whole party were ushered with much solemnity into an apartment upon the first floor-Timothy wearing a face of intense gravity, Philip in a gentle perspiration, and Peggy and Miss Leslie dumbly gripping one another's fingers. room was plainly but expensively furnished. Upon a pedestal in one corner stood a plaster cast of an Exalted foot.

Two serious gentlemen in frock-coats stood awaiting them. These, after providing chairs, and offering a few observations upon the weather and the parliamentary situation, asked Timothy's

pleasure.

'I want a Wellington boot,' said Timothy.

The stouter of the two serious gentlemen touched a bell; whereupon a third gentleman in a frock-coat appeared.

'A pair of hunting tops,' announced the stout

The new-comer brought a small stool, and, lowering himself upon the knee with knightly grace, began to grope under Timothy's chair for one of Timothy's feet.

'Not for myself,' explained Timothy. 'For a grand-uncle of mine—Lieutenant-Colonel Busby,

of the Indian Army.'

'If the Colonel,' suggested the senior frockcoat deferentially, 'would favour us with a call, we could measure him for a pair more satis'-

'Not a pair,' corrected Timothy. 'I said just My grand-uncle had the misfortune to lose a leg in Afghanistan in eighteen-sixty-seven, so naturally he does not require two boots. Besides, I doubt if he could call on you. He goes out very seldom now; he is almost bedridden, in fact. All he wants is a number nine Wellington boot. Have you got one?'

The frock-coats conferred in mysterious whispers, while the two ladies did not cease to cling

to one another.

'We should be happy to make the boot, sir,' was the final verdict. 'Is it for the right foot or left?'

Timothy's face expressed the utmost dismay. 'I have entirely forgotten,' he said. 'It is un-pardonably stupid of me.' He turned to the eowering Philip. 'Cousin Theophilus,' he said, 'can you recollect which leg it was that Uncle Hannibal lost?

'The right, I think,' said Philip hoarsely. "Not sure, though. Don't rely on me."

Tim turned to Peggy. 'Cousin Geraldine?'

he inquired.

'The left, I believe,' replied Peggy composedly. Timothy gave a perplexed smile, and turned to Miss Leslie. 'We must leave it with you to decide, Aunt Keziah,' he said. 'What have you to say?

'Honk! honk! honk!' replied Aunt Keziah

Timothy rose to his feet and smiled apologetically upon the gentlemen in frock-coats. fear,' he said, 'that there is nothing for it but to go home and look. Good-morning!'

After two hours of this sort of imbecility, the troupe found itself consuming ices in a bunshop, having become possessed so far of two bath-mats and a waste-paper basket.

'Now we must be serious,' announced Miss Leslie, wiping her eyes. She had learned to her cost this morning that no woman is ever too old to be immune from a fit of the giggles. 'Mr Rendle, will you kindly go home?'

Timothy's only reply was to dash out of the tea-shop and into an optician's on the other side of the street. Presently he returned, putting something into his pocket. 'Fall in and follow me!' he commanded.

'Where are we going?' inquired Peggy, as

the expedition meekly complied.

'International Furniture Company,' was the brisk reply.

Timothy's dupes regarded one another more hopefully.

That sounds like business,' said Philip. 'Come along!'

But Timothy's exuberance was not yet exhausted. On approaching the stately premises of the International Furniture Company he suddenly produced a pair of tinted spectacles from his pocket and put them on. assuming the piping voice and humped shoulders of doddering senility, he took the scandalised Miss Leslie by the arm, and, limping through the great doorway of the shop, demanded the immediate presence of the manager of the Antique Furniture Department.

On the appearance of that functionary Tim bade him a courtly good-morning, and said, 'I desire first of all to inspect your dining-room suites. We are setting this young couple'—indicating Philip, who flushed crimson, and Peggy, who exhibited no confusion whatever-'up in a flat.'

The manager, a short-sighted young man with a nervous manner, after a startled inspection of the decrepit figure before him, turned upon his heel and led the way to the dining-room suites. Timothy hobbled after, leaning heavily upon Miss Leslie's arm and coughing asthmatically.
'Tim, you young ass!' urged Philip, hot with

shame on Peggy's account, 'dry up!

The relentless humorist took not the slightest notice. Instead, he addressed the back of the 'The young folk!' he wheezedmanager. 'the young folk! The old story! The time comes when they must leave the nest. My little bird'—here he laid a palsied hand upon the shoulder of Peggy, who emitted a distressing yelp-'has flown away at last. It took her a long time to find her wings; at one time I thought she was never going to do it; but all's well that ends well, as Will Shakespeare puts it. My little bird has found a nest of her own, with honest John here; and, damme! her old grandad is going to furnish it for her! Are these your dining-room suites? They don't make furniture like they did in my young days, when Bob Chippendale and Nick Sheraton were alive. I remember'——

'I like this oak table very much,' said Miss Leslie to Philip, in a high tremolo. 'I wonder if there are chairs to match it?'

But before any business could be transacted the irrepressible octogenarian was off again.

'Dearest Pamela,' he said affectionately to Miss Leslie, 'how well I remember the day that we two bought our wedding furniture together! We made a handsome couple, you and I. You wore a crinoline, with a black bombazine tippet; and I was in nankeen overalls and a fob. I was a mad wag in those days. I remember I offered to fight the shopman to decide the price of a harpsichord—or was it a spinet?—that I considered he asked too much for. But times have changed.—I suppose you never fight your customers now to save chaffering, young man? If you do, all honour to you! I like to see ancient customs kept up.' He surveyed the flinching vendor of dining-room suites with puckered eyes. 'I am an old fellow now, and I fear I would hardly give you full measure. But if you have any inclination for a bout with the mufflers'—a relentless hand descended upon the fermenting Philip, and drew him forward-'my son-in-law here, honest John'-

But the manager, murmuring something inarticulate about a telephone-call, turned tail and fled, his place being taken by a man of more enduring fibre.

And so on.

They got home about six, having purchased an imitation walnut wardrobe which they did not want.

'We simply had to buy something after all that,' said Honest John.

11.

A week later the flat was sufficiently furnished to be habitable, and the new tenants moved in.

It was about this time that Philip began to realise the portent and significance of a mysterious female figure, resembling an elderly and intensely respectable spectre, which had been dogging his footsteps and standing meekly aside for him upon staircases ever since he entered into possession. With the arrival of the furniture the apparition materialised into a diminutive and sprightly dame in a black bonnet, who introduced herself as Mrs Grice, and asked that she and her husband might be employed as the personal attendants of Philip and Tim. The pair resided in some subterranean retreat in the

basement, and their services, it appeared, were at the disposal of such of the tenants of the building as possessed no domestic staff of their own. Mrs Grice could cook, darn, scrub, and dust; while Mr Grice (whose impeccability might be gauged from the fact that he suffered slightly from gout, and possessed a dress suit) could wait at table and act as valet to the gentlemen.

Philip was alone when the assault was delivered, and capitulated at once, a natural inclination to wait until he had consulted Peggy being overridden by constitutional inability to say 'No' to a lady. The bargain concluded, Mrs Grice advanced briskly to practical details.

Grice advanced briskly to practical details.

'Now, sir,' she said, 'I see you 'ave your furniture comin' in. And very nice furniture, too,' she added encouragingly. 'But if you'll allow me, I should like to consult you about the fixtures. I always likes to be business-like with my gentlemen. There's that curtain-pole over the window. That was given me by Sir Percy Peck, the gentleman what 'ad the flat last. 'E said to me, just as 'e was leavin'—'e was leavin' to be married to Lady Ader Evings, and they sent me a pink ticket for the weddin', but I couldn't go, what with my daughter losin' 'er 'usband about that time, and Grice gettin' one of 'is legs, so it was wasted, not bein' transferable—well, 'e says to me, says Sir Percy, "That curtain-pole is a present from me to you, Mrs Grice."

The recipient of the departed Sir Percy's bounty paused to inhale a large quantity of sorely needed breath. Philip, who had written out a cheque only two days previously for all the fixtures in the flat, waited meekly.

'Now, sir,' continued Mrs Grice briskly, 'what shall I do with that curtain-pole? Shall I 'ave it took down, or would it be any convenience to you to buy it from me?'

'I have an idea, Mrs Grice,' said Philip, plucking up courage, 'that I took over all the fixtures from the landlord.'

'Right, sir; quite right!' assented Mrs Grice promptly. 'But those were landlord's fixtures. I'm talkin' about tenant's fixtures. I dare say,' she added indulgently, 'that you didn't know about them. Perhaps you 'aven't taken a flat before. Well, Sir Percy, 'e says to me, "That curtain-pole is a present from me to you, Mrs Grice." Now, sir, will you 'ave that pole took down, or will you take it off me 'ands?'

'After all,' argued Philip to himself, 'I dare say the old lady needs the money more than I do; and in any case she appears to think the rotten thing is hers, which will mean my getting another; so'——

'Certainly I will take it, Mrs Grice,' he said.
'Er—how much do you want for it?'

At the mention of money Mrs Grice became greatly flustered. 'Really, sir, I would rather leave it to you,' she protested. 'A gentleman

knows more about such things than what I do. I am quite sure you will give me a fair price for it.'

Philip, feeling perfectly certain that he would not, again pressed Mrs Grice to name a figure.

Finally the old lady overcame her extreme delicacy of feeling sufficiently to suggest ten shillings. 'But we must be fair about it, sir,' she insisted. 'I don't want to overcharge you.' She paused, as if struck by a sudden thought. 'I'll tell you what, sir; we'll ask a third party!'

Next moment Mrs Grice was at the door.

'Grice!' she called shrilly.

'Comin', Emmer,' replied a husky voice, and Mr Grice sidled into the room with uncanny suddenness.

''Ow much, Grice,' inquired his helpmeet, pointing to the curtain-pole, 'would you think was a fair price for that pole? A fair price, mind!'

Mr Grice fixed his wandering and watery eyes upon the article under consideration, and ruminated. Finally, 'Ten shillin',' he said.

Mrs Grice turned to Philip with a smile of delighted surprise. 'Well, I declare!' she exclaimed. 'I was about right after all, sir.'

Philip, quite overwhelmed by this convincing coincidence of judgment, announced humbly that he would take the curtain-pole.

'I had better pay for it now,' he said.

'One moment, sir, if you please!' replied Mrs

Grice. Darting out on to the landing, she reappeared almost instantly, heralded by a sonorous clang, carrying a bedroom ewer and 'Now, these things, sir,' she announced, basin. 'belongs to Grice. They were Sir Percy's present to 'im. "Grice," 'e said, just as 'e was leavin' to marry Lady Ader Evings, "this jug and basin are yours now; they are my present from me to you."—Didn't 'e, Grice?'

Mr Grice was understood to mumble assent.

Mrs Grice took another breath.

It is hardly necessary to add that within the next thirty seconds Philip had become the reluctant owner of a chipped jug and basin, recently the property of a baronet.

Mrs Grice swept on. 'Now, sir,' she continued, with unabated vigour, 'these fire-

irons'-

But at this moment, to Philip's unspeakable relief, Timothy arrived, and took command of the situation at once. Philip put on his hat

and went for a walk in the Park.

'We had great fun,' reported Timothy on his 'The last thing she tried to sell me was return. the fireplace. I think it was Sir Percy's parting gift to the cat. I said that I had no money, and that she had better take it away. That spiked her guns. And now, my lad, you are going to put on your best duds and come poodlefaking with me!'

(Continued on page 435.)

SUMMER IN THE ARCTIC.

By AUBREY FULLERTON.

THE somewhat common impression that the Arctic coast of America is a region of perennial ice is quite incorrect. It is not a dead and unchanging wilderness, but has a life and beauty and wealth distinctively its own. Nor is it always snow-bound. Even on the top edge of the continent there is a summer, filled with a strange and winning brightness and gay with The Arctic, in fact, is a region of surprises.

By way of introduction to the coast-country proper is a great area of sub-Arctic prairie of more than a million square miles, over which the caribou range at will. This is sometimes known as the Barren Lands, but in no sense is it barren except that it is practically treeless. Vast plains covered richly with grasses and flowers stretch almost limitlessly. Instead of a sombre desert deadness over the face of the country, there is a riotous wealth of natural tints all through the summer: wild flowers in every nook and corner and in great rambling beds over the plains, patches of gorgeous scarlet and purple where the mosses and heathers have covered the rocks and hillsides, bushes of delectable berries here and there for miles around. Here, too, is the

breeding-ground of many birds and the native haunt of many wild-folk.

But above the rose-strewn prairies is the Arctic coast, which can be reached best in winter, when the colours have given way to a vast white, and the Barrens have been covered over with a blanket that men may walk upon. The winter trail across the northern prairies, a way travelled only by brave, bold men, leads to pretty nearly the middle of the long Arctic coast-line, where one may see the upper edge of the continent stretching beyond him on each side into regions of mystery. If one sets out from the Barrens or Hudson Bay in February, travelling by dogsled at from ten to twenty miles a day, he will reach the coast in time to see the opening of an Arctic summer. It is a short season, at its best. There is usually not more than a week of spring, but it comes with a rush at the end of May, and as hurriedly ushers in the full-blown summer. The next three months are intense, and always in haste. Winter closes in again, with but little warning, about the middle of September. By the last week of May the northern sun has grown strong enough to set the snow melting, and patches of bare ground and open pools of

water begin to show along the shore. In another week the sun is blazing hot at noonday, and things change swiftly. The birds appear againlarks, ducks, gulls, cranes, buntings, sandpipers; ground squirrels and hares are out; the grass begins to green. June is the perfect month on the Arctic coast, with a pleasant temperature; and the flies, which a little later are a veritable plague, not yet due. By its third week the face of the Barren Lands, from the shore away inland, is emerald green, several flowering plants are in bloom, and the long days are filled with bird music. Fifteen or more varieties of butterflies, in extraordinarily varied colourings, flit about.

The Arctic sea itself breaks up under the heat of an all-day sun. The ice loosens from the shore-line, cracks, and rots away, but not rapidly. Ordinarily it is possible to travel on the ice a bit out from the shore till the middle of August; but a fringe of open water borders the coast-line all along the way. Then at the end of the summer, the ice-sheet having by that time gradually broken away, the great northern sea is open sometimes far into the Polar distance, and dotted here and there with bergs. This vast cold sea of the far north is a sea worth better knowing. It has good fishing-shoals of salmon, codling, and trout, to say nothing of the seals and whales which men come around from the Pacific to A homelike and human aspect is given it by the driftwood brought down from the west that it casts up along the shore; and the current bringing the driftwood has the peculiar advantage of being so slightly salt that by the time it gets half-way across, its surface water can be used for drinking. There is a tide of about a foot, indicating the presence of some northern land area that has not yet been discovered.

A journey along this northern coast is one of repeated surprises, whether in early summer, when the ice still holds on the water, or in September, when the travelling is best. would hardly expect, for instance, to find trees and flowers growing on the shores of the Arctic, and the novelty of it never weers off. The trees, it is true, are few and far apart, and only stunted willows and birches at that; but they are trees, and they prove that this hopelessly frigid region has a growing-power. One has only to go some twenty miles inland, too, on the Coppermine River, to find the first signs of spruce.

As to flowers, their number is legion. view of the topmost country, as seen while coasting along the Arctic shore in July and August, is normally a view of long grassy slopes profusely abloom. A blue lupin, a miniature rhododendron in a mass of red blossom, and a little white heather, whose stalks make serviceable fuel, are typical of the Arctic flora. There are even blueberries seventy miles up the Coppermine. On Herschell Island, off the northernmost coast of the Yukon Territory, there is a floral pageantry every summer. It includes the wild rose, which grows nowhere else so far north. Blue and white daisies, forget-me-nots, bluebells, the dainty aconite, and marguerites, all of them small and wonderfully delicate, and banked in moss, spring abundantly from the otherwise barren soil. Their beauty is short-lived, but immensely cheering to the roughened sailors and whalers who come around from Behring Sea to Herschell every year.

To travel in the Arctic country with safety and a fair measure of comfort one must adapt himself to the country. Experienced explorers go light, carrying only the most necessary supplies, and relying upon the country itself to give them the bulk of their food. With a few Eskimos in their party as guides and handy-men, they themselves live as the Eskimos live; and even alone, a properly equipped traveller in the Arctic is in danger only when overtaken by accident or sickness. Ordinarily he will find abundance of food; for, from Hudson Bay to Behring Sea, and to the very edge of the Polar Ocean, the north land is filled with game. The caribou and musk-oxen of the Arctic plains are the great food-supply of natives and travellers alike; and the supply never fails. It is a land of many surprises, this topmost country along the American Arctic. There is much that is likeable about it, a keenness and a brightness always mixed with wonder, and a mysterious something that draws men back to it. Its summer, however short, is a season of unexpected richness, the secret of which is the long sunlight of the northern summer days. During June there are practically twenty-four hours of it, and from May to August there is hardly any night. A proof of what this northern sun can do is the fact that at Fort M'Pherson, within seventy miles of the Arctic Ocean, the hardier vegetables grow in open garden-plots, and surprisingly well.

RETURN OF HUMPHREY AYSCOUGH. THE

By FRANCIS VIPOND.

THE new bishop of the diocese of Northchester paused and looked at his host, Humphrey Ayscough, squire and churchwarden of the outof-the-way parish of Ellersands. He had come

following day, and his host was showing him the church and its surroundings. He had duly admired the lichgate and the fragments of a Runic cross in the churchyard, and was now to see the parish, and to hold a confirmation the gazing at the family burying place of the ancient family of Ayscough, a large, gloomy vault entered by a little door covered in with a huge stone slab, on which the names of long-departed Ayscoughs were more or less legibly inscribed. 'Funny little rhyme to scribble on a tombstone,' the bishop commented, putting on his eyeglasses to read it the better. It was a deeply cut doggerel rhyme that had caught his sharp eye, and he read it aloud:

When Ayscough lyes not in thys plaice Sore trubble falls on Ayscough's raice; When Ayscough returneth over Sandys Gode fortune smyles on Ayscough's landes. HUMPHREY AYSCOUGH of Ellersandys.

'It was my ancestor, Humphrey Ayscough, who wrote that,' said Ayscough. 'His spelling was a bit rocky, but he hit the nail on the head.

It is a rum yarn.'

The bishop glanced at his host's kindly, rather stolid face, and continued his study of the Ayscough monument. The last inscription again arrested his attention. 'Humphrey Ayscough. Died 1684; returned over sands 1903,' he read out. 'He took a long time returning,' Mr Ayscough.

'He did indeed,' replied the squire dryly.
'Come and sit on the churchyard wall, bishop, whilst we are waiting for Farmer Tyson, the other churchwarden, and the vicar, and I will tell you the story. I see you are interested.'

He led the way to a low wall which protected the churchyard from the inroads of the sea. Far away, over mile upon mile of golden-brown sands, glittered a silver line, the sea; and eight miles away, at the other side of a great bay, rose the dim lines of distant blue hills. Here and there the level stretch of sand was broken by the deeply cut channels of mountain streams running out to empty themselves into the sea.

'I thought the church stood in the middle of the parish,' said the bishop, as the two men sat

down on the sun-baked wall.

'So it used to,' returned Ayscough; 'but bit by bit the side of the parish has gone. Every twenty-five years or so comes a great gale and a very high tide, and the sea has swept away acres of land. There are farms and fields and woods under that smooth sand out there. Even the church and churchyard would have gone had it not been for this massive groined protecting wall. The last great storm and tide came in 1903, and I have very good cause to remember it. Since the Humphrey Ayscough who died in 1684 reigned here bad luck dogged the Ayscoughs. No man was succeeded by his son. The eldest son of this house is always a Humphrey; but till I, a distant cousin of old Ralph Ayscough, to my own great surprise, in 1903, found that I had dropped into his shoes, and a sadly encumbered property and the home of my race, there has not been a reigning Humphrey. They have all come to a violent end before succeeding.

'I had never seen the place or the district, and

I can tell you I was pretty excited the first time of my home-coming, when I was landed at the little wayside junction where the main line abandons the hapless traveller to the tender mercies of a local branch line. It is nearly opposite to us across the sands there, but thirty miles round by road or the local line.

"Ellersands is it you want to gae to?" said the porter. "Weel, ye'll jist have to bide till seven, because there is nae train. She's awa' fra' ye, the Lon'on train was that ahint her time." It was too true. I had five mortal hours to wait. The junction is nothing but a bleak, forlorn station and a few railwaymen's houses. I

groaned in vexation of spirit.

'Here a tall, thin-faced, dark man in rough, salt-stained blue clothes, who had been taking a polite interest in the conversation, came to my rescue. "I'se gaing over sands i' ma cart, if ye'd radder coom than bide siccan a gey while," he said in a sweet, gentle voice. "I'se been here wi' cockles for t' train."

'I closed thankfully with his offer; and leaving my traps with the porter to come on by train, I set forth with my Good Samaritan in a stout two-wheeled spring-cart drawn by a powerful black cob. The man's name, the porter was good enough to inform me, was Dixon Pharaoh, a cockler of Ellersands, "a rare good lad." With this sentiment I fully agreed.

'We drove steadily through the dreary hamlet,

'We drove steadily through the dreary hamlet, then down a rough and narrow track on to the waste of sands, smooth and hard as a rule; but I noticed that in places the cockler made detours to avoid what he told me were dangerous places. "Gin we ganged in yan o' they scoop holes we'd

never coom oot," he said grimly.

'It was a moist October day, with puffs of a vicious wind. Far out on the horizon, in a gray haze, boomed the sullen roar of the sea. "It'll be a dirty night," said Dixon; and I thought there was an uneasy note in his quiet voice. He touched the cob with his whip, and we descended into a deep channel to ford the first of the three rivers crossing the sands, which have to be crossed. Here is the greatest of the dangers of the sands, for they are always changing their channels, scooping out ever-shifting quicksands. Down and down we went, till high above our heads on each side rose an almost sheer wall of sand; then, with a rush and a scramble, up the other side, after splashing through a rushing stream up to the horse's knees. It was an eerie feeling, and I was glad to be out again on the smooth, hard sands. Suddenly across our faces came a whipping sting of salt mist. Billowing across the sands from the sea it came, blotting out everything, swirling like wet smoke, dense

'All sense of direction left me, but the cob plodded steadily on. The roar of the sea grew nearer, and the cob pricked his ears, as, mingled with the noise of the surf, came the rush of running water. We were near another of the fords. Suddenly the cob stopped dead. Right in his path stood, looming huge and ghostly in the curtain of dark sea-fog, the figure of a man on horseback, the horse reined in on its haunches, and a whip uplifted to bar our progress. The cockler seemed paralysed, and the cob was sweating and trembling.

'Dixon set his teeth and pulled himself together, then turned the cob's head to the right, leaving him to pick out his own course. He took us through the ford in safety, though some distance from where we had originally intended to cross when the man on horseback had barred our way. "Was that a guide?" I

asked Dixon.

"Yon were Humphrey t' deil," he said in a shaky voice.

'He told me that late in the seventeenth century there had been a mad, wild Humphrey Ayscough who had one day ridden forth on the sands, and was never seen or heard of again. With him went the luck of the family. Disaster after disaster came upon the Ayscoughs; the old prophecy on the tomb held good. Occasionally cocklers and travellers over sands declared they saw the figure of a man on horseback, and it occurred to me most disagreeably that I had seen my ancestor's ghost. Shivers ran down my spine, and I was more than glad when at last we reached Ellersands Hall, and an ancient house-keeper bade me welcome.

'There was a terrific storm that night. I could not sleep for the roar of the wind and the boom-

ing of the sea. Next morning, however, was bright and clear. Just as I finished my breakfast I was told that Dixon Pharaoh wanted to see me. "Yon second river's changed her way," he said; "coom ye oot over sands an' see."

said; "coom ye oot over sands an' see."

'I got into the cart and went. There, far out in mid-sands, a great cliff of sand had fallen in, and the river-channel had gone several hundred yards to the right of its previous course. At the bottom of the new slope, like a bas-relief, was the figure of a man on horseback, one arm raised aloft to whip on his steed. Dixon pointed at him. "Owd Humphrey is coom back, sir," he said in an awed voice.

'He had. He had gone down in a quicksand, which had held him fast, the salt of the sands preserving him for over two hundred years, till once again the river changed its course, and in the storm, as the tide ebbed, the cliff of sand fell in, bringing horse and man to light. We managed to get them out, and Humphrey was safely laid to rest in the family vault. Since then the family fortunes have looked up. We have found both coal and hæmatite iron ore on an outlying portion of the estate. Year by year the revenues are increasing. I have three sons, and the eldest is, of course, Humphrey. But I hate the sands! Since the day "Owd Humphrey's "body returned for burial in Dixon Pharaoh's cart I have never been out on the sands. They are so sinister and so greedy.'

The bishop gazed thoughtfully out over the golden-brown plain. 'Yes, I agree with you,' he said.

AIRCRAFT FOR WAR.

By BREECH-SCREW.

THE airships and aeroplanes that are built at present are built for war, those constructed for sporting or business purposes being so small in number as to be negligible. It is very unlikely that the large rigid airship will ever be used for sporting purposes by private persons, as its initial cost, upkeep, and housing are so expensive; but as a business concern a fleet of dirigibles would be, and even now is, a great success. In Germany the passenger-carrying Zeppelins the Viktoria Louise, the Hansa, and the Sachsen have made regular trips during the past year. An account of their tours in 1913, which was lately published, shows that these three vessels carried twelve thousand persons, and covered forty thousand miles. In addition to their passenger-carrying duties, these craft were extensively used on military tests, so that the actual distance they covered must have been considerably greater than that shown here. Persons who have seen the Bovril airship in London will know that small airships are sometimes used for advertising purposes.

In the case of the aeroplane, a certain number of these craft are kept at the various aerodromes for giving displays, trick-flying, &c.; but constructors at home and abroad mainly rely on the naval and military authorities for the sale of their machines. Compared with the dirigible, the aeroplane is very cheap, and it can be easily stored, now that it is made with folding wings. Its coming as an everyday vehicle is only a matter of time. The aeroplane constructor, like all of us, has to live by his work; and as he finds that the article he produces is only required at present for war, he has set his mind to making it efficient for war; otherwise he would have to shut down his factory.

The bomb-carrying Bristol is a good example of the constructor's work. This biplane was exhibited at the recent Paris Aircraft Show, and an account of its capabilities was lately given in the Aeroplane. Twelve bombs are carried in a 'revolver' frame under the seat of the observer, who can release them at will. Facing the pilot—for the machine carries two persons—is a set

of sights, the rear one of which is moved by the observer. The duty of the pilot is to keep the machine on the object whose direction is given to him by the sights.

Over the bomb-dropping arrangement there is another set of sights which point downward; these sights are used by the observer. When the machine is over the desired object, and the observer sees that it is in line with his sights, he then releases a bomb. A patent safety arrangement is fitted to the bomb, so that an accidental explosion cannot take place inside the aeroplane. This device consists of a small screw propeller attached to the bomb, which unscrews itself when a certain velocity is reached, and the bomb is then ready to explode on hitting the object.

A large number of aeroplanes are now being built of steel, and they also carry armour sufficiently thick to turn a rifle or shrapnel bullet. Generally speaking, only the vulnerable parts of the machine are protected, such as the engine and the seats of the pilot and the observer.

One of the requirements of the American Government for scout aeroplanes is that armour of chrome-steel one-tenth of an inch thick must be carried to safeguard the engine and aviators. This armour is tested for penetration by the American Ordnance Department before being placed on the machine.

Machine-guns have been carried on aeroplanes for some time, and almost every craft has now some means of protecting itself from the attacks of other vessels. Last November tests were carried out with a machine-gun, the invention of Colonel Lewis, late of the United States army. The chief attributes of this gun, so far as aeronautics is concerned, are its weight, which is only twenty-six pounds, and the fact that its barrel is air-cooled. The barrel of the ordinary machine-gun, such as the Maxim, is cooled by water, and water means weight. Colonel Lewis's gun seems to be well suited for use on aircraft, the one objection to it being that its magazine at present holds only forty-seven rounds, while the Maxim belt holds two hundred and fifty. The Lewis gun was tested from an aeroplane under very adverse conditions, and it obtained 50 per cent., or nearly so, of hits on a target five yards square.

But it is not only in armouring and guncarrying that the constructor is doing so much;

for the machines some makers have built are the equal of the airship in rate of climbing, and far superior to it in actual speed. The Sopwith Company lately turned out a small biplane whose high speed is ninety-two miles per hour, low speed thirty-five miles per hour, and climbing speed twelve hundred feet per minute. This machine is so efficient that it is very doubtful whether the rigid airship—with its guns, two in each car, and one on top of its envelope—would always control the situation in an aerial battle. In the case of the Zeppelin and the Sopwith history is repeating itself, and Goliath again meets David. It must be remembered, however, that the accuracy of fire from the rigid dirigible must be considerably greater than that from an aeroplane, owing to the steadier platform from which its guns are fought; and it is accuracy of fire alone that counts in action, whether that action is fought on land, on sea, or in the air.

The main point is that the constructor of heavier-than-air craft has now built a machine which can rise in the air as fast as the airship, and has an extraordinarily flexible speed.

But there is still one question that has not been given the attention it deserves, and that is the identification of aeroplanes in war. It is impossible, except in certain lights, to distinguish the colours of a machine when it is at so low an altitude as even fifteen hundred feet. During the Balkan war the Bulgarian machines were painted red, white, and green on the underside of their wings; but, in spite of colours so conspicuously displayed, Bulgarian aeroplanes were often struck by Bulgarian bullets. In the case of the Maurice Farman biplanes, these machines are built for the English, French, Italian, and other Governments; and there are other makers who supply the navies and armies of several Powers. How are we to know which of these machines is on our side and which is against us when a European war takes place? There is only one way out of the difficulty, and that is for each country to standardise one particular make of aeroplane with clearly defined features. The B.E. machine is to all intents and purposes the standard type of biplane used in the British army; its shape of wing, rudder, and elevator is a guide that cannot be well mistaken. It is time that some steps were taken to prevent what must otherwise be a cruel and needless waste of life in war.

THE BIG TROUT OF BLAGDON.

By R. W. Burgess.

MY first day was blank. Monster trout in plenty I knew were in the lake, for I had seen them all day rolling up like dolphins to the surface. I had tried all I knew—fished wet, fished dry, skimmed a small silver fly just below

the ripples, raked the depths with a silver doctor, dropped a tiny gnat on fairy gut in the centre of rings made by rising fish on the glassy surface of sheltered bays, but they would have none of it. The sedgy shallows where the streams flow in, the deep water by the great dam, the shelving banks where the water sparkles over what were meadows and corn-fields before the building of the dam—all places were alike unprofitable. From Blagdon church tower, high up in the hills that enfold the lake, came faint and clear the knell of the barren hours as they slowly passed. The mellow light of the still evening brought no better fortune. Big trout were rising in a slow and dignified manner at small green gnats that swarmed over the calm, clear The fish would pass my floating fly with a contemptuous glance, then rise and suck in a natural fly within six inches of it. The rise ceased as darkness came on, and with the hopeless feeling strong upon me that all anglers know so well on blank days, and that vanishes like smoke before a gale at the first rise, I climbed slowly up the hill to my farmhouse lodgings. A generous slice of juicy home-cured ham, followed by baked apples and clotted cream, and cheese that had never left the Cheddar country, soon dispelled the gloom. During a chat with my host over the evening pipe and glass I picked up many a tip concerning the habits of these fish.

The time has gone by when any day a man could fill his creel with heavy fish by dragging a salmon-fly through the water on thick gut. The trout have been educated in the bitter school of experience, which brings wisdom to fish and fools alike. I was certainly the wiser for my day's lesson.

Next day dawned bright and clear, with a light breeze, scarce enough to ripple the water. Far below, the lake lay gleaming, and the morning sun struck sparks of light from the cottage windows of the village on the hillside across the valley. Though perfect weather for most sports, it was not a day for Blagdon fishing. I had gathered that here the days of gloom and gale are the days of heavy bags. As for the nights—well, wait a bit.

However unpromising the conditions may be, is there any fisherman, with only another day to spare, who could resist the call of the water? It drew me irresistibly. My friend had given me a likely fly, a tiny 'Dusty Miller,' a brilliant little silver gem, smaller than anything of that class I had ever seen. By his advice I donned short waders, and, discarding my lake trout cast, substituted a fine one, tapered to 3x gut, wondering as I set it up what would happen if a Blagdon giant should grab my fly. As I waded along the margin of the lake, casting the fly as far as I could straight out from the shore, gathering the line up in my fingers as one sometimes does when spinning, one of the leviathans did make a dash for the fly, only to swerve aside at the critical moment. The water was too at the critical moment. clear, the sun too bright, and the gut came glittering along like a silver thread.

The morning was not entirely blank, however.

After I had crossed the dam, fishing my way toward the lodge where the Ranger holds his court, a lusty young 'rainbow' took hold and made the reel sing. In my ignorance of the strength of Blagdon fish, I put him down at two pounds at least. He proved to be only a small thing of a pound and a quarter. In accordance with the unwritten law of the place, I reluctantly returned him. Although it is permissible to keep fish of twelve inches, measured from eye to fork of tail, no one ever does.

The Ranger was in when I reached the hut, and gave me a warm and cordial welcome as a new recruit, also kind and fatherly advice. He agreed with my host that it was little use to fish that afternoon, but cheered me considerably with the news that if I turned out about the time I left off yesterday, and fished after dark with the right fly, I was sure to get a fish. There would be a spell of darkness available, and a calm, black night, with no moon, formed ideal conditions. I was evidently in for a new experience, and was eager for information.

He produced a box of flies that absolutely staggered me. The specimens selected for my maiden effort at the weird game resembled huge and hairy woolly-bear caterpillars. They were over two inches long, built up on two hooks in line, the body being covered with a mass of long ginger hackle. These gruesome insects were to be used on stout gut, and no longer line to be thrown than the rod would easily and cleanly pick up, as the fish come close inshore after dark.

On the way home to lunch I pondered deeply. I foresaw much trouble. How was I to disentangle the line if I hung up? Could I with a trout-rod cast any sort of line at all with these monstrosities walloping about on the end of it? How could I land a fish in the dark? How avoid the ditches and pitfalls of the bank in my game of blind-man's buff with the trout? I called the farmer into consultation as soon as I got in. He relieved my anxiety to some extent by lending me an electric bull's-eye lamp, to be hung round the neck on a string, with a switch to turn the light on when required, leaving both hands free. I rested until tea-time, and then set forth, laden down under such a weight of tackle as I had never before carried when troutfishing. I was dressed in thick, heavy tweeds against the damp and chill of night; legs encased in waders, and huge brogues on my feet; my tackle-bag over my shoulder, supplemented by an eighteen-inch rush-basket to hold the fish, with landing-net hung on the strap; the lamp, which weighed full two pounds, bumping against my chest, swinging from the loop of string which cut shrewdly into the back of my neck. Thus arrayed, climbing fences, of which there were several on the way, was a desperate tribulation. I had turned out while the daylight lingered, as I wished to get a little practice with my strange equipment before darkness fell. It was well I

did, as my team of flies was most unmanageable at first. There were two of the big heavy brutes on the cast, as the Ranger had advised a dropper about two yards above the tail-fly. Instead of flying out clean and taut to the spring of the rod as a fly-line should, it twisted into heavy, sodden loops and curves, and the flies flopped into the water with two sullen splashes warranted to scare any trout within a hundred yards.

However, before the light faded I had got some command over my line, and could control a short cast of ten to fifteen yards without fidgeting the line about with my left hand. As the sunset colours died out of the sky and water, giving place to a dull leaden gray, I took up my position on the weed-fringed shore of a deep bay, and started casting with mechanical regularity, about eight or ten casts a minute, drawing the line through the water by lifting the rod between each cast.

Darker and darker it grew until the opposite shore was lost, and the hills beyond showed only as a mass of deeper black against the night sky. Distant lights twinkled out here and there in the gloom from small villages and isolated cottages on the hills, and the occasional intermittent flash of a lamp across the water told of a fisherman on the opposite shore. A nebulous darkness drifted slowly past on the water, from which came a faint swishing sound as the boat fishermen's rods cut the air. An eerie feeling crept over me as time went on. I felt like a lost soul in Dante's Inferno, condemned to some endless, useless penance. That anything could result from this absurd labour seemed wildly impossible. I could see nothing whatever of my flies or line, and could only tell that they were in the water at all by the flip-flop as the two flies struck the The feel of the line as it went out was surface. the only indication as to whether it was clear or tangled up.

I was thinking of giving up in disgust, when whump / bang / came a terrific tug as I was lifting the rod, and the line went shricking off the reel out into the night. Strike! Good heavens! the fish had attended to that all right. It was all I could do to hold on. I had heard of the strength of Blagdon fish, but had not anticipated anything quite like this. was a light six-ounce cane, and I was quite powerless to stop the rush until full fifty yards of line had gone out. Then the rod suddenly straightened, and I heard a mighty splash far out in the lake. Reeling in like mad, to my relief I felt the fish again. What he was doing and where he was going I could not tell, but he was still on, anyway. I switched on the lamp and followed the course of my line with the beam of light, reeling in bit by bit as I had the chance, until the fish was nearly at my feet. He was not caught yet, however. As he came into the focus of the light, a great silver-gray shape dashing about in the water, he made another wild rush out. He was tiring now, and soon came in again floating on his side, and I got the net under and splashed him out on the bank. He lay like a bar of polished silver in the halo of light, a wide stripe of iridescent colour glittering along his side, a glorious three-pound 'rainbow.'

I made all haste to unhook him and to recommence my labour, moving on a bit, as the light would probably have disturbed the fish. Shoals of trout must just have come into the bay, chasing the sticklebacks on to the shallows (there are no minnows in this water), as I was into another one immediately. This was a smaller fish, a brown trout of two pounds, and his fight was short and feeble in comparison with the other.

It was about time to return home, so I started to walk slowly along the margin of the water, casting as I went. Things were getting exciting. A few minutes later the reel was singing again. The speed of this fish was not so great as that of the first one, but there was a feeling of irresistible power about the way he moved. The line stopped its mad career before it had gone far, and there was a steady jerking strain on it. The fish had found a bit of deep water, and was boring. He was probably in weeds. I started to pump him, moving the rod up and down steadily. This gets a sulky fish on the run very quickly, and he came to the surface with a mighty rush, right in the track of my light, and leaped a good three feet into the air. A dogged fighter was he, never running far, but leaping and splashing about on the surface all round me. I got him into the net at last, a thick, deepbodied brownie of four pounds weight.

My further homeward progress accounted for two more good fish, about three pounds each, before I found the steep field-path that led to

supper.

A noble sight my catch made when laid out on the cool stone slab in the dairy—five trout, weighing together fifteen pounds! Nothing large, as judged by Blagdon standards, where fish of six pounds and over are taken every season, and anything up to fifteen pounds is possible; but, anyway, it was my record catch, and still remains so.

Many a blank day have I had on this water since then, and never have I had such another evening; but still I go, and shall go again, in

faith and hope.

The charm of Blagdon Lake lies in its boundless possibilities. No one can say what monsters lurk in the depths, and the big fish are there for all to see, not sulking at the bottom among the weeds all the time, but rising and rolling about on the surface occasionally to gladden the eye. Possibly more fish are caught from the boats, but in boat-fishing there is to me always an intangible something missing from that mysterious, compelling attraction that draws the true fisherman to the waterside.

THE MENACE OF MEXICO.

By H. ROBERT BUCHAN.

WHEN will revolution cease in Mexico? Not until the iron hand of another Diaz utterly destroys the lawless instinct that lies deep-seated at the heart of the nation. That the Government of Mexico is unable, even in times of peace, to maintain law and order within the borders of the republic is a self-confessed fact; for in recent years it was possible for any responsible person, on application to the governor or resident magistrate of a state, to obtain an official permit authorising the bearer to carry arms for his self-protection.

A country where every outlaw and murderous bandit is regarded as a popular hero; where the spot of his death is commemorated with a cross, which becomes a shrine whereon the ignorant peons (peasants) burn candles and lay their offerings for the repose of his guilty soul; and where human corpses hanging from trees are a feature of the landscape to-day, is surely in a state of

anarchy.

The present-day Mexican is in the main a halfbreed, part Indian and part Spanish, descended from the ancient Aztecs and the soldiers of fortune who served under Hernando Cortez, the conqueror of Mexico in the earlier half of the sixteenth The combination is an evil one; for, century. added to the Indian's stoicism and indifference to suffering and death, we have the fiery passions of the Spaniard. The result is a race whose chief characteristics are its inherent cruelty and a total disregard of any authority not enforced by drastic means; a race whose women can look unmoved upon the spectacle of a blindfolded horse being forced by its rider, the picador, upon the horns of a bull, and whose citizens can be compelled to respect the law only by means of its ruthless administration at the hands of the rurales, a body of military police, by whom Mexico's notorious ley de fuga, or fugitive law, is enforced without compunction. This law empowers a policeofficer making an arrest to shoot any prisoner at the least attempt to escape, and is responsible for many a man being done to death on some lonely road to avoid the trouble of bringing him in for trial. The prisoner is purposely allowed an opportunity to escape; but when the poor man makes a run for it he unintentionally furnishes some sport for his escort in the form of a little target practice, and is bowled over like a shot

rabbit. A report is then made to the nearest local authorities: 'He attempted to escape, and was shot.' That is all, and no questions are asked.

An instance of these methods was once witnessed in camp by the writer, when a suspicious officer of rurales peremptorily halted a passing pedlar and ordered him to open his pack. The man was terrified, and hesitated for a moment; whereupon the officer, snatching a sword from one of his troopers, rushed at the defenceless man and belaboured him with the weapon until he sank, bleeding and senseless, to the ground. On another occasion one of these police attempted to arrest a noted bad character in camp; but the man drew an ugly-looking knife and defied the policeman to take him. The trooper waited until the man had left; then he summoned one of his comrades to his assistance, and they both followed him. As soon as they were out of sight a few shots were heard. The man's dead body was viewed by the local authorities next day! Another example of the ley de fuga!

In most cases, to ensure the presence of a witness at a trial, it is customary to confine him, as well as the prisoner, in jail until the day of the trial. The consequence is that evidence of any sort is difficult to procure, and no man will of his own accord render assistance toward the enforcement of the law. This was demonstrated in a remarkable manner on one occasion when a drunken mule-driver, who had been discharged by an American foreman, suddenly appeared out of the jungle alongside the track where the men were working, killed the foreman with two shots from a revolver, and as suddenly disappeared again. The rurales were soon on the scene; but, in spite of the fact that more than sixty men were working within a few yards of the spot, not a single man would acknowledge that he saw the act committed. It was manifestly impossible to arrest the whole gang, and the murderer was never captured.

It seems almost incredible that in this enlightened age there should be a country where the collection of taxes in outlying districts is sold to the highest bidder; but such is actually the case in Mexico, and a friend of the writer's was once a successful bidder for this privilege. For many years the Government had been unable to obtain any revenue from a certain district,

JUNE 13, 1914.

the various collectors in turn appropriating the amounts to their own uses. Applying the old adage that 'a bird in the hand is worth two in the bush,' it then hit upon the happy idea of inviting bids for the office of tax-collector, the highest bidder to retain the revenue for his personal profit, and to have the services of the police placed at his disposal for the enforcement of refractory payments.

The Church and the State are at enmity, and no marriage in Mexico is regarded as legal unless performed in the presence of a magistrate or state registrar; likewise the Church will recognise no marriage not solemnised by one of its own priests. Both ceremonies entail a considerable outlay in fees, and the consequence is that among the poorer classes the marriage ceremony is more honoured in the breach than in the observance.

The peon, or peasant, of Mexico is more or less the bond-slave all his life of his patron, or employer; he is never out of debt to him, and exists upon a handful of frijoles (black beans) and a few tortillas (thin cakes) daily; his home is a mere shelter of palm-leaves, and clothes are not of much consequence to him in that land of perpetual sunshine. His possessions consist of a red blanket and a woman; and the charms of a revolution offer him unlimited opportunities of loot and mescal, such as his heart desires, without the irksome necessity of work.

Here you have the ideal material for creating a revolutionist; one whose commissariat requirements are nil, and whom the zopilotes, or buzzards, will save you the trouble of burying when he is killed. A rifle and bandolier of cartridges are thrust into his hands, and at once a full-fledged revoltoso and bandit, whose depredations will commence from the day of his initiation, is turned loose upon the country. He has absolutely nothing to lose (except his worthless life), and everything to gain; and in the gaining of it is not troubled with scruples of any kind. and sandal-footed nondescript, who the previous day would have spoken to you with his sombrero in his hand-scratching one leg with the toe of the other foot—will now, with a couple of bandoliers across his chest, accost you as an inferior, and grandiloquently proclaim himself a patriot and saviour of his country. His slogan of 'Viva Mexico!' is an all-embracing one, and it matters not to him whom he is fighting for. He will fight for one general to-day, and as soon as his leader has seized the presidency he will be equally ready to espouse the cause of another

It is not the men in the cities, who wear clothes imported from Europe and American shoes, who do any of the fighting—they do the talking; it is the peons, vaqueros (cowboys), and adventurers of all nations who take the field, with some butcher's assistant or ex-cabdriver, self-promoted to the title of 'General,' as leader. Of this type is

General Villa, the rebel leader in the north. Before his espousal of the cause of the late President Madero he was a robber, a bandit, and an outlaw, with the blood of several murders on his hands and a price upon his head. To such men loot, murder, and pillage are a pastime; and when we consider that the soldiers of the Federal army opposed to them are recruited mainly from convicts serving a long-term sentence by enlistment in the army, we cannot wonder that the country is in a state of perpetual turmoil.

A friend relates that during the present revolution he was on one occasion walking with his assistant toward a refugee camp for non-combatants, when a Federal outpost opened fire on They were forced to take cover under a low embankment on the shores of the bay, and there they had to remain until evening, with the rising tide soaking them from below and the hot sun scorching them from above. It was unsafe to make a run for it, as they had two hundred yards to cross in the open, and every time they showed themselves, it was the signal for a hail of bullets from the soldiers. Undoubtedly the officer in charge had field-glasses, and could see that they were non-combatants; but a lucky shot meant the elimination of two more of the hated gringoes (foreigners), and the affair could easily have been explained as an 'unfortunate mistake. Whenever darkness set in the unfortunate men were, of course, able to escape.

The incident recently related of a rebet offering for sale the gold-mounted teeth of a fallen officer is corroborated by a similar episode in the writer's knowledge during the previous revolution. A Mexican soldier deliberately smashed in with the butt of his rifle the mouth of a brave Texan who had fallen in a rebel charge, tore out the gold mountings of his teeth, and offered them for sale in the city of Culiacan.

Porfirio Diaz, a pure-blooded Indian from the state of Oaxaca, ruled Mexico as Dictator for thirty years, and during his reign the republic made great strides in commercial prosperity; but when the people rose in arms against him he was an old man—some say over eighty years of age—and for the first time in his life he was unable to stem the tide of revolution, and had to flee the country. The reign of his successor, the late President Madero, was a short one; but Madero is dead, foully assassinated, so 'De mortuis nil nisi bonum!'

The nation may disclaim responsibility for the individual acts of rebel leaders; but the fault rests with the nation nevertheless, for at the root of the whole matter is the system—or rather the lack of it—which renders it possible for such men to attain to almost autocratic power. The time for conciliatory measures is past. The Mexican does not understand the use of the snaffle, and must be ridden on the curb, with a strong hand on the reins.

A KNIGHT ON WHEELS.

CHAPTER XXV .-- LA BELLE DAME SANS MERCI.

I.

THE enterprise thus mysteriously designated turned out to be nothing worse than an afternoon reception, and was the first of many.

Philip, remembering why Peggy had sent him to live with Tim, began conscientiously to school himself to the rigours of a society life. He went everywhere and flinched at nothing. learned to converse with the modern ingénue without feeling like an infant of five; he learned to endure the cross-examination of dowagers without looking as if his one idea was to bolt. He went to balls and crushes. He was introduced to Ranelagh, and became acquainted with mixed foursomes. He did the thing thoroughly. It was all a means to an end, he felt. He was a dull dog; he had no parlour tricks. In Peggy's eyes, although in her kindness of heart she endeavoured to conceal the fact, he was only Most Excellent Theophilus, a worthy person. Ergo, he must overcome these defects in his character, and then try his luck again. So he attached himself to that admitted social luminary Tim Rendle as a humble disciple, acquiring merit by abandoning some of his favourite recreations, and going out at night when he would rather have been in bed.

It was an ingenuous and characteristic method of procedure, and it puzzled Peggy more than a little. 'You are becoming quite a butterfly, Theophilus,' she said to him one day. 'I thought you did not like gadding about.'

'Neither I do, very much,' confessed Philip.
'Excepting, of course, when—except at such times as—well, now, in fact!' he concluded bluntly.

They were walking along the Chelsea Embankment together on their way to the new flat—completely equipped at last—where Peggy and Miss Leslie were to be entertained at a great house-warming tea-party. It was the first time that they had been alone together for nearly a month.

'Thank you, kind sir,' replied Peggy, with a gracious inclination of her head. 'But why don't you like it? Isn't it pleasant to go out somewhere after a hard, dull day, and meet your friends, and talk about things that don't matter, and forget all about Oxford Street?'

'Yes,' agreed Philip, 'I suppose it is. I will confess this much: I know I should hate to go back to my old life at Wigmore Street now. I have widened out to that extent. But the worst of these social functions is that you have to put in a terrible lot of spadework before you get down to what you came out for.'

'You mean supper?' suggested Peggy, with intentional flippancy. She found it difficult

to control Philip's movements in conversation. He had no small talk. Introduce him to a topic, and in five minutes he had brushed aside the flimsy superficialities to which we are content to confine ourselves in our social encounters, and was digging heavily at the fundamental root of the matter.

'No, not supper,' replied Philip gravely. 'I mean this. A man usually regards these gatherings as a means to an end. He doesn't turn out after a hard day's work to stand wedged in a hot room for hours on end just because he likes it. He does not want to meet a chattering mob in the least. But he does want to meet one particular person very much indeed; and perhaps the only way in which he can achieve his object is by plunging into a crowded room and talking to fifty bores first. It seems a terrible waste of energy, like installing an entire electriclight plant to illuminate one globe; but sometimes it is the only way. And usually it is worth it!'

He paused, feeling a little surprised at himself. He could never have talked like this to Peggy a few months ago. Peggy said nothing.

'I often wonder,' continued Philip presently, 'when I find myself at one of these entertainments, how many of the men there have come because they like it, and how many have come simply in the hope of encountering one particular pair of bright eyes. Women, I suppose, go because they really do enjoy it—the dresses, and the gaiety, and the opportunity to sparkle, and because it is the right house to be seen at '——

'Not always,' said Peggy. 'But why do you go, Philip?'

She repented of the question the moment she asked it; but Philip, who had planned the lines of this conversation months beforehand, and was not nearly nimble enough to take advantage of unexpected short cuts, blundered straight on.

'I go,' he said frankly, 'to try to get polished up a bit. I think I confessed to you once before that I was a pretty dull dog. I'm trying to cure that. So I go out tea-fighting.'

'And all the time you would rather be at home with your feet on the mantelpiece?'

'Not necessarily. Supposing, as I sat with my feet on the mantelpiece, that some one—some one particular—came into the room and tapped me on the shoulder, and said, "Now then, wake up! I have a new frock on, and I want you to take me out somewhere where I can show it off." Well, that would make all the difference in the world. I—I should be proud to go then!'

These words were spoken hurriedly and awkwardly, for Philip's heart was beating furiously. He was getting near the climax of this laboriously engineered conversation, and it seemed almost too much to hope that he would be permitted to deliver the grand attack without being headed off. But he certainly was not prepared for Peggy's next remark.

'I see. Well, Theophilus, there is nothing

else for it; we must find you a wife.'

This was said quite deliberately, and, needless to say, it entirely disorganised Philip's plan of campaign. With a sudden cold shock he realised that the conversation had taken another short cut, and that the crisis was upon him before he

was ready.

'You are the sort of man,' continued Peggy, in the same unruffled voice, 'who would get along better in the world with a wife than without one. There are two kinds of men who marry, you know. One likes to make a position and then ask a woman to come and share it, and the other cannot make any position at all unless he has got the woman first. You are the second kind. Now'-Peggy bent her brows judicially, like a panel doctor prescribing for an out-patient-'do I know of any one who would suit you?'

Philip made a desperate attempt to release his tongue, which was cleaving to the roof of his mouth; but before he could do so Peggy

had resumed her discourse.

'She must be the sort of girl,' she said, 'who likes being killed with kindness; because you

are that sort, Mr Philip.

'Don't all girls like being'—began Philip.
'No, not all. There are lots of women who rather despise kindness in a man. They prefer to be bullied by him, and regarded as tiresome, inferior creatures. For some mysterious reason it helps them to look up to him.'

'Do you mean to say,' exclaimed that simpleminded gentleman, Philip Meldrum, 'that a woman would like a man just because-not although, mind, but because—he was a brute

to her?

'Yes,' said Peggy, 'it is true enough of some omen. They don't want to be considered, or studied, or understood; they would rather be swamped by the man's personality and give up thinking about themselves altogether.'

'But not all women?' persisted Philip, whose conception of the sex was trembling on its base. 'Some of them like being considered and studied

and understood, Peggy, don't they?'

'Oh yes, most of us do,' admitted Peggy, 'Not that we ever are, poor things!' she added resignedly.

Philip saw an opportunity of getting back to prepared ground again. 'I say, Peggy,' he began, wouldn't you like to be'-

'To be understood? Yes, indeed! Do you want me to practise on, Philip?'

'Yes,' said Philip with sudden fire, 'I do. And I want to say this'-

Peggy laughed serenely. 'You may study me and consider me as much as you like, Mr Theophilus,' she said. 'I shall enjoy it. But you won't ever understand me.'

'I would have a thundering good try, all the same, replied Philip doggedly. 'I understood you once-when we were children together.

'Yes,' agreed Peggy more soberly, 'I believe you did. Life was a simpler business then. As we grow up we grow more complicated—at least, women do. But you seem to be very much the same as when I first met you, Philip.

'Is that a compliment?' asked Philip dubiously.

'It is the greatest compliment I have ever paid you,' said Peggy, flushing suddenly. 'What a sunset! Look!'

They paused, and leaned over the parapet. The October sun was dropping low, and the turbid flood of the Thames had turned to crimson.

Philip glanced at his Lady. The hue of the water seemed to be faintly reflected in her face. Suddenly something took hold of him—a power greater than himself. For once the gift of tongues was vouchsafed him. 'You are right, Peggy,' he broke out. 'I believe I am exactly the same as when I was a boy; in one thing anyhow, in my views on '-he boggled at the word love, and finally continued—'in my feelings about the biggest thing of all. Perhaps it is because I have always been shy and awkward, and have not sought out adventures that would correct my illusions. Anyhow, I am an idealist -a sentimentalist, if you like. I believe my father was too, and even the knowledge that his ideals were shipwrecked does not discourage me. In my Utopia the men work and fight, and take all the hard knocks and privations cheerfully, and run straight and live clean. They work because they like it, and not simply to make money. A man may work for fame too, if he likes, but not the sort of thing we call fame nowadays—titles, and newspaper paragraphs, and stuff of that kind. If one of my Knights achieves a big thing he is not excited about it; he just polishes up his armour and goes and does another big thing, without hanging about until a reporter turns up. I think the title of Knight is the grandest honour a man can win; and it makes me mad to-day to see how that title has been stolen from its proper place and bestowed on men who have subscribed to party funds, or happened to be mayor when Royalty opened a new waterworks. My Knight is a man who has done things, and done them for just one reason—for the joy of doing them; and who dedicates the glory and the praise, however great or small, to '—Philip's voice dropped suddenly—'to the honour of his Lady.'

'And what is his Lady like?' asked Peggy softly. She knew she ought not to do so. If a maid permits herself to embark with a young

man upon a romantic discussion, it is sometimes difficult to prevent the conversation from taking an uncomfortably personal turn. But for the moment Philip had carried her off her feet.

'The Lady?' Philip descended from the clouds abruptly, and replied, 'Well, I think you would make a very perfect Lady for a Knight,

The Rubicon at last! One foot at least was over. Dumbly he waited for Peggy's next word.

It came.

'Unfortunately,' said the girl lightly, 'I am not eligible for such a post. Knights are not for me. You see, Philip,' she continued hurriedly, avoiding his eyes, 'times have changed. Knights are too scarce and Ladies are too numerous. There are about a million women in this country alone who will have to get along without a Knight for the whole of their lives.

'But not you,' said Philip eagerly. 'Any

man would be proud'-

'Thank you,' said Peggy, 'for the compliment. But perhaps I prefer to be one of that million. There are so many things that a woman can do now which were impossible in the days of chivalry that she can live her own life quite happily and contentedly, Knight or no.

'It's all wrong! all wrong!' cried Philip passionately. 'It's all against every law of God

and man! I won't believe it!'

'Wrong or right,' pursued Peggy quietly, 'it is a fact that many a woman nowadays would find a Knight rather—what shall we say !—an encumbrance. For instance, I'

'Not you! not you!' said Philip. But Peggy continued relentlessly, 'If ever I do encounter a man who wants to be my cavalier, which is of course extremely unlikely '-She paused. 'You ought to say, "No, no!" or "Impossible!"' she pointed out severely.

Philip summoned up the ghost of a smile, and Peggy proceeded steadily, 'If ever I do meet a would-be Knight I shall tell him that I am greatly obliged, but that I have other things to occupy me, and that I prefer to remain independent. So it is no use, my romantic friend,' she concluded with a whimsical smile, 'for you to select me as a suitable helpmeet for one of your imaginary Knights. Now we really must get along; the other two will be wondering what has become of us.'

She turned from the parapet to resume her walk.

But Philip looked her straight in the face. 'Is that—final?' he asked.

For a moment they regarded one another unflinchingly, these two reserved and reticent people.

Then Peggy's eyes fell. 'Yes,' she said in a subdued voice, 'that is final. So don't go hunting up a Knight for me, Philip.'

When Peggy returned home after the teaparty she found her parent sitting in front of a dead fire, wearing his overcoat and a face of resigned suffering.

'Hallo, dad!' she remarked cheerfully. 'Why

have you let the fire go out?'

'It is of no consequence,' replied Montagu Falconer. 'I am fairly warm in this overcoat.' He coughed and shivered. 'Are we having any dinner to-night?

Peggy bit her lip, and kneeling down, began to coax the remnants of the fire into flame.

'Dinner will be at the usual hour,' she said. 'If you don't put coal on a fire it usually goes out, doesn't it?'

'At my time of life, and in my state of health,' replied her amiable parent, 'I think I have a right to expect a certain modicum of comfort and attention. This room, for instance, might be kept decently heated, without'-

'If you don't like putting on coal yourself,' Peggy pointed out, 'you can always ring for a

servant.

Suddenly the querulous Montagu blazed up. 'Servants! Exactly! I am left to the servants! I have a daughter, a grown-up daughter, who nominally directs my household. But I am left to the tender mercies of half-witted domestics, in order that my daughter may go out to tea—may trapeze from one scandal-exchange to another! Do you ever consider me at all?

'Yes, dad, sometimes,' said Peggy, bending low over the smouldering fire. At the same moment one of the hot cinders sizzled.

(Continued on page 454.)

A DAY IN A CANADIAN SWAMP.

IT is autumn that, to French Canada at least, brings the full glory of the Canadian year. The wandering Englishman sings of the joys of an English spring, 'Oh to be in England now that April's there!' forgetting, under the touch of home-sickness, that April may be very tedious and chilly and disheartening, and that the joys may have more poetry than reality about them.

But spring in eastern Canada scarcely exists. One leaps at a bound, as it were, from winter to full summer; and it is only afterwards one recollects that there were days full of 'the infinite expectation of the dawn,' when one watched the exquisite little waves of warm, light green breaking over the tree-tops, and welcomed the robins back to the garden, full of the business of life and love and mating; to see them later settling down to the responsibility of the worm-winner of the brood. Summer in Quebec is hot, and is given up to tourists who take infinite pains to 'do' a number of things that no native has ever heard of; but with the beginning of September one looks forward to eight weeks or more of fine, exhilarating weather, and the sport one loves best. Each day is like a golden gift, accepted with deeper intensity of gratitude because of the underlying, poignant sense of impermanence, and the knowledge that 'the shadow of the winter's on the year.' Mind and body are in tune after the holiday, and respond gloriously to the fine, incisive quality of the halfsummer, half-autumn air that makes all exercise a delight. The beauty of the splendid autumn fires burns on every hillside, and kindles every bush and roadside weed into scarlet and copper and gold. The primitive instinct to kill awakes, and the hunter goes off to the hill, or, taking his gun and his dog, spends long days tramping the

The swamp extends from Quebec to St Joschim, a distance of some twenty-six miles. It lies all the way between the railway track, from which it is separated by a natural hedge of amall bushes—alder, thorn, and young willow—and the river St Lawrence. Near Quebec the ground behind the swamp is almost level, but it gradually humps itself into steep and irregular hills the nearer one gets to St Joachim. These hills, being wooded with birch and maple to a great extent, have often begun to turn even by the last week of August, and to colour finely in true Canadian fashion. The prevailing tone varies in accordance with the season; if there has been a great deal of rain the leaves are sometimes almost wholly yellow, giving the effect of hills in perpetual strong sunlight. An early frost produces the brilliant and various reds, broken here and there by the dark or vivid greens of the conifers or deciduous trees that, for some reason or other, are unaffected by the causes that have touched the others. In these hills there are plenty of partridge—more properly ruffed grouse—and not many miles north of Château Richer and Ste Anne, caribou and a few red deer may be met with.

The swamp itself is a slightly raised ridge, averaging about one hundred and eighty yards in width, but varying greatly. It is crossed at intervals by little streams, which at high tide are filled with river water, when one has to walk up to the railway bridge to cross them. The swamp is only completely covered at the high tide once a month. It is thickly overgrown with rank grass, sea-hay, and a tangle of wild stuff; and as old seigniorial law gives the resident right to the hay, the swamp is cut by the farmers, who feed their cattle with this coarse fodder. The strips of cut-grass just the width of the land higher up owned by the farmer, alternating with frequent

pools and the generally wet and soft ground, add to the difficulty of walking. This is particularly the case toward the end of the season, when the west wind and rain have beaten down the tall grass, making the walking from east to west almost impossible for any but an ardent and youthful sportsman. Below the swamps are the Beauport Flats proper—wide, level stretches of mud, inlaid, as it were, with pools which are full of curious reflections of form and colour, and broken by sudden, angular ridges of slaty rock. It is here the plover feed. Beyond the flats are huge boulders on which numbers of great blue herons-very picturesque in spite of their poker-stiff necks and mechanical movementsand gulls of various species sit to feed at low tide. With the herons it is a case of distance lending enchantment, and it is perhaps as well that they are difficult of approach, for their ungainly legs and neck, and their loose, dull gray plumage infested with parasites, at close quarters detract somewhat from the effect gained by their remoteness.

The natural beauty of the swamp is very great. Behind, in the north, are the hills ablaze against the clear blue sky with the transforming fires of autumn; and parallel with the swamp from Montmorency to Ste Anne runs the Island of Orleans, separated from the mainland by a shallow channel three-quarters of a mile wide. In late October and the beginning of November great convoys of thousands of ducks of many species gather in the channel; and though the Quebec game-laws distinctly state that no wildfowl of any sort may be shot from a motor-boat, yet the duck are constantly being stalked by men in gasolene-launches, and this in broad daylight, under the eyes of every sportsman on either the Island or the Ste Anne swamp! The Island swamp closely resembles the Ste Anne side, except that, on account of the small size of the Island, there are no streams. At Ste Anne, Grande Rivière, which is of considerable size compared with the numerous little runnels that flow down the hillsides, and almost deserves its name, divides the swamp by its several channels. At high tide the delta is full of islands frequented sometimes by small 'bunches' -to use the local term-of golden-eye or mergansers. The general colour of the swamp is brownish-gray, yellowing in the distance. On a clear day, as one looks down towards the end of the Island, the water is of an intense ultramarine blue, and the bold promontory of Cap Tourment is backed by almost summer-like masses of white cumulus cloud. Strange and wonderfully beautiful mirage effects are seen near St Joachim, and through the crisp air one can hear the church bells of Château Richer and Ste Anne for miles. The shining spires of the great church, to which thousands of pilgrims make their way every year, are clearly visible lifting into the sky. The original shrine was

built by a few French sailors who had been saved from drowning, and expressed their gratitude and devotion in simple and patriarchal fashion by erecting an altar to their friend and patron, 'La bonne Ste Anne, Sauvegarde des Marins;' but splendour has long since swallowed up simplicity.

One leaves the town about six o'clock in the morning for a good long day in the marsh. takes a little less than an hour to get to Ste Anne by electric tram; but a favourite device is to shoot for an hour or two in one place, and then take the tram, which runs hourly, for three or four miles, and try the swamp again farther down. It is a clear, almost windless day in early September, with a slight haze hanging about marsh and river, that veils and softens all harsh outlines without obscuring the view. The swamp is full of birds; but so early in the season snipe are few, and those found are small, breeding birds, very generally distributed. Later on in October, when the duck are arriving in large flocks, the larger snipe come from the north in pairs or small groups of four or five. The migration of the jacksnipe or pectoral sandpiper is just commencing, and the yellowlegs, young turnstones, black-breasted and ring-necked plover are still to be found. Sandpipers and plover are on the beach early in the day, but about eight o'clock snipe seem to drop in from nowhere. They flush zigzag and curving, uttering a harsh 'Escape! escape!' as they do so; but at this season the snipe-shooting is nothing to what it will be in late October, when no other shorebirds, except perhaps the jacks and a few greater yellowlegs, remain. Even now the commonest shore-birds, the least and semi-palmated sandpiper, of which at the very beginning of the season one may see flocks of hundreds swinging up the river, wheeling, alighting, feeding, and upon being disturbed taking flight again, always up, are almost all gone, all but a few stragglers. Sora rails are very common, but the Virginia rail, the larger cousin of the sora, is rare; one seldom sees more than two or three in a season. Bittern are numerous, and put up with a frightened squawk. Sometimes they fly to the

hills, and are lost to view in the trees. habitants make them into a not unsavoury pie, and are very glad of a present of a couple, when at midday one finds one's way up to a cottage to get a cup of steaming coffee and a huge bowl of real habitant soup-almost a stew, and extraordinarily good. The French-Canadian farmers in this locality are extremely well-to-do, and live very comfortably. 'On mange comme il faut chez nous,' was the dignified reply of a farmer's wife to a young and hungry hunter who demanded rather magnificently what he could have to eat; and after partaking of their good fare he felt inclined to agree heartily in the vernacular 'Beau-dommage!' which is equivalent to 'Rather!

The least bittern, not inaptly described as resembling a bit of yellow tape, is uncommon. Young black duck in the early season sometimes flush from the snipe swamp, and there are plenty of other wild-fowl in the river—scaup, goldeneye, mergansers, and 'butterball.' Often small flocks of butterball are flushed from the crossing streams. They paddle violently along the water for a few yards to gain impetus, hurl themselves into the air, and fly like small cannon-balls far down the river, till they join a flock of their own species in mid-channel, or disappear completely.

The sun drops below the northern hills comparatively early, and the mist which has hung about the swamp and river all day becomes a translucent golden haze. The spires of Ste Anne reflect a crimson glow, and the little cottages on the Island seem to be on fire. The luminous colour gradually becomes more opaque, and through the thickening mist the lights of Quebec begin to appear one by one, till dusk falls completely, and the city lies like a handful of twinkling jewels on the hill.

Twelve hours is a long day, and one reaches the firm ground above the marsh to wait for a tram, well content to be on one's homeward way, and to have perhaps some dozen or fourteen snipe, twice as many plover, a couple of fat black duck, and possibly a bittern to be experimented on in a pie, after the excellent fashion of the habitant.

THE SLEEPY PEON.

PART II.

THE next morning Domingo rode out into the mountains behind his master, and many were the good wishes thrown after him. But poor Domingo's heart was heavy. When things hit him, they hit him hard; because of his sleepy, unimaginative nature he could only think of one thing at a time, and that one thing hurt. In the evening Juanita heard of Domingo's fortune in obtaining a post as mozo to the English cattlebuyer. She also heard that he had ridden out

that morning, and would not return for three months or more. Then she remembered he had tried to tell her something, and she had cut him short. But the most terrible part of the whole thing was that she now knew she loved him, caring not whether he was a peon or the richest ranchero in Mexico. He was Domingo, her poor one, that she had been unkind to, and she loved him.

This was the reason why, when she lay down

that night on her straw mat in the mud-floored house of her father, she made one end of the blanket that covered her wet with tears, and with her right hand she had to hold that part of her little brown body where she believed her heart to be, in case it might break.

Three months afterwards the English cattlebuyer came back, but he had a new *mozo* with him. Domingo's friends asked the cattle-buyer what had become of him. All the information they got was that Domingo had left him at Samora, saying he did not wish to return home, and that he had found other work.

'But why, señor, did he not wish to come home?' they asked.

'Who knows?' answered the Englishman in the idiom of their language which was the same as saying 'Keep guessing.' All this was reported to Juanita.

But the Englishman did know why Domingo had left him. He knew the whole story. One night, by their camp fire, Domingo had told him, from beginning to end, his trouble. He told him he could never come back. And the Englishman, being English, and matter-of-fact, lacking the smallest bit of romance, said, 'All right, Domingo, you may go; and I will help you, for I am sorry for you.' And help him he did. He gave him money and an excellent letter of recommendation.

What he should have done—had he been romantic—was to seize Domingo by the hair of his head and drag him back to face the music. But, summing up Juanita as an arrant little flirt, he helped Domingo to disappear. Perhaps the Englishman had 'had some' himself. Who knows? Anyway, he found out very soon that he had done the wrong thing, and then he was sorry. It happened that he was riding into town a few days after his return. He was passing the abode of Ramon Garcia, when a very nice apparition bobbed up over the wall, and the apparition said, very nervously, 'Señor, with your permission.'

The Englishman pulled up his pony, raised his hat, and said politely, 'With much pleasure, señorita.'

Then the apparition—which of course was Juanita—became very much embarrassed, and could say no more.

The Englishman, being at heart a very sympathetic man, and knowing Juanita quite well by sight, helped her out.

'It is, perhaps, about Domingo you wish to speak?' he said. 'I cannot tell you much, señorita; only that he left me in Samora because he did not wish to come back here. You may perhaps know why.'

Little Juanita's heart nearly burst. 'Will he be hungry, señor?' she asked.

And then the cattle-buyer's heart was touched. 'No, no!' he said. 'Domingo is no fool; he will find work. Do not worry. Besides, he had some

money. He is a very good boy, Domingo—a very good boy.'

Then the whole story came out. She told it all, and the tears rolled down her pretty cheeks. This Englishman was so kind that she had to tell him, even how much she had loved Domingo, which no one had been allowed to know before, not even Domingo, else this story would never have been written. It was all very embarrassing for the Englishman, holding a very, very pretty Indian girl's hand in an open highway; but he did his best to comfort her, and more or less succeeded. Also, he gave his word to try to trace Domingo. Then, having felt he would really not have half minded being in Domingo's shoes, he kicked up his pony and rode into town.

That afternoon Juanita spent questioning all the arieros (the pack-mule drivers) that passed through the town from Samora—quite casually of course—whether they had news of one Domingo, a sleepy fellow. Gleaning nothing, she consoled herself with the thought that he had probably gone north to Celayo, where she had heard there was much work for peons.

The Englishman spent time and money in sending telegrams to Samora for the late *mozo* or news of him; he even went so far as to offer a reward for information. However, the days went by, and never a word from, or of, Domingo came to him. The 'sleepy one' had effaced himself completely. The cattle-buyer told his junior the story.

The junior, having just received a letter enclosed in a large pink envelope from somebody in England, felt very sentimental.

'I say, old man,' he said, 'I'd give my soul to bring those two dear silly fools together again, to make them feel the joy of living, the joy of love.'

The elder man said, rather more practically, but less romantically, 'I'd give a hundred dollars reward for information of where the blighter has got to; and I mean to worry every commandant of every town he's likely to have struck till one of 'em digs him out. And if I'd only known the fools they'd made of themselves, I'd have knocked him silly before I'd have let him quit.'

Eighteen months went by, and no sight of Domingo. Faithfully every Sunday Juanita leant against her father's stall, and, looking alluring, decoyed successfully. Nevertheless, no amount of chaff and flattery could make her forget.

Then one Sunday the Ramon stall was empty; in fact, many a stall in the plaza was out of business. The reason was that the big town of Moralia, forty miles to the north, was holding a great fiesta, and all the local peons had flocked to it, some by train, some afoot. The chief attraction of this gala week was the bull-fight announced for the Sunday. It was to be a wonderful fight; they had some of the brightest

stars of the Mexican bull-ring performing. Six fine bulls would be killed, and the espadas, the big stars, two in number, were to kill three bulls each. Bombo, the chief espada, was the more famous; he had even been to Spain to fight. Some said he had killed a bull before the king in Madrid. The other espada was most interesting, being comparatively new at the work, but most proficient. He had worked for a short time with the Juvenales—the preparatory school for torreros in Mexico—and had done so well that he had earned for himself a place among the front rank. His name was Siempre Cierto (which means 'always certain'), and seemed without much trouble to live up to his cognomen.

Everybody was terribly excited about this bullfight. Juanita almost—but not quite—forgot Domingo in her anticipation of seeing the finest fight she had yet seen. The head cattle-buyer was-well, not exactly excited, but very interested in it. There was something about the personality of this Siempre Cierto that he wished to look into; for, as he said to his junior, 'If he isn't Domingo I'll eat my hat.' So he too took a day off, and went to see the bull-fight. the Sunday morning, prior to the fight, the Englishman was sitting sipping a long lemonsquash, and trying to keep cool, in the chief café of the town, when a slim, well-knit figure, clad in the becoming 'walking-out' dress of a bull-fighter, stood before him, hat in hand, and said, 'Buenas dias, señor.'

The Englishman laughed, and motioned him to a chair. 'I was pretty sure it was you, Domingo,' he said, 'from things I saw in the papers. Will you drink anything?'

'Thank you, señor, not now; after the fight, but not now, answered Domingo with a sleepy smile. Then, after a pause, he went on, 'Do you think, señor, that others suspect?'

The Englishman went straight to the point,

and said, 'She doesn't.'

'I am glad,' said Domingo. 'It will be a surprise for her when she is told. I am-if money has anything to say-better than a peon

Then the Englishman talked to him, a real fatherly heart-to-heart talk. He told him the truth about the business, and poor Domingo looked very troubled. 'You must come back, Domingo, and marry Juanita,' he finished.

'Yes, señor,' Domingo said. 'Yes, I shall give this business up, come back, and buy a little ranch, and we shall be happy.' He smiled; then his face grew troubled as he went on, 'But she might not want me now. Some girls admire bull-fighters, but would not marry them. So we must hide it from her.'

The Englishman knew this was only some foolish idea Domingo had got into his head. So he blurted out, 'Nonsense, Domingo! Besides, she can't help knowing; she will be there

this afternoon.

The moment he had said it he could have bitten out his tongue. Both of Domingo's hands were on the table toying with a match-box. They started shaking violently.

Domingo looked up at him. 'She will be there, on the sunny side of the ring, this afternoon?' he asked dully; then he rose and looked stupidly round him. He was trembling all over.

The Englishman jumped up, caught hold of his arm, and said, 'Domingo, pull yourself together. Remember'-

'Yes, señor, I remember,' he said; 'but it is better that I should have known now than later on in the ring;' and, without a word, he turned and went out.

The Englishman sat down again, and could have kicked himself. Here was this sleepy and apparently impressionless Domingo thrown into a state of nervous panic because he had heard that within a short time he would be face to face with the girl he loved. But the terrible thing was that at the same time that he came face to face with her he would also be face to face with death in the shape of an infuriated bull, and all

his nervous energy would be badly wanted.

The Englishman certainly could have kicked himself; he could have kicked Domingo; in fact, it was a most uncomfortable and over-anxious Englishman who took his seat that afternoon on the shady side of the ring. The sunny side was a mass of peons clad in bright colours, red and blue, orange and white. The shady side was crammed with the flower of Moralia. Blue sky above, and the golden sand ring below. The Englishman, with the aid of his glasses, picked out Juanita almost opposite him. She was talking and smiling to those around her. Then the band struck up, the big doors opened, and the torreros entered.

Domingo had one wing, Bombo the other; they marched across the ring and bowed to the president; then Domingo bowed to Bombo and effaced himself. For it was Bombo's bull, and therefore Domingo must only hover about and have as little to do as possible in the playing and killing of it. Bombo acquitted himself well. Then came Domingo's turn. His bull entered and despatched two horses, and Domingo played it for a while with his cape. Juanita was instantly struck with the indolent, slow, easy way that this Siempre Cierto went about things. The crowd cheered. How like he was to Domingo! If only he would come nearer! But how silly! As if it could be; and she laughed at herself.

Domingo very quietly and very certainly killed his bull. The Englishman breathed again. Nothing wrong with this man's nerves now.

Domingo dedicated his second bull to the president, and fought it brilliantly, working it to the sunny side. Then it was, just before he got it in position for the kill, that Juanita recognised him. She flew down the gangway to the very barrier just as the sword went home. Domingo looked up, and their eyes met. He smiled in his old jolly way, and went to make

his bow to the president.

Poor Juanita stood trembling. Her Domingo a torrero, and such a splendid one! She was delighted. She was also terribly frightened. Domingo must kill one more bull before she could get to him; that bull might kill Domingo. So she stood and trembled, and the soldier whose duty it was to keep the gangway clear forgot his duty. 'Look,' he said 'it is Cierto's turn again. Ah, and a bull well worthy of him -a red bull.'

Juanita's heart jumped. A red bull! Why, it was a red steer from the kraals that Domingo had vanquished so easily that day. And now it was a red bull. This was going to be the end; she was sure this red bull would end Domingo. Oh! it was wonderful to love a bull-fighter, but it was also very terrible. However, it did not appear to others that Domingo had met his fate, for he did just what he liked with the red bull in the cape-work. He positively shone. He knelt on one knee and passed the bull; he passed him from behind, sideways, every way. he took the sword and muleta, a very brilliant scarlet cloth, on a stick eighteen inches long, which the espada uses for the kill.

It was thought that he would dedicate this bull that he had played so well to some big person on the shady side of the ring. But not so. He walked lazily over into the sun and stopped before Juanita. 'I dedicate this bull.' he shouted, 'to Senorita Juanita Garcia.'

The peons roared with delight. Here was a

true bravo, if you like.

He lazily moved over toward the bull. Juanita's heart banged at a terrible rate; but she must be brave, so she bit her little lip till the blood came, and gripped tight hold of the barrier.

Domingo passed the bull to the right, then to the left, and the bull stood glaring at him, flanks heaving and tongue out.

Then Domingo showed off. He went out of his way to take chances. He took a handkerchief out from under his red sash, then very carefully, without taking his eyes from the bull, spread it on the ground, straightened up, and stood on it. Now only the most experienced espadas-and very few of them-would dare to do this, for it meant taking the bull at a headon rush, and killing it before it reached you.

The Englishman squirmed in his seat. Juanita let out a little cry; she could not help it. Domingo stood on his toes on the handkerchief, and gently waved the muleta. Then the bull suddenly came with a rush right at him. Up flew Domingo's sword, his eyes glancing down it. The bull came on, its horns touched the red *muleta*, and then—the sword shot down, down and in, true to a hair, to the bull's heart. Crash came the heavy body at Domingo's feet, and crash came the mad cheers from the crowd.

'Siempre Cierto!' said the soldier, turning to Juanita.

But this was not to end all the excitement. Domingo was a man of surprises to-day. He stepped off the handkerchief and drew the reeking sword from the bull's withers. He felt with his hand for the little three-inch pigtail that all bull-fighters wear as a badge of their calling; then the sword went up and cut it off. A cry went up from the crowd, an agonised cry, for it meant that they should see their hero no more. He had retired.

He carried the little wisp of hair to Juanita, and handed it to her. 'I have killed my last bull, Juanita,' he said.

She took the pledge in both her little hands, looked at it, and then kissed it.

'Caro mio,' she whispered.

And what with the band playing the triumphal march and the yelling crowd, the Englishman said he had never before heard such a row in his whole life. And all for a sleepy peon, too!

THE END.

THE MOST-QUOTED POEM IN THE WORLD.

By GEORGE A. WADE, B.A.

F you were to ask any average man—even one who can boast of a good education, and who is acquainted with most of our English literature by actual reading and study—which author had won the glory of having his chief poem most often quoted, and thus, generally speaking, of being best known to the wide public, the odds are probably quite a hundred to one that he would answer, 'Shakespeare.' But he would be wrong, and very far wrong, too. Others, recalling perhaps one or two special lines whose fame has become world-wide, would give you the names of other poets

they consider entitled to the honour. One might suggest Milton, another Longfellow, another Tennyson, and so forth. But again they would all be wrong, very far wrong. Were any of the folk thus consulted, however, to mention the less widely known name of Thomas Gray, and to suggest the 'Elegy' as the poem in question, they would be getting much nearer the truth, though they would not quite have hit it; for there cannot be a doubt that, next to the poem to which I am about to award the honour, the 'Elegy' does contain more lines that have become immortal as quotations known far and wide, constantly repeated, and always recognised, than any other of its many rivals, even from Shakespeare's works.

But the poem which is the most quoted, and which is therefore the most popular, according to that criterion, the one whose lines are most recognised by a vast circle of folk as familiar and old friends, is unquestionably 'The Deserted Village.' And the man who has, therefore, the right to be regarded as the most popular poet, from this same point of view, is Oliver Goldsmith.

It has been well said, many and many a time, that there are two long poems so polished, so complete, so clearly containing neither a word too much nor a word too little, so utterly excellent, as to stand quite by themselves in the realms of English literature. These two are 'The Deserted Village' and the 'Elegy Written in a Country Churchyard.' The glorious rhyme and rhythm of each, the splendid thoughts therein given expression, the loftiness and grandeur of both subject and treatment, the popular 'touch' pertaining to each poem, these items have won for the poems not only an immense vogue, but an immortality which is assured. For both poems alike suit British folk of every age and every clime, in the way they appeal to the imagination, the feelings, the hearts and minds of men.

It is simply astounding what a wonderful hold 'The Deserted Village' has thus obtained on the public everywhere. You may not, perhaps, have looked at it, and considered it, from this standpoint of being the most widely quoted poem, the one whose lines are immediately recognised as familiar by man, woman, and even child here and there, in every part of our Empire and America. But just let us—you and myself—go a bit deeper into this, and I think you will acknowledge the truth of my assertion and contention.

The whole poem contains only about four hundred and thirty lines. Yet in those four hundred and thirty lines there are something like fourteen which have become what we may term absolutely 'household words,' lines every one knows and says time after time, even though he or she may not know whence the lines come or who wrote them. I say there are at least fourteen such, if not more, for I do not wish by any means to overstate the case. Indeed, were we to stretch a trifle the meaning of the word 'proverb,' we might well say that those fourteen had become English proverbs! Let us recall one or two of them; for you must know them word for word, so familiar are they:

And the loud laugh that spoke the vacant mind. And passing rich with forty pounds a year.

And fools, who came to scoff, remain'd to pray.

Allured to brighter worlds, and led the way.

For e'en though vanquish'd, he could argue still.

And still the wonder grew
That one small head should carry all he knew.
Shoulder'd his crutch, and show'd how fields were
won.

Ill fares the land, to hastening ills a prey, Where wealth accumulates, and men decay; Princes and lords may flourish, or may fade—A breath can make them, as a breath has made; But a bold peasantry, their country's pride, When once destroy'd, can never be supplied.

I have often regarded it as one of the greatest marvels in all English literature, in its way, that out of the first two hundred and twenty lines of this poem there should be no less than fourteen absolute gems, perfect treasures, quite common and familiar quotations, such as we see here. No other poem in the language, not even the immortal 'Elegy,' can approach to such a triumph.

And in castle and cottage, with queen and farm-labourer, these fourteen lines from Oliver Goldsmith's finest poem are 'household words' indeed. When the good and great Queen Victoria had that beautiful white marble statue made, after her beloved husband's death-that statue showing herself and him standing side by sideshe wanted an appropriate line to place under that beautiful figure which was pointing upward, for her to follow in his steps. It was she herself who supplied the line, which she caused to be carved in letters of gold on that noble statue, as it stood in the Grand Corridor at Windsor Castle. the line was Goldsmith's famous one: He 'allured to brighter worlds, and led the way.' Then, when I myself was tramping through an old Devonshire village a few years back, I saw three cottagers standing outside a garden gate, arguing about some local topic. One of them guffawed scornfully at the views of another; whereon the latter said slowly, 'I reckons nawt o' laughin', Zamuel! It be easy to laugh when us carn't argify, bean't it? Maybe as you knaw the zayin', "It's a loud laugh as shaws the vacant moind."

As to the rest of the excellent specimens here given of Goldsmith's glorious lines which have become favourites with everybody—well, is there any line in all the English tongue better known or more often quoted than 'Fools, who came to scoff, remain'd to pray'? Why, you could not repeat that line in an assembly of Britons anywhere in all the world but every man would recognise it immediately as a very old friend! And no wonder, for he has heard it from boyhood upward, he sees its perfect application time after time, he grasps its significance at once.

A famous writer of our own day has given it as his opinion that probably the six finest lines ever written by man on the eternal 'laud question' are those beginning with the well-known one: 'Ill fares the land, to hastening ills a prey;' and I have not the slightest hesitation in agreeing with him. Each word in those six lines ought to be carved in letters of gold on the

walls of our House of Commons, House of Lords, every public school, mart, and other place where thinking men meet, study, or legislate. For in these lines is contained the whole secret of a nation's greatness, whatever be the wishes, designs, or methods of parties and Governments. Think of their intensely deep meaning, their wonderful conciseness, their noble diction, their pregnant forcefulness. Repeat them, and try to grasp their full signification, their wondrous truth, as shown by the experience of all ages and nations in history. Look back at Greece, at Rome, at Egypt, at Carthage, at Spain, in the light of these six lines; and the more you do so, the more you'll marvel at Goldsmith's insight into the land question as shown in them!

During the past thirty years, amid the constant debates and questions about the land which have time after time agitated the people in our kingdom, those lines have become historic. They have been quoted from platform and pulpit; they have been heard in Parliament and village taproom; they are known to everybody, and recognised by all as a deep and marvellous expression of the truth. And they come from 'The Deserted Village' of Oliver Goldsmith, that wandering minstrel who was supposed to be careless, idle, trifling, as he passed from town to town, living indeed the simple life, and too often 'dining with Duke Humphrey.' But, oh, if English poets to-day could give us such lines!

As to the village parson, what can any poet ever sing of him which will excel that immortal quatrain, so often quoted, and quoted again?—

A man he was to all the country dear, And passing rich with forty pounds a year; Remote from towns he ran his godly race, Nor e'er had chang'd, nor wish'd to change, his place.

Of course the second line of these four is the most quoted of any of them; but we should not be wrong in saying that all the four lines are 'familiar in our mouths as household words.' Which fact is again a marvellous tribute to this poem and its author.

Other lines of Goldsmith about the parson, however, have become almost as historic and familiar. Have you forgotten how he was described as—

Unpractis'd he to fawn, or seek for power, By doctrines fashion'd to the varying hour?

Have you not felt how excellently this description suited more than one noble village clergyman you yourself knew, as the poem went on !—

Far other aims his heart had learn'd to prize, More skilled to raise the wretched than to rise.

And then come those supreme verses telling how in the Sunday services,

At church, with meek and unaffected grace, His looks adorn'd the venerable place; Truth from his lips prevail'd with double sway, And fools, who came to scoff, remain'd to pray. Why, every line is a quotation in itself; you have known it from boyhood; it comes to you like a dear old friend when you hear it or read it again nowadays! Talk about fourteen lines of first-class proverbial quotations in 'The Deserted Village'! Surely it would be nearer the mark if we said forty!

However, besides the fourteen lines thus mentioned of this comparatively short poem which has become such a classic of our language, there are at least thirty others which are more or less well known to all who are fond of reading, study, or quotations. Thirty more which the average intelligent man and woman recognise at once! Such famous lines as:

Where health and plenty cheer'd the labouring swain, Where smiling spring its earliest visit paid, And parting summer's lingering blooms delay'd. The decent church that topp'd the neighbouring hill. The young contending as the old surveyed. The bashful virgin's sidelong looks of love. A youth of labour with an age of ease. His heaven commences ere the world be pass'd. Up yonder hill the village murmur rose. His pity gave ere charity began. The village master taught his little school. I knew him well, and every truant knew.

If severe in aught, The love he bore to learning was in fault. Where village statesmen talked with looks profound.

These are but specimens of thirty or more well-known lines which have hardly obtained the absolute pre-eminence and familiarity that the fourteen first spoken of in this account have obtained. But these thirty are good enough to go on with, in all conscience, when one is dealing with this subject, in order to prove the contention that 'The Deserted Village' is undoubtedly the most quoted, and hence the most popular and familiar, long poem in our literature.

In addition to those forty-four lines already included in my estimate of familiar quotations, I think we might very fairly put down another twenty, as lines that are far better known to a wide circle in every English county than many others which are supposed to be extremely popular. For several of these twenty would come only a little distance after the lines already dealt with, in point of popularity, polish, and beauty. Consider the following, amongst this score, and think how well known even they are:

This wealth is but a name That leaves our useful products still the same.

To pamper luxury, and thin mankind.

When idly first, ambitious of the town, She left her wheel and robes of country brown.

Teach erring man to spurn the rage of gain;
Teach him that states, of native strength possessed, Though very poor, may still be very bless'd!

Full well they laugh'd with counterfeited glee At all his jokes, for many a joke had he!

The very spot, Where many a time he triumph'd, is forgot.

Is there any need for me to say more in order to prove that this beautiful and wonderful classic of our literature has every right to be regarded as the world's chief poem for well-known quotations? I trow not. If you have the least doubt of it, just try, as I said at the beginning, to recall any other poem which may even be supposed to challenge its proud boast, apart from the noble and immortal 'Elegy,' and then you'll soon find how miserably even the best of such fall short of the glory and renown which Oliver Goldsmith's panegyric of 'Sweet Auburn,' his dear old native village in Ireland, has attained wherever the English language is spoken and read.

Moreover, as was pointed out previously, this surpassing poem's glory rests not merely in its familiarity, its popularity, its homely touches, which have all combined to give it pride of place in this respect. It stands for all time owing to its magnificent diction, its wonderful polish as a literary gem, its deep and surprising thought, its marvellous grasp of problems which lie at the very root of a nation's life, its noble sublimity which 'allures to brighter worlds, and leads the way.'

No wonder that Oliver Goldsmith, notwithstanding his many and serious faults, was so loved by every one who knew him. The secret was because the man was so human and so lovable himself! It needed a genius of this kind—for no other could do it—to produce such an immortal poem as 'The Deserted Village.' But this lovable Irishman did it. And, owing to this, Goldsmith's own fame and glory will be handed down with that of his grandest and finest poem to all ages, as long as literature shall last, as long as familiar quotations shall endure.

OLD-TIME REMINISCENCES.

By an IRISH CLERIC.

IT is more years than I care to remember since I was at an elementary school in M----, a small town in the county of Galway. I won't state the exact date of my birth, but will say as Colonel Luttrell is said to have replied to Lady Holland, who teased him jokingly more than once as to his age, 'Well, my lady, if I live till the end of this year I shall be-devilish old.' I am old, but not as old as the gallant soldier I have just mentioned. I am old, but I feel young; and there is a saying, 'A man is as old as he feels, a woman is as old as she looks. Man does not fear old age as much as does woman. It is La Rochefoucauld who utters the dictum, 'Old age is woman's Inferno.'

My youth was spent at a school where I learnt little and suffered much. In those days corporal punishment was thought to be an absolute adjunct of a sound education. In the elementary, middle class, and upper schools the rule was the same, 'Spare the rod and spoil the child'—a rule promptly defended, if a tender-hearted parent was found to object to it, by the high authority of Holy Scripture: 'He that spareth his rod hateth his son; but he that loveth him chasteneth him betimes.' Flogging was the vogue everywhere, and our schoolmaster was a great flogger. He was a portly, pompous, and pedantic dominie, lame in one leg; but this did not interfere with his vigorous use of the rod. Within the walls of the schoolroom, Dr Busby, who was his prototype, was not more autocratic than he. Every man, it is said, has his hobby. Flagellation was his. I may call it his besetting sin, for his brutal method constituted it in him a sin. When an unhappy wight came up before him

for castigation, his usual address, uttered in a loud, stentorian voice, so that the whole school might hear it and tremble, was, 'Peel, sir,' which meant the removal of the nether garments. The wretched delinquent was then hoisted on a strong boy's shoulders, and received a certain number of strokes, according to the gravity of the offence. I have sometimes seen the skin torn and the blood flow under the pedagogic cane. 'The fear of him and the dread of him' was continually over his scholars. I did not know my Dante then, or I might have imagined the line in the Inferno to be written above the schoolhouse door, 'Leave every hope behind who enter here.'

The transition from school to church is easy and natural, and so I will say a few words here about ecclesiastical matters. My earliest recollections of M—— Church are these. It was a plain, cruciform building, with a well-kept, pretty churchyard stretching away at the back for some distance, and thickly planted with trees and flowers of various kinds. Everything connected with it was tenderly cherished:

A quiet haven where the shattered bark Harbours secure till the rough storm is past.

The interior of the church was similar architecturally to most country churches of that day. There was what is called the three-decker arrangement, metrically expressed by an old parish clerk who was endowed with the gift of versification:

First came my desk, then the parson's, the pulpit top o' that; Like yer neck, and then yer face, and then over all yer hat.

It was fitted up with the old-fashioned pews, with

seats all round. Those nearest to the chancel were occupied by the gentry of the neighbourhood, and had an arrangement of brass rails on which were suspended scarlet curtains, so that the worshippers behind them could not be seen by the other members of the congregation. They were not unlike the pews humorously described by Dean Swift as common in his day:

A bedstead of the antique mode, Compact of timber many a load, Such as our ancestors did use, Was metamorphosed into pews, Which still their ancient nature keep By lodging folk disposed to sleep.

At the present day, when churches are lighted with gas, electricity, or oil-lamps, it is not easy to picture the gloomy appearance of our church on Sunday evenings in winter, when the only illumination available was a small tallow candle which was fixed in a tin sconce temporarily attached to every alternate pew. About midway in the service the sexton made the round of the church, and entered each pew for the purpose of 'snuffing' the candles. This regular perambulation, it is easy to understand, tended not a little to disturb the worship of the congregation. It was usual, also, for this same official to march up the aisle once at least during the service, with coal-scuttle and poker in hand, stir up the dying fire in the old Musgrave stove, and replenish it with coals, taking no pains whatever to deaden the noise necessarily caused by the operation.

The pulpit stood in front of the Communion table, over which, just beneath the east window, the Ten Commandments were displayed. were to be seen in nearly all English and Irish churches in the first half of the nineteenth century. There is a story told of a late Bishop of Exeter to the effect that, making a tour of his diocese, he was surprised to find that in one small church the commandments were not exhibited, as usage prescribed. He called the attention of the verger, who was showing him round, to the fact. 'My lord,' was the reply, 'we used to have 'em up right enough; but nobody paid any attention to 'em, so we took 'em down two year ago.' That congregation, I am afraid, was morally on all-fours with a Roman Catholic countryman of mine. He had received no benefit from a Lent mission which had been held in the parish, though he was very regular in his attendance at the various services. priest asked him how it was that the preaching of the holy fathers had done nothing to reform 'Ah, Father,' he replied, 'I can manage the faith right enough; but the morals bate me.' Some one said to a late Bishop of Manchester of a certain parish in his diocese, 'There's a great deal of religion, my lord, in this parish, but very little morality.

Our clergyman was typical of the old-school divine. Calvinistic in doctrine, humdrum in preaching, under his monotonous mumbling of

the greatest truths men dozed comfortably till he ended the reading of his sermon. In preaching he invariably wore the black gown and bands; it was the common pulpit dress of the period, and for long after. The music which accompanied the psalms and hymns was furnished chiefly by fiddles, flutes, flageolets, and bassoons. I remember what an imposing sight the west gallery of the church presented on Sunday, with its choir of male voices thundering forth Tate and Brady, and certain favourite hymns, to the accompaniment of these instruments. There was much noise, but the lack of harmony was excru-The keeping of time seemed to be ciating. beyond the artistic qualification of our choir, so that a visitor might appropriately say of them, as Bishop Wilberforce once said of a country choir, 'The singers go before, and the minstrels follow after.' The clerk usually gave out the psalm or hymn in these words, 'Let us sing to the praise and glory of God,' adding the number of the psalm or hymn and the verses to be sung. This functionary was responsible for the music; and as he was, generally speaking, an illiterate man, we can imagine what the character of the services would be. His pronunciation was as faulty as his manner was autocratic. In my young days the clerk was as indispensable as the parson himself. The responses were left wholly In fact, if any one dared to join he to him. silenced him by a look! And sometimes he took extraordinary liberties with the service. Cowper has the lines:

There goes the parson! oh, illustrious spark! And there, scarce less illustrious, the clerk.

John Wesley tells us that he remembers how his father's parish clerk, as great an admirer of William, Prince of Orange, as the most red-hot Orangeman in Ulster to-day, once astonished the congregation by announcing from his desk in church, 'Let us sing to the praise and glory of God a hymn of my own composture:

King William is come home—come home— King William home is come; Wherefore let us together sing The hymn that's called To D'um.'

Another worthy, on the occasion of an episcopal visit, thought he would do honour to his lordship in the following strain. He gave out, 'Let us sing to the praise and glory of God a hymn of my own makkin':

> Ye little hills, why did ye hop? Was it to please my lord bishop? Ye little hills, why did ye skip? Was it to pleasure his lordship?'

The reader, I take it, will be satisfied with this specimen of the good man's poetic genius.

This was the day of irreverently conducted services, soiled surplices, tattered gowns, drawling in the pulpit, and listless demeanour in the pew. The influence of the Oxford Movement, which brought with it higher ideals, was not yet felt in

far-away Galway, or indeed in any part of Ireland. No attention was paid to rubrics, no respect to canons. Daily services were unknown. Even the chief fasts and festivals were in many places neglected. The church was locked up during the week, left to dust and cobwebs and bats; and to enter it on Sunday was not unlike going into a charnel-house.

In our neighbourhood there was an old clergyman who had been over sixty years rector of the parish of B., during the last ten of which he had been confined to his bed. The only part of his duty he could perform was baptising infants. The weak and ailing ones were brought to the Rectory, and many a parishioner used to boast, 'I was christened in the ould rector's bed.' Even in the days of his health and activity he had evidently lax notions and hazy views of rubrics, for when riding through the villages he would call out to young couples, 'Now, Peggy, if you get Andy in out of the field I'll do that little job for

you,' and marry them forthwith.

Let me here say a word about the parish priest of M. I was a very little boy at the time, but I remember his coming to dine at my father's house. He was of that class of priest more common in other days than now, who, having said Mass on Sunday morning, liked to spend the afternoon or evening of the holy day at a hurling-match or a game of football. Father Pat M. was a short, plump, silver-haired man, with bright, laughing eyes, and a mouth that showed the utmost good-nature. He was no scholar, but he became wise and shrewd 'by gathering notes out of the world's great Book.' His chief reading, apart from his daily office, consisted of Alban Butler's Lives of the Saints. When he was not pottering over his flowers and vegetables he was deep in one of the big volumes. And everything contained therein he swallowed with religious and affectionate scrupulosity, and suffered no indigestion! Father Pat was destitute of the critical faculty. Perhaps, for his own peace of mind, it were better so. He was never troubled with doubts. The fides carbonarii found its truest type and expression in him. He was as simple as a child, and believed, like a child, everything he read. If anything striking or uncommon met his eye in his peregrination through Butler's holy ground—as, for instance, the story of St Denis carrying his head under his arm after the persecutor had chopped it off—he would exclaim, 'Wonderful!' The ways of God are wonderful!' And so his simple, untroubled, serene life flowed on like a tranquil, sun-glinted stream through meadow-lands to the sea where all is still. He could tell a good story and relish a good song; and when the whisky-punch—which, according to the custom of the day, washed down the dinner—appeared, none could more thoroughly enjoy it than he. He used to say, 'A bad dinner requires a glass of punch, and a good one deserves it.' And he himself kept a most

hospitable table. Many a battle he had with his old housekeeper, whose stinginess was a byword in the parish, owing to his kindness and charity to the poor and needy. He did his duty zealously as a parish priest. His faith was simple, and he looked with the most tolerant feelings upon his neighbours who differed from him in belief. In those days religious partyspirit was unknown in the place. Priest and parson lived on the friendliest terms. parish priest of K. was dining one evening at the Rectory. On these occasions the clerics sometimes too freely indulged in the native. On the particular evening in question a Roman Catholic woman brought her ailing infant to the priest's house that he might baptise it. She was directed to the Rectory. Learning what she wanted, Father John said to the Rector, 'I say, Le B., you christen the child while I make the punch!'

The peasantry of the west of Ireland are, speaking generally, greatly under the influence of the supernatural. They have a vivid sense of the presence of beings other than humans, and they feel themselves continually liable to the effects of their anger or good-will. Every valley and mountain and rath and fort is the abode of uncanny creatures in whose hands the natives believe their fortunes and destinies are more or less involved. The usual story is told as to their origin. It is said they are fallen angels who are doomed to wander over the earth until the day of judgment. To propitiate them—for they are malicious if provoked—the hearths are swept up at night, and clean water is left out for them; and at poteen-making some persons place a jug of what is called the 'first shot' of the spirit for them. A cross of wood is, at certain times—St Bridget's Eve and Hallow Eve, for instance nailed to a rafter of the house specially to keep off fairies and avert other evils. The notion is held that a Mayo man cannot be harmed by them, or by ghosts of any kind, 'on account of St Patrick.' He is in a very special sense He is in a very special sense identified with that county. Wherever you go in Ireland evidences of supernatural existences meet you. Sixty years ago, as we can imagine, this belief had taken deeper and wider hold upon the people-ghosts, fairies, leprechauns, phocas, haunted houses, the evil eye, witches. belief in these things was rife and universal in my boyhood's days. To escape injury from the 'good people,' as fairies were commonly called, a man in going out at night carried a lighted turf-sod in his hand. This was supposed to be a charm against evil spirits. To sneeze in company, and the bystander not to exclaim, 'Dhilum!' 'God bless us!'), would involve the sneezer in illluck. If butter failed at the churning, it was traced to some occult influence of the 'good people.' A puny, delicate infant who showed no sign of growth was adjudged by the neighbours to be a fairy changeling, and was often exposed to die. The original child was carried off by the fairies, to be made a playmate to the young fairies, and a substitute resembling it was deposited in its place. A curious superstition!

The influence of the National schools and the general spread of science have done much to put an end to these foolish and fantastic fancies and beliefs among the young; but the older members of the community, especially in the Celtic districts, still cherish a lively faith in them. Only within the last few months a case was reported in the Daily Mail which shows the superstitious dread of fairies that still prevails among the Irish peasantry. A labourer threw up an acre of land which he had secured under the Labourers' Act, and upon which the district council proposed to build a cottage for him, solely because he was 'afraid of the fairies.' On the ground allotted, it appears, there is a fort where the fairies are said to gather, and this would have to be removed if a cottage were built, and on no account would the man 'interfere with the fairies' home,' because one would never have any luck after.

An institution common to the whole of Ireland now and for many generations back is the 'wake.' In that country, at least, waking has always been attended with drinking and drunken-When a death occurred the neighbours assembled in the house of the deceased, and smoked and drank, sang songs, told stories, and danced until the gray hours of the morning. Practices were carried on altogether inconsistent with the seemliness and solemnity which should characterise such an occasion. But the more tobacco that was smoked and the more whisky that was drunk, the greater respect and honour was shown to the relatives of the dead. In the death-chamber common accompaniments to the trappings of woe were a plate of salt which, on account of its preservative quality, typified immortality, and a pair of large wax candles fixed in huge china candlesticks. Snuff was also provided for those who used it. Within a few miles of my home there lived an old farmer whose wife was the 'boss' of the family. She ruled the house with a rod of iron, and the poor man had little comfort during his life. At length death released him from his domestic troubles. She gave him 'a dacent wake and a gran' funeral'always objects of satisfaction to the Irish mind. A neighbour remarked, 'Poor man! it's the only bit of dacency and comfort he ever had!' A story of a different kind, where the husband was the element of contention and unhappiness in the household, was related to me. In this case he too died before his wife. I cannot say what kind of 'wake' she gave him; but some time after his death she went to place a floral tribute of respect upon his grave, and was stung by nettles. Angrily drawing her hand away, she irreverently exclaimed, 'Bad scran to you, Pether; living or dead, there was always the sting in you!

Many amusing incidents have been related to me by old people in connection with the life of a well-known, half-witted individual who lived in our neighbourhood, and went by the sobriquet of Cunnaheena. Like Puck, he was largely imbued with the spirit of mischief, and, curiously enough, his mischief took the form of playing tricks on the parish priest. For example, after some offence, the priest imposed on him the penance (not uncommon at the time) of a pilgrimage to 'Patrick's Reek'—the famous mountain of Croagh Patrick, in the county of Mayo, on which there is a holy well, where 'stations' are held annually-and the recitation on his knees of a certain number of prayers. On the following morning, when the priest looked out of his window, what was his astonishment to see Cunnaheena kneeling on his turf-rick with hands crossed in devout attitude, and evidently doing his best to demolish it! Throwing up the window, Father Pat called out in angry inquiry, 'You rascal, what brings you there?' Cunnaheena, assuming the air of injured innocence, replied, 'Doin' my penance, yer reverence. Didn't you tell me to go to Patrick's Reek !-- and sure I couldn't see no rick in the parish as big as your own.' At another time this man displayed the humour that was in him to the confusion of the priest. It was the habit of Father Pat to catechise his flock on Sunday mornings before the celebration of the Mass, while waiting for two or three of his principal parishioners who were usually late in their attendance. On one of these occasions he called to Cunnaheena by name, and put the question, 'How many gods are there?' Promptly the reply came, 'Three in this parish.' 'What do you mean by that answer? angrily cried the priest. 'Well,' was the cool reply, 'there is Mr D. of C., and Mr B. of B., and Mr M. of L.; they are the gods of this parish; we must wait for Mass till they plaize to attind.' It is satisfactory to know that the hint was not lost upon the priest.

MOUNT FUJI.

UNENVIOUS peace doth thy calm brow impress, Madonna! who, while lesser mountains lour, With lovable dignity dost gently tower; Thine arms about the land as if to bless, Thou seem'st a spirit in a mountain's dress, Sharing with man and art the spiritual dower Of love, that warm communicating power Which is their proof and crown of perfectness.

For thou hast come out of great tribulation,*

And now thou wearest heaven's white robe of snow!

Oh, might the fires so rear us! years that move
To age and loss—all separating woe—
That we, in grief, might win men's admiration,
And, in prosperity and power, their love.

LILIAN RAWLINGS.

* It will be remembered that Mount Fuji, the beautiful, symmetrical sacred mountain of Japan, was once an active volcano.

DAVID PATRICK, LLD.

BORN AT LOCHWINNOCH, RENFREWSHIRE, 19TH APRIL 1849; DIED AT EDINBURGH, 22ND MARCH 1914.

Head of the Literary Staff, and one of the Directors of W. & R. Chambers (Ltd.), Editor of Chambers's (1) 'Encyclopædia,' (2) 'Cyclopædia of English Literature,' (3) 'Gazetteer,' and (4) 'Biographical Dictionary;' and Translator and Editor of 'Ecclesiæ Scoticanæ Statuta, 1225-1559' (Scottish History Society, vol. 54).

By the Hon. Lord GUTHRIE.

NOWADAYS eighteen is a common age to enter the Scottish Universities; but when David Patrick and I matriculated at Edinburgh, in November 1864, we were, each of us, only a few months over fifteen. It was natural that we two should forgather, for we were both sons of Free Church manses; we were educated under great rectors at Scotch Burgh Schools—he under Dr Macdonald at Ayr Academy, and I under Dr Schmitz at Edinburgh High School; we were in full sympathy with Scotland's traditions, civil, ecclesiastical, and literary; we attended the same classes in the Faculty of Arts, and we met in the same Debating Societies. The band of students to which we belonged were all of Scottish parentage, but we were scattered afterwards to every quarter of the British Empire, as well as to the United States and the continent of Europe. Among the few survivors are Sir Andrew Fraser, ex-Lieutenant-Governor of Bengal; Dr William Cunningham, Archdeacon of Ely; and Dr Thomas Young, parish minister of Ellon.

Two years ago, meeting at Harrogate, Dr Patrick and I recalled many incidents of college days. The quaintest occurred in the Greek class-room, a place famous at that time for quaint occurrences. Professor John Stuart Blackie's freakish moods were not the outcome of affectation, as some supposed; they were as much a part of his nature as his genius, his devoutness, his shrewd sense, and his kindly heart. In one of these moods, he ordered a student to write an essay in English on 'Is suicide ever justifiable?' a theme preposterous in itself and with no relation to the work of the Greek class. The student resented the order, but wrote the essay, and it was duly read to us by the Professor. At its apparent close, the essayist stood up, his face white as a sheet, and said, in emphatic but quite respectful tones, 'The Professor has not read the last sentence of Will he please read it?' The Professor at first declined; but the demand from the crowded benches became at last too urgent.

'I have given a foolish answer to a foolish question,' was the missing sentence, plain and pungent! For a few moments, I remember, we were struck dumb at our comrade's audacity; and then roars of laughter and rounds of cheers acclaimed his legitimate triumph. The student was Thomas Kirkup, afterwards a distinguished writer on Socialism and kindred subjects, who contributed many important articles, at Dr Patrick's request, to Chambers's Encyclopædia.

After we graduated in Arts, in 1868, David Patrick went to the New College, Edinburgh, and to Tübingen, Leipzig, Berlin, and Göttingen, to study for the ministry of the Free Church. He never lost his interest in theological studies, although he turned from theology to literature as a profession. But, in theology, no more than in literature, history, or archæology, was he, at any period of his life, the man to accept any opinion merely because it was old, or because it had the adherence of great names, or because it was current coin at the time. Nor was he the man to sign a creed under qualifications which were not expressed, even although these qualifications might be generally (but not universally) understood to be implied.

There was another reason, which would have equally deterred him from a forensic, or a scholastic, or a political career. No more genial companion ever lived, none who more inspired a feeling of camaraderie among those with whom he was in sympathy. Yet he avoided membership of a social club; and week-end invitations he managed ingeniously to parry. He had, indeed, no relish for miscellaneous society, consisting largely of persons either indifferent to him or with tastes and aspirations antagonistic to his own. Still less did public life attract him, with its simulated interests and its friendships de convenance. Perhaps least of all could he have adjusted his fastidious insistence on the truth, the whole truth, and nothing but the truth, to the halftruths, the special pleading, the inadequacies

JUNE 20, 1914.

and exaggerations of statement, the parade of irrelevant learning, the euphemisms, which are inseparable from public speech. When he got from Sir Edward Grey the remarkable article which he induced him to write on 'John Morley' for Chambers's Encyclopædia, he must have enjoyed the sentence, curiously descriptive as it is of all the three men-Morley, Grey, and Patrick: 'He feels that only the best is worth an effort, but that this is worth all effort, while indifference and mediocrity of aspiration are the greatest curses of mankind.' Add to this, a physical nervousness which, if necessity or a sense of duty had forced him into public life, might well have hindered the most effective use of his great powers, and rendered his life a scarcely tolerable burden. But that he had effective public speech at command, when he chose to nerve himself, was shown by sundry felicitous little speeches at the dinners of an Ayrshire society, and by the admirable reply he made when a presentation was made to him on the completion of the Encyclopædia.

He liked to recall his days as a divinity student. He had his heroes, ancient and modern, of different nations and creeds; but he was not so dominated by any human personality as to be incapable of seeing the rare faults of those he most admired, as well as the rare or rarer virtues of those he least esteemed. He would speak about the two great personalities in the New College in his day—Dr Rainy, the Principal, and Dr A. B. Davidson, the Professor of Hebrew. The aloofness of these men from all popularity-hunting, and their reserved manner, with their intellectual and spiritual pre-eminence, made them, for him as well as for others, the dominant

forces in that theological college.

Here again he always had an eye for the Indicrous. More than once we laughed at his experience at Abercorn, a village not far from Edinburgh, where he had gone, when a divinity student, to preach what I understand was the only sermon he ever delivered. The minister, an eccentric bachelor, an old college friend of his father's, proposed an evening stroll on the Saturday afternoon. When they came near the church where Patrick was to hold forth next morning, his host, to his surprise, asked him, with manifest anxiety, what text he was going to preach from. On Patrick mentioning the text, the minister, without another word, disappeared hastily into the church. Presently he returned, with a triumphant air, shouting, 'It's all right! It's in it!' Then he explained to the puzzled divinity student how, owing to the dilapidation of the pulpit Bible, he had feared lest the page containing Patrick's text might be missing!

In after years, apart from other occasions, some of us met him as colleagues in the councils of the Scottish History Society, the Scottish Text Society, and the Edinburgh Philosophical Institution, in all of which—in private consultations,

not on public platforms—his stores of knowledge, accurately remembered and instantly available, and his sagacious counsel, were drawn upon and valued.

It was for the Scottish History Society that he translated from Latin and edited, with Introduction and Notes, The Statutes of the Scottish Church (1225-1559). The Introduction of fully one hundred pages is his most important piece of independent work. Founded largely on the Statutes themselves, it is a valuable contribution to the history of the Church in Scotland, presenting fresh views, in many cases startlingly subversive of current opinion. Although written from the only standpoint which was possible for David Patrick-namely, that the Church is made for man, not man for the Church—it is judicial in tone, and it is notable for its combined insight into general principles and its grasp of details, as well as for the allowance constantly made for the different conditions and standards of pre-Reformation times and our own. The style is terse, flowing, lucid, and, when occasion calls, picturesque, humorous, and eloquent. It suggests what he might have accomplished as a historian, or as a biographer, say, of one of his heroines, like St Margaret, Malcolm Canmore's Queen, whom he calls 'The Morning Star of the Scottish Reformation of the Twelfth Century.

He characteristically shows himself much more moved by the disclosures of the loose lives of priests, monks, and nuns, of all orders and of all ranks, their crass ignorance of letters, and their shameful neglect of the interests of the poor and unlearned, than by any revelation of their theological unsoundness. He says: 'We must accept these records, so far as things go, with a confidence it would be unfair to extend to the Rabelaisian jests of Lyndsay against clerical incontinence, the Erasmian sneers of Buchanan at monkish ignorance and hypocrisy, or Knox's unkind allusions to the priests of Baal, which so many nowadays dismiss without more ado as grotesque and unchristian misrepresenta-

tions or exaggerations.'

'In literature proper the two Scottish clergymen who were really eminent were both peculiarly unclerical clergymen. Gavin Douglas, an intriguing and political bishop, was justly said to have studied Virgil much more fruitfully than the Bible or the Fathers; and Dunbar, an accomplished poet, was a type of the ribald priest whom churchmen and moralists and all good Christians detested, who entertained his royal patron with erotic obscenities and blasphemous parodies, yet was disappointed that he did not receive preferment in the Church of which Elphinstone was the chiefest ornament.'

'If our Scottish (Roman Catholic) churchmen were right, the Reformation was not, primarily so far as the mass of the nation was concerned, a rebellion against the Catholic Church, against Catholic doctrine, or Catholic rites, but a rising in defence of the holiest Catholic tradition against a crew of worthless ministers who dishonoured their office and the Catholic name. On their own showing, the Catholic bishops and priests had provoked an orthodox and Catholic nation into mutiny, open rebellion, and souldestroying heresy. Woe unto them through whom the occasion of stumbling comes!

In occasional literary ventures over uncharted seas, there were very many to whom, on questions of history, literature, or archæology, Dr Patrick was an infinitely patient and kindly pilot. Among Edinburgh's many learned men who have acted as literary advisers-in-general, alike to experts and to amateurs, Patrick was exceptional in this, that you always knew he would take no offence if you did not do what he advised. He would hail with gusto some improvement on his suggestion, which you had happened, very likely by a pure fluke, to light upon. It was generally, however, the other way. Once I asked him for a free translation of one of the ancient mottoes on the outside wall of Huntly House, in the Canongate of Edinburgh: 'Hodie mihi, cras tibi; cur igitur curas ?' He approved my translation of the first part, 'This house is mine to-day; you will be the tenant to-morrow;' but instead of my clumsy conclusion, 'Why therefore do you put yourself about?' he flashed out, 'Why worry?' Patrick was a mine, rather than a dungeon, of learning, in the which a wayfaring man, even although foolish enough, was welcome to dig gratis, and from which none ever went empty-headed away.

The quality of the help he gave to experts may be seen from Dr William Wallace's words in his Preface to the new edition of Robert Chambers's Life and Works of Robert Burns: 'My friend Dr David Patrick, Editor of Chambers's Encyclopædia, has read the proofs of the new edition from the beginning. To his great and various learning, and to his knowledge of Ayrshire, I am indebted for most valuable suggestions, more particularly in tracing to their often unfamiliar sources the numerous quotations which, better than anything else,

show the range of Burns's reading.'

Here is an illustration—one out of scores—of his amiability and patience in answering inquiries made to him even from the ends of the earth. An Englishman in China, having read a surgical article in the *Encyclopædia*, wrote the Editor to say he would be much obliged for information as to how best and cheapest to get a wooden leg for his son! Dr Patrick saw quite well the humorous inappropriateness of the request; but, nevertheless, he at once set about inquiries, with the result that, on skilled advice, he suggested delay till the boy should be full grown, promising that he would make further inquiries, if desired, when that time arrived. Several years passed, and

then came a letter reminding Dr Patrick of his former kindness, and asking his continued good offices, the condition now being fulfilled. These were cheerfully given. Dr Patrick arranged the whole matter, both surgical and financial, and the affair ended with a grateful letter from the heart of China that the new leg was the pride and comfort of the wearer, and the admiration of all beholders, British and Chinese!

What his work as an Editor covered for Dr Patrick may be realised from his own statement in his Preface to the *Encyclopædia*: 'An Editor's chief work is to edit; but, besides revising all the articles, the Editor has been one of his own most frequent contributors, mainly in the shorter articles, and such as fell within his special competency. Over and above corrections by authors and by printers' readers, every article has been read in proof by the Editor and at least two of his colleagues.'

As a writer, I have heard it said that his pen was not a fluent one. Of course, it was not; a style so terse, so devoid of an ounce of padding, and yet so smooth that, like an ancient helmet made by a skilled armourer, it shows no sign of the hammer, cannot be rapidly produced. In Hugh Miller's case, such a style sometimes involved an excursion by its author round his study, with a poker, to find the exact shade of

meaning!

I wrote two or three short articles in Chambers's Encyclopædia at Dr Patrick's request, and he used, both when I was at the Bar and since I have gone on the Bench, to come across the High Street from Chambers's office to the Parliament House to ask me about points on which he thought I might have special knowledge. Otherwise, I was only—in relation to the four great compilations published by the firm of W. & R. Chambers, of which he was the head of the literary staff, and one of the directors-one of a countless number who use these books for daily information and reminder, and who seldom find it necessary to consult more extended works of reference. It is when we remember that our own case must be multiplied by tens of thousands all over the English-speaking world, and consider the enormous benefits this man and his colleagues conferred on humanity, that we realise his place in the history of national and international development, and cease to regret that the calls of his daily work made it impossible for him to give to the world some great book, containing the results of a lifetime's thinking and research on some special subject, with which his name might have been permanently associated. If he sometimes felt the same regret, he was also sustained and stimulated by the same consolation. To have one's name identified with books to which gentle and simple, rich and poor, young and old, learned and unlearned, all over the world, are daily debtors-is that not as worthy an object of ambition as to

earn the gratitude of a limited number of experts in some corner of knowledge?

Re-reading some of Dr Patrick's writings, it is striking to notice the way in which they unconsciously reveal his ideals and his opinions; in many passages you can almost hear him speaking. I refer particularly to the great contribution to Scottish Church History already mentioned, also to his Prefaces to the first and last volumes of Chambers's Encyclopædia, his Preface to Chambers's Cyclopædia of English Literature, and the signed articles on Scottish Literature in the latter work. But I have also in view the countless anonymous articles in the two Cyclopædias, and in Chambers's Biographical Dictionary, many of which those familiar with his points of view and turns of phrase can easily identify as his, although his robust English was singularly devoid of mannerisms. In all his writings his information is up-to-date, and situations are put in a new and fresh setting; but you never find him boasting either that the facts are entirely new or that a new light is being cast for the first time on the problem in hand.

As examples of what I mean, I quote three passages, very characteristic ones, from his Preface to the Cyclopædia of English Literature:

'English literature is in the fullest sense of the term a great literature; the English pen has been mightier than the English sword or the English steam-engine. If it be said—as often it is said—that we are the most materialistic nation on the face of the earth, we have a cloud of witnesses to the contrary; our divines, our sages, our poets, our story-tellers, our men of science, our historians have uttered in our tongue words which the world will not willingly let die. It is no dream, indeed, that the other sheaves have made obeisance to our sheaf; Shakespeare is not the only Englishman who has won the willing homage of the world.'

'Neither Virginian colonists nor Pilgrim Fathers were keenly interested in literature as such. It was the English temper that led them into the wilderness; and it was the same spirit as had again and again moved their forefathers in the past of English history that led them finally to repudiate the English King and Government. But they had no thought of renouncing any essential of their English birthright; Puritan or Cavalier, they clung to the tradition, which, overseas as in the mother-land, in literature as in life, makes for freedom, fair-play, security, reserve, common-sense, steadiness, breadth, depth, strength, and individuality.'

The closing paragraph of this Preface to the Cyclopædia of English Literature is written straight from his heart: 'Mankind may not be growing much holier or happier, but the stream of tendency makes for greater kindliness and the breaking down of boundaries; kindliness which begins at home extends by degrees to all the outlying kin in their several places and relations;

and at the close of the nineteenth century, in the last years of Victoria's reign, the bands of kindness have been drawn sensibly closer between the island people and their colonies, between the United Kingdom and the United States. To the youth of the English kin this work is once more and in a new shape offered as a help in seeking out and laying to heart the wisdom and the wit of our famous men of old and the fathers that begat us, in the confidence that allegiance to the highest traditions of our literature will increasingly obliterate local and temporary jealousies; and in the hope that many a saying herein recorded may make generations to come proud to be of the English name, and stir in them the thrill that tightens even the grasp of blood brotherhood.'

Although during these fifty years, from 1864 to 1914, David Patrick continued to grow in everything that dignifies humanity, he did not change in any essential particular. In his appearance there was the same thin, alert figure, with eager step, the same rapid, nervous utterance, the head thrown back in animated speech, or bent forward when intently listening; for in him there was a rare union—he was a good a listener as a talker. How little his appearance changed is manifest from three photographic groups in which we both figure: the first, a band of students taken in 1867; the second, a sadly diminished company, thirty years later, in 1897; and the third, including Sir Andrew Fraser, and Dr Thomas Young, taken a year ago.

In manner of speech, his courtesy and his sympathy never varied, except that, while courteous, with an old-world courtesy, to all, there was that flavour of chivalry in his address to women, the existence or non-existence of which, however much the relations of the sexes may be de-artificialised, will always remain the touchstone for the name and character of gentleman. I never heard him speak with such severity, such sæva indignatio, on any subject as on Robert Burns's treatment of women, his social inferiors, and, in particular, his base treatment, from first to last, of Jean Armour. With a complete knowledge of the whole material, published, unpublished, and unpublishable, he had made a special study of this aspect of Burns. As an Ayrshire Scot, who considered admiration for Burns's verse a fair test of the genuineness of any man's professed love of poetry, his bias was in Burns's favour; and he was no censorious critic of other men's failings. Yet, if any man could have been found to print it, he had material for the production of a monograph, impotent denunciation of which would at least have lessened the staleness of Burns Dinners. But, if Professor Spencer Baynes, the editor of the Encyclopædia Britannica, refused to publish Robert Louis Stevenson's plain-spoken but guarded article on Burns prepared for that Encyclopædia, much more impossible, I am afraid,

would Dr Patrick have found it to put before the public his points, partly founded on material

unpublished because unpublishable.

His manner of speech in no way depended on the rank or wealth of the person addressed; to David Patrick such distinctions were not only unimportant, they were irrelevant. Dr George Neilson of Glasgow writes: 'He was so full of ideas and always so sympathetic that to chat with him for twenty minutes was a real inspiration. He brightened many a visit to Edinburgh for me with his swift, sharp, clear-cut talk, so full of knowledge, and absolutely void of the detraction and love of fault-finding, which, not without cause, are apt to characterise men who require to be as exact as he was in all his facts and inferences.'

As to the man himself, he had no conceit or side whatever; he knew what he could do, and he did it, late and early, day in and day out, with all his natural force, systematised by habits of industry and stiffened by a sense of duty. He showed that literary gifts of a very high order are consistent with punctilious business habits. His limitations he knew perfectly well; and he had a just estimate of other men's capacities. He often spoke of the splendid work done by his fellow-workers of all grades. His relations with them may be judged from the words attached to the wreath they laid on his grave: 'In affectionate remembrance of the best of colleagues and the dearest of friends.'

David Patrick's modesty was proverbial. He loathed the chief room at social assemblies and shunned the platform at public meetings; when not tactfully intercepted, he was most likely to be found in a back-seat under the gallery. Intimate friends, like Professor Hume Brown and the Lord Chancellor, Lord Haldane, did not fail to let him know how much his work was appreciated, and how extensively it was utilised. His standing in the literary world was shown by the band of distinguished collaborators he was able to secure for the issue of the Encyclopædia and the Cyclopædia of English Literature. Yet I remember being astonished at his gratitude for a somewhat elaborate acknowledgment I sent him of a vigorous and original paper he wrote in 1908 on what he took care to call 'the so-called Culdee Library of Lochleven.' He explained that I was one of the few to whom he had sent the paper who seemed to have read it.

His charities were many. Mr Chambers writes to me: 'One feature of his character, which was known only to a few, was his big heart and his open hand. As a rule his open hand was only known to those who benefited by his good deeds; but in a roundabout way it has, from time to time, come to my knowledge.'

Humorous and optimistic, he had yet that touch of melancholy and reserve which goes with humour and optimism. He knew the past too well not to love it, and too well not to prefer the age in which he lived. Scorn and contempt were reserved by him for hypocrisy and imposture, not for unavoidable ignorance or honest prejudice. I remember his emphatic approval when I once reminded him of Sir Walter Scott's golden phrase, 'I will never cut any man unless he is proved to me to be a blackguard.'

He combined love of the study, and its contents, with enthusiasm for the open air and with love of Nature, inside his garden and outside it, in all Nature's seasons and moods. He played no games, and he was not a sportsman nor a horse or dog fancier; but nobody would have dreamed of nicknaming him 'dry-as-dust,' or a bookworm; he was a 'fell' walker and cyclist, regardless of weather, and there are unsightly mineral-heaps in the neighbourhood of Edinburgh, which will cease to be blots on the landscape when the saplings, which he carried in his pockets and planted with his own hands, have grown into trees. No 'recreations' were assigned to him in Who's Who. Had he been asked for a list, he would probably have named 'Walking, gardening, travel, music.' His love of travel in foreign lands, in his far too short annual holidays, did not lessen his attachment to his early home and his devotion to family ties. He delighted to spend week-ends with his brother in the old family house at Lochwinnoch, in which he was born, and he had a very tender affection for his only sister and her children, in one of whom he was proud to recognise a genuine literary gift. With all his admiration of foreign literature, and his interest in and knowledge of foreign peoples, there always went whole-hearted love of his native land, with a specially warm side to the part of it called Scotland, and a special jealousy for the fair fame, all over the world and down the ages, of Scotsmen and Scotswomen of all ranks.

Outside his own family circle, few knew Dr Patrick longer and none knew him better than Professor Hume Brown. He permits me to quote these words about his friend: 'Dr Patrick's gifts of mind and his personal traits gave him a unique place in the regard of all who knew him. "He was like no one else," was their common remark. His personal charm in his best hours it would be impossible to convey in any form of words. He had kept through life "the child's heart in the man's;" and, in his childlike simplicity, accompanied by no lack of virility or of maturity of character, in his spontaneity and vivacity, his friends found an attraction that made personal intercourse with him at once a stimulus and a solace. His unconventionalities only gave piquancy to a character incapable of affectation, and added another trait of interest to his elusive nature. He lived in an element of moral beauty; and in the memory of his friends he will abide as one who evoked their own best qualities—the highest debt that friend

can owe to friend.'

A KNIGHT ON WHEELS.

CHAPTER XXVI.--CONFESSIONAL--MASCULINE AND FEMININE.

I.

WELL, I have one thing to be thankful for —there might have been another man in the background. Now we must get back to work. Labor omnia vincit, my son.' Thus Philip to himself.

Then he continued, less philosophically, 'I suppose I had better keep right away from her. I simply couldn't stick any half-a-loaf sort of friendship. All the same, I'll keep in the offing in case I am wanted.'

Then he went back to Oxford Street, and told himself that work was the salt of life.

But the spell was broken. Labor omnia vincit proved to be exactly what Julius Mablethorpe had said it was—only half a truth; and Dumps's conclusion that Love and Work are interdependent terms was borne out to the letter. Philip worked as hard as ever-harder, in fact; never had the business in Oxford Street been more efficiently conducted. But the zest of it all was gone. Without Peggy—or prospective Peggy—the day's work, which had been a series of absorbingly interesting enterprises, was now a monotonous round. The whir of machinery had been music; now it was merely an un-pleasant noise. To overcome difficulties and grapple with emergencies had been a sheer joy; to do so now was a weariness to the flesh. Philip could not but recall to mind, as he slogged on, Uncle Joseph's description of his beloved regiment after the episode of Vivien: 'The only difference was that, whereas the regiment had formerly been commanded by a Damascus blade, it was now commanded by a broomstick. Family history appeared to be repeating itself.

But he had no blame for Peggy. She had never encouraged him, never led him on, never deliberately appropriated his services. She had been infinitely kind to him, and that was all. If this hitherto unsuspected hardness in her nature were a permanent thing, if she were determined to live her own life and be independent, well, here was a unique opportunity for a Knight to prove his metal, to justify his boast that he could serve without ulterior motives or hope of reward. If his Lady had selected another Knight in preference to him matters would have been different; proper pride would have driven Philip away. But so long as Peggy walked alone and unprotected, his vocation in life was clear and unmistakable.

But it was an uphill business, until, by a fortunate chance, it occurred to those in authority at Coventry that Philip's abilities were being wasted upon the mechanical routine of the London office. Straightway he was transferred to headquarters, where he was put in charge of

the Design and Construction Department of the company, at liberty to invent and experiment to his heart's content.

Here he felt better. He was relieved of the constant fear of encountering Peggy, and of the exasperating effervescence of Tim. He also felt himself absolved from any further obligation to cultivate social graces. So he reverted whole-heartedly to the realm of Things, determined to eliminate people from his scheme of life for good and all. Machinery, as Mr Mablethorpe had said, might break your arms and legs, but it left your heart alone.

Still, it was a black winter. Extreme tragedy is the privilege of the very young. Those of riper years do not hug tragedy to their bosoms: they know too much about it; and in this respect Philip, for all his twenty-eight years, was youthful indeed. But no human experience is without ultimate profit. Most of us have to live some portion of our lives under circumstances which make it necessary to keep our eyes resolutely averted from the future; and once we have acquired the courage which this performance demands—and it demands a great deal we have acquired the most valuable asset that experience can give us. Any one can be happy who has no care about things to come; that is why children laugh and sing all day. But the man who can keep a stiff upper-lip when there is no confidence in his heart can fairly count himself one of those who have graduated with honours in the school of adversity. During those months Philip acquired the priceless art of taking life as it came, and, abandoning the pernicious habit of drawing upon the bank of the Future—his account was sadly overdrawn there already-of living within the income that the Present supplied to him. True, it was a mere pittance, but he learned to live on it. Upon such foundations is character built up.

Mr Mablethorpe summed up the whole situation in his own fashion when Philip, in the course of a week-end visit, had unburdened his soul over the last whisky-and-soda on Saturday night. 'Philip, my son, you are learning; your education is proceeding apace. But it hurts, and you are puzzled and indignant. But never mind! Hold on, and things will right themselves. Your sense of proportion will come to the rescue and pull you through. I know, old man—I know! I have been through it all. I wasn't always a dull British householder with an expanding waistcoat. I have been young, and now I am old—or perhaps middle-aged—and I know! Middle-age has its compensations. When we are young we alternate between periods

when we feel that there is nothing on earth that we cannot do, and periods when we feel that there is nothing on earth that we can. Advancing years bring us a comfortable knowledge of our own limitations. Though we may not have so many moments of sheer sublimity—moments when we touch the stars—as the young man, we have fewer hours of blackness. So, carry on, Philip. Steer by dead reckoning, if necessary; you will get your bearings in time. This experience will do you no harm, provided you face it between the eyes. I know nothing of your little lady friend, but she does not sound to me like a member of the third sex. On the contrary, she appears to be gratifyingly feminine. Her present attitude is probably a pose of the moment. They can't help being made as they are, you know. I fully expect to find my beloved Dumps suffering from the effects of some germ or other when she comes home from abroad next month. That reminds me. spring Dumps is to come out-not of jail, but the schoolroom, which at eighteen is very much the same thing-for ever. The festivities will include what she calls a Joy-Week in town. You had better come and stay with us during that period, and join me in contracting dyspepsia. In fact, I have a ukase from my daughter to that effect. Will you come?

Philip assented listlessly. Joy-Weeks were not for him.

п

Miss Jean Leslie lived in a roomy flat high up in a tall block of buildings that overlooked the Thames at Chelsea. The larger of the two rooms was her studio. Hither, fat, sweet-scented, and rebellious little boys and girls in expensive laces and ribbons were brought by mothers or nurses; and after they had been coaxed into smiles by the arts and blandishments of their hostess—and for all her spinsterhood she excelled in that accomplishment—Jean Leslie painted miniatures of them, for which their doting and opulent parents paid fancy prices.

'My dear, you must be very rich,' observed Peggy one afternoon, inspecting three portraits of cherubic innocents, recently completed and

awaiting despatch.

Jean Leslie poured out the tea complacently. 'Thank you,' she said; 'I scrape a living. Sit down and eat something. I have some of your favourite valencia buns.'

But Peggy seemed restless. She wandered round the little sitting-room, minutely examining photographs and pictures which she already knew by heart.

'Peggy Falconer,' inquired Miss Leslie at last, 'will you come and sit down in that chair, or will I take you by the shoulders and put you there?'

'Sorry, dear,' said Peggy; 'I have the fidgets.' She dropped rather listlessly into a chair, and then, for no apparent reason, got up and sat in another.

'Why is my best chair not good enough for you?' inquired Miss Leslie sternly. 'At your age you ought not to be manœuvring to get your back to the window.'

'It wasn't that, really,' protested Peggy.

'It just was,' replied Miss Leslie.

She rose from her seat, and, taking the girl by the elbows, turned her toward the light. Peggy submitted, smiling.

'And now,' resumed Jean Leslie, sitting down

again, 'what is the trouble?'

'You really are very Early Victorian, Jean!' said Peggy severely. 'You yearn for sentimental confidences and heart-to-heart talks. But it's simply not done now; hearts went out with chignons. Give me a large and heavy piece of that muffin, please, and I will pander to your tastes by talking about Prince Adolphus.'

Prince Adolphus was the exalted title of a purely hypothetical Fairy Personage who was one day to lead Miss Leslie to the altar. He had been invented by Miss Leslie herself, and formed a stock subject of humorous conversation

with her younger friends.

Miss Leslie said no more, but passed the muffins. 'How is that boy Timothy?' she inquired. The mention of Prince Adolphus had brought Timothy into her thoughts; Timothy had always expressed profound jealousy of his Royal Highness.

Peggy laughed. 'Very careworn,' she said. 'Since Philip was sent to Coventry he has been in sole charge at Oxford Street. By the way, he wants us to lunch with him on Sunday.

Can you manage it?'

'I don't know. I am half expecting a visit from a fellow-countrywoman of mine.'

'Do I know her?'

'I doubt it. Her husband is second engineer on a liner that plies between London and Melbourne. She has a good deal of leisure on her hands, poor soul!'

Peggy asked the question that a woman always

asks another in this connection.

'No,' replied Miss Leslie; 'neither chick nor child; so when her man has been away for a month or so, and drinking tea with the wives of other second engineers in Gravesend begins to pall, she likes to come round here and crack with me. I knew her in the old days: her father was head-forester to us. She would be disappointed if she found me from home. She never tells me when she is coming; she would regard such a proceeding as presumptuous. So'—Miss Leslie sighed resignedly—'I just have to stay in for her. Her husband sailed four weeks ago, and there has been a hurricane in the Indian Ocean this week, so I fancy she is about due.'

'Everybody seems to bring their troubles to you, Jean!' said Peggy.

Miss Leslie looked up. 'Troubles? Oh, no! I assure you, when Eliza Dishart and I drink tea together there is no talk of troubles. We are very grand. We talk about the Court, and turbines, and the possibility of union between the Established Kirk and the Free. But trouble —oh dear, no! Once only did we consent to be informal. That was one wild night in December two years ago. Half the chimney-pots in London were flying about in the air, and she knew that his ship was in the Channel, homeward bound. She came chapping at my door about ten o'clock, just as I was going to bed, and asked me if I would let her sit here for the night. Indeed I was very glad of her company. I remember I managed to pick out the tune of the Hymn for Those at Sea for her on my piano, and we sang it together. Very ridiculous we must have looked. We have never mentioned the occurrence since.'

During this narrative Peggy sat silent and preoccupied. Finally she said, 'It must be a great relief to be able to unload your worries on to some one else. A girl has just been unloading hers on to me.'

Jean regarded her friend's averted face curi-

ously. 'Indeed!' she replied.
'Yes. A man'—

Miss Leslie nodded. 'Quite so,' she remarked dryly. 'She has presumed too far, and he won't come back.'

Peggy looked up. 'Now you are getting romantic again,' she said reprovingly. 'No, it is nothing of the kind. My friend has had to be rather brutal to a man, and she feels sorry for him, and she is afraid he must think rather badly of her. That's all.

'Has she been playing with the poor creature?' demanded Jean Leslie, in a voice of thunder.

'No. She is not that sort of girl.'

'Then where does the brutality come in? There is no brutality in putting a man in his place, provided you do it in time. As soon as a woman sees that a man is preparing to fall in love with her—and she can usually tell about five minutes after she has made his acquaintance -and she doesn't feel like wanting him, she should get him at arm's length at once / Have -has your friend not been overlong in adopting that precaution?'

'She couldn't do it before,' explained Peggy rather eagerly. 'They were thrown together in a very unusual way. She saw it coming, but could not do anything to prevent it. And now the man has gone away; and I'm—she is sure

he thinks'-

Jean Leslie handed her guest a fresh cup of 'Are you certain,' she inquired, 'that this friend of yours wanted to keep the young man at arm's length?'

Peggy twisted her long fingers together. 'I rather fancy, from what she said, that she cared

for him a bit,' she admitted.

'Then why send him away?' demanded Miss

Peggy summoned up a troubled smile.

old Jean,' she said, 'you are so practical!'
'Practical! Ay!' replied Jean Leslie grimly, 'if women were a little more practical, and a little less finicky about what they are pleased to call their hearts, this world would be a more understandable place to live in. Listen! I had a girl friend once—as intimate a friend as yours, I dare say—and when the man she wanted asked her to marry him she said "No." She meant "Yes," of course; she merely wanted him to ask her another half-dozen times or so more; but the stupid man did not understand. He went away, and married some other body whom he did not love, just to be quit of thinking about Men are made that way. They will do any daft thing—take to drinking or marry another woman-to drown the pain of remembrance. But this friend of mine, being a woman, could not do that. She just stayed single, and in course of time became an old maid—and a practical one, I promise you! But let us get back to the other girl. Why did she send her lad away?'

'Because there was some one else whom she

could not leave.' 'A relative?'

'Yes.'

Jean Leslie nodded her head slowly and comprehendingly. 'I see,' she said at length. 'That is different. You mean that the relative would have been helpless without her?'

'Helpless and—friendless,' said Peggy gravely. 'Did she tell the young man that that was the reason?

'No.'

'Why?'

'Because—because I fancy he was the kind of man who, if he had known the real reason, would have persisted in staying single on her account.'

'And why not? Men like that are rare.'

'Well, he—she told me that he was the sort of man who had no idea of looking after himself, or making himself comfortable; the sort of man who really needed a wife. It would have been cruel not to let him go. She might have had to keep him waiting twenty years, and she couldn't bear to think of his living in discomfort and loneliness all that time; so'-

'So she gave him another reason?'

'Yes.'

'What reason?'

'Oh, the reason a girl usually gives nowadays: other interests, freedom to live one's own life, and so on. You know.'

'Yes, I know,' said Jean Leslie bitterly. 'You need not tell me. I should like to have just five minutes' talk in here with the man that invented the higher education of women! However, that is a digression. Your friend's case, as I have said, is different. Evidently she is not that sort of girl. I don't know what advice to give her, poor soul! She is in deep waters. But you can tell her from me'——

'Yes?' said Peggy eagerly.

'That she is doing the wrong thing'—Peggy caught her breath—'for the right reason. You can also tell her that she is a brave lass. Perhaps it may help her a little to be told that.'

'I know it will,' said Peggy, getting up. 'Good-bye, Jean dearest! I think I will go and

tell her now.'

Jean Leslie sat long over the teacups, deep in thought. Mechanically, she found and lit a cigarette, and smoked it to the end. Then she lit another. Darkness had fallen by this time, but still she sat on, gazing into the glowing fire.

At last she rose and turned up the electric lights. Having done this, she surveyed herself

intently in the mirror over the mantelpiece. For all her forty-three years she was a youthful woman. She possessed the white teeth and fair complexion that Scandinavian ancestry has bequeathed to the north-eastern Highlands of Scotland. Her hair was abundant, and with a little better dressing would have looked more abundant still.

She turned from the mirror with a quaint little move, and her eyes fell upon a framed photograph which stood upon her writing-table. It was a portrait of Peggy's mother. She picked it up, and regarded it long and thoughtfully.

'Thank God, death cannot always close the

account!' she said softly.

Then, with a resigned sigh and a downward glance at her comfortable but unfashionable attire, she seated herself abruptly at the bureau and wrote a letter to her dressmaker.

(Continued on page 468.)

COMPRESSED AIR FOR MAKING SHIPS UNSINKABLE.

By W. O. HORSNAILL.

WHEN water finds its way into a ship through a hole in the bottom, those on board naturally resort to the pumps with a view to pumping it out faster than it comes in. At the same time, attempts are made to cover the hole from the outside by passing collision-mats, or even sails, under the bows, and working them along byropes over the sides until they reach the cause of the trouble. These were the only known means of saving the earlier vessels from sinking.

Later on, what are known as collision bulkheads were introduced in the form of watertight partitions right across the ship a certain distance back from the bows, so that when a vessel ran into another ship, or damaged her forepart on the rocks, the water was confined to a small compartment. This precaution was followed by making a watertight inside skin over the bottom and up the sides, leaving a space between the inside and outside plating, which was divided by partitions, so that damage to the outside skin only meant the flooding of one or more spaces in the Many vessels were saved by double bottom. these means; but the principle has long since been carried much farther by building a number of watertight bulkheads or partitions across the ship, with generally another bulkhead right along the middle. These arrangements do not interfere with the passengers, as the bulkheads only come up to a little above the waterline, whereas the passenger accommodation in large liners is all on the upper decks. Of course the watertight compartments have to be used for storage and other purposes, but the doorways into them are fitted with watertight doors which can all be closed at the same time by electricity in cases of emergency.

In battleships, with their liability to punctures by projectiles and torpedoes, the number of compartments is much increased, and a Dreadnought has many hundreds of watertight partitions worked into her construction.

Now, instead of pumping water out of these compartments, it is quite possible to prevent its coming in by using compressed air; or, if the compartment has already filled, the water can be blown out again through the hole at which it entered. It is only necessary to close the watertight doors, and to pump in air until the pressure is high enough to eject the water. According to the *Engineer*, this is exactly what an American inventor, named Wotherspoon, proposes to do, and his system is being applied to three United States warships, but with the addition of varying pressures in the different compartments according to the depth below the water.

Thus, if a compartment right at the bottom of a ship, perhaps nearly thirty feet below the waterline, is broken into, it would take about fourteen pounds to the square inch of air-pressure* to blow the water out; but, to avoid straining the partitions by this high pressure, the adjoining compartments are pumped up to nine pounds pressure, so that there is only a difference of five pounds instead of fourteen pounds to the square inch tending to burst the sides and top. Again, the compartments surrounding those at nine pounds are pumped up to four pounds, thus limiting the bursting pressure throughout to within five pounds. If this were not done the lower partitions would have to be strong enough to stand

^{*}That is, fourteen pounds above the pressure of the atmosphere itself.

fourteen pounds to the square inch, involving heavier plating—a serious disadvantage in warships, where all weights are reduced as much as possible to allow of carrying the largest guns and

the thickest armour-plating.

The advantages of the compressed air system do not end with the keeping out of the water, although this is its main purpose. By means of what is known as an air-lock it is quite possible for workmen to enter a damaged compartment while the water is being kept out by compressed air, and in many cases a hole could be temporarily stopped up. An air-lock is in principle similar to a water-lock on a river or canal, the difference in water-level being represented by the difference in air-pressure. All that is needed are two airtight doors with space enough between them for one man. The man enters this space and the door is shut behind him; then the air-pressure is gradually let in, and finally the other door into the compartment under pressure is opened. This system is being constantly employed for building foundations in rivers, large cylinders under airpressure being sunk down as the work proceeds inside them, the pressures needed being often much higher than would suffice to empty the bottom compartments in our largest battleships and liners.

THE WEAK STRAIN.

By WILLIAM ARTHUR MEYRICK.

CHAPTER I

JOHN RINGTON came back from nothingness to this world with mighty effort and some pain. In his ears was the flutter of a screw; in his nostrils mingled odours of fish, hot oil, and bilge-water; and before his eyes was a dirty little cabin. His head pained him, and he raised a hand to find it bound in a dirty towel. Suddenly there bent over him the blackest of black faces, with the whitest teeth he had ever seen. To the grin on the black face he grinned responsively, and asked, 'Where am I?'

'Steam-trawler Capistrano, off to Moroccy

coast, out of Milford.'

'How did I get here?'

'Run down in lil' boat, and then picked up. Tought you dead, sure; but keep you to make sure. Now you not dead. You hungry, eh? Good! I give you to eat. Then you must see cap'n.'

Under the ministrations of the black cook, John came back rapidly to himself, and he did not know whether he was glad or sorry. His open-boat adventure ending in the collision was no accident, as was apparently assumed. had wilfully yielded himself to an open boat in the Channel from mere indecision. The heroic thing, he knew, was either to have faced his troubles manfully, or to have walked gently and without scandal out of them into the hereafter. He had favoured the latter alternative, but was undecided, as usual; he had left the matter to fate, luck, Providence, or whatever else ruled this world of ours. This was the result. Nothing settled—the weary round to go through again.

Under the bridge, in a little cabin, he interviewed the captain, a hairy little ruffian-looking man, who sat in solitary state over his whisky.

'Who the blazes are you?' was the greeting.
'John Rington, and I suppose I must thank

you for picking me up.'
'Right-o! What were you doing so far off land in an open boat? Blown off, I s'pose, like other Cockney sailors.'

'No, I wasn't.'

'Then the bigger fool you. Lucky for you,

you blundered into us.'

'I have not settled that in my own mind yet. I might have been better off if you'd left me there.

The captain bristled in surprise. 'What do you mean? You don't look one of those suicide grave's fools. Done anything wrong?

'Yes,' said John. 'Lost all my money, and made a fool of myself. That's the biggest crime a man can commit in England.'

'You had some money on you when I picked

you up.'

'Yes; there ought to be about twenty pounds. In addition to that, I don't suppose I have five hundred pounds to my name,' said John.

'Thundering Jupiter! hark at the fellow! ne s a plutocrat. I wish I'd five hundred pounds of my own.' Only five hundred pounds—only five—— Why,

'Five hundred pounds is nothing,' said the

puzzled John.

'Moses! hear the fool talk! Five hundred pounds nothing, indeed! Why, it's a small fortune for any man.'

John was still more puzzled and surprised. This was a world of another standard from his. in his world five hundred pounds was a trifle.

'What can you do?' asked the captain sharply, interrupting his thoughts.
'Do? Nothing. What is there to do?'

'I mean, have you learnt to do anything for yourself? Have you any trade?'

'Trade! Of course not. There has never

been any need.

'So much the worse for you. You've eaten the bread of idleness, my lad. We'll alter all that. Let me see your hands.' John found himself humbly putting forth his hands. 'Good hands, but soft as putty. Muscles fairly well developed; bit of an athlete in his way. Not up to much now' (all this in a soliloquy). 'You'll have to help the cook.—Cook, take him for'ard and set him to it.'

'Excuse me,' interrupted John, 'I had enough

money on me to pay for my passage.'

'No idlers on my ship,' interrupted the truculent captain. 'For'ard with you. At the end of the cruise you'll have your money back, and anything you've earned.'

John still essayed argument, but the scandalised cook caught him by the arm and rushed

him forth.

'Hush!' said his sable lord and master.
'Cap'n Royl a drefful man when he'm roused.
He'll knock h—l out o' us if he comes after us.'

CHAPTER IL

JOHN was sitting on an upturned bucket peeling potatoes under the direction of the cook. The last time he crossed the Bay it was in the fine yacht *Florida*, and he was an honoured guest. To-day, however, he was not unhappy. There was an art in peeling potatoes. Moderation—neither too thick nor too thin—that was the rule. He began to wonder if, after all, peeling potatoes was what he was best fitted for.

The crew interested him—three or four Englishmen; two Swedes, both called Dutchy, but distinguished as Big Dutchy and Little Dutchy; a Greek donkey-man for the cluttering, bucking donkey-engine on deck; a broken-down Scots engineer; and two or three stokers, one called Tiny, the finest specimen of a man he'd ever seen. It was Big Dutchy who was cock of the walk; and John wondered if, having surrendered to the superior authority of the tousled little captain, he would also have to knuckle down to the superior brutality of a lumpy Swede. John smiled at the idea; he might surprise them yet.

He was not popular on board. He had made a fool of himself in the fo'c'sle. He had 'come the toff,' and repelled all attempts at sympathy or friendship on the part of the others. Only

Cookie stood by him.

The veneer of his gentility was soon badly cracked. He had left a bucket of slops just outside the galley door, and into it had blundered Little Dutchy, the smaller Swede, to the detriment of his shins. The little man looked so grotesque, dancing with pain and squealing with rage, that John, who had come to the door, was caught smiling. The retort was instant and prompt. Picking up the bucket, Dutchy hurled the filthy contents over his tormentor, and in return was instantly floored by John with the empty bucket. On Dutchy's bald head there was a lump as big as a plum, and in John's hand a bundle of staves.

He was summoned aft, where the captain poured on him the vials of his wrath. John bent before the storm, but treasured up the captain's peroration. He was not going to have buckets spoiled by cook's mates in that way. John would have to make it good out of his wages. Meanwhile not a word of complaint about Dutchy's head. John returned to his galley, and pondered on the strange world he had come into, where buckets were more valuable than Dutchmen. His standard of values was upset again, and he felt there was much to learn in this new world of his. That evening he made an effort to be amiable to the crew. He promised Little Dutchy half-a-crown when he got ashore to buy a plaster, and altogether he came to the conclusion that his new world, if rough, was not a bad world after all.

Next morning he began to wonder if he would have to fight his way right through the crew. As cook's mate and ship's boy he found that he was supposed to be receiver-general of all the ill-usage going aboard. It never entered the minds of the simple sailormen that he could have any objections to fulfilling these onerous duties of his station. At breakfast he fell foul of one of the English sailors, who answered to the nickname of Squinty. Finding John in charge of the galley—Sambo being busy with the captain and engineer—he thought it a fitting opportunity for a little foraging.

'Gimme a cup of cawfee, m' lad,' said Squinty,

patronisingly.

'Are you supposed to have one now?' asked John, in surprise.

Squinty ought to have bluffed, but mistakenly he exposed his hand. 'Never you mind about serposed or not. Hand it over.'

You'll have to wait till cook comes back; and, if he is willing, you can have it,' said John with an air of finality.

'Wait your granny!' answered the valiant Squinty, pushing his way into the galley, whence two seconds later he emerged hurriedly, sat on the deck, and tenderly nursed his jaw. Then he pulled himself together, and retired to his mates, who received him with a sympathy that hurt more than his injured jaw.

John came out of the galley with a charred stick, and ostentatiously scrawled a big 'No. 2'

on the paint-work.

'Why for that?' asked his sable overlord anxiously. 'Why you make sums on the door, eh?'

'So as not to lose count. About eight more I make it,' answered John ambiguously. Whereat cook shook a curly head.

Nevertheless, John never went beyond No. 3, as it happened to be unnecessary. He was undoubtedly to blame for the next big disturbance, which was with Big Dutchy, the cock of the fo'c'sle. A cook's mate should know his business better than to permit himself to be tricked into allowing one man two dinners, while another man had to go without any. Big Dutchy was naturally annoyed, as he happened to be the missing man. John was not sufficiently apolo-

getic, so Dutchy emphasised his discontent by grabbing John by the throat and pushing him back into the galley, shaking him like a rat. In the confusion, Sambo managed to get himself pinned between the struggling pair and the hot stove, and when his hide began to scorch he wept aloud and told his sorrows to the world. A coffee-pot on the stove came in reach of his hand, and, picking it up, he managed to get most of the contents into Dutchy's face, who instantly raised the blockade and rushed forth full of threats of what would happen to John and Sambo, separately and collectively, when he caught them out of their burrow.

As a consequence, John found that he was engaged to do battle with the Swede that evening in the break near the forecastle-head, when the captain would be below. The men were Epicureans with regard to a fight, and wished it to take place at a time of fullest enjoyment for the greatest number. John was admittedly nervous of the result. He had experienced the grip of Dutchy, and had estimated his force. In skill he felt that he would hold his own; but there was not very much room for manœuvring, and in rough-and-ready in-fighting the Swede ought to be supreme. Tiny gave him good advice. The big stoker knew the ring well, and advised John to keep out of the grip

of Dutchy, and trust to speed.

It was whirlwind work. Dutchy rushed his man, but was checked with a cross hit on the jaw, and one in the wind that gave him pause. The next blow of his, however, nearly finished the bout. It knocked almost all the available breath out of John, and he was lucky to escape the knock-out. For some minutes John had to go warily, and recover his breath and strength. Then Dutchy tried to grip, and as he came John caught his wrist and with a swift jerk nearly dislocated his arm, twitching him forward on to his face. John was thankful for a slight knowledge of jiu-jitsu acquired from a smiling and deferential valet on the Florida, who had taught him just as much as he thought a mere Occidental ought to know. Another fall in quick succession rattled up his opponent still more, and a pretty bit of in-fighting ended in Dutchy getting it on the point of the jaw and going down like a sack. An iron deck-bracket completed the work, and he went aft, after his recovery, to get his head bound up with diachylum. He was closely cross-questioned by the captain, and lied heartily and heavily. In the end Captain Royl kicked him forth, and sent for John.

'Now then, my man, what is your little game?' was the greeting.

'My little game? I don't understand you,'

replied the innocent John.

'Oh, you don't, don't you? Well, I'll clear your understanding for you. You come on my ship, smash a bucket and a Dutchman one day,

and waste all the diachylum plaster in the ship the next.'

'He fell against an iron bracket, sir.'

'And you helped him. I'm not a fool, my lad, and I reckon to know what's what.'

'I assisted nature, it is true; but whatever I did was from motives of economy, sir.'

'Economy? What the thunder are you talking about? What the dickens do you mean with your economy?'

'Well, you see, it was this way. It looked as if I'd have to work right through the crew before I got peace, so I took on Dutchy to save the waste.'

The captain leaned back in his chair and glared like a puzzled chimpanzee. 'Thundering Jupiter!' he muttered; and then the old Adam revealed itself. 'Tell me all about it.'

John told his tale modestly, while the captain offered his excited comments.

'I wish I'd seen it,' he said regretfully when the tale was told. 'Where did you learn to scrap?'

'I'm fairly useful at most sorts of sport. I'd nothing else to do. I learnt a bit of wres-

tling from a Jap from Yedo.'

'It must have been all right'—this with a tone of regret. Then, rousing himself to a sense of his duty, the captain said, 'Say, here, though, my son, don't think because you've been lucky enough to knock out a lumpy Dutchman, who can't fight a cent's worth, that you can boss my ship. There are at least two of us left who can give you more than you want. Take my tip. Don't get crosswise with Tiny the stoker, and don't rile me.'

John looked at the little captain, and felt that he was no boaster. To the captain's visible discontent, John said nothing.

'I almost wish you had given me back-chat,' the captain said dolefully; 'but you are wise. Go for'ard. You needn't do cook's work any longer. Blow me if I don't make Dutchy cook's mate, and give you his job.'

'I'd rather you didn't, sir. Somehow or other, since I have fought Dutchy, I like him

better.'

'All right. Go for'ard and send me Dutchy

When nobody was looking that night, Dutchy shamefacedly offered a dirty hand to John, who took it, and felt warm right through when he shook it.

Incidentally, the trouble did John good. He had felt a coward every time he thought of his ridiculous adventure when he put himself adrift in an open boat from sheer cowardice and indecision, from inability to face his fate, and this adventure of his had rehabilitated him. He thought that he was no such coward after all. In reality, he had only proved his physical bravery; he was still to prove his moral bravery.

THE WHITE JEWS OF COCHIN.

By ALFRED C. VINCENT.

HIDDEN away in the midst of a mixed population of Hindus, Mohammedans, and Christians in the old town of Cochin, on the Malabar coast, may be found one of the most interesting races of polyglot India. Few people, indeed, know of the white Jews of Cochin, and of the centuries of struggle they have had to maintain their existence in the face of strenuous religious and racial opposition. Yet their story

is as interesting as any.

Their origin is obscure, but they have stories to the effect that the original settlers came to Malabar at the time of the escape of the Jews from Babylonian captivity. There is every reason why this should be true, and there is evidence that they were a power in the land soon after the birth of Jesus Christ. their possession at the present moment is an engraving on copper of a grant to one Joseph Rabban, made by one of the kings of Old Malabar. Its probable date is the third century A.D., and, as may be imagined, it is their most cherished possession.

These Jews do not appear to have escaped the persecutions by other races which seem to be inseparable from the history of Jewry in all parts of the globe. Successive massacres by Mohammedans and Christians have taken place amongst them, and they have repeatedly been driven from their habitations to take refuge in the distant jungles at the foot of the Malabar hills, only to return with the persistence of their race when their persecutors seem to have been satisted with their blood. During the Portuguese period of possession of Cochin, they were discovered to have helped the attacking Dutch in the year 1662, and the Portuguese consequently destroyed their synagogue, together with most of their valuable records and parchment Bibles. The Dutch, however, on defeating the Portuguese in the following year, helped the Jews to rebuild their synagogue; and there is at present in Jewtown an old Dutch clock which is still an object of great interest to the few visitors who find their way there. With reference to the rebuilding of the synagogue there is an interesting story. The floor of the building is tiled with the most beautiful willow pattern and rose pattern blue Canton tiles of great value, and these came into the Jews' possession in the following manner. It was the custom years ago for the Chinese to send trading-ships to Cochin, and on one occasion a ship arrived with a load of these beautiful tiles as a present from the Emperor of China to the Rajah of Cochin. The wily Israelite at once saw his chance of getting a cheap floor for his new synagogue, and so caused it to be spread about that the blood of cows had been used in the making of the tiles. Now it is well known that the Brahmins, of whom the Rajah of Cochin was one, could not on any account have in their houses such an abomination as the blood of the sacred cow, and so the Rajah, on hearing the story, was easily persuaded to hand over the tiles to the Jews, who were known to be eaters of cows' flesh, and so had no religious scruples in the matter. An application of a little palm-oil to the hand of the Prime Minister probably accelerated matters; and so at the present moment the floor of the synagogue at Cochin is worth a Rajah's ransom!

In appearance these Jews are much like all other members of their race. They have the same Semitic cast of countenance, but have chalky-white skins and red lips. Their language is Malayalam, which is that of the country they live in; but all their ritual is in Hebrew, and that language is taught to all their people. To a man with an imagination it is a sad spectacle to see them at their devotions crying out to God in a loud voice, and all wearing on the right hand the leather thong (the tephilin) to signify their bondage in a strange land. One thinks with sympathy of their great struggle for life in exile, and admires their constancy and devotion in preserving both race and religion in the face

of adversity.

Their numbers are much diminished, and amount to only about one hundred and fifty members, a large number of whom are patriarchal old men who still seem to bear traces in their faces of the fierce opposition to which they have been subjected during the history of their community.

DAY'S SPORT IN THE UNITED PROVINCES.

THE nearest railway station to the district in which we intended to commence operations is about a hundred miles from Jhansi, and it takes quite eight hours to get there. The journey can hardly be called de luxe. The dirty and uncomfortable coaches are probably among the oldest that remain on Indian railroads. train stops at every station, to be greeted by a

howling mob of excited and hysterical coolies, making it next to impossible to get a wink of However, peace comes at last when our coach is slipped into a siding somewhere about

At six A.M. the station restaurant provides us with a hurried breakfast; in addition we give a long list of our wants to the man in charge. These railway restaurants are stocked with every species of canned goods, from Nestlé's Swiss milk to Cambridge sausages, and they do a large business with people who, like ourselves, are going to picnic or rough it for a few days off the beaten track.

Having ordered a sufficient quantity of food and drink to last us for the greater part of our outing, we had it packed on an ecka (bullockcart) with our personal baggage, rifles, and a couple of tents. So we set out on our march of seven or eight miles to a dâk-bungalow, where we intended to spend at least two nights. Although we could have procured wretched little ponies to carry us on the journey, a walk appealed to us early in the morning—the cool of the day.

Our party consisted of two servants—one a fine-looking Sikh orderly, and the other a rascally but 'most obliging' Mussulman from Benares—and one or two coolies. The chief of police met us at the station, and gave us a lot of help as to the best and nearest way to get to our destination. Before we had gone two miles we left the bullockcart behind.

The walk in the early morning was most enjoyable after our close quarters. For the first two or three miles the country was quite open; but we noticed as we proceeded on our way that trees and shrubs became more and more frequent, and after a tramp of about four miles we called a short halt in the midst of comparatively thick jungle, though most of the trees were small and scrubby.

The heat was now rather uncomfortable, especially when an open plain was reached, whence we could see the bungalow, which seemed nearer than we had expected, and prettily situated among some shady trees. But, alas! distances are deceptive in India, and we found we had to make a long detour through a native village to avoid a deep nullah which was partially filled with water, and approach the bungalow from the rear.

Needless to say, I was glad to get to our destination. We were very hungry, thirsty, and hot, and unfortunately, owing to thoroughly bad management, we had left all our supplies and baggage with the bullock-cart, and actually had to wait two and a half hours before it arrived. Most of this time we spent sitting by the edge of the nullah in the shade, with our feet in the water. We did not dare to bathe, as the sun was too hot; and it was just as well, for I heard afterwards that this water is a very favourite resort of crocodiles.

Supplies did come at last, and then we enjoyed a siesta. By five o'clock we were thoroughly refreshed, and sallied forth, shot-gun in hand, with one or two beaters, in search of peacock and partridge. I was lucky, for I took the left of the line, with T. on the right. A partridge was the first bird to show itself, running very quickly, and finally getting up pretty far out.

However, I managed to down it. I also collected a couple of peacocks and other two partridges. These partridges are very similar to the bird we are so familiar with at home. All sportsmen know how the British bird can run; but I think its Indian cousin can give it twenty-five yards in a hundred, and beat it in a canter. Peacocks give little sport unless they can be driven high over you like a pheasant. They are most excellent eating, rather like a turkey, but better. They were a valuable addition to our food-supply during the week's stay in this district.

Our bungalow might almost be called luxurious, considering its remote situation. There were two beds, one actually a spring-bed, and the other an ordinary native charpoy. We drew lots for the spring-bed, and I won; but unluckily I fell through it in the night. In spite of this, I slept soundly, and was loath to get up at five-thirty next morning. But the prospect of sport is a wonderful incentive, and by six-fifteen, dressed and breakfasted, we were ready to make

a start for the jungle.

Stepping out on to the veranda, we found a large assemblage of coolies and carriers waiting for us, all very excited, each armed with a small axe, which the natives of this district use very skilfully to cut their way through thick bush. Our *shikari* was indeed a striking figure, very broad, with long shaggy beard, and fierce of eye; and he was particularly conspicuous, as he was the only one to sport a pair of European trousers, which he was very proud of, although both knees were gone. He had originally been a native policeman, and, like all the members of his order, he terrorised the coolies, and had them in complete control.

The morning was brilliantly fine, and at this time deliciously balmy and cool. Scores of green parrots were screeching overhead, and one hardly took a step without flushing a partridge, a peacock, or, in larger numbers, the small Indian dove, pretty little creatures, and good eating.

Our party consisted of seventy beaters, six carriers, the shikari, two ponies, T., and myself. We parted from the beaters soon after leaving the village, and after a long tramp got into our position for the first drive, which was over a thickly wooded hill, the beat starting quite close to the village, and driving right away from it. I was on the right with the shikari, my friend on the left, some distance lower down. There was a fairly deep ditch in front of me, and an open space on the right, which would give a splendid opportunity of a shot if anything were to come that way. I had with me a '475 double-barrelled rifle and a '360 express. I trusted more to the former than to the latter.

After a short wait there was a signal for absolute quiet, and in the distance, far up on the hillside, I could hear branches cracking, the noise becoming louder and louder, as of a large herd of sambur (the so-called Indian 'elk')

approaching. I don't think there is anything so exciting in all the world as the noise of big game on the move, and coming in the direction where you are waiting for them. You sit fairly quivering with anxiety, wondering if you are going to get your shot in, and if it will be a straight one.

The sambur—for such they were—galloped straight down the hill toward me; but when they were not more than seventy-five yards away they seemed to turn and make for T., lower down. But I think they must have seen him, for they took a turn to the left and came straight for me. Neither seeing nor winding me, they trotted into the open space, and I waited anxiously for the large head to appear which I thought must be there. But I was to be disappointed; for, although the herd numbered about thirty, there were only two small heads among them, so, naturally, I left them alone.

I had hopes that the beat was still to be productive of something better, and when I again heard branches smashing, and the beaters shouting away on my left, I thought my hopes were justified. The animals broke to their right before they got any distance, and must, I thought, have gone straight for T. But I heard no shot, and concluded they must have broken back

again.

The line of beaters was nearly up to us now, and when T. joined me he said three nilgai (a large and ungainly antelope) had passed quite close to him, but he had not fired in case of frightening away any sambur which might still be on the hill. So the first drive, though full of excitement and interest, was unproductive of a shot.

Now came a gruelling walk of about a mile and a half to the next beat, which was to be along the top of a fairly precipitous hill. We made fair way at first, and I think I might have bagged a nilgai if my small rifle, which I happened to be carrying at the time, had not misfired. We separated from our beaters at the bottom of the hill, and the climb commenced. It was getting on for midday, and the sun was almost at its hottest. I thought the top would never be reached; but we plodded on, and, coming to an open space about one hundred and fifty yards from the summit, I left T., who was to take up his position behind a big rock at the far end of the clearing. I rather envied his not having to climb to the top; but I got to my stance eventually. When I was able to look round me, I found I was on the edge of a huge slab of rock which jutted right out from the very top of the cliff, with a drop of about thirty feet. My position was truly a commanding one, for practically I could see to shoot on every side, though in most places the grass was very long, so my shot, if I got one, would be difficult, and I didn't quite fancy a tussle with a wounded panther or bear, for I should be completely

cornered, situated as I was on the edge of the rock.

I had plenty of time to admire the view before the beat started. It was perfectly wonderful. All around me as far as the eye could see was one enormous expanse of hilly jungle, with here and there a small sheet of water glittering in the sun. The many hills dotted over the country were all thickly wooded, and did not reach to any great height.

A touch from the shikari, who was pointing at my rifles, told me that I ought to be in readiness, for the beat was about to start. One never knows in this sort of shooting what to expect. An animal may break cover the instant the beating line begins to advance, or, again, it may lie close till the line is almost up to you, and then probably break back. I had hopes of seeing a panther, for I knew there were some about, and it was an ideal bit of country for them. But this was not to happen, for the panther is perhaps the most cunning of all animals; and, though the beaters swore they had seen one, it never came forward. The fact is, men beating on foot, and armed with only a small axe, even if they see a panther, will leave it to go its own way without making any effort to bring it forward; and one really can hardly blame them for thinking that discretion is the better part of

I had been sitting stock-still for about ten minutes, when I nearly jumped out of my skin, for about fifteen yards from me came a series of short barks and snarls, evidently from a small rock cave on the side of the hill. All-expectant and quivering with excitement, I cocked my big rifle in readiness, when the shikari, with a disdainful grunt, muttered, 'Girdar' (jackal), much to my disgust and humiliation. The beat had got about half-way, when I heard a lot of shouting near the top of the line. These shouts resolved themselves into 'Bhaloo' (bear). Now at last I was going to get a shot. I kept perfectly still, waiting and hardly daring to breathe, when suddenly, about seventy-five yards from me, a large bear broke to the left of the line of beaters and over the hill. I had time to get in one shot and no more before it disappeared. It was only a snap shot, for the ground was rocky and uneven; and when I went up to the place after the beat, I found the mark of my bullet on a stone about a yard nearer me than where the bear had passed, showing that I had fired too low, and the animal had escaped untouched. This beat was otherwise unproductive, for T. had seen nothing; so, descending the hill, we sat down rather disconsolately to lunch. So far our luck had been out.

The first beat in the afternoon, which was situated along the bottom of a high cliff amidst thick jungle and large stones, was also blank. I took up a stance within twenty-five yards of the cliff, with T. about one hundred and fifty yards

on my right. Two tigers, I knew, had been killed here the year before; and, although none had been seen this year, I still thought there might be the chance of a shot. If so, it would have to be a straight one, for there was no other protection than my two rifles, not even a friendly tree of sufficient size to swarm up if the worst came to the worst, and if there had been time, which would be highly unlikely. But no tiger came, and the only excitement of the drive was furnished by some sambur, which broke back through the line of beaters, and a small bear which passed somewhere among the rocks between myself and T.

Although we had a long distance to cover to the next beat, which was on low ground, it was an easy walk, being mostly downhill. We passed through some very pretty country, and when we reached a large nullah, which had quite a depth of water in it, unmistakable tracks of panther were in evidence; the spoor was sharp, and it could not have been more than one or two nights previous that the animal had been there to drink. There was a chance of seeing it in the next beat; but if it was there, it proved too

cunning to appear.

Just after we had crossed this bit of water, some chinkara were sighted about one hundred yards distant, feeding on rough and open ground. T., who was in front, got to within about seventy yards, and let blaze, dropping a buck with a really nice little head. It was a good shot through the neck. The chinkara is a small Indian gazelle, and at seventy-five yards makes a tiny target. The animals are very graceful, and can cover the ground rapidly. The horn measurement of a good average head is from ten to twelve inches.

Nothing more occurred till we took up our places for the next and last beat. I was on the right, T. on the left, both of us facing some fairly open ground at the bottom of a thickly wooded hill. Almost before I had settled down some pig passed to my right; and although I could not get a shot at them, I killed one on the walk home. There is no pig-sticking in this district. A few minutes later I heard some heavy animals moving on the hillside some distance away, between myself and the gun on my left. I hoped they were a herd of sambur, but they turned out to be nilgai. The brutes came forward splendidly, and, passing about forty yards below me, stood in the open and gave an easy shot. I killed the foremost one. There were three altogether, and they had very small heads even for nilgai. Better luck at last, for the beat had only commenced; and although nothing more came near me, I heard T. fire twice, and when the drive was over found he had secured a sambur stag, a large and heavy animal, but carrying only a moderate head.

I was well satisfied with the day, for up till the last drive I thought we were going to draw blank. It is a well-known fact that one may spend a week in this part of the country and never see a single animal worth shooting, though the country is generally infested with game. This is very often the case when wild dogs are about, and I had seen unmistakable signs of them. I shot one the next day.

It was nearly seven o'clock when we got back; and having paid the coolies, and told them to be ready for us about five-thirty next morning, for we had farther to go, we sat down to a plain but

ample supper, and then to bed.

Such is one out of many delightful and interesting days' shikar in the United Provinces, one of the most fascinating districts in India for sport. One has to be an enthusiast, work hard, rise early, and sometimes walk long distances. There are no elephants, and one must not expect large and sumptuous luncheon picnics in the jungle. There is a delightful uncertainty about it all, and quite enough danger to make it exciting. One never knows what sort of game may be met with; and on the rare occasions when dangerous game is encountered there must be accurate shooting, otherwise anything may happen.

THE LAST MILESTONE.

Another milestone marks the way; Sombre and stern its height uprears, It chills us with the shadowed gray Of fleeting time and vanished years.

So short a time ago—in June— With dancing steps we gaily went; Now mellow lights of afternoon Give warning that the day is spent.

Ah, when we parted, young and true,
How high we dreamed of conquests won!
Alas! how much we planned to do
Our feeble hands have left undone!

How many broken visions trail

Their fitful splendour o'er the skies;
How many heights we thought to scale

Life's mists have hidden from our eyes!

How many lovely dreams of sweet

Have drifted out of sight and mind;

How many hopes our hasting feet

Have left forgotten far behind!

Ah me! the milestones thronging fast
About us, on our shortening way,
Imperious date our far-off past,
And beckon back to yesterday.

Thus, while the sun sets, flaming strange
Wild beauty o'er the darkening night,
Thrills through us that great thought of Change
Should the last milestone be in sight.

MARY M. CURCHOD (MYRA).

Algiers.

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, Yesterday.

THE summer is the season for games, those of the outdoor kind. Some of them are played in the winter, chiefly golf and football, and in the case of the latter there is more watching of games during the part of the year that is poorest in weather than at any other time, and it is perhaps something that the sense of British hardihood is satisfied in this matter of winter sports, and that we never cease to take part in them just because it is wet and cold. Yet it is obvious that the summer and autumn are the periods for their most perfect enjoyment. shine and warmth are essential to absolute enjoyment of life in ways like this, and now we are at the height of the season for them. Many circumstances have combined to make questions of sports and games of far greater interest and importance at present than they have ever been before. In several directions the whole scheme of life and the world seems to be in process of reconstruction. What has satisfied for hundreds of years with little, if any, alteration is now condemned as poor and insufficient. In nearly every detail of the system of existence there is an upheaval, and since sports occupy such a considerable portion of the average person's lifetime, it was inevitable that they also should be made the subject of investigation from new points of view. It happens that there have now come forward certain questions in regard to this country and its games which are really of supreme importance, not merely to the people who play and watch these games, but to all the individuals of the State. It is very true that games do not end at the playing and the watching, or even at the talking about the play that ensues. They have been so much advertised, and rivalries-local and international—have been so artificially stimulated, that they have come to occupy a very high place in public attention. Many times since last winter far more space has been given to them in leading and the most serious newspapers than to the whole of the foreign news; it has inferentially been considered that readers are more concerned with what are, or should be, sparetime diversions than with all the other affairs of the outside world. And the first and chief of the questions is the increase and intensity of

what we may call internationalism in sport. There may be no such word in a comprehensive dictionary; but it is necessary to the circumstances of the present case, and at once suggests its meaning. Twenty years ago there was hardly any such thing. At that time Britain was so much the foremost in games as to be almost the only country that gave them more than casual attention. We were the first to look upon them as almost important matters of life. With us they did not then occupy one quarter as much public attention as they do to-day -witness the fact that so far back the number of spectators at a football match was five or ten thousand at most against the fifties of thousands that frequently watch a game nowadays—internationalism extended only to cricket matches between this country and Australia, some yacht-races in which Britain and the United States were concerned, and occasional contests spasmodically in other departments of sport. At that time America was very young in these matters. It had not cultivated its own baseball as it has done since; its college football had not developed to the point of engagements in which players are seriously injured and even killed, as sometimes happens now; its golf was only just beginning; in tennis and polo, at which it is now so prominent, it was as a child. France and Germany were not at that time concerned with games at all; they despised them, and ridiculed this country for the attention it gave to them. Whether, considered as for the good of humanity and the world, the case was better then than it is now or not, it is certainly the fact that there is a striking contrast between the circumstances of the periods, and the difference must have a meaning and a consequence. Games are becoming universal, Britain is said to be losing its supremacy, and this loss is being looked upon as a serious matter and an indication of racial decadence and physical inferiority. That is what internationalism has done.

* * *

See what the state of things is now. Games have become an even greater consideration in American life than they are in ours. The American people play them more, they watch them more, and they read about them more. Young in their zeal and violent in their en-

thusiasm, and infusing into their games that aggressiveness towards others and ambition for supremacy which is a national characteristic, they have determined to take the lead in internationalism, and consider that they have already done so. It is part of their new principle that the practice of games makes for physical fitness and perfection, and that they are necessary to their life in view of the strain that is exerted upon them in the ordinary affairs of commercial and professional work. So they have organised them to such a degree as they have never been organised before. In other countries the same tendencies have been more slowly manifested in recent years, but hardly less firmly. The attention which our colonies are giving to their sporting affairs is fast increasing. In France a veritable fever for sport has set in. Ten years ago the French did little more than make themselves ridiculous when they tried to play football against our people; now the game is thoroughly well established in the country, great skill has been attained, and France can, and does, make a good match of it with parts of Britain. Golfcourses are being made all over the country; and quite recently two Cabinet Ministers were discovered playing this game for the first time, and were forthwith led to express their belief that such a diversion is necessary to France, and must be greatly encouraged. Germany ten years ago laughed at us for the interest we showed in outdoor pastimes, and professed to be content that we should continue in this way while the children of the Fatherland took our trade away, educated themselves beyond us, and prepared themselves in different ways to take the lead in the world. Now Germany also is giving herself to games; she too is adopting golf, and there is a German Golf Association which publishes a bulky year-book about its doings and arrangements. The Spaniards used to be regarded as much too lazy for anything except smoking, loafing, and making love. Their ideas of sport were limited to the bull-fight. they also have begun to play golf, and a new course has been established near Madrid on which a sum of money equal to about forty thousand pounds has been expended. Football clubs have been set going in all parts of the country, the Association game having been adopted on precisely the same lines as in Britain; while they have a national cup competition, to which King Alfonso has given a trophy, and the tournament excites general attention and draws large crowds of spectators. It is even being suggested that football will displace bull-fighting, and to that extent it would certainly be a very good thing for Spain. Italy likewise is starting with similar games, and it is the same in many other foreign countries. In such circumstances it is no doubt inevitable that a certain amount of international rivalry should be stimulated. As soon as a boy or a man begins to play a game of any sort he wishes to compare his skill with that of others, and he tries to improve it so that he may become better than they are, and, if possible, the best of all. Without competition, games have hardly any meaning. As a matter of high ethics, sport should be indulged in for the sake of sport only; the game should be played for the game and not for the winning of it, and the essential and admitted object is not conquest, but diversion, mental relief, and physical improvement. The winning and the losing, however, give a necessary stimulus to the pursuit, and it is almost inevitable that they should come to be paramount considerations, since human nature is what it is, and no man likes to be beaten at anything. As with the individual, so with the nation; and therefore, as the countries come to compete against each other, these games have become both national and international affairs, and there is the desire for conquest everywhere.

* * * Two years ago the series of Olympic Games that were held at Stockholm, in which most of the civilised countries of the world took part, created enormous general interest and placed internationalism in sport upon a new footing. Very soon another series of these games will be held at Berlin, and for a long time past there have been preparations for them by all the competing nations. It has been urged that the results of the last meeting of this kind showed that Britain was on the down-grade physically and athletically, and that the Americans and others had become our superiors. This was regarded as a most serious menace to our national future, and an attempt has been made to raise money for a new and vast organisation of our human sporting and athletic material. In a large measure this attempt has failed; and is its failure altogether a matter for regret? How much will it benefit a nation if, say, twenty thousand pounds is spent in the selection and training of a number of specialised athletes who will represent it at such games, and beat others on whom money has been spent in the same way by their own people? It may be that each country will take a keener interest in such games, will read about them more, and will watch them more; but it by no means follows that for all that expenditure on the selected representatives the physical quality and efficiency of the young people generally of the respective countries will be to the smallest extent improved. When it is suggested that they are thereby encouraged to try to emulate the successful in these matters, and to become their country's chosen champions, thus bettering their bodies and increasing their human efficiency, it often seems that the ambition on the one hand, so far as the first part of it is concerned, is not desirable, and on the other it is not practicable. So the nation's youth in general is content to watch and read, and the success of one nation at the

games is not at all indicative of the athletic and physical superiority of the nation as a whole; while there is the fair inference that the nation that devotes less attention to these affairs is expending its energies on some others which it regards as of greater importance. The love of British people for sport and games of all kinds, and their activity and enthusiasm in participation, stand in no need of vindication. Before this internationalism set in with its present vigour, the question had already arisen in a grave form as to whether we were not playing far too much, to the neglect of other and more important interests; now it is being urged that we are not sufficiently keen, that we are losing our place, and hence that we are degenerating. But the truth is that we are playing more, watching more, and generally give far more attention to the subject than ever we did; and if, with all this, we really do not maintain our place, and countries that have taken up sports like new toys show themselves better at them, for the time being, than we are, the answer of those who take the broader and farther view of life and work and national interest is simply, 'Let them.' During the long period that Germany has almost entirely neglected games has she suffered as a nation? It is in that period that she has made the most remarkable advance, has lifted herself to a topmost place in power and interest, and become the gravest menace to other nations.

But there is another aspect of this internationalism which is of deep consequence. It is commonly suggested that it improves friendliness and understanding between nations, encourages peace in the world, and promotes human advancement. How far is this so? When nations play against each other there must be winning and losing, just as there are when individuals are matched; and as no single man likes to be defeated in any competition with another, however much pleasure he may be supposed to derive from the game, still less does a nation like defeat. The nation as such does not play, and the pleasure of the game is nothing whatever to it. The mere playing and the pleasure of it are not a consideration; the winning and the losing are absolutely everything. Nothing that is fair must be left undone to achieve victory; there must be sacrifices of old and favourite systems; new, inconvenient, and often disagreeable departures must be made; and at the end, when, some one having won, some one has lost, a smarting sense of failure is experienced. Effort has been in vain, inferiority has apparently been proved, and where then is the satisfaction? There is exultation on the winning side, and depression amounting almost to shame on the other. Certainly in such circumstances the cause of friendliness is not improved. It can hardly be said of any of the great international contests of the past that they have been productive of international good; very often they have brought about grave misunderstanding and harm. There have been yacht-races between Britain and America that have aroused the most unhappy feelings, and even the cricket contests between the mother-country and the colonies have had unfortunate sequels. So far from such contests being good for countries, they are undoubtedly bad for them—bad in both their national and international effects. The controversies that ensued on the last Olympic Games were of the most unpleasant character.

The matter is considered in this way now because there is a movement in the making in a quiet but forceful way for the discouragement of this form of international sport. It is not the desire that it should be abolished altogether; but the object is to lessen the organisation of it, to lower the plane of importance that it has assumed, and so to mitigate its consequences. This movement is not originated by faddists or by men who are merely bookworms, scientific professors and students, and have no love for games and sports. It is supported by people who are themselves keen sportsmen, great lovers of games, and have the best interests of these games at heart. What they do not wish is that either the games themselves or the people who play them should be spoiled, and so they call for a lessening of this international activity and a slackening of the system of organisation. The circumstances of the present season are remarkable. The British and the American people are, and can be, the very best of friends. There are many reasons why they should be, and the blood reason and that of mutual interest—the two best conceivable—are paramount. But in the nature of the case intense rivalry between the countries in almost all departments of life and work is inevitable, and it is a matter of no small difficulty so to control and regulate these rivalries that perfect and continual peace and friendliness shall always be maintained. The fewer new and unnecessary elements that are introduced into this international competition the better. As it happens, this element of sport and games is the most dangerous of all, partly because of the American aggressiveness and our own susceptibilities; and partly because, without saying that they are better or worse, the American ideals and systems and temperament are by no means the same as ours. If our own tendency is to regard games less as media for physical pleasure and mental diversion than as things for winning and losing, the American disposition in the same direction is far in advance of ours. With them competitions are absolutely everything. We do not like to be beaten by the Americans; the Americans certainly are not pleased when we beat them, and they determine that, at any cost, the case must be reversed. No game or contest, whatever its results, ends with one particular victory or loss. There must be retaliation

and revenge. Nobody can ever be satisfied, and there must be continual comparison and controversy. Great preparations are now being made in America for the celebration of the centenary of peace between that country and ours. The American Peace Centenary Committee have determined upon the expenditure of more than two hundred thousand pounds in different ways for this celebration, and their efforts may be productive of very much good in the mitigation of the doubts and jealousies which still exist. The opportunity is magnificent, incomparable. At the same time, the international rivalry in sports and games has assumed a proportion far beyond anything it has attained in the past. There are to be more yacht-races, more polo contests, more lawn tennis matches, and the competition between the countries at golf has sprung up in the most surprising manner, so that even this game—which above

all others is one for the playing and the pleasure of playing, and not for the watching and the reckoning of wins and losses—has become one of general public interest in the international sense, and has had its old happy equilibrium completely disturbed. No doubt there is something, perhaps much, to be said on that side of the question. Golf is certainly a fine thing for the American people; it is just that kind of game they needed, and it is well for them that it should be extensively advertised in their own country. But there are some people who are a little doubtful as to what is the British gain in this matter, and whether the cause of international amity is likely to be much advanced. For myself, as one by no means without experience of the matter in both countries, I express no opinion now, but state the case as it is being stated by others. Its importance is manifest.

KNIGHT ON WHEELS.

CHAPTER XXVII.-THE RIVALS.

T was five o'clock on a fine spring afternoon. The model had just resumed his ordinary raiment and departed, and Montagu Falconer was cleaning his palette. To him entered a timorous maid.

'If you please, sir, Miss Leslie has called.'

'That is quite possible,' replied Montagu calmly; 'but it does not interest me.'

'But she wants to see you, sir.'

'I fear I cannot oblige her. It is Miss Marguerite's duty to receive afternoon callers.'

'Miss Marguerite is out, and Miss Leslie specially asked for you, sir,' persisted the maid, trembling beneath her employer's cold blue eye.

Montagu Falconer ruminated for some few moments. Unfortunately he omitted to remove his eye from the maid, and that sensitive young person was on the verge of an hysterical yell when he turned upon his heel and said curtly, 'Ask her what the devil she wants.'

The maid humbly withdrew. Having closed the studio door behind her, she indulged in a few grimaces of a heartfelt and satisfying character, and after pausing to admire herself for a brief space in a Venetian mirror conveniently adjacent, returned to the drawing-room, where she took her stand before Miss Leslie with downcast eyes. 'Mr Falconer sends his compliments, miss,' she announced deferentially, 'and would be very much obliged if you could say whether you wanted him particular, because he is painting a picture.

Jean Leslie smiled. She was wondering what Montagu really had said. But to the maid she merely replied, 'Is the model there?'
'No, miss. Models go at five.'

'Then say to Mr Falconer that I should be greatly obliged if he could see me for a few

minutes, as I wish to consult him upon an important matter.'

When the maid had departed Miss Leslie rose and walked to the window, through which the afternoon sun was shining. Peggy's tastes rather leaned to rose-coloured curtains and silk blinds. Jean Leslie arranged these to her liking. Then, having adjusted her hat to the proper angle, she sat down with her back to the light, and waited.

'Well, Jean,' Presently Montagu entered. he said affably—he was flattered by his new rôle of consultant—'you are looking very smart to-day.

'This testimonial is most gratifying,' said Miss

Leslie. 'Do you like my furs?'

Montagu surveyed her critically. He had a real eye for form and colour, and he nodded 'Yes,' he said; 'they suit you perfectly. And that bunch of violets adds just the right touch of subdued colour.'

'Thank you,' said Miss Leslie meekly.

Montagu sat down on the other side of the 'However,' he said importantly, 'I believe I am correct in supposing that you did not come here to show me your clothes.' In this he was not so correct as he thought. 'I understand you wish to have my opinion on some matter.'

'Yes,' said Miss Leslie. 'It is a matter which I could confide to no one but a very old and

very trustworthy friend.'

Quite so, quite so,' said Montagu, much gratified, but a little staggered. For the last twenty years he had rarely encountered the lady before him for more than five minutes without becoming embroiled with her in a skirmish of some description, and pitched battles had been not infrequent.

'I want to ask what you think, Montagu,' continued Miss Leslie. 'You are one of the few people I know whom I would describe as a true man of the world.'

Montagu Falconer began to purr gently. 'Possibly!' he said; 'possibly! Well!'

'The fact is,' confessed Miss Leslie, after a momentary hesitation, 'I have received an offer of marriage.'

'Good God!' exclaimed Montagu. 'Who is the '—he was about to say 'idiot,' but corrected himself—'gentleman?'

'His name,' said Miss Leslie, casting down her eyes, 'is Adolphus Prince. I have known him for many years.'

'Extraordinary name! Is he old or young?'
Miss Leslie considered. 'He is about fifty,'
she said.

'Rather elderly,'commented Montagu Falconer, who was only forty-eight. 'How old are you, by the way?'

'Forty-two,' said Miss Leslie coyly.

'I am bound to say, Jean,' remarked Montagu handsomely, 'that you don't look it. Now, what of this fellow? Is he a gentleman?'

'I hope so,' said Miss Leslie humbly.

'But are you sure? You dear women, Jean, if I may say so, are too apt to be carried away by your feelings. What is his station—his position?'

'He is a retired colonel of militia,' replied Miss Leslie. This statement would have surprised Timothy, who would have it that his rival was a superannuated tea-taster. 'He has lived a great deal in India, and is now quite alone in the world.'

'I see. One leg and no liver, I presume!' said Montagu facetiously.

Miss Leslie laughed appreciatively. 'You are as caustic as ever, Montagu,' she said. 'You spare none of us. But what do you think I should do? I am a solitary woman. It is a dreich business living by one's self, is it not?'

'It is—it is,' agreed Montagu, lapsing straightway into self-pity. 'Too true! Believe me, Jean, I know what it means better than most.'

'Still, you are not entirely alone,' Miss Leslie reminded him. 'You have Peggy.'

'It is a fact,' admitted Falconer with an air of gloomy sarcasm, 'that I do possess a daughter; but for all practical purposes I might as well be Robinson Crusoe. I never see her by day, for I am busy in the studio, and naturally do not want to be pestered. In the afternoon, as often as not, she goes out or invites some people in. In either case I take my tea alone, for I cannot stand her associates. When she does go out, she frequently returns only just in time to give me my dinner.'

Miss Leslie nodded sympathetically. 'I am sorry,' she said. 'I had not realised things from your point of view. It all shows how little we really know of one another's inner lives.'

'And the only nights upon which she ever seems to stay at home,' concluded the neglected parent, 'are those on which I go out.'

Montagu was accustomed to go out about five nights a week, and his daughter perhaps twice a month; so this statement may have been approximately correct.

'I see I have often been thoughtless in my previous attitude toward you, Montagu,' said the contrite Miss Leslie. 'We women are apt to forget that a man—even a strong, self-reliant man—may sometimes unbend. He too may desire companionship—the right sort of companionship, of course—as much as the weakest woman. Forgive me!'

Montagu, highly appreciative of the very proper spirit displayed by Miss Leslie, forgave her freely, and then launched into a further catalogue of grievances, Adolphus Prince retiring for the time modestly into the background.

When he had finished, Miss Leslie said, 'Peggy is young, and perhaps thoughtless. When she marries'——

Montagu Falconer nearly bounded out of his chair. He was genuinely alarmed. 'Marry? That child marry? Good God, Jean, don't suggest such a thing! What would become of me, I should like to know? What does the girl want to marry for? Hasn't she got a comfortable home of her own? Hasn't she got me—her father—her only relation in the world—to take care of her? My dear Jean, do not be romantic at your time of life, I beg of you! You haven't been putting notions into her head, I hope?'

Miss Leslie hastened to still the tempest which she had created. 'How masterful you are, Montagu!' she said. 'I declare I am quite afraid of you.'

Again Montagu purred. In the course of a long and stormy acquaintance, extending over twenty or more years, this was the first indication that he had ever received that Jean Leslie regarded him with aught else than a blend of amusement and compassion. A less vain and self-centred man might have felt a little suspicious of such sudden and oppressive adulation, but he did not. Montagu was one of those persons who like flattery laid on with a trowel.

'I am sorry if I alarmed you,' he said graciously; but I feel very strongly upon the subject. I haven't forgotten the trouble I had in getting rid of that bargee, Whatsisname—that chauffeurfellow! Curse it! What was he called? I have it—Meldrum! I foresaw trouble, of course, from the day upon which my daughter persisted in dragging his mangled remains into my best bedroom, instead of sending them to the workhouse. During his convalescence I had to be perpetually on guard. The fellow followed her about like an infernal dog. Once, when I had occasion to reprove my daughter—my own daughter!—for some fault, he showed his teeth and nearly flew at my throat! Oh, I had to be

pretty firm, I can tell you! However, I got him out of the house at last, and I am glad to say that he has not shown his face here for some months.'

'I like a man to be master in his own house,' said Miss Leslie approvingly. 'I fear my friend Adolphus Prince has not your strength of character, Montagu. I wonder if I should be happy with him,' she added musingly.

'He sounds to me,' remarked the courteous Montagu, 'a confirmed and irreclaimable nin-compoop. Has he a weak chest?'
'Yes. I wonder how you knew.'

'Any money?'

'I believe not.'

'Then why marry him?'

'Well,' said Jean Leslie slowly, 'I think I might be able to help him a little. A lonely man is a very helpless creature. Not a man like you, Montagu, but an ordinary man. Such a man lives, we will say, in chambers or a flat. He may even have a comfortable house; but he lives alone, for all that. He is at the mercy of servants; when he is in doubt about anything he has no one to consult; when he has done a good piece of work he has no one to show it to; when he is out of heart he has no one to encourage him. If he wants company he has to go out and look for it, instead of finding it ready to hand by his own fireside. Altogether, if he has not your great spirit and resources, Montagu, he is a very miserable man.'

The worst of the artistic temperament is that it is intensely susceptible to the emotion of the moment. Describe joy, and it becomes hilarious; describe sorrow, and it becomes tearful; describe

fear, and it becomes panic-stricken.

Montagu Falconer positively shuddered. 'Yes,' he said quakingly, 'that is true - very true. And more than that. It is not the weak man who suffers, or suffers most. The strong have their moments of dejection too, Jean. would hardly believe it, but even I'-

Miss Leslie, like a naughty little girl who is determined to make her small brother's flesh creep before he retires to bed, continued remorselessly, 'And what has he to look forward to? Nothing! Nothing but old age, with its increasing feebleness, and helplessness, and friendlessness. That is all!' She looked across at the shaking figure in the arm-chair, and suddenly there was real pity and kindness in her eyes. 'I should like to be able to save a man from that, Montagu,' she remarked gently.

Montagu nodded his head. For once he had

nothing to say.

'That is why,' continued Jean Leslie in the same even tone, 'I am thinking of marrying Adolphus Prince. I am no longer a girl. I should understand his moods, which are many. I could manage his house, and I would not be likely'—she smiled modestly—'to go losing my heart to some younger man after a year or

two. And of course, when I saw that my husband wanted to be left to himself and not bothered-as all husbands have a right to expect -I should have my painting to occupy me.'

'I will say this for you, Jean,' said Montagu Falconer almost effusively, 'you always had an appreciation of Art. But come now! What of this fellow? Is he a philistine—a bourgeois—a chromolithographer?

'I am afraid poor Adolphus has little knowledge of Art—Art as you and I know it,' replied Miss Leslie regretfully. 'But he is a

good creature in other respects.

Montagu Falconer began to walk excitedly about the room. 'There you are!' he said. 'There you are! Isn't that a woman all over? Here are you, Jean, with your splendid talents and comparative youth, with a strongly developed sense of what is right and beautiful, prepared to throw yourself away upon a half-pay, knockkneed, blear-eyed militiaman, who probably wears Jaeger boots and furnishes his rooms with stuffed parrots and linoleum. The idea is unthinkable—impossible! You cannot do it!'

'Then you forbid me to marry him?' said

Miss Leslie timidly.

'Certainly I do,' replied Montagu, noting to himself with intense gratification that a man has only to be thoroughly firm with a woman to win her complete submission. 'You don't care for the creature, I suppose?'

'Not very deeply,' confessed Miss Leslie.
'He is just a friend—a very old friend.'

She sighed, rose from her seat, and held out her hand. 'Good-bye, Montagu,' she said, 'and thank you! I must be going now. It was good of you to have such a long talk.'

'I say, don't go yet,' said Montagu. 'I mean '-He hesitated. He hardly knew

what he did mean.

'I think I really must,' replied Miss Leslie.

Montagu accompanied her silently to the door. 'You are going to take my advice, I trust?' he remarked as they stood upon the steps.

Jean Leslie pondered. 'I suppose so,' she 'A man's logic and common-sense are so invincible. Still, I owe you a grudge, all the same, for having deprived me of my one romance. I am not likely to have another, you see! Good-bye, Montagu, and thank you!

She gave her counsellor a shy but grateful glance, and departed down the street-a welldressed, well-carried, and well-bred figure.

Next morning Montagu Falconer, after a disturbed and introspective night, came down to breakfast at ten o'clock, and dismally surveyed Tite Street through the dining-room window. There was a piercing east wind, which penetrated through every nook and cranny. Peggy had breakfasted an hour ago.

Montagu rang the bell for his coffee, and shivered. He was feeling stiff in the joints this

morning. Could it be rheumatism? He would like to consult some one about this. But of course there was no one to consult. His daughter, naturally, was not at her post; she was downstairs ordering dinner, or something of that kind. Besides, it could not be rheumatism; rheumatism was an old man's complaint. Old man! Old men suggested thoughts of Adolphus Prince. He had some one to consult about his troubles; he could take them to Jean. Montagu consigned Adolphus to perdition. Who was Adolphus Prince, to monopolise——

Next moment Montagu, seized with a sudden idea, was at the telephone.

'Number, please?' said a haughty voice.

'I want seven six seven one, Chelsea, and I'm in a devil of a hurry,' he replied frantically; 'so put me on as quick'——

Br-r-r-r-/ $C\bar{h}'k$ / 'Number engaged,' announced the instrument dispassionately.

Montagu hung up the receiver, and swore. He was quite panic-stricken by this time. So Adolphus Prince rang her up at ten o'clock in the morning, did he? He would show the old dotard who was the better man! Five minutes later he had secured his call, and was inviting Miss Leslie to lunch with him at the Ritz.

A WANDERER'S NOTE-BOOK.

By A. F. WHYTE, M.P.

III.—GLIMPSES OF PARIS.

1

'GOOD Americans, when they die, go to Paris,' we are told; but I doubt whether the best of them ever really knows Paris, for the city which is haunted by these ghosts from overseas is the Paris of the Champs Elysées and the Rue de la Paix, of expensive shops and luxurious hotels, where prices rise at the approach of the Anglo-Saxon. Some treat it as a city of pleasure, some as a milliner's shop; few of them ever remember, if indeed any of them ever knew, that, outside the narrow circle of cosmopolitan luxury which constitutes Paris for them, there lies another Paris: the city of high finance, the Paris of the rive gauche, the Paris of Belleville, the Paris of that unexplored region for which I know no other name than Outre Montmartre. How many, I wonder, of the habitual clients of those costly establishments in the Rue de la Paix have ever asked themselves why their favourite street was so named; or in passing to its neighbour, the Rue du Quatre Septembre, ever stop to look back over the forty intervening years, and see the Paris of 1871? How many even know whence the street took its name? Could they, from the steps of the Madeleine, take you to the scene of the guillotine in the square once known as the Place de la Revolution; or in the Opera House interpret the jest, 'Dans le palais du son on fait de la farine.' Probably not; and yet to the lover of Paris, be he stranger or nativeborn, these are the very essence of its life.

But how, you may ask, can the uninitiated visitor discover this 'essential' Paris, especially if his sojourn be brief? There are as many roads to that discovery as there are travellers to take them; and I know but a meagre few. The beginning lies in your choice of hotel. The knowing stranger, on his arrival in Paris, escapes with all possible speed from the region of the grands hôtels—the Bristol, the Ritz, the Elysée Palace, and the like, with their polyglot flunkeys

and exorbitant prices—shuns the Englishman's beaten track which leads to the Lille et Albion or the St James and Albany, and crosses the Follow him and you may have your choice. If you wish to see the Seine, the Louvre, the Tuileries Gardens, and half-a-dozen bridges from your window, go to the Hôtel du Quai Voltaire, remembering that, like its companions of which I am about to treat, it is a French hotel manned by Frenchmen and catering for Frenchmen. Or, if you have a taste for the French clergy and the penniless nobility, you can satisfy it at the Hôtel des Saints Pères, in the street of that name; while, if the last word in cheapness is your watchword, go to the Ambassadeurs in the Rue de Lille, or the Etrangers in the Rue Racine, or (cheapest of all) The last the Saint Michel in the Rue Cujas. two are clean, well-kept hostels in the heart of the Latin Quarter. Your guide-book will probably call them 'unpretending;' it may even sneer at the paucity of their furniture, and it will certainly warn you that 'they are not much frequented by English visitors.' So much the better reason for choosing one of them!

Whatever choice you may make, you may rest assured that in the cheaper hotels on the left bank you will get a handsome return for a small outlay, especially if you have the good fortune to fall in with some old habitué with a communicative tongue. He may be a guest in the same hotel, or a concierge, or one of those fraternal old fellows who carry on a meagre trade in books on the quays, and can tell you more about Paris than you are likely to learn from Baedeker or Joanne. Find him if you can, and leave the rest to fortune and your own 'five wits.'

Till you have found your man, and by way of introduction to the spectacle of Paris, take an electric tram from the Quai du Louvre to the Point du Jour; then go down to the river-bank,

board a steamer—direction Austerlitz—and seize a place in the small semicircular gallery at the Then ten centimes will give you a little voyage of thirty to forty minutes up the Seine, during which you may enjoy the unrolling of an urban panorama of infinite and fascinating variety, broken and enhanced by a score or more of as fine stone bridges as you will see in a day's journey anywhere else. There are in all thirty-eight bridges spanning the Seine in Paris, and their names are symphonies of history: Jéna, Alma, Invalides, Alexandre III., Concorde (built of the stones of the Bastille), Solferino, Royal, Carrousel, Pont Neuf (the oldest of them all), Pont au Change, Notre Dame, Arcole, St Louis, and so on to Austerlitz. It is perhaps naturally reserved to London to name one of her bridges Waterloo!

Once you have arrived at the pontoon labelled 'Austerlitz,' I am prepared to wager that you will wish to do it all over again immediately; for you will probably discover, as I have many times, that these little penny steamers offer three mutually exclusive distractions. There are, first of all, the two banks of the river each demanding attention, though in all probability the right bank, with its more imposing architecture, will at first outbid the left. The third competitor is the ever-changing throng of people on the deck of your steamer; and the pleasure of watching them and mingling with them will in itself repay as many journeys as you choose to make. Indeed, such is the inexhaustible interest of these 'bateaux' Parisiens' that a stage or two by them, long or short as convenience dictates, may well form a daily interlude in the somewhat wearying routine of sight-seeing. Let us suppose that you have just left the Chamber of Deputies, and wish to make some purchases at the Louvre, or visit the Sainte Chapelle, or-if you take your pleasures pathologically—the Morgue (now mercifully closed to the merely idle tourist), or the Hôtel Dieu, you have only to take your steamer at the Pont de la Concorde, and in the most pleasant and cheapest fashion possible you are conveyed to your desired goal. The penny steamers are one of the greatest of Parisian assets, both for business and pleasure; and at all seasons, though not in all weathers, they are thronged with people.

To the open-eyed traveller a visit to Paris is essentially a visit to her people; and when an understanding of them has begun to grow in the mind, the eye finds everywhere a rich meaning in buildings, bridges, shops, and customs which otherwise might seem very like those of other foreign cities. The old bookmen on the quays, the Parisian crowd so easily collected and as easily dispersed, the knots of fishermen with their bamboo rods and inextinguishable hopes of a good bite, old 'Pol,' with his sparrows and pigeons and post-cards, in the Tuileries Gardens—un être pas extrèmement civilisé, as he was described to me by a Parisian friend who endeavoured to flatter him by reading to him a

eulogistic sketch of his occupation that appeared in a recent English book on Paris—one and all are funds of curious information not to be procured for love or money at any other source, and, taken by the right approach, are the true guides to Paris.

On one of the quays near the Institut de France there used to be found just such a travellers' friend, full of years and humour. In all weathers he was there; apparently a person of no occupation, his mind stored with vivid memories, possessing withal a ready turn of speech. Being asked one day by a foreign passer-by what 'one ought to see in Paris,' he grunted with contempt, 'Hein / vous autres Anglais, you go to see the Morgue, and the Moulin Rouge, and the sewers. Well, go and look at them if you like.'

'But I don't like,' said the traveller, wary enough to see that this large, gray-headed idler with heavy red cheeks could tell him many things worth knowing. 'I don't want to waste my few precious days with your vulgar show-pieces. I want to know the real Paris.'

'The real Paris! Qu'est-ce que ça veut dire? The real Paris! How long do you stay?'

'Fifteen days.'

The giant shook with laughter, heaved his vast bulk slowly down from the parapet of the quay, and stood before his questioner, a living mocking counterpart of the big man in Mr Chesterton's poem:

A mighty man was Eldred, A bulk for casks to fill; His face a dreaming furnace, His body a walking hill.

When the laughter had subsided the Parisian laid his finger to his nose with a quizzical air. 'Quinze jours / I have lived a thousand fortnights and more in Paris, and I don't know my city yet. You must live here, be born here, die here, here in Paris, and haunt her as a ghost of centuries before you know her-like Henri Quatre down there on the Pont Neuf. But tell me why it is called the Pont Neuf, when it is the oldest bridge in Paris. Yes, Henri Quatre knows something about Paris; he has been watching her for I don't know how many hundred thousand of your fortnights. You rememberno, you do not remember—that he bought Paris for a mass, because he didn't; but I always say he did, because I like to think that he did, and that he sits there at the end of the nose of the Île de la Cité watching his purchase. But, n'importe, why do I talk to you? It is perhaps because, unlike your stupid countrymen, you are ready to listen.

'They'd all be ready to listen if they knew where and when to open their ears. But you were saying'——

'I was saying that the man who thinks he can pierce the secret of Paris in a fortnight is an idiot; yes, nom de Dieu / an imbecile. But,

pardon, monsieur, you are not an idiot; vous n'en avez pas l'air. But, all the same, you want to do the impossible.'

'Pardon. No; I only want to know how to begin.'

And you come to me! Well, you have come to the right man, said he, beating his huge chest with his fist. 'I have seen Paris in all her moods, and I love her: no ennui, everything lively, variable; sensations, rumours, excitements follow one another fast. Paris is indeed true to her motto, "Fluctuat nec Mergitur;" and with her, "Plus ça change, plus c'est la même chose." She is tossed on many waves of fortune and never overwhelmed. And I hate when they call her "La Ville Lumière." That is no name for her; it is a tourists' label invented by the shopkeepers to conceal the dark places, places of vice and crime, from the ignorant foreign idler. Call her "La Ville Tempête," "La Ville Mystère," call her what you will, but shun the untruthfulness of "La Ville Lumière."

'But, as the intellectual metropolis of Europe, and compared with fog-bound London, Paris, in more senses than one, is a City of Light.'

'Nom de Dieu! Paris defies your comparisons and spurns your compliment. She may be La Ville Lumière in the Champs Elysées on a sweet evening in May; but where is your lumière in Belleville! Tell me that. And was she a City of Light to Marie Antoinette, to Napoleon the Third, to Dreyfus! And is she now a City of Light to all those poor devils in the factories of the eighteenth and nineteenth arrondissements, who toil and live on nothing!'

'You are right. La Ville Tempête is a good name, and'——

'But, yes, yes, yes! Of course I'm right. Think of 1870—the wild delight at the outbreak of war, the intoxication of the populace, and then—the sobering of them. I was through it all, and I can tell you that there has never lived the man who could tell that story as it ought to be told, for it was beyond belief or imagination. The fever of war ran through the city like a flame, devouring our wits as it went, making us dream of the sack of Berlin and filling our waking thoughts with fiery unreason. The newspapers fanned the blaze with their windy rhetoric, foretelling rapid French victories, ridiculing even the meagre preparations on the fortifications of Paris, assuring us that it would need a million and a half of men to besiege us, and that the accursed Prussians would be too hard pressed in their own defence to be able to send a single man across the Rhine. Bah! what Wissembourg, Woerth, Fræschwiller, Reischoffen gave them their answer. All Paris We refused to believe; but was stupefied. slowly the truth prevailed. Week after week nothing but bad news, till we accepted the invasion as a fact which might any day bring the Prussians to the gates of Paris. Sedan drove the truth home; and in our blind rage we overthrew the Empire and set up the Republic. Sunday, 4th September; that was the date. Our spirits revived; our lost confidence returned. The fortune of war would surely turn now. "They will not dare to come now that we have a Republic," was the word that went from mouth to mouth. Flamboyant placards were drawn up and pasted on the walls appealing to the Prussian soldiers, in the name of Liberty, Equality, Fraternity, to cease firing; but the firing did not cease; it came nearer every day. And the rest you know."

77

National contrasts are seen at their sharpest in great congregations of people, whether on business or pleasure bent; and I know no more illuminating occasion for such a contrast between ourselves and the French than a visit to the Chamber of Deputies. Adequately to describe its many aspects would demand more space in Chambers's Journal than even its generous editor is likely to give me; therefore I must leave the enterprising reader to make the complete observation for himself. In parliamentary forms, in the temper of public discussion, in the alignment of parties in the Chamber, in the very shape of the Chamber itself, are to be found subjects of rewarding study which, apart from their vast intrinsic interest, may shed much light on our own problems of political machinery and the like at home. And after the Chamber come the theatres and restaurants—as repositories of international contrast—particularly the latter, anywhere outside the opulent cosmopolitan area of the first, second, and eighth arrondissements. Of the smaller eating-houses which abound in the Latin Quarter-and they are the greatest contrasts of all-my favourite is 'Polidor,' in the Rue Monsieur le Prince, within one minute of the Odéon and five of the Sorbonne. Here a little company of students, lecturers, and others used to take their evening meal together in the winter of 1905-6. There was Renard, a burly young civil servant, attaché au cabinet du Ministre de l'Intérieur (at that time the redoubtable Clemenceau), overflowing with enthusiasm for his chief and enjoying his meals and his music with equal gusto; next Gaston and Membrun, Algerian Frenchmen and bosom friends in the study of medicine—Gaston, a short, black-bearded man with an explosive conversational manner, and Membrun, his caustic, taciturn complement; Raymond, an American known to us all as Raymond of Kansas, a quiet person with a faculty for missing appointments; then Russier, lively and red as a fox; and, to finish the table of seven, Liddell Geddie and myself, both Scotsmen, and both at that time Lecteurs Adjoints in English Literature at the Sorbonne. Sometimes only one or two would come, sometimes the party was swelled by passing guests, but always on Tuesday these seven dined together in full

strength before going to the Concert Rouge. Tuesday was 'classical' night; and we would be seated—four or five of us—at our table in 'Polidor,' with Monsieur Bouy, the proprietor, busily chopping the big stick of bread into short lengths, and Henri, the waiter, who is still there, taking his orders from three people at once, when Gaston would appear, late and breathless as usual, jerking out the items of the programme for that evening: '— au concert, — Siegfried Idylle, — Cinquième Symphonie Beethov—— Enterrement d'Ophélie,' &c.—'c'est magnifique—dépêchons-nous'—— And Membrun would grunt, for concerts were no place for him.

These concerts were first founded in 1889 by Benjamin Rouge, who leased a large ground-floor room in a building on the site of the present Gare du Luxembourg. His aim was to combine the nonchalant freedom of the café-concert with the highest appeal of orchestral music. succeeded, and inevitably the audiences which gathered round him subordinated the wine and tobacco to the spell of the great musicians; and when, after a few years in the Boulevard Saint Michel, the auditorium was transferred to its present home in the Rue de Tournon, near the Palais du Luxembourg, the Concert Rouge had made a hall-mark of its own in the perfect co-operation of musician and hearer. Laffite as conductor created the organisation and launched it on its happy career; but to the present generation it was François Touche who 'gave the increase.' Touche was a genius with the 'cello, and a greater genius with the bâton. Under his spell a great silence fell upon that square little hall near the Senate; pipes went out, and coffee grew cold; the music and the musicians held perfect sway. He has now taken a higher flight, and conducts greater concerts of his own in the Boulevard de Strasbourg; but the Concert Rouge still flourishes in the Rue de Tournon under Rabani, who conducts an augmented band.

In the matter of museums and historic buildings, the visitor is usually a victim of considerable perplexity; so I make bold to give a hint. If you are bent on seeing and knowing Paris as

she is, turn a deaf ear to Baedeker and all such priests of convention, and divide your time, if it be short, between the Parisian people, as seen in all kinds of public and private assembly, and the Musée Carnavalet. People of to-day are always more interesting than the bricks and mortar of yesterday, or even the most dazzling canvas in the Louvre. Why then, you may ask, add the Carnavalet Museum, since it too is but the stone and lime of the day before yesterday? I send you there—forgive the peremptory word—because there you will find the key of Paris. Museums, as a rule, are very heterogeneous things; but the Musée Carnavalet has a unity of its own. It is the story of Paris from Lutetia to the Third Republic. Within its walls you will find a pageant displaying the history of the most amazing city the world has ever seen. museum is indeed the only complete commentary extant on the motto of the city of Paris.

For the rest, the guide-books, with their stars and leaded type, are good enough; but Paris is a city with a genius of her own so marked that the consecrated method of sight-seeing is all but useless with her, and even the best guide-book is apt to be a Misinterpreter's House. 'There is no place in the world,' said the Times recently, 'where the noise and glare of pleasure make so silly a parody of happiness;' and thus the traveller, deafened and blinded, too often forgets that all the paraphernalia of Parisian 'gaiety are the mere overflow from her inexhaustible fertility. True it is that she applies a vast and skilful industry to her provision for strangers which has given her an easy supremacy as a city of pleasure; but that is neither the mainspring of her life nor the source of her perennial power. It is her discriminating hospitality to the philosophy of all nations, her appetite for, and easy assimilation of, great ideas, that gives her the hegemony of intellect. She is the clearing-house of European thought; and if it be true, as I said in quotation in my opening paragraph, that all good Americans go to Paris when they die, it is still truer that all ideas must go there also if they mean to live.

THE WEAK STRAIN.

CHAPTER III.

THE Capistrano was nearing her ground. The advent of the big steam-trawler has widened enormously the effective range of fishing operations. From the White Sea to the Morocco coast, wherever a warm current meets a cold, and the sea-floor is sandy, you will find our fishing-fleet. Now the Capistrano was drawing near.

John was almost happy; he had won his victory, and was wearing his laurels. Withal, he was a modest victor, and the crew liked him. He also discovered that he liked the crew. They

were a source of great wonder to him, for he was in a world, in intimate relations with a world, he had never dreamed of; a hard world, in some respects a brutal world, but a world radiated with the beam of manly virtues.

At dinner they discussed wealth, and John discovered that he was wealthy. His five hundred pounds was a huge fortune.

'Five hundert poundts!' said Dutchy reflectively. 'Mit dose I go to sea no more. I buy me a little farm on de Baltic, where de sea runs

into de landt. I marry me a little girl, and I stay at home and smoke my pipe.'

John thought of a little girl who had turned a very cold shoulder on him when he was left with only five hundred pounds, and thought, for the first time, that he was well quit of her. This little girl of the North would make a better mother of men.

Marco the donkeyman would go back to his beloved Ionian Sea, would marry a daughter of the isles, buy a little coasting-vessel, and be happy. A Devonshire man knew of a little inn overlooking a harbour where trawlers and drifters lay moored. It had roses over the porch, and five hundred pounds would set him up in it. Even poor Squinty, a regular wharfrat of a big port, knew of a little tobacco-shop which would keep him and his missus, and feed and clothe and shoe the kids.

So it went on, and John sat apart and recognised that he had been a coward. At the first onset of disaster he had vacated the field before a foe which these poor uneducated fellows faced bravely all their miserable lives. For the first time in his life he knew what the courage to live meant, and was humbled and ashamed—nearly, but not quite, for his desires were still of the world whence so lately he had been exiled.

Then they were on the fishing-grounds, and two days of incessant activity followed. The great trawl-beam swung outward, the great net with wide-open jaws lay straight and without kink on the smooth sand, and the old boat plunged ahead like a great horse drawing her load behind her. At the end of the sweep the donkey-engine clucked, the great bag rose slowly and was swung inboard, the strings were unloosed, and a shower of fish, weeds, gravel, and all the raffle of the sea-floor came down on the deck. Out went the net again, and the old Capistrano made a second sweep; while skilled hands sorted fish, and packed them away, and cleared overboard the raffle. Then inboard with the net again, and so on, hour after hour, the long days through. Back-breaking work, not very pleasant work, but man's work, and John rejoiced in it until his spell was over, and he lay down to sleep wherever he could, to awake stiff and tired, but ready for a new turn of work.

Nor was it safe work. A thumb jammed between rope and bulwark burst horribly. A rag was twisted around it, and that was all the surgery for the time. The man was not incapacitated, so he continued his work. John was told tales of hawsers breaking that kicked back and brained a man; of the devilish little winch that mangled men between its cogs. John lived in a state of astonishment the whole time, and recognised that he knew nothing of life.

John talked over matters with his old friend Sambo, who could not understand why any man could get tired of life. Pleasure was quick upon the heels of grief. Besides, as Sambo said, God hated a coward. So John learnt his lesson.

With her full load, the Capistrano was homeward bound, and John felt that he had to face the future. Every hour she spluttered out her solemn eight knots, and they were already near the Bay. Then in the night came disaster. Wreckage, berely awash, sucked under her counter, caught the propeller, stripped the blades, and cracked the shaft, then vanished into the darkness. The engines raced for a moment, and then stopped. The captain took a boat, rowed round to the stern, and came back wrathful and grief-stricken. His old ship was no better than a log, to drift wherever the currents might carry Daybreak showed an ocean clear from horizon to horizon. So she drifted all day, and the captain premised she would go ashore somewhere about St Vincent unless she were picked up and got a tow. At nightfall it looked threatening; the wind was rising, and the waves running sullenly high, in advance of the wind.

'They've been getting it to the north, and before morning we'll catch it hot,' said the captain; and he was right. Before morning she was tossing like a cork and rolling like a barrel. A heavy sea swept Marco overboard and smashed poor Squinty on the bulwarks. John just caught him, and Dutchy caught John, and all three were hauled back into comparative safety. They bound up Squinty's ribs as well as they could, and left him, for they could do no more. Later they managed to rouse up a tarpaulin for'ard, and she ran before the wind, wallowing and spluttering, strained and leaky, but still afloat.

John could not admire enough his mates' steady nerves. Death yawned for them, yet all—English, Dutch, and Dago—went their ways unafraid. They looked their fate full in the face, and bade it welcome. These were men!

The captain was a true hero. His courage was high; his nerve never faltered. He animated and transfused all with his courage. Yet this was the hairy little man that John had smiled at so contemptuously a few days before. Now his laughter was silenced: the farce was becoming tragedy. In his heart he prayed that he too might make a clean end with the rest, for cold fear was gnawing at his heart. He forced himself to laugh and talk with the others. Outwardly he was as fearless as any; inwardly yawned an abyss of shameful fear that threatened to engulf his whole moral being.

Daylight saw a high cape looming ahead which they could never weather, and they endeavoured to run ashore in the bay to the northward of it. As it happened, they took the ground some two hundred yards from it, and the sea made a clean sweep of their deck. Boat, deck-houses, and bulwarks were swept away, and the wreckage whirled landward.

This was the most trying time to John. He did not like this cold, wet death. A week ago he had played with the idea of it, but he kept

telling himself that was another man. The new John wanted to live. How could the crew accept their end so passively? Surely they could do something. He was in a rage to do something, for cold fear was nagging him to do foolish things. One of the men was chewing his tobacco as if all were well, and John hated the man, with his regularly working jaws. He must do something. Better instant death than this passive waiting. He would throw himself overboard, sink or swim; it was better than this passivity, for there was always that cold feeling making a coward of him. A larger sea than usual shipped broadways, flooded the hold, and buckled a part of the iron deck like cardboard. Little Dutchy was swept away on the resurge. The shock was brutal to John, and he raged against a power of destruction which made so light of life and of the works of man. It made him feel absolutely helpless in the grip of an overwhelming power. At any rate, he would look after himself. A current was sweeping away the wreckage toward the cape. It ran within sixty yards of the beach in one place, and on the shore stood a gang of fishermen, helpless though willing. He made up his mind, and turned toward the captain.

'I'm not going to stay here to drown like a rat in a trap!' he shrieked. 'I'm going ashore.'

'Steady, lad! Keep a grip on yourself,' came the cool reply. 'We would all go ashore if we could. We're not here for our health.'

'I'm going to try, at any rate,' said John.
'How! Fly!' asked the skipper halfcontemptuously.
'No. Swim.'

John flushed with shame.

'Good for you, if you can. There's stuff in you. If you can get ashore with a light line, there's more than half-a-chance for all of us.'

John winced as if he had been stung. His cowardice was to end in the heroic. His nerves all unstrung, he felt like peals of laughter. If the captain only knew that there was no idea of rescue, no heroic aim, just the mad desire to get away and fend for himself! However, he said nothing; he merely slung the rope about him, and lightened himself for the struggle. As he went overboard his mates gave him a parting cheer, and he smiled grimly at the idea.

Afloat on a wrecked fish-box he trusted himself to the sea. Every wave seemed to run at him, to rise above him as if to fall and beat the life out of him; but he clung to his raft. It kicked and bucked under him like a restive horse, but he clung to it like grim death. Once he was thrown off, and struggled wildly to get back to it. As he was despairing a sportive sea threw it back at him; and, breathless and broken, he clung to it again. For a moment he had almost forgotten he could swim. Nearer and nearer he drifted to the point where the current most nearly reached the shore, whence again it turned outward, seaward and toward the cape.

Here he would have to leave his ark and trust to himself. When he reached the point aimed at, one of his cursed fits of indecision seized him, and he feared to strike away, and lost some precious yards of distance. He knew it was a choice between a faint chance of life in a dash beachward or certain and horrible death beneath the granite crags of the headland. Yet he hesitated, and only after a nerve-racking struggle got himself away. He pushed diagonally across the boiling current, and nearly gave up when he saw how little progress across he made because of the intolerable distance he was carried down. A line of broken water stood before him where a ledge of rocks ran out, and he was within an ace of being smashed upon them as they boiled with half-covering seas. A lucky wave carried him across with no worse mishap than a scraped shin. Now he was in slacker water, behind a sort of breakwater. He held on to a spur, and recovered his breath, swept over now and then by the larger waves. After a time he saw a resurgent current from the cape sweeping along inshore, and he nerved himself for the struggle into this current, which would probably dash him ashore. Finally he kicked off, and dreaded the last struggle.

It came at last. He made for the beach, and saw the waves breaking on the sand; but strong hands seemed to push him away from the shore and to pull him seaward, and other hands to grasp his legs and pull him down. He could never do it; yet he struggled on, even as a blind puppy will impotently thresh the waters in its instinctive struggle for life. His foot touched something-wreckage, he thought. Again it touched something unyielding yet all moving. It was the shore! And he dropped his feet and blundered wildly forward. The resurgent wave rolled him back amidst the sand and gravel sucked seaward. The next wave sent him headlong to the beach, where he gained a precarious footing, and blundered forward a few yards. Again the ebb was carrying him out, and he was losing hope and consciousness, when a rope whipped across his face, and he clutched it wildly, to be hauled in against the rush of the ebbing wave, with great pain and dolour to himself. Then he sank away into oblivion, a blessed nothingness, free from all strife and pain.

The return to life was worse, infinitely more painful, than the loss of it. The struggle was too hard, and he flickered back again into oblivion. Then the life current flowed strong, and he wanted to shriek with the grief of it, and he fully awoke to life once more. His arm was smashed—he knew it by the bandaging; his ribs hurt him; his head was bound, and the skin felt too tight and all throbbing. How did it all happen? Then his gaze caught the captain, and he struggled on the verge of a full consciousness and remembrance, but fell asleep in the struggle, and slept peacefully for four hours.

The captain came in soon after he awoke, and John was conscious of everything.

'How many?' he asked the captain.
'All but one,' was the reply.

'Who's gone?'

'Squinty; he was swept out of the hands of Tiny and me when we were getting him ashore."

'Poor Squinty! He didn't want much in this world, and that was denied him. Life's a mix-up, captain, take it at its best.

'The way of the world, my lad.' The captain was fidgeting, and at last shamefacedly he got it out: 'You did a d-d plucky thing, Mr Rington. We owe you our lives, and I can't tell you how we all feel about it.

John squeezed the hand held out to him. 'Captain,' he asked, 'were you ever afraid?

Did you ever play the coward?'

The captain thought he was still wandering

in his wits, and looked amazed.

'I've got to tell you the truth. I'm a coward—a downright coward,' broke in John. 'When I started to swim ashore it was because I was afraid to stop aboard. I was a stark coward, and wanted to get away. I never even thought of trying to take a line ashore. That was your idea. He turned his head to the pillow to hide his face.

The captain put his hand on John's shoulder. 'None the less, you did carry the line, and you did think of the rest of us. Now listen to me. We are all cowards within. It's often only the thickness of cigarette-paper between what is called heroism and hopeless panic. The great thing is to get a grip on yourself. In any case, you redeemed all your fear in the end.'

The captain was silent; and John, too, silently He looked half-doubtfully at the

captain.

The captain smiled back at him. 'I have got your money here—the money you brought aboard with you. I have made up my mind not to charge you for the bucket you spoiled.'

John asked him to keep charge of it yet

awhile.

'What will you do when you get home?' the

captain asked after a short pause.

John looked straight before him for a few seconds, considering a new prospect. At last he turned toward the captain. 'I'm going to play the game. I'm going to stand on my own legs. I'll use no man as crutches. I'll work for my living, and enjoy the living I work for.'

The captain put out his hairy hand, gripped John's, coughed, and then went out.

THE MONTH: SCIENCE AND ARTS.

OIL AND ELECTRICITY FROM COAL

THE growing scarcity of light crude oils and the increased demand that has arisen for the naphtha products from petroleum have prompted the chemist to investigate the oilyielding properties of other substances. Coal has come within the scope of his researches, and the fact that an appreciable yield of crude oilfifty-eight gallons—has been obtained from one ton of Irish cannel coal has aroused considerable interest. But this achievement is by no means new. Half-a-century ago oil was extracted from coal merely because the commercial world was ignorant of the methods of winning oil from the earth. Very satisfactory results were obtained by this roundabout process, and possibly the distillation of oil from coal would have been prosecuted to this day had not the cheaper and more prolific supplies from mother-earth been tapped. In this latest development the main idea governing the investigations is the procuring of an additional source of motor spirit, and it is stated that by 'cracking' the hydrocarbons in the oil to the utmost a yield of twenty gallons per ton of coal is obtained. This is a low yield, and certainly in itself would be unremunerative. But the idea is to regard the naphtha spirit as a by-product, dependence being placed upon the other products—heavy fuel liquid, paraffin wax, pitch, sulphate of ammonia, and coke. All of these articles are in keen demand, and command fair market values, so that apparently it would prove remunerative to dispose of the light spirit at a low figure. Unfortunately precedent is rather disappointing. In early days of distillation the most volatile of the naphtha series—benzine or petrol—was a bête noire to the oil-refineries. given away, wasted, and even burned in the open in large quantities to effect its disposal. The coming of the high-speed internal-combustion motor altered the outlook completely. The light spirit, instead of being a nuisance, became a necessity, and its consumption advanced by leaps and bounds. Simultaneously chemical investigation ascertained that this commodity was an excellent substance in other industries, particularly as a substitute for turps, and was readily utilised by the paint and varnish manufacturing interests. Further fields of application are being discovered, so that the consumption of petrol is certain to increase; and as supply is diminishing rapidly, every available source of yield is bound to develop. The production of electric light direct from coal is a far more vital discovery; as Thomas A. Edison has stated, its commercialisation will be one of the greatest triumphs of human activity. This development is of German origin, and is based upon the well-known fact that when the junctions of different metals are kept at different temperatures electricity is generated. But the completion of the junction between the metals offered the greatest difficulty. In the new apparatus, however, the junction is ingeniously secured by electric deposition, which is proof against oxidation, will withstand high temperatures for long periods, and is of great strength. The electric generating units are disposed around a chamber where the gas from the coal undergoes combustion. The hot junctions are in contact with this combustion tube, and consequently are raised to a high temperature. Outside the tube casing currents of cold air are circulated in order to keep the cold junctions at a low temperature. With this apparatus, and using lignite as fuel, it is stated that electricity may be generated at a cost of two-thirds of a penny per unit. Arrangements have been completed for the exploitation of this process upon a practical scale, and should anticipations be fulfilled, some interesting developments may be expected. It certainly brings the idea of generating light, heat, and power at the pitmouth a step nearer realisation, and tends to prove that the chemists' dream is by no means so wild as appears at first sight.

AN IMPROVED BRUSH.

One of the objections to brushes used upon extremely hard surfaces is the liability of the hairs to become detached under the pressure and friction exerted. In order to overcome this defect a new method of securing the hair or fibre is adopted. An iron hook is used as The hair or fibre is doubled a foundation. through this hook, and the latter is then clamped so as to hold the material firmly in position. Wire is then bound round the brush in a spiral manner, and sealed by soldering. Thus the brush is virtually encased in a metallic covering. No cement of any description is utilised in the process, and it is stated that brushes made in this manner will withstand the hardest wear without giving any signs of premature 'moulting.' For cleaning engines and machinery they are to be commended, because there is no risk of the mechanism becoming clogged by detached hairs.

A SELF-LOCKING EGG-PACKING BOX.

A serious drawback to egg-raising in this country has been the failure to despatch the produce in cartons of one dozen capacity which, while they can be conveniently locked, are of a sufficiently presentable appearance for the shopman to display upon his counter. The latest box removes this disability very effectively. It is made of cardboards, and is fitted with the usual divisions for the reception of the eggs. The outer edge of the lid, however, is fitted with a bent piece or hinge which is provided with a number of notches along its edge. When the lid is closed

a slight movement causes these notches to engage with suitable locking-pieces upon the inside of the front wall of the box. In this manner the carton is fastened securely. The box may be opened and closed repeatedly without suffering any deterioration. The idea is ingenious and simple, and imparts that attractive appearance which impresses the purchaser.

A MOTOR-CAR BODY MATERIAL.

Hitherto automobile bodies have been made from wood and metal, in order to secure strength with the minimum of weight. Now a French firm has introduced a new method and material, which ensures the body being made as it were in one piece, and without any seams whatever. This substance is described as fibromonolithe, which is a plastic material. Its composition is kept a secret, but shredded wood, granulated cork, and other substances, together with suitable binding mediums, are associated. This substance is made into the form of a thick paste resembling cement, and is applied to the foundation by means of a trowel. This is composed of strong wire netting of small mesh, which is attached to the skeleton or framework. Wood is used for this, but it follows lighter lines than that generally adopted. The skeleton completed, very thin strips of bamboo are nailed to it, the idea being to prevent the netting from touching the frame. When this has been done, the fibromonolithe is applied in much the same manner as a plasterer dresses a wall surface. The wire netting, not being in contact with the frame, enables the plastic material to be worked well behind the metallic part, and to effect a firm hold upon the wood. The composition is applied to both sides of the netting, which acts as a reinforcement. After the coating has been given it is permitted to dry, which requires about twenty-four hours. Then the surface is planed and smoothed down in the usual way, as if it were solid wood. One notable feature is that the whole body, including doors, locker, and other fittings, is made in one operation. Thus, for instance, the door includes the wooden frame, and is hinged to permit free movement. The workman pays no attention to this fact, but covers up the whole surface. When the material has set and hardened, the space between the door-frame and the body is sawn through, so that it may swing freely. All necessary mouldings can be carried out easily by means of suitable strikes, while more graceful curves can be given. After being planed and surfaced, the material is about a fifth of an inch in thickness, and its weight about the same as that of a combined wood and metal body. Not only is the body fashioned in this manner of great strength, but repairs are not such a serious item. Should the body suffer damage it is only necessary to flatten out the netting or insert a new section, and to fill the space with fibromonolithe. The material gives an excellent surface for painting. As a rule, this operation may be simplified by combining the ground coat with the materials in the paste. The first applied coat fills all the pores, and presents a flat surface, which may be rubbed down to permit the following coats to be given. The material is noncombustible and homogeneous, and consequently does not disintegrate under vibration; it is unaffected by fluctuations in weather and climatic conditions, does not warp, and does not resound. Its successful use in connection with motor-car bodies, where the conditions to be fulfilled are admittedly exacting, should render it equally applicable for the manufacture of horse-drawn carriage bodies, railway cars, and other vehicles, since the thickness may be adjusted to meet any requirements.

UTILISING THE SUN'S ENERGY.

Complete success has attended the installation of the Shuman sun-power engine in Egypt, which has been carried out by a British company under the supervision of the inventor, assisted by several eminent engineers, who have suggested various improvements in the plant to adapt it to local conditions. The sun's rays play upon what is called an absorber, which is a trough-like arrangement of parabolic section, fitted with mirrors. The latter are thin, and are set in a light metal framework. The absorbers, disposed in rows running north and south, are made to rotate, so as to receive the solar radiation at the best angle. This movement is effected automatically by means of an ingenious electrical heliostat. In the centre of the trough is the boiler. The water occupies a narrow, elongated space, and as it is evaporated by the heat reflected from the mirrors, and turned into steam, it ascends into the upper cylindrical boiler connected to the water-space. This boiler is really a long length of pipe which extends to the engine. The first plant was set up in 1911; and although it accomplished the designed work, it revealed certain shortcomings. These were remedied, and last year an improved installation was erected. The total absorbing surface is fourteen thousand four hundred square feet, and the maximum output of steam has been so far one thousand four hundred and forty-two pounds per hour, at a pressure of 15.8 pounds per square inch. The engines employed are of the low-pressure type. The total cost of the plant was one thousand five hundred and sixty pounds, which is about twice the cost of a steamraising plant of equal capacity. At the same time, in such a country as Egypt the solar plant is cheaper to run than a steam-engine, owing to the high price of coal, which averages about sixty shillings per ton. The solar engine was tested in connection with irrigation pumping, and the trials were so satisfactory that the Egyptian Government ordered a further installation of one hundred horse-power. Plants of this kind, however, can only be used in tropical climes, where the sun shines the whole year through, and throughout the day; but as such countries as a rule are deficient in native fuel resources, the solar engine possesses wast possibilities. In fact, it is possible to generate electricity with the heat from the sun's rays, and to light tropical towns and cities thereby, although in this instance ample accumulator facilities would have to be provided to carry the station over the periods—hours of darkness—when the solar plant could not be worked. This subject was discussed here in 1913, in an article entitled 'Solar Heat for Human Use.'

A BY-PRODUCT OF THE RAISIN INDUSTRY.

The United States Department of Agriculture calls attention to the waste in the raisin industry when no use is made of the seeds, and describes the different products that can be got from that neglected source. The waste from the seedingmachines has been found to average 10 per cent. of the yearly crop. As they come from the machine the seeds are covered with a sticky mass of pulp that cold water easily dissolves. When it is concentrated, the pulp yields a syrup somewhat like strained honey. The syrup has a reddish colour, and is slightly tart, owing to the It is a useful addition to the grape acids. housekeeper's supplies, and it can be used in making mincemeat with less expense and less labour than when the raisins alone are used, besides having all the delicious flavour of the raisin. It is suitable for table use, and a manufacturer of syrups for soda fountains finds it excellent in carbonated drinks. The syrup, however, is not all, for the seeds still remain. When they have been screened, dried, and ground, it is possible to extract from them about one-seventh of their total weight in a pale, golden-yellow oil that has a delicious nut-like taste. This oil dries rapidly, and can be used in paints and varnishes. The oil also makes a compact soap, with a pleasant, From the residue tannin can aromatic odour. be extracted, and there will still remain a substance, known commercially as 'meal,' which makes good cattle food.

THE LATEST IDEA IN TEACHING SWIMMING.

Now that swimming is practically recognised as an item in the curriculum of British schools, the method which has been adopted in America to impart this knowledge and skill is well worth following, inasmuch as it simplifies the task very appreciably. Above the bath a circular or oval track formed of steel girders is suspended from the ceiling. Upon this run a number of wheeled trollies, from each of which depends a rope terminating in a belt. The pupil fastens this belt around his body and enters the water, and there follows the instructions of the master, executing the desired strokes. As the pupil cannot possibly sink, he learns to swim almost

unconsciously. The trolly itself is not driven around its track; it merely moves in accordance with the progress of the swimmer through the water. The advantage of the system is that a number of pupils can be taught simultaneously in the class manner, the tutor assuming a suitable position and issuing his instructions to one and all, besides being able to detect instantly whether a pupil is making a false stroke. number of pupils who may be taught in this manner depends solely upon the dimensions of the bath, since they follow one another closely in single file, swimming round and round. It is virtually class calisthenics applied to the water. The speed with which the pupil masters the natatory art, and the few lessons necessary to enable him to gain the requisite confidence and ability to swim without the suspended belt, have so impressed the educational authorities of America that the idea is being very rapidly extended.

AN EYE-PROTECTING CAP.

The intensity of the sun's glare and its injurious effects upon the eyesight are well known. During the summer months numberless people are compelled to wear coloured glasses when in the open air in order to rest the eyes. Recently a cap has been placed upon the market, the peak of which is fitted with a visor of a suitably tinted transparent medium. In fact, the peak of the cap is made in two pieces, the ordinary projection of material and the visor beneath. If the sunlight conditions do not demand recourse to protection the visor lies beneath the peak of material, being secured firmly thereto by clips. To bring the visor into use one simply releases the outer material peak, and folds it back, clipping it to the crown of the hat. The transparent peak is then bent down over the forehead to enable the eyes to look through it. The cap is useful not only to pedestrians, since it acts also as a dust-protector, but is especially so to motorists for wear both by day and night. The screen is made of transparent xonite, which is tinted so as to neutralise the highly dangerous ultra-violet blue rays present not only in dazzling sunlight, but also in the electric and acety-lene headlights of motor vehicles. Blinding by powerful lights suddenly brought before the eyes, such as, for instance, the headlights of a motorcar at night, is avoided. Directly the vehicle has passed, the eyes can see normally instead of suffering incapacity for several seconds. cap is preferable to spectacles, goggles, or adjustable glasses, as the anti-glare device can be brought into use much more readily and easily, while there is less danger of the protector being lost. The essential feature of such devices is the correct tinting of the transparent medium, because what is applicable to sunlight is not efficacious against electric light; but this problem appears to have been effectively solved.

CATTLE FOOD FROM TOMATO-SEEDS.

Canning tomatoes is a flourishing industry in Italy, but in connection therewith the packers have been confronted by a serious waste. The tomatoes are deprived of their seeds previous to canning, and hitherto this residue has been discarded as possessing no commercial value. As the seeds constitute an appreciable accumulation, chemists, convinced that they must possess some economic value, embarked upon a series of investigations to devise, if possible, a cheap process for turning them to account. The experiments have recently been crowned with success, since a valuable cattle food, rich in proteids and carbohydrates, has been prepared therefrom. The process is simple and straightforward. The seeds are first desiccated in dryingfurnaces, and then carefully sifted to eliminate the woody fibre which is useless. After this treatment the seeds are passed between heated millstones, which reduce them to a kind of pulp. The latter is then submitted to tremendous pressure in hydraulic-presses, which treatment not only drives out the oil which is present in large quantities, but consolidates the granulated mass into large slabs similar to cotton-seed and copra cakes. Careful tests with this residue have been carried out at the Portici Agricultural Station to determine the nutritious value of the food, and the stock has thriven thereon. The oil is a valuable byproduct, since vegetable oils are now in keen demand, especially for the preparation of foodstuffs of various descriptions, so that the canneries are presented with two additional sources of profit.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

BLIND.

IF 'twas God who made me blind, He is careless or unkind. Only a revengeful foe Could invent such grievous woe;

Could ordain a flower's delight, Just to dream of through the night; Could create a world so fair, And deny a child his share.

But He also made the kind With grief and pity for the blind; Surely then their hearts reveal All that God Himself must feel.

When they soothe my childish cries, Softly kiss my sightless eyes, God, who taught their tender touch, Lent the love that feels so much.

Man it was who broke the law,
With greedy hands for all he saw;
While within the vast unseen,
He left the good that might have been.
BEATRICE ALLHUSEN.

PETERSTON. FORTUNE ANDMR

By W. E. Cule.

CHAPTER I .-- AN AMBASSADOR AT FOREST GATE.

MR PETERSTON and Mr Butterworth frequently walked together from Liverpool Street down to the Bank. There they parted, the former making for Cannon Street, and the latter directing his steps to Cheapside, where he was managing clerk to a firm of solicitors. this particular day they paused for a few moments at the Bank, so that Mr Peterston might finish his story.

'And that was the end,' he said. 'A tenpound note by post, without a word. Not bad,

was it?'

'You had certainly saved his life,' said Mr Butterworth, wondering whether the incidents had not been a little exaggerated. Mr Peterston seemed an extremely unlikely person to perform such deeds of daring. 'So ten pounds was not All the same, it may have been a extravagant. good deal to him. Now, you see how your story could be improved and rounded off, as it were. Why, what a story it might make!' he proceeded, his eyes twinkling as the idea developed in his exuberant fancy. 'Suppose you had rescued a Somebody, instead of a ten-pound Nobody!some such man, for instance, as Rupert Beckstein, whose will we have just been reading in the papers! And suppose you were told now that, as a kind of supplement to the original gift of ten pounds, he had left you in this will a legacy of ten thousand! Wouldn't that come in useful? And wouldn't it round off the story neatly?'

Mr Butterworth chuckled. If he had had a hand free he would have prodded Mr Peterston in the ribs. He was a humorous managing clerk, and he liked best the flavour of his own jests.

Mr Peterston saw the jest, but only smiled faintly. He did many things in a timorous way. 'It doesn't happen,' he said.

'Well, not often, but sometimes—sometimes.

May it happen to you! Good-morning!

Then Mr Butterworth went his way, still smiling with keen enjoyment. A moment later Mr Peterston, looking back, saw that he had been joined by a man in a brown overcoat, to whom he was speaking with a face that positively beamed. He envied his friend that good-humoured way of looking at things, and was rather pleased that he had told him the story. Then the day's work

forced itself upon his attention, and he forgot the whole matter until the evening.

He left Liverpool Street for home by the 8.30 P.M. train, and it was nearly nine when he reached Forest Gate. At that hour the suburb was fairly quiet, and a light mist gave an aspect of chill dreariness to that great region of red brick and gray pavement. When he opened his door with his latchkey he found a faint light in the hall lamp. This was against his instructions, but it prepared him in some degree for what followed when he had put away his hat, coat, and umbrella, and made his way to the kitchen, which was always called, and quite justly, the breakfast-room. His wife was sewing, and his elder daughter, who was seventeen, and in training for a pupil-teacher, was busy with her school-work on the other side of the meagrely

furnished supper-table. Mrs Peterston had spent her married life in honourable contriving. She was a neat little woman, who had succeeded in preserving a certain youthfulness of style in spite of the lines upon

When her husband entered she looked up and smiled. 'Still the eight-thirty?' she said simply.

'Yes, worse luck!' replied Mr Peterston, but in a subdued way. For he remembered that there might some day be a sadder story to tell. Anything happened to-day?'

This was a conventional question, and usually a fruitless one, but he was thinking vaguely of the light in the hall. And his instinct was a

'No,' she said. 'Oh, I almost forgot! There is some one in the front room waiting to see you. I don't know him, but he seems quite respectable. I told him that I expected you by this train, and he said he would wait.

Mr Peterston asked no questions, but at once changed his boots for his slippers. His sense of curiosity was failing with advancing age, but the necessity for economy never failed in that household. There was no fire in the parlour, and if the visitor sat there long he would be cold. It would be true politeness—and economy to dismiss him as soon as possible.

When he entered the parlour his visitor rose JULY 4, 1914.

No. 188.—Vol. IV.

[All Rights Reserved.]

to meet him with distinct relief. He was quite respectable, as Mrs Peterston had said—comfortably clad, clean-shaven, middle-aged, and substantial. His manner was brisk and pleasant, but a trifle important.

'Good-evening,' he said, quite cordially.
'Good-evening,' responded Mr Pete responded Mr Peterston. 'You wished to see me?'

They stood with the table between them, regarding each other. Mr Peterston was much the poorer in appearance. He felt, vaguely, that the stranger was not utterly a stranger. Where had he seen him before? Perhaps on the train.

'I believe,' said the visitor pleasantly-with, indeed, a quite paternal pleasantness—'I believe that I am speaking to Mr Frederick Peterston, formerly resident in the Highbury district?'

'We lived at Highbury once,' answered Mr Peterston.

And again the visitor smiled. 'My employers,' he said, wished to be positive, though we had no real difficulty in tracing you. So they asked me to come and see you—quite a simple matter, since I live at Manor Park myself. My firm is Lisle & Lisle, solicitors. According to our information, some seventeen years ago you rendered signal service to a City gentleman by going to his assistance when he was attacked by hooligans late one night near Farringdon Street Station.

Mr Peterston was more than mildly surprised. 'Why—yes,' he stammered. 'I—I remember

the matter quite well.'

'But,' said the visitor impressively, 'you did not know the name of the person to whom you rendered this service?'

'No-oh no. He sent me a ten-pound note; but there was no name.'

The visitor seemed to expand visibly. he said, 'that is just the point. Sometimes there's a good deal in a name! Will it surprise you to learn, Mr Peterston, that the unknown person whose life you saved was no other than Mr Rupert Beckstein, who died quite recently, and whose bequests to science and to charity are announced in the public press this morning?

Mr Peterston stood motionless, his gaze upon

the stranger's beaming face.

But the stranger did not wait for a remark. He gave the rest of his message at once, as if anxious to view the complete effect without loss of time. 'But it will probably surprise you more, Mr Peterston, to learn that, in recognition of your service to him that night, Mr Beckstein has included your name in his will. To use his own expression, the person who rescued him from the hooligans seventeen years ago, if still alive, receives a legacy of — The visitor paused portentously. No effect should be lost by indecent haste. And after a long, breathless moment, he completed the sentence, 'Ten Thousand Pounds /' Then he stood on the hearthrug and smiled.

Now, was not this an extraordinary, an amazing

situation—in view, of course, of the Butterworth-Peterston conversation in the morning! Or, rather, would it not have been an amazing situation if that conversation had never taken place? Mr Peterston listened with incredulous ears. For a time, indeed, he was absolutely helpless, as most people would have been in like circumstances. But, as it happened, he never had the chance of enjoying the situation to the full—never abandoned himself to the transports which the visitor had evidently looked for. It was not intuition that saved him, nor the tendency of his workaday mind to seek natural rather than extraordinary explanations. It was a simple fact that came to his rescue, put him instantly on his guard, and enabled him to handle the situation in the masterly manner now to be described—in a word, gave him the chance of scoring. In that instant of stupefaction he somehow thought of Butterworth as he had seen him last, speaking, with beaming face, to a man in a brown overcoat. Immediately he perceived that this man—the man on his hearthrug now, the man with the wonderful tidings—also wore a brown overcoat. It was an overcoat of exactly the same shade of brown; it was the same coat!

It was this discovery, this certainty, that saved Mr Peterston from an extravagant outburst, and enabled him to make a delightful wreck of one of the prettiest plots ever invented by any humorist. Great credit is due to him for his swift grasp of the position, for the ready way in which he took his stand with regard to it. Another man would have pricked the bubble at once with a roar of laughter, but not so Mr Peterston. With all his humble sedateness, he yet possessed a fund of humour. So he did not look astounded; he did not break out with a flood of exclamations; he did not rush to call his wife. He looked mildly pleased, and his reply was a peculiar one.

'Yes,' he said reflectively. 'It will surprise me more—much more! It is quite a bit of news. Of course I am still living, as you see, though I don't know how long it will last. am greatly pleased, too. Don't I look it?'

The visitor was considerably taken aback. He ceased to beam, and his manner became much more subdued. He gazed even a little anxiously into his host's amiable but unmoved face. 'I am delighted to be the bearer of the news,' he said. 'This, however, is only a preliminary. Would it be convenient for you to call to-morrow to have an interview with the firm !

'At'-- suggested Mr Peterston calmly.

'Say four o'clock.'

'That would do,' said Mr Peterston, 'as well as any other time.' And he smiled. 'Yes, quite as well as any other time. May I have the name and address?'

The visitor gave both, with increasing but

well-controlled surprise. He had no card, but Mr Peterston did not seem to expect one, and cheerfully wrote the particulars on his cuff. 'Lisle & Lisle,' he repeated slowly. 'Lis-le. Thank you. If I put it here, you see, I can't very well leave it behind in the morning, unless I happen to go without my-ahem! And it was hardly to be expected that you should get cards specially printed for this visit, of course. Eh?

'I beg your pardon!' exclaimed the ambassador.

'Don't trouble; it doesn't matter at all,' said Mr Peterston, still more airily. 'Now, let me see. Do I get the ten thousand when I call at this address? Will it be waiting for me? If so, I suppose I had better order a Carter-Paterson van. I have heard that ten thousand sovereigns make a very respectable bulk.'

'There will, I imagine, be certain formalities first,' stammered the visitor uncomfortably. 'Subsequently the amount will be paid to you

in any way you may prefer.'
'Good! Good! Very good!' said Mr Peterston. 'Your principals are going to deal with me handsomely; I can see that. Dear me, what a number of pleasant things a man may hear in one evening! Won't Butterworth be amazed when I tell him?'

A less observant eye than Mr Peterston's would easily have noted the fall in the visitor's features at that point. It was in vain that he tried to conceal the effects of the thrust.

'Butterworth?' he muttered. 'Butterworth?' 'Yes,' said Mr Peterston playfully. 'Don't you know him? He lives in the very next street.

'I know the name, sir, and I am a little acquainted with one person who bears the name. This person is managing clerk to Squires and

Stevens, Cheapside.

'The very man!' said Mr Peterston. 'The very man, jokes and all! Well, I was talking about Butterworth's amazement when he hears my news. He said only this morning that this was the very thing that ought to happen. I replied that it never did happen, and he protested "May it that it might happen—sometimes. happen to you," he said as he left me. Yes, those were his very last words. What a prophetic soul is Butterworth's! It seems almost incredible. Don't you think so?

The unfortunate visitor had almost ceased to think connectedly; he was too uncomfortable. Nor is there any doubt of the fact that he

wished himself away.

But Mr Peterston took a full revenge, rattling on with a most uncharacteristic abandon. It was his field-night; he had got Butterworth and the Brown Overcoat on the hip! 'And it is so beautifully complete,' he proceeded. 'Nothing is left out. Just at the time I want it most, that is the time it comes along. Evidently the Old Lady is in one of her best moodsa real, old-fashioned story-book mood. I hope she won't mind my calling her an Old Lady; it is a mark of affection, not want of respect.'

'The Old Lady!' exclaimed the visitor help-

'Yes, Dame Fortune,' explained Mr Peterston. 'She is certainly old, and to-night she is quite a lady. Yet we must not be too familiar, and tempt her to withdraw. It would be an awful thing to wake up in the morning and find it all a dream!

The visitor smiled, but only with difficulty. Then he looked at his watch, having apparently made up his mind to go. He made, however, one last effort to restore a conventional tone to the interview by taking Mr Peterston's City address with great care, in case it should be necessary to communicate with him during the day. Mr Peterston gave him what he asked with every willingness; a little sorry, perhaps, that he had gone so far. And the visitor tried to get off with colours flying.

'My principals, of course, will give you full particulars,' he said. 'They will expect you at four. And may I be permitted to offer you my

personal congratulations?

It was a gallant effort, most unkindly received. 'It is very good of you,' said Mr Peterston gratefully. 'Of course this is quite the best news I have ever had. I would not have missed it for anything. Ah, let me open the door. The mist, I am afraid, is thickening. I hope you haven't far to go.'

'Fortunately, no. Manor Park,' said the visitor, a little lamely; 'almost next door, one might say.' He walked down the tiled forecourt, and opened the little iron gate, which gave a

sharp crescendo of pain as it moved.

'I'll be able to afford a little oil now,' murmured Mr Peterston pleasantly. 'You'll catch the 9.35—if you run! Good-night, and my very best thanks!

The visitor only lingered for a moment or so. He looked once at Mr Peterston, once up the street, and once down, finding mist, perhaps, in every direction. Then he said, 'Good-night,' as pleasantly as he could, raised his hat-'A neat touch that,' thought Mr Peterston; 'it would never have occurred to me'-and turned away up the street. In five seconds he was entirely gone.

Mr Peterston closed the gate with care. Then he returned to the parlour to put out the light there, but before he did it he smiled at his own reflection in the glass. His amusement was never noisy, but on this occasion he was distinctly pleased with himself.

'Not a bad bit of work,' he thought. 'He carried it through very decently on the whole, but I fancy he didn't get much change out of me, poor fellow! But this is a distinct warning against talking too much in the train. I can't make out why I told that old story. Butterworth is full of ideas, but I was ready for him this time! We'll play it out to the end, and then see his face! Wasn't it luck that I

saw the man this morning!'

Having turned out the parlour light, he did the same with the one in the hall, and immediately ceased to enjoy the great joke. These minor but necessary economies reminded him of the shadow under which he lived and worked, and there was no humour in the situation. He took his seat at the supper-table, and looked round. His daughter was putting up her books, and the fire in the range was declining. He noticed the girl's boots in the corner by the fender, both pairs rather down at the heel. They would need attention next week. And his wife was still at her mending, only laying it down to serve his supper.

'What did he want?' she asked listlessly.

'Oh, nothing of importance,' he said. 'A little idea of Butterworth's, that's all. Butterworth is full of ideas, but they're not very valuable.'

At half-past ten he retired to rest, his candle—another little economy—throwing on the wall as he passed upstairs a grotesque shadow, whose outlines he observed with a feeble glimmer of humour. It was an unreal figure, and it reminded him of another thing that was unreal.

'No,' he said. 'It doesn't happen.'

As he went to bed he was rather more silent than usual, though silence had been growing upon him of late. The great joke was not the thing to communicate to his wife; she would see a lack of heart in it; but it was worth contemplating at a little distance. And his last thought on the subject came just as he fell asleep: 'I got through it very well, after all. But it was a bit too bad of Butterworth!'

(Continued on page 504.)

THE TIME OF THE WORLD.

By H. P. Hollis.

THIRTY years ago the nations conferred and combined on the subject of Time, the result being the Zone Standard Time System, which had its beginning in the United States and Canada in November 1883, and by the adherence last year of Brazil and some smaller Governments may be said to be now in use throughout the world. To-day the invention of wireless telegraphy has brought about another International Time Conference, which makes this an opportune moment to review the progress of the earlier scheme, and to take a glance at the one now being initiated.

It is scarcely necessary to give any explanation of the zone-system. Natural or local time is not the same in all parts of the world at the same instant. Noon at Melbourne is ten hours before the same event in Great Britain, a fact brought home to us when we read the news of the late day in Australia in the forenoon editions of the evening papers; and the occurrence of noon in London five hours earlier than in New York has its influence on the transactions in the Stock Exchanges and markets of both cities. Not only is local time different in places far distant from one another, as in the cases just specified, but the principle holds for short distances, and in the latitude of London eleven miles westward or eastward is equivalent to a difference of one minute in the true local time. In days gone by, when life was more leisurely, these things had little effect; and the time by the church clock, set right by the sundial in the rectory garden, was sufficient for local needs; but when railways and telegraphs began to be part of daily life, and communication between distant towns became more immediate, these differences of time in different parts of the country became important. The working of the railways, for instance, made it necessary to have one homogeneous time-system for all parts of a line, and for all the lines of a country; again, it is frequently important that there should be no ambiguity in the time of sending a telegram; and these things led eventually to the use of the time of the meridian of Greenwich for all parts of Great Britain, and to a legal enactment in 1881 which made that time the legal time of the country, or, as the Act definitely states, when the word 'time' occurs in any legal instrument the words Greenwich Mean Time shall be understood.

The suggestion was made fifty years ago that it would be expedient to have a universal time which should be used by all the world, and that the hands of the clocks should point to identical hours and minutes at any particular instant, whether the clock was in India, Russia, California, or elsewhere. Such a system has the disadvantage that the middle of the day, or daylight hours, is not marked by the same hour of the clock in all localities; but, on the other hand, an anomaly of the converse system, according to which each country keeps its own time, is well illustrated by the fact that five distinct time-reckonings, those of Switzerland, Baden, Wurtemberg, Bavaria, and Austria, were formerly in use around the shores of Lake Constance; and when the subject was seriously discussed at the Geodetic Congress at Rome in 1883, it was resolved to suggest the adoption of a universal hour side by side with the local or national hour,

which would continue to be employed in civil It was also resolved at this same conference to recommend the adoption of the meridian of Greenwich as a universal initial meridian, longitudes to be reckoned from Greenwich in the sole direction from east to west. Following on this, as the subject of time-reform was becoming a matter of much interest, a special conference was held at Washington in 1884, and attended by representatives of twenty-four nationalities, to fix on a meridian to be employed as a common zero of longitude and standard of time-reckoning throughout the globe. By almost unanimous vote it was resolved that this initial meridian should be the meridian of Greenwich, and that there should be a universal time-reckoning based on this prime meridian.

The resolutions at both these conferences were purely academic, for the representatives had no power to bind the nations they represented to take definite action, nor was a practical scheme This had, however, already been formulated. done by the managers of certain American railways, who, because the multiplicity of railway times had become a serious nuisance, had adopted, with considerable broad-mindedness, a system of standard times, each differing a whole number of hours from the time of the Greenwich meridianan ingenious plan, the credit for which has been ascribed to various persons. Reasons are not far to seek to show the impracticability of having one time for the whole of a continent as large as America; and by the efforts of Mr W. F. Allen, secretary of the General Railway Time Convention, at the meeting of 18th October 1883, it was decided by the managers to run all their roads by four standards, differing five, six, seven, and eight hours from Greenwich time, which were called respectively Eastern, Central, Mountain, and Pacific times. A fifth zone was afterwards added, four hours slow on Greenwich, used in Newfoundland and eastern Canada, which has been called Maritime, or alternatively Atlantic, and Intercolonial time. This scheme, begun in America, illustrates the system of zone standard time, which has now passed its thirtieth anniversary, and has spread over the entire globe.

Though there was no definite international agreement, as the Governments of the world have one by one gradually found it expedient to legislate that the time of some particular meridian should be the legal standard time of the country, in most cases the meridian chosen has been such that the time is a whole number of hours fast or slow on Greenwich, and so conforms to the zone-system. France, which for many years stood aloof, now keeps Greenwich time, and a traveller journeying eastward, having set his watch for English or French time, finds himself an hour slow when he crosses the frontier into Germany, and two hours slow if he travels as far as Bulgaria. After the railways of the United States and Canada had

initiated the system, Japan was the first to follow, and the time nine hours fast on Greenwich was made the standard time of that country in 1886; Belgium and Holland adopted Greenwich time in 1893, though the latter country, for some reason, has since reverted to Amsterdam time. In 1893 and 1894 Germany, Italy, Denmark, and Switzerland each began to use mid-European time, which is the name given to time one hour fast on Greenwich; and east-European time, two hours fast on Greenwich, has been since adopted in Roumania, Bulgaria, and Turkey. The Australian states fell in with the plan in 1895. South Australia in that year adopted the time nine hours fast on Greenwich; but this has since been altered to nine and a half hours fast, because the inhabitants of the colony found that their eastern neighbours had an advantage by beginning their business day a whole hour earlier than they. and so compromised, though the reason is not apparent why they should not have overcome the difficulty by an alteration of office hours. introduction of standards differing by a number of hours and a half-hour from Greenwich is a little variation of the original scheme, but has been found advisable in other places; as, for instance, in New Zealand, where the clocks are eleven and a half hours fast on Greenwich, and in Burma, where the time is six and a half hours fast, whilst in India it is five and a half hours. The time of Cape Colony was formerly one and a half hours fast on Greenwich, but in 1903, after the war, the time two hours fast was made the legal standard for all the South African states.

Recent legislation by the Government of the republic of Brazil has bridged the Atlantic in the matter of time-reckoning, for it has completed the consecutive series of hourly zones from ten hours east of Greenwich to nine hours west. If India and Burma may be considered to occupy the six-hour zone, each of the zones from ten hours east to nine hours west has at least one occupant, as will be seen from the following table, which gives one or more, though not necessarily all, of the representatives of each of the zones:

EASTERN ZONES: CLOCK FAST ON GREENWICH.

10 hr. Eastern Austra-5 hr. Chagos Archipelago. lian States and 4 " Mauritius. 3 11 Tasmania. 3 " S. African Susant Egypt, Turkey.

1 " All the Countries of Mid Europe, and Portu-Aden. 91 " South Australia. Japan. 8 West Australia, East China. Straits Settleguese and German West Africa. ments. 61 " Burma Burma.

Greenwich time is in use as standard in Great Britain, France, Belgium, Spain, Portugal, Algeria, and in certain Portuguese islands and territory in West Africa. The occupants of the western zones will be seen in the table similar to the above which follows:

WESTERN ZONES: CLOCK SLOW ON GREENWICH.

1 hr. Iceland, Madente, and Portuguese Canada, Jamaica, part of Brazil, Panama, Peru, and Guinea. 2 " Azores, Cape Verde Chili. 6 hr. A section of U.S.A. Islands. Part of Brazil. and Canada, Hon-4 " Newfoundland, cer-tain West India duras. 7 " A section of U.S.A. Islands, of and Canada. Brazil, and British A section of U.S.A. Guiana. and Canada. 5 " A section of U.S.A., 9 " Yukon, Sitka.

Brazil and its dependencies have been divided into regions in which the times two hours, three hours, four hours, and five hours slow on Greenwich are respectively the legal standard. The Eastern and Western Hemispheres may be said to overlap, since the Brazilian islands off the east coast and the Portuguese islands, the Azores and Cape Verde, all use the same meridian, thirty degrees or two hours west. In the division of this republic the separating line between the regions of three hours and four hours is formed mainly by rivers; and, similarly, in the continent of North America, which is divided into five sections or zones as above stated, the dividing lines are not necessarily straight lines or At first sight there may appear to meridians. be difficulty in having a sudden change of time at some arbitrarily defined lines of demarcation. Actually, the plan has been carried into effect in the United States by adopting points of separation which are convenient for the service of the railways, the change from one hourly zone to another taking place at some large town on each line, although it may not be exactly on the meridian midway between two consecutive hourly meridians. There is, for instance, a change on one railway line at Pittsburg in Pennsylvania whose longitude is eighty degrees (five hours twenty minutes west), and is therefore well within the accurate zone of Eastern time (four and a half hours to five and a half hours west), and would not be expected to be on a line of When the railways had chosen such separation. places for change of their time, the authorities of these cities took action and adopted one or the other standard for public use, the adoption being sometimes settled by public vote, as in the case of Detroit, where the local mean time is almost exactly five and a half hours slow on Greenwich, or midway between Eastern and Central time. Central time is in use, but an attempt was made to abandon this and use Eastern time. A vote of the people was taken on three propositions: should Central time, the local Mean time, or Eastern time be used in the city? The first received a large majority of votes.

Turning to the rest of the sphere, and the zones which fall on the Pacific Ocean, there is a gap in the four hourly zones between nine hours west, which is the legal time for Yukon and Sitka in North-West Canada, and the zone ten hours east

occupied by Australian states. The western and eastern series will be joined up by mainland when far Alaska and far Siberia are attached to the universal system; but meanwhile some half-hourly zones in this part of the world have been formed. In the Hawaiian Islands the time is ten and a half hours slow, in Samoa eleven and a half hours slow; and in New Zealand, as has been said, the clock is eleven and a half hours fast on Greenwich time. How the sailor adapts his time-reckoning to this violent change in passing from Samoa to New Zealand, or vice verså, is another story. He experiences a week in his lifetime which apparently has six or eight days in it in the respective cases.

At recent international conferences matters relating to time have been discussed altogether apart from the question of standard meridians. In January 1905 the United States navy department began sending out time-signals by wireless telegraphy at noon each day by which the officers of ships at sea might determine the rate of going of their chronometers; and from May 1910 signals have been sent out by Hertzian waves from the Eiffel Tower at Paris and from a wireless sending station at Norddeich, in north Germany, at certain definite instants of the day, the instants being defined by Greenwich time. In October of 1912 an International Time Commission was initiated, having its headquarters at Paris, to discuss questions relating to this time distribution, and at the first conference it was resolved to establish a chain of wireless time-signal stations round the world, so that any place on the globe will be able to receive two accurate time-signals, one by day and one by night, for the purpose of checking clocks. This scheme will doubtless be realised in the not distant future. From January 1915 the signals from the Eiffel Tower, which are sent automatically by the clock of the National Observatory, but so corrected from the nine minutes twenty-one seconds, which is the difference of longitude between the two meridians of Greenwich and Paris, that the time corresponds to that of the Greenwich clock, will be issued at ten o'clock A.M. and at midnight, and those from the German station at noon and ten o'clock P.M. These signals are received in the first place by ships at sea, who use the information conveyed for the purposes of navigation, which is the original object. They are received also by many private persons in England who have set up wireless receiving apparatus, and by observatories, where the time of their reception is carefully observed; and though the utmost care is taken to send out the signals from the Paris and German stations precisely at the chosen instants, small discrepancies of fractions of a second are found when their reception is accurately timed, which may be due to idiosyncrasies or peculiarities in the instruments or the method of time determination at the different observatories. Part of the scheme of the Time Commission is to make comparisons of the

time of the different observatories by these wireless signals, so that eventually a perfectly harmonious system may be derived, and signals may be issued precisely at each hour of Greenwich time by one

or other of the sending stations which will be established round the globe. The time may then be said truly to be universal, but still it will be reckoned from the meridian of Greenwich.

A KNIGHT ON WHEELS.

By IAN HAY, Author of The Right Stuff, A Man's Man, Happy-go-Lucky, &c.

CHAPTER XXVIII.-THE SECOND BEST.

'WHERE shall we go to-night?' inquired the insatiable Dumps.

'Bed,' replied her exhausted papa, before any

one else could speak.

The Joy-Week was nearly over. For five days and nights the newly emancipated Miss Sylvia Mablethorpe had been allowed a free hand. Each morning she had conducted her mother relentlessly to shops. Once or twice her devoted father had accompanied the expedition, but after being twice warned by an officious young policeman for loitering outside a modiste's in Dover Street, had excused himself from further attendance.

'They are a most amazing sex,' he observed to Philip. 'My precious pair actually spent an hour and a quarter in a hosiery establishment in Knightsbridge yesterday morning-into which my modesty prevented me from accompanying them—and when they came out neither of them could say for certain if she had bought anything or not. I wonder how they do it; if a mere man were to spend an hour and a quarter in a shop, he would by the end of that time either be lying dead on the floor or else equipped with several thousand pairs of everything. No; henceforth they shop alone! I decline to run any further risk of contracting flat-foot through standing about on a hard pavement, or mental prostration from thinking out topics of conversation suitable to retired heroes who open carriage To-morrow morning, Philip, I will give them one shilling each—they don't really need so much, for it costs nothing to have things dragged off high shelves and put back again; but they will probably require ices or some other poison about eleven—and you and I will get up an appetite for lunch by going for a ride.

At the present moment the party were taking

tea at the Carlton, after a matinée.

'I think it would be nice,' continued Sylvia, entirely ignoring her male parent's suggestion, 'if we went to a music-hall. I haven't been to one yet; and I am getting a bit tired of theatres.' Which was not altogether surprising, considering that Miss Sylvia and suite had visited seven in five days. 'Then you could smoke, daddy,' she continued artfully. 'You will come, won't you, Philip †'

'It may possibly have escaped your memory,' Mr Mablethorpe mentioned, 'that we are engaged

to dine to-night with Derek Rayner.'

'Oh, bother!' said the ungrateful Dumps; 'so we are. Has he invited you, Philip?'

'No,' said Philip; and Mr and Mrs Mable-

thorpe exchanged glances.

'Well, I'll tell you what,' announced Sylvia, who was not of an age to have any regard for the feelings of young men; 'we will dine with Derek, and you must join us afterwards, and we will all go to the Arena together. I hear it is the best place. Derek won't mind, will he?'

'I am sure the arrangement will meet with his entire approval,' remarked Mr Mablethorpe

solemnly.

'In that case,' continued Sylvia with great cheerfulness, having gained her point, 'we had better telephone to him that we shall want dinner earlier. What time do music-halls begin?'

'The performance,' said her father, 'is timed to commence at eight P.M.; but attendance during

the earlier turns is not compulsory.'

He spoke bravely, but without hope, for he

knew his daughter.

'I insist,' announced the voracious Dumps, 'upon being there when the curtain goes up. I shall tell Derek that we will dine at a quarter to seven. Do you think this hotel is on the telephone?'

'Possibly. If not, we can always light a beacon-fire at the top of the Haymarket, or get a carrier-pigeon from somewhere,' replied the caustic Mr Mablethorpe, still sore at the thought of yet another scrambled dinner.

His daughter ignored the pleasantry. 'Will you come and help me to find it, Philip?' she said.

Philip complied, and the pair went out to the hotel telephone exchange, leaving Mr and Mrs Mablethorpe to regard one another curiously.

'Poor Derek!' said Mrs Mablethorpe.

'Poor Dumps!' said Mr Mablethorpe to himself.

Meanwhile, at the telephone, Sylvia was saying to Philip, 'It would never do to leave you out, Philip, on the last evening, would it?'

For a moment their eyes met. Then Sylvia's dropped quickly.

11.

Philip dined in solitary state in his own flat. He still retained his holding therein, for his duties involved a good deal of travelling, and it was convenient to have a *pied à terre* in London.

Timothy was out, and he had the premises to himself, for which he was not altogether sorry. He had a good deal to occupy his mind just at

present, and he wanted to think.

But his thoughts had made no appreciable progress when he arrived at the Arena Palace of Varieties at five minutes to eight. He found the party already assembled in the foyer, under the radiant direction of Sylvia and the thunder-cloud escort of Mr Derek Rayner, who greeted Philip gloomily but politely. A mincing damsel in a lace tucker conducted them to their seats, which were situated in the fourth row of an unpeopled desert of stalls.

'It's lucky we got here in time,' mused Mr Mablethorpe, surveying the Sahara around them.

'We might have had to stand.'

'If people,' remarked Sylvia with asperity, 'think it grand not to come to a heavenly place like this till ten o'clock, so much the worse for them!' She sank down luxuriously in the armchair which called itself a stall, and commanded Philip and Rayner to dispose themselves upon either side of her, leaving her parents to shift for themselves. Rayner, with the air of a conjurer who is a little doubtful as to whether his audience are not getting slightly tired of this trick, produced a box of chocolates out of his hat, and the party settled down to enjoy the performance.

The ladies and gentlemen who figured in the earlier portion of the programme were obviously surprised and pleased to find the stalls inhabited. Accustomed to shout across an ocean of blue plush to an audience of pigmies encircling the distant horizon, their gratification at finding human beings within a few yards of them was extreme. More than one of the comedians worked an allusion to the fact into his 'patter.'

About a quarter to nine the ranks of the stall-holders were stiffened by the arrival of a magnificent gentleman in evening dress, with a gardenia in his button-hole. He took a seat in the front row.

'I told you there would be lots of people soon,' announced Sylvia.

But, alas! her triumph was premature. Shortly after the arrival of the gentleman with the gardenia the drop-curtain ascended upon Turn No. 5—Professor Bruno, the Man of Mystery, assisted by a stout lady in mauve tights. The Professor, speaking with a French accent which had plainly served an apprenticeship in New York, opened the proceedings by appealing to the audience to send up an impartial and unbiassed body of gentlemen upon the stage, to act—why, heaven knows—as 'committee.'

'You go, dad!' said Sylvia.

'I expect the Man of Mystery has made his own arrangements,' replied Mr Mablethorpe.

And sure enough, almost before he had spoken, the gentleman with the gardenia left his seat and scrambled up a pair of plush-covered steps

upon the stage. He must have repented bitterly of his public-spirited precipitancy; for, instead of being treated with the respect due to a committee-no one else had come forward-he was subjected by the Professor to a series of humiliating and embarrassing indignities. Showers of playing-cards were squeezed from his nose; flapping goldfish were extracted from his ears bullets were fired point-blank into his shirt-front and discovered (by the lady in tights) in his coat-tail pockets. His silk hat was turned into a coffee-urn. His very gardenia was snatched from him and shaken out into a Union-Jack. Still he maintained a heroic attitude throughout, smiling woodenly at each successive outrage, and loudly proclaiming his entire satisfaction with the genuineness of the performance before resuming his seat. However, it was plain that the strain had been too great for him; for presently he put on his hat, stole quietly away, and was

'Poor thing! I wonder where he has gone to,' said the sympathetic Sylvia.

Derek Rayner, who was at the age for which the drama has no secrets, explained that this gentleman was now probably travelling in the same cab with the Man of Mystery and the lady in tights to undergo further humiliations at another music-hall.

Presently the stalls began to fill up in real earnest, and turns came thick and fast. Some were sentimental, some were funny, a few were vulgar, and some were merely idiotic. Once or twice Mr Mablethorpe held his head and said his brain was going; but on the whole they enjoyed themselves greatly, especially that unspoiled child of nature, Miss Sylvia.

Sylvia was particularly pleased with Mr Arfur

Mow, Comedian.

When that gentleman's number went up there was a round of applause, and the orchestra dashed into a merry tune. There came a pause. Then the tune was played again. Then another pause. Slight uneasiness among the audience.

'He hasn't turned up,' remarked the worldlywise Rayner. 'These chaps do four halls a night. He's probably on the other side of

London, in a broken-down taxi.'

The band played its prelude once more, and then some one—presumably the manager—appeared upon the stage and offered an apology for Mr Mow's absence. 'He was here a moment ago, ladies and gentlemen,' he declared.

'Rats!' observed a disappointed lady in the

gamery.

The manager redoubled his assurances. They had searched high and low, he said, but could not find Mr Mow anywhere. Would the audience——

His speech was interrupted by the conductor of the orchestra. 'If Arfur Mow reelly 'asn't arrived,' he announced, rising to his feet, 'I'll give you a turn meself.' And bounding upon

the stage, the conductor turned and faced the audience with a flourish. He was none other than the missing Arfur Mow! Having chased his apologist into the wings amid shouts of delight, the great man proceeded to the serious work of the evening—a ditty entitled 'A Glorious Death; or, How I was Drowned in the Brewery.

'What is the next item?' inquired Mr Mablethorpe in a hollow voice, after the audience and Mr Mow had taken a reluctant farewell of one another. 'The thumbscrew, or boiling oil?'

"High Jinks in a Parisian Café," announced Sylvia with great satisfaction.

'Be prepared to Mr Mablethorpe coughed. read your programme sedulously until further notice,' he said to his wife and daughter.

But his fears were groundless. The only occupant of the café when the curtain rose was a waiter of melancholy aspect. To him entered a lady and gentleman in evening dress, arm-inarm—the gentleman carrying an umbrella and smoking an unlighted cigar—who intimated in pantomime that they required an abundant and satisfying meal. The waiter responded by stepping forward and bowing so low that he fell right over on to the back of his neck, coming up again to a standing position after one complete revolution. With a deeply injured expression he went down upon his hands and knees and began to search for the obstacle over which he had tripped. Presently he found it. It was so minute as to be quite invisible to the audience, but when thrown into the wings it fell with a reverberating crash.

Any further doubts as to the nature of the entertainment were now dissipated by the gentleman in evening dress, who, instead of hanging up his opera-hat in the orthodox fashion, gave his head a backward jerk which sent the hat flying backwards on to an adjacent gas-bracket. He next removed his evening coat, and having lighted his cigar from a candle upon the table, proceeded to give a juggling exhibition with the

candle, the cigar, and his umbrella.

At this his lady friend withdrew, possibly in arch of a less eccentric host. The waiter, search of a less eccentric host. instead of serving supper, remained a fascinated spectator of the gentleman's performance. Presently, fired with a spirit of emulation, he took a plate and a raw egg from the table-with the exception of a property chicken the egg was the only edible thing in the restaurant—and having thrown the egg into the air, endeavoured to catch it upon the plate. He succeeded. While he was wiping his face the lady made an unexpected reappearance. She had left her opera-cloak and evening gown in the cloak-room, and was now attired in what looked like a bathing-suit of tight pink silk. Evidently having abandoned all hope of supper, she had good-naturedly decided to come and lend a hand with the juggling exhibition. She incited her companion to further enterprises. At her instigation he took the table by one leg and balanced it upon his forehead-fortunately the chicken appeared to be clamped to the dish and the dish to the table -keeping three plates in the air with one hand and a fourth spinning horizontally upon the ferrule of his umbrella with the other. The waiter, discouraged and fatigued by his want of success with the egg, here opened an ingenious little door in his own stomach, revealing a small cupboard; and taking out a bottle and glass, proceeded to refresh himself in the usual manner. Then, catching the eye of the lady, who was regarding this somewhat unusual arrangement of nature with pardonable astonishment, he hastily returned the bottle and glass to their place and shut the little door. But feminine curiosity is not easily allayed. As soon as her companion had completed his performance with the table, the lady drew his attention to the phenomenon which she had just witnessed. The gentleman promptly stepped behind the shrinking waiter, and, holding him firmly by the elbows, invited the lady by a nod to investigate the mystery for herself. This she did. But the opening of the door only revealed a tiny venetian blind, drawn down and bearing the legend, 'BAR CLOSED.'

'I wonder how they think of such things!' said Sylvia rapturously.

'They do that to give the juggler a rest,'

explained the undeceived Mr Rayner.

After this the band played louder and faster, and the gentleman took all the furniture within reach and proceeded to hurl it into the air, keeping it there with incredible ease through the whole of a frenzied rendering of *Il Bacio*. lady friend, quite carried away by her enthusiasm, skipped about the stage clapping her hands and uttering shrill whoops. The waiter, roused to a final effort, rushed off into the wings, to reappear with a perfect mountain of plates. These he hurled hysterically heavenward. They descended in all directions, splintering into fragments amid appreciative yells from the audience. Having caught exactly one plate out of the avalanche, the waiter displayed it to the house with great pride, and then (evidently afraid of spoiling the ship for want of a ha'p'orth of tar) produced a small coal-hammer from his pocket and smashed it to atoms. The performances concluded with a general mêlée, in which the gentleman and lady combined to bombard the waiter with all the plates they could lay their hands on. But he caught them, every one of them, two at a time; and then, once more unlocking the door in his waistcoat, and pulling up the venetian blind, was seen generously offering liquid refreshment to his discomfited assailants as the curtain fell.

By this time the majority of Sylvia's party were enjoying themselves thoroughly. Sylvia herself was bubbling over; Julius Mablethorpe was shouting like a child; and his wife, weak with laughter, was wiping her eyes.

Mr Derek Rayner was in the seventh heaven, for his young hostess had devoted her entire attention to him, and had hardly given her other companion so much as a look. 'Perhaps the chap is just a family friend, after all,' he said to

himself optimistically.

Philip alone was preoccupied. That morning he had received a letter from his firm, offering him what was practically a year's holiday. Some time previously the representative of a great industrial corporation in the United States had visited England as the guest of the Britannia Company. He had been royally entertained; several excellent understandings had been reached, and an important commercial alliance cemented. Now Philip was invited to represent the company on a return visit. It was a signal honour and a tempting prospect. He would encounter fresh people and new ideas; he would be able to enlarge his technical knowledge, for he would go everywhere and be shown everything; andwell—he might be able to get a little farther away from his own thoughts. He was suffering at present from a satiety of thought, and the morning's letter had brought matters to a crisis. Numerous forces were at war within him.

Chivalry said, 'If you may not live with her, live for her. Go your own way as far as you must, but do not go too far; she may need you.'

Common sense said, 'Why sigh after a girl who does not care for you, and never did? You are nothing to her. Why offer her what you do not owe and what she cannot take?'

To-night a third voice had joined in the debate. It said, 'Love is not entirely a matter of twin souls and divine passion; it has a very material side. Life is short; we live but once. It is given to few to encounter their affinity in this world; it is foolish to waste one's youth waiting for a thing which may not exist. Why not be practical? Why not cut the Gordian knot? Marry some nice pretty girl, with no nonsense about her, and have done with it. Then you will have a comfortable home and a loyal mate, and be able to turn out some decent work.'

Thousands of men and tens of thousands of women have debated this problem in their time; but Philip did not know this. We are apt to think that our own human experiences are unique

Suddenly Sylvia turned to him. Her dark eyes were full of reproach. 'Philip, you are not listening a bit. This next song ought to be

lovely.

Philip, apologetically conning the programme, recognised therein the name of a great singer—the latest recruit to the variety stage—who, having achieved a European reputation as the leading operatic baritone of his day, had abandoned that strenuous calling in the zenith of his drawing powers in order to earn an ambassadorial income by singing selections from

his repertoire — which means the hackneyed ballads beloved of the British Public—for some fifteen minutes per diem.

Presently the great man appeared. He began with the Toreador's Song from *Carmen*, which set heads nodding and toes beating time. Then came 'O Star of Eve,' and last of all, 'I'll Sing

Thee Songs of Araby.'

Struck by an unwonted stillness at his side, Philip glanced at Sylvia. Her effervescence was gone. With a child's instant susceptibility to external influences her mood had changed; she was raptly drinking in the limpid notes that came floating to her through the smoke-laden atmosphere of the Arena Palace of Varieties. A humorous remark from Derek Rayner fell upon unheeding ears. Her eyes shone; her breath came quick; her flower-like face was alight with tender enthusiasm.

And all my song shall strive to wake Sweet wonder in thine eyes!

crooned the singer. Certainly he had achieved his purpose in one case, Philip thought.

To cheat thee of a sigh!
To charm thee to a tear!

The words died away to nothingness in the absolute stillness of the great audience. Then, after a brief interval, came the applause, in mighty gusts. But during that interval Philip had had time to hear the sound of a long, tremulous sigh close beside him.

'My reason has been saved at the eleventh hour,' said Mr Mablethorpe gratefully. 'Talking of the eleventh hour, shall we go home?' Nothing

but the kinematograph now!'

But Sylvia insisted upon seeing the programme out. Accordingly the party sat on, what time such of the audience as still remained were plunged into darkness, and a flickering travesty of life in the American backwoods was thrown upon the screen.

First came the announcement: "I love you," says the Sheriff to the pretty Station-Mistress."

There followed a picture of the Station-Mistress at home. The only visible furniture was a writing-table, but technical exigencies were satisfied by a lever standing up in the middle of the floor, evidently designed to control the railway traffic of the district. The only other notable feature of this interior was a strong breeze. Presently the Sheriff, a theatrical-looking young man in a slouch-hat and trousers like a pair of door-mats, sidled in at the door; and an interpolated line of explanatory matter inquired, 'Will you come riding with me?'

Apparently the lady was willing, for next moment she was discovered in a stable-yard blowing a whistle. Instantly a horse appeared, saddled and bridled, and after performing several tricks with obvious reluctance, consented to allow itself to be mounted, and departed at full gallop.

apparently to join the Sheriff.

'I guarantee that we shall meet that animal

again,' prophesied Mr Mablethorpe.

Meanwhile the plot began to obtrude. direct result of the Station-Mistress's culpable negligence in leaving the railway traffic to direct itself, the way was now open for an attempt to hold up the 'bullion express.' This enterprise was engineered by a gentleman called Mexican Steve, assisted by a gang of six. Being apparently familiar with the unbusiness-like habits of the Station-Mistress, Mexican Steve very sensibly selected the station office as a suitable place wherein to confer with his associates. The conference took place forthwith, the members thereof huddling close together in order to keep within the picture.
'The express does not stop here; we must flag

her,' said the next line of print.

What does that mean? inquired Sylvia.

'I fancy it means that they are going to put the signal at danger, and so stop the train,' said

Philip.

This, as it turned out, was a correct surmise; but much had to happen first. As the audience had fully expected, the symposium in the stationhouse was now interrupted by the intrusion of the Station-Mistress herself, whose horror and astonishment at finding her home in the possession of Mexican Steve and party was a little unreasonable, considering that she had been absent some hours, and had left the door unlocked. The ensuing mêlée was not depicted, the scene being suddenly changed to a railway-track, with a train approaching in the distance. There was a signal-post at the side of the line. The signal suddenly rose to danger; after which the scene was switched back to the station office, where Mexican Steve had just finished pulling over the lever. The Station-Mistress, it is regrettable to have to add, was sitting bound hand and foot to her own table. The rest of the gang had disappeared, doubtless to hold up the train. Before joining them, Mexican Steve addressed his victim. 'Now, Maimie Matterson, escape if you can!'

'And she will!' remarked Mr Mablethorpe

with conviction.

'Hush!' said Sylvia under her breath. She was on tenterhooks; it was all real to her.

Any doubts as to Miss Matterson's ability to escape from her present predicament were at once set at rest. With a few convulsive wriggles she succeeded in getting her lips to the horsewhistle which hung round her neck.

'Thank heaven we can't hear her!' said Mr Mablethorpe to his wife, as the lady's cheeks distended themselves in a resounding blast.

Next moment the door was kicked down, and Maimie's performing horse entered the room and pawed the floor politely. Sylvia clapped her

'I knew it!' remarked Mr Mablethorpe resignedly.

In obedience to a frenzied signal from his

mistress, the sagacious animal first proceeded to operate the lever in the middle of the floor, pulling it back (presumably) to safety. This feat accomplished, he set to work, amid thunders of applause, to unpick with his teeth the knots which kept Maimie Matterson bound to the table. He was rewarded for his gallantry by being promptly mounted and ridden at full gallop across a heart-breaking line of country, apparently at a speed of about forty miles an hour.

Then for the last time the scene changed to the railway-track. The train, which had covered quite two hundred yards in the last quarter of an hour, was now close to the post, and Mexican Steve and his friends were crouching by the line armed with six-shooters. Above their heads the signal-arm still stood at danger. Suddenly it dropped.

'Who did that?' inquired an indignant line

of print.

'That was the dear horse!' proclaimed Sylvia

triumphantly.

The train, which had been exhibiting signs of indecision, suddenly quickened its pace and shot past, to the discomfiture of the desperadoes, who childishly fired a volley at the wheels. moment an armed band, headed by the Sheriff and Miss Maimie Matterson-they must have covered twenty miles in something like fifteen seconds—dashed out of an adjacent wood. After a perfunctory struggle, the incompetent criminals were duly taken into custody and marched off The Sheriff, having got rid of by their captors. his posse, seized the opportunity to indulge in an exchange of tender endearments with Miss

'We will find the preacher-man, right now!' he declared.

Miss Matterson's reply was not recorded in print, but to judge from the last few yards of the film it was of an encouraging nature.

As the Sheriff's arms closed round the unresisting form of his athletic bride, Philip was conscious of a gentle movement beside him. Then a small, warm, gloved hand was slipped into his own in the darkness. He made no sign; he merely allowed the hand to rest where it lay. Presently it was withdrawn as softly as it came. It was a brief, almost momentary episode, but it settled the course of Philip's life for him.

The lights went up; a blurred and bearded figure was thrown upon the screen; and the band, rising to its feet, offered a hurried tribute of loyalty.

'Supper?' suggested Mr Mablethorpe to the

company in general.

'You must all be my guests to-night,' said Philip. 'I may not have another opportunity.'

At supper he told them that he was going to America for a year at least.

v.

'I presume,' said Mr Mablethorpe, as they sat alone together after Sylvia and her mother had gone to bed, 'that when you do return from your travels we must not expect to see—quite so much of you as hitherto?'

'No, I think not,' replied Philip. Then he added awkwardly, 'You understand the situa-

tion?'

Julius Mablethorpe nodded. 'Yes,' he said,

'I do; and I know you are right. There is a power of difference between giving one's best and one's second best. You can't compromise over the really big things of life; with them it must be everything or nothing. You are doing the right thing. But we shall miss you, my son Philip—all of us!'

VI.

So our Knight rode away, exceeding sorrowful. His departure was mourned by many, notably one; but not by Mr Derek Rayner.

(Continued on page 499.)

HUMAN LEOPARDS AND ALLIGATORS.

By ROBERT MACHRAY.

T is from the depths of the Dark Continent that the strangest true stories come. are no stories quite like them, probably because nowhere else are there quite the same conditions of life. Rarely concerned with the mysterious or the occult, they usually centre in the elemental, the primitive, the abysmally savage. In them we seem to get back to the beginning of things, the primeval. So much is this the case that some of these African stories might dispose us to imagine that the vast curtain of the past had been rolled up in order to present to this late age weird or terrible pictures of the thoughts and deeds of the men who lived in the troubled morning of the world, in the terror-haunted childhood of the human race.

One of these strange true stories came recently from the Protectorate of Sierra Leone, but the theatre of its action extends to an unknown distance beyond that comparatively small territory. From the same dim regions also came another story, but fundamentally so similar that it may be regarded as a variant of the other. Part of the latter was told in a White Paper laid before Parliament shortly before the close of the session last August; but Parliament is not a particularly good place for the telling of such a tale when there is no party capital to be got out of it, and this one passed practically unnoticed by both Houses. Portions of the story are to be found in the letters and other writings of missionaries and travellers. Much illuminating colour can be derived from an article by Mr Fitzgerald Marriott which was published in the proceedings of the famous Quatuor Coronati lodge of Freemasons. The story is not yet absolutely complete, and most likely never will be, for it is impossible for a white man to understand fully the psychology of a black any more than for a black to comprehend thoroughly that of a white; they are separated not so much by pigmentation of skin as by the unnumbered centuries that have made the white what he is, and left the black what he However, there is more than enough detail, of a singularly interesting character, to furnish forth the story with scenery, incidents, emotions, and 'the red blood of men.'

Sierra Leone became a British colony-of sorts, it must be premised—more than a hundred years ago. Its area was small and insignificant. and its capital, Freetown, commemorated the fact that it was mainly a settlement of slaves of different tribes who had been recovered from their captors at various times, and set free. For a period Sierra Leone consisted of nothing more than a short, narrow strip of coast; but traders penetrated into its hinterland, with the ultimate result, to put the matter briefly, that the latter was proclaimed a British protectorate in 1896, the whole area thus brought under the Colonial Office being about twenty-five thousand square miles. So much has been done since to improve the country that Mr T. J. Alldridge, whose acquaintance with it in his capacity of magistrate extends over many years, described it as A Transformed Colony, when writing a book about it in 1910. The most notable change is in the south, through which a Government railway has been built for a length of some two hundred miles. Not many whites have lived or live in the district, which used to be known as the 'White Man's Grave,' but is now in somewhat better repute. In the colony the negro population is very mixed. In the protectorate there are several semi-independent tribes, each with its own customs, manners, and language, and each having its own chiefs and headmen, but under the paternal control of the central Government, which administers both colony and protectorate.

Perhaps the most striking feature is the prevalence of native secret societies in the protectorate, differing in their aims and objects, but alike in exercising extraordinary power and influence in the special spheres of their activity. Some of these secret societies are not only innocuous, but beneficial and praiseworthy; others are of a totally opposite description. To the

former belong the Purrhu and Bundhu societies, the one for men only, the other exclusively for women. The paternal Government does not seek to interfere with organisations of this sort, which may be said to bear a eugenic character; but it is trying to stamp out those in the other

category.

The White Paper laid before Parliament is entitled, Despatch from the Governor of Sierra Leone, reporting on the Measures adopted to deal with Unlawful Societies in the Protectorate, the unlawful societies in question being known respectively as the Human Leopard Society and the Human Alligator Society. These curious names will suggest that the title given to this article is not entirely fanciful. The members of these secret organisations, more especially some of them, are designated Leopards and Alligators. A kind of parallel as regards nomenclature may be seen in the American Ancient Order of Buffaloes; but these African societies put the prefix 'Human' before the symbolical appella-It is around and about the Human Leopards and the Human Alligators that the strange true story is—or perhaps I had better say can be-woven, for I do not purpose to construct a detailed and finished narrative out of the material at command; nor, in fact, is there any need of literary artifice in presenting that

The date of the origin of these societies is unknown, but most likely should be referred to a remote past. Mr Alldridge, in the book mentioned above, writes as if the Human Leopard Society came into existence in 1890; but the Governor of Sierra Leone is far more probably correct when he states in his despatch that it has held sway for many years, possibly for centuries, over the large tract in which it works; and it is equally probable that the Human Alligator Society is also very ancient. For innumerable ages the real leopard and the real alligator struck terror into the native heart; their ruthlessness, strength, and cunning, as well as numbers, invested them with something akin to the sanctity of the dreaded unknown gods who had to be propitiated; their very names, as those of the lords of life and death, were associated with a trembling fear. It, therefore, can readily be understood how secret societies, desirous of power, should select such names for themselves, and how old they may very well be as organisations, for they smack of the primitive, the elemental order of the world, when 'darkness covered the earth, and gross darkness the people.

So dark and terrible are the objects of these societies that they are sometimes described as murder societies—that is, societies existing for the purpose of committing murders—and compared with the Assassins of the Middle Ages, the Thugs of India, and similar associations; but it is certain that they do not commit

murders for the mere sake of murder, though their existence is bound up with the taking of human life, with what white men must call murder, and cannot permit to continue in any land over which they exercise control; yet to the black the killing of a human being for certain purposes seems no murder. These societies have also been called cannibal societies -that is, societies that practise cannibalism; but a good deal more than cannibalism enters into the matter, for religion and therapeutics play a prominent part. As has been pointed out by Mr Marriott, these societies are not bands of conspirators, but the outgrowth of tribal developments. Their roots lie deep in the past—the past of Africa, which no man knows. In his despatch, Sir E. M. Merewether, the Governor of Sierra Leone, states: 'For a number of years past the Northern Sherbro District has been the principal field for the operations of an organisation which goes under the name of the Human Leopard Society. It has not yet been decided whether the object of the society is merely to satisfy the craving which some savages have for human flesh, or whether the eating of human flesh is only part of some ceremony which is believed to have the effect of increasing the mental and physical powers of the members of the society.' Mr Alldridge's account of this society is that 'when the Imperri country (Sherbro) was under the control of chiefs, a numerous but select body of natives associated themselves under the name of the Human Leopard Society for the purpose of keeping alive a most drastic, solid medicine called borfimor, which required to be anointed with human fat in order to be perfectly efficacious. To obtain such a fat the killing of human beings was necessary.' He adds that persons who joined the society paid the life of a human victim as entrance fee.

It was not till 1912 that anything like an adequate idea of the extent of the operations of this society became known. In that year the commissioner of the district received information that from twenty to thirty human beings had been killed since 1907 by the society in Imperri and in the neighbourhood of Pujehun for its dreadful purposes. These deaths were all brought about in a way peculiar to the Human Leopards, no other method apparently being permissible according to their rules, a circumstance which attests the ritual character of these murders—this way of killing being termed 'leopard palaver,' just as the manner in which the Human Alligators slay their victims is called 'alligator palaver.' To all appearance those killed by the Human Leopards had been killed by actual leopards. Before the truth was discovered by, or, more correctly, to, the Government-for the facts came later from native sources—there was an impression that specially trained tiger-cats did the killing; but this was not the case. The victims met their fate at the hands of particular members of the society dressed in leopard-skins, and they were done to death by means of a 'leopard knife,' an iron instrument usually with three blades arranged like Prince of Wales' feathers, which left on the body marks closely resembling those made by the claws of a real leopard. To carry the similarity still farther, the persons killed were struck with this knife first on the skull, which was crushed in, then on the neck (the vertebræ being severed), and next twice deeply in the back, the series of wounds being very much the same as those which would be made by the animal when

it springs on a man from behind. Substituting the alligator for the leopard, the method employed by the Human Alligators is analogous to that of the Human Leopards. Here again the killing must be done by special members of the society; but the executioner is either dressed in alligator-skins or is concealed in a species of vessel called a koonkoo-be, to which the semblance of the saurian has been given. In the former guise much ingenuity is shown in lying in wait for the doomed man. With one nostril plugged up with clay, and the other having in it a long hollow reed with its upper end raised above the surface of the water, the executioner, dressed in alligator-skins, lies in the stream or pool to which the victim is known to be in the habit of going to bathe or drink. When the opportunity comes the Human Alligator falls on his unsuspecting prey, and kills him with an 'alligator knife,' mauling the body as the real alligator would maul it. In the latter form the koonkoo-be is used. This is a vessel, twelve feet long by three feet wide, consisting of two canoes, one turned over on top of the other, and made watertight, the bow being shaped in the exact figure of an alligator's head. Beneath the upper canoe are holes just large enough to admit the handles of the paddles which propel this weird craft. Near the bow are two larger openings, and from these protrude the hands of the executioner, who with sharp iron claws resembling those of the real alligator drags the victim into the water and kills him. The Human Alligators might be described as a water society, and the Human Leopards as a

land society.

When a man or woman, boy or girl, disappeared, otherwise unaccountably, from the life of the tribe, and it was rumoured that he or she had been devoured by the leopard or the alligator, the rest was silence, such was the immense intimidating power of these societies; yet some knowledge of their frightful proceedings penetrated in time to the Government, which took action to put a stop to them. Ordinances were passed by the authorities of Sierra Leone in 1896, 1901, and 1909 making the societies illegal, forbidding their operations under the severest penalties, and proscribing certain specific

characteristic articles-namely, 'a leopard-skin shaped or made so as to make a man wearing the same resemble a leopard, or dressed differently from the ordinary dressing of leopard-skins for wear, or an alligator-skin similarly treated; an alligator-canoe, or koonkoo-be, a canoe shaped to resemble an alligator; a knife having two or more prongs, commonly known as a leopardknife or an alligator-knife;' and the so-called medicine borfima, the borfimor of Mr Alldridge. Any person having any one of these proscribed articles was liable to fourteen years' imprisonment. Chiefs abetting the societies or failing to report their doings were to be imprisoned or heavily fined. Death, deportation, and other penalties were decreed against the principal offenders.

But the killings still continued, and the Government took further proceedings, on a large scale, in the autumn of 1912. A company and a half of the West African Frontier Force were sent to Northern Sherbro, and no fewer than three hundred and thirty-six persons were arrested, including several paramount chiefs and leading men from the different chiefdoms. Three of those arrested turned king's evidence; they admitted being members of the Human Leopard Society, and described what took place at the various murders in which they had taken part. This was the only direct evidence, and in most cases it was not corroborated. All attempts to obtain full corroboration failed, as a very impressive oath of secrecy had evidently been imposed on all the people; even the relatives of the victims were afraid to give information. The Government officials had relied on being able to prove a special mark indicating membership of the society, but this test broke down. The result of a preliminary inquiry was to liberate two hundred and ninety-one of those accused; but later sixty-six other persons were arrested, all of whom were committed for trial on various charges connected with this society. A special court was constituted, under the presidency of Sir W. B. Griffith, formerly Chief-Justice of the Gold Coast, in December 1912, and sat for several months. The prisoners were represented by counsel, and their trials were conducted with the utmost care and patience. The hearing of the first case occupied eleven days, of the second thirty-six, and of the third twenty-eight; the rest of the cases were disposed of more rapidly, particularly as the majority of them had to be abandoned owing to the failure of the test of the identification mark of the society, a mark said to be burned into the flesh in the initiation ceremony. In the upshot, nine persons were convicted of murder, and ten of lesser offences; seven of the nine were executed, and capital sentence on the other two was commuted to imprisonment for life. Those convicted of lesser offences than murder were sentenced to long terms of imprisonment, to be undergone in Nigeria. Several of those acquitted, but of whose guilt there was no moral doubt, were expelled

from the country.

Notwithstanding the drastic and comprehensive action of the authorities, which is recorded in the despatch of Sir E. M. Merewether to the Colonial Office, it is certain that neither the Human Leopards nor the Human Alligators have been completely crushed. The task of stamping them out will be one of great difficulty, for both organisations still have, as they have long had, an extraordinary hold on the native mind. The despatch concludes, indeed, on a pessimistic note. 'While it is permissible,' it says, 'to believe that the action taken by the Government has had the effect of checking the activities of the Human Leopard Society, at all

events for the time being, it would be by no means prudent to assert that this criminal organisation has been broken up. Many persons of whose connection with the society there is little or no doubt are still at large, and probably there are not a few others who have hitherto not come under the notice of the authorities. The blind belief of the natives in the efficacy of the medicine concocted by the society (especially that known as borfima), the power and authority enjoyed by the possessors of these medicines, the fact that periodical human sacrifices are considered to be necessary to renew the efficacy of the medicines, and the tendency on the part of some natives to cannibalism pure and simple all these causes will contribute to the survival of this baneful organisation.'

PONNAS.

By IAN SPEARMAN.

MANDALAY, the capital of Upper Burma, is still the home of what remains of the one-time Burmese régime. There are to be found some of the old Ministers in retirement, though most have joined the majority. The Upper Burman, though he has lost his king and all that royalty carries in its train, yet has the palace, the royal monasteries, the relics, as well as the relatives, of the once all-powerful to help to keep alive hopes which are destined never again to be fulfilled.

A sine qual non at an Eastern Court is the soothsayer; and the Court of Thibais, the late king of Burma, was no exception. These soothsayers were not only a necessity, but also wielded great influence, in those bygone days. There are three classes of them to be found in Mandalay, but I propose to deal only with the astronomers or soothsayers and the mendicants. The word ponna is generic, while bedinsaya, or soothsayer, applies particularly to those who busy themselves with the irremediable past or the uncertain future.

The ponnas still have a quarter to themselves in dear old dusty and decaying Mandalay. They are an exclusive class, whose birthright is either idle and innocuous prattling to a nation of credulous and gullible children, or else a life of idle luxury. The ponnas wear a dress peculiar to their class. They wear the long hair, the gaungbaune or head-dress, and white cotton jacket of the Burman; but, instead of the Burman putsoe or longyi for a nether garb, they wear the Indian dhoti. They have a language of their own, but are nevertheless well versed in Pali, Burmese, and Hindustani.

The more learned of the Brahmin ponnas remain in Mandalay to make out the Burmese calendar. In these calendars the probable happenings of the year are foretold. The Burmese

year commences early in March. The male portion of the ponna community have no regular work, but their womenfolk are bazaar-sellers. The ponnas are half Hindu, and as a body of men they are far better-looking than the Burmans. The same applies to their womenfolk, who are handsomer and prettier than the ordinary Burmese woman. Unlike the men, the women have no distinctive dress. Ponna women rarely, if ever, marry outside their own community.

The bedinsaya is a Brahmin, but the mendicant is not. Every year, about the beginning of February, ponnas, both bedinsayas and mendicants, are to be found in almost every large town and village of Lower Burma. They wander through Lower Burma at a period when they are certain of making money. In February money, which has been so scarce till then, is plentiful. Paddy has been sold, and the happy-go-lucky Burman, like the spendthrift he is, doles out rice to the mendicant, and silver to the bedinsaya to foretell what is in store for him in the near future.

The majority of the ponnas who wander through Lower Burma are mendicants pure and simple. They carry across the shoulder a fair-sized white cotton sack, into which they invite you to put a little rice to add to the quantity already there. These mendicants beg rice not because they are poor and unable to purchase it, but because they hope to obtain sufficient to retail at a profit. That these men are never in want is evidenced by their spotless dress as well as by their fat and sleek appearance.

Deserving beggars we have in plenty in Burma; but these self-centred, supercilious, and haughty mendicant ponnas are a positive nuisance, standing, as they do, at one's front-door mumbling a string of sentences wishing you and yours health, wealth, and prosperity. These, to them,

meaningless benedictions are repeated in the hope of inducing you, if they persist long enough, to give them a little rice. The Burman, who is perfectly well aware that these mendicants are a scourge that needs checking, instead of resolutely refusing to feed them, encourages them by gifts of rice and money to continue in a life of luxurious idleness.

All ponnas are Hindus, and therefore unable to accept cooked food or water from you. Many a time have I watched them, under pongyi kyaungs (monasteries), cooking their food in the weird cooking utensils common to all natives Often do these mendicants visit of India. me, though I persistently refuse to give them a condensed-milk tin-a common measure of rice in Lower Burma-full of rice. They stand unmoved on my doorstep repeating, parrotlike, their stereotyped form of blessing in the hope of inducing me to bribe them to go. Angry and sadly disappointed, they leave me, devoutly hoping to meet with one more charitably disposed.

In his heart of hearts the Burman has no love for this class of ponna, but he has his national weakness which shows itself in his every walk of life. The Burman is given to thanarde (to have pity). It is like charity; it covers a multitude of sins. The Burman looks upon the mendicant ponna as a necessary evil. Whether he is a useful member of society or not is outside the question of practical politics. He exists; therefore he must be provided for.

In this annual migration of ponnas there is a fair sprinkling of Brahmin soothsayers (bedinsayas). Their dress is the same as that of their mendicant brothers; but, instead of the white cotton sack of the mendicants, the soothsayers carry a bundle of books, their stock in trade, tied up neatly in a white cloth. The mendicant visits each and every house in search of rice to eat and sell, whereas the bedinsaya is forbidden to enter a house uninvited. After partaking of food in the early morning, he is to be seen wandering the streets casting a furtive glance here and there in the hope of being asked to tell the past and expose the future.

Once in a house, the bedinsaya is treated with almost as much respect as is shown to a pongyi (monk). The best thenbyn (a finely woven mat used in all Burmese houses for guests to sit upon) is unfolded for the soothsayer to sit In front of him is the cross-legged upon. ubiquitous betel-box and a plate full of cheroots. A slate, a slate-pencil, and a horoscope keep this worthy man busily engaged for almost five minutes. Let us notice what he does. In one corner of the slate he draws two parallel lines, crossed by two vertical ones. The device is similar to that used in the game of O's and All the spaces are filled up with various figures. Rapid mathematical calculations follow, which are rubbed out with the help of the

forefinger and a little spittle as soon as made. These calculations range from addition and subtraction to multiplication and division. The slate is now gradually covered with figures, when, after much scowling and violent tapping of the slate with the point of the pencil, the bedinsaya asks His answers to your you to question him. questions are naturally such as you desire. You were born on the tenth labyiegyan of Tabodwai, 1230 B.E. (about 1st March 1868 A.D.), and on With these meagre details, he tells a Sunday. your past history—accurate in so far as it refers to an attack of smallpox. This he sees from your face. He then gives you an account of what is in store for you. The bedinsaya, being above all else a most observant person, is able to make a fair guess at what you would like him to say, and he accordingly says it.

A Burman's horoscope is not usually written up till a person is of age. The details necessary are said to have been recorded on a slip of paper at birth. It is usually advisable to take the accuracy or genuineness of a horoscope or parabeik (palm-leaf document) 'cum grano salis.' I have come across so many faked palm-leaf documents that I am inclined to place little or no trust in them. The Burman is just as expert in making a brand-new horoscope look old as a Chinaman is in making new china coffee-cups look old and coffee-stained.

A soothsayer never allows himself to be caught. If an answer is impossible he does not admit defeat, but states that a definite reply is impossible owing to the indistinctness of the indication. Future occurrences or happenings are fixed at a reasonably distant date to prevent awkward questions.

A Burman attaches great importance to the hour and day of birth. He is told to believe, and he does implicitly believe, that it makes all the difference to him whether he was born on a Sunday or a Wednesday. To be born on Sunday is to be bad-tempered; on Wednesday, short-tempered; on Thursday, good-tempered. The whole existence of a Burman from the day of his birth to his death, and even subsequent to his death, is fraught with superstition. It is, therefore, not surprising to find the Burman calling in the aid of a bedinsaya to enlighten him as to his future.

That the occupation—if one may use the word—of a bedinsaya, as also the life of the mendicant ponna, is profitable cannot be denied. I have been at some pains to discover whether these ponnas really make the large sums they are reputed to do, and I have come to the sorry conclusion that the Burman does allow these men to return to their homes in Mandalay the wealthier by fifteen to twenty pounds sterling.

It is extraordinary what little effect, if any, Western thought and education have had on this fascinating race of children at school.

FLIGHTS BY WILD FALCONS IN KINTYRE.

By DUGALD MACINTYRE.

THOUGH not so plentiful as formerly, falcons are by no means rare near the Mull of Kintyre, where lofty sea-swept cliffs afford suitable nesting and roosting places to this, the real king of birds. The peregrine builds no nest; a slight depression in a grassy niche high up on the cliff is utilised to hold the eggs, orwhen such a site is available—they are laid in the old nest of a raven. The male falcon, known as the tiercel, assists in the labour of incubation; but should his mate be shot in the earlier stages, he finds another in a day or two, and the newly mated couple seek a fresh site for the next attempt to rear a family. I have known a tiercel find four females in one season to replace those shot; which is explainable only on the assumption that the increase of the peregrine is regulated naturally in a manner not yet understood. Probably there is a non-breeding reserve, with a preponderance of females, attached to each hereditary eyrie, on which reserve the male draws when necessary. Should the female bird, known in falconry as the falcon, be shot after the young have hatched out, the tiercel rears them; the only domestic duty he fails to perform being the sanitary one of carrying to a distance the heads and wings of the birds fed to the young, which the hen-bird always does. One tiercel under observation, whose mate was shot when the eggs in the eyrie were within three days of hatching, succeeded in hatching out; and another male found time in the intervals of attending to his own brood to feed an orphaned falcon on a cliff at a distance of quite two miles.

The prey of falcons at the eyrie varies with its situation. At one nest jackdaws may form the staple food, at another puffins; while on inland cliffs grouse, golden-plover, and curlew are most commonly seen. Should a pair of falcons, as is not uncommon, nest on an island cliff, the sight and sound of these fine birds returning from the mainland with quarry in their talons are, once seen and heard, always remembered.

There is little truth in the old legend of the enmity existing between the falcon and the raven, the latter bird being quite able to defend itself from the falcon's attack, which it does by turning on its back in mid-air, presenting beak and claws to its adversary, and croaking in a hurried and angry manner. Young ravens some-

times get rough treatment from the peregrine before they have been taught the 'lesson of the wild;' and I have seen a young raven fall from an immense height, as if shot, when stooped at by a falcon which seemed to the human eye to have passed without touching its prey.

Young peregrines in the eyrie, when almost full-feathered, show a most astonishing variety of colour; indeed, it would be quite possible to mistake some young birds of large size in a particular hereditary nesting-place for young Iceland or Gyr falcons; and the feet of these exceptionally large falcons are often slate-coloured when they are young, which suggests an evolutionary relationship between the species, the feet of the Gyr-falcon being of that colour.

Falconers find that hawks from particular eyries differ much in courage and other qualities which render them valuable, and I have seen a young eyess from a rock famous for the quality of its falcons pursue and capture a young pigeon which two much older eyesses had abandoned, evidently from lack of pluck.

A flat, boggy stretch of heather known as the Moss separates the Moil or Mull of Kintyre from the northern portion, and is a favourite hunting-ground of falcons, which find there a variety of game and wildfowl to suit their taste. Just beyond the Moss, to the northward, a range of hills affords good poising-ground to the hawks, which sail along the ridge at a height which gives them the benefit of the wind deflected upward by the crest of the hills. I quite lately saw there six peregrines in the air at once, stooping at, and playing with, each other, and at times uttering their mating cry, a sound difficult to describe, but sufficiently wild and peculiar to attract attention.

The steady, plodding progress of a falcon which has lately fed differs from one in hunting mood, which is direct and regular for a few beats of the powerful pinions, then a pause or glide, during which the round head is turned from side to side in a searching scrutiny for prey. If the quarry is espied even a mile distant, the hawk's flight is gradually increased as it nears its objective, culminating in that grand first stoop which so often proves fatal to the object of pursuit.

Should the weather during the short winter days suddenly clear, the falcons from the Mull

No. 189.—Vol. IV.

[All Rights Reserved.]

JULY 11, 1914.

reach the Moss in a few minutes in full hunting humour after an enforced fast; and at all hours some very sporting flights are seen, the hunted bird, if a grouse or partridge, almost invariably seeking shelter in the heather. It is not at game, whose short wings and round bodies serve them ill when the falcon is close up, that the most interesting flights are seen. Golden and green plover are remarkably clever in evading the falcon's stoop, as are rockpigeons and curlew; and a flight at a strong bird of any of these species sometimes extends for miles. On one occasion a large flock of golden-plover, collected for migration, and flying at a great height, failed to notice the approach of a falcon, which, ascending quietly, seized one and carried it off piping in her clutches, though mobbed for some distance by the others. Again, on a very still day a single golden-plover, pursued by a haggard tiercel, evaded each stoop by turning sharply and flying in a directly contrary course. In the hawk's effort to turn quickly, by braking strongly with one wing, the sound of the wind passing through the feathers emitted a longdrawn note audible at a distance of quite half a mile. The plover continued to evade its pursuer while in view; but a few days later, in the direction the chase had led when last seen, I found its close-picked skeleton. The pewit is a frequent prey of wild falcons, though falconers with their trained hawks find its pursuit hopeless. There is little to wonder at in this, as I have often seen a wild peregrine in full chase of a pewit disappear later in the distance without having attained its object. On a very windy day I saw the finish of one of these long chases, the falcon rising-or, in falconer's phrase, 'throwing up'-to an immense height after each stoop, when, coming down with ever-increasing momentum, it was nimbly evaded at the critical moment of the stoop by a side-flirt on the part of the quarry, which kept straight on its course down-wind between the stoops, being unable to make headway against the storm. At last the falcon, an old haggard, changed her method of attack. After each downward stoop, which was executed as usual, she hung on the wind to leeward of the quarry awaiting its approach; then, rushing upward, she tried to grab it, and, failing, winged upward for the next downward stoop. At one upward grab the pewit just failed to shift in time, and was caught by one wing, carried for some distance, and let go, only to be caught again at the next downward stoop. This occurred high in air over some houses and trees, and the falcon continued leisurely stooping and clutching till these were passed, when a last stoop resulted in a permanent 'bind,' and a gradual descent of the falcon and her prey to the ground, both with wings spread to their full extent. Another falcon, which succeeded in attaining a position right over a flock of pewits feeding in a turnipfield, made a false stoop or two at a bird on the ground until flushed, when she made a real one, failing on four occasions at different birds; then, coming back to the flock, she put up still another, and this time the pewit proved unequal to the situation. A tiercel in red plumage, attacking a party of green plover high in air, missed his first stoop; but, seeing another of the flock on a lower plane than his first quarry, he made a second lightning stoop, and scored by binding to it.

Falcons sometimes kill for sport. One, stooping at some teal, killed a cock-bird stone-dead, and neither paused in its flight nor looked back to see the result of its blow. Another, catching a grouse by direct pursuit, let it go after carrying it some distance to pursue some passing wild-At a grouse-drive one morning a large falcon bound to a mallard at its first attempt, but let it go to pursue the first pack of grouse flushed by the beaters. Flocks of birds which progress in close order are practically safe from a hawk so long as they keep together. A large flock of wood-pigeons closely attended by an overhead falcon moved in close order in progressive circles down a strong gale toward the shelter of a small plantation. The falcon made false stoops first at one end of the flock and then at the other, which had no effect except to make the pigeons bunch more and turn in shorter circles. At one particularly acute turn caused by the close proximity of the hawk to leeward, a pigeon was thrown out from the flock, on which the falcon stooped with closed wings, failing to strike it, however, as it shifted with celerity into the middle of the flock. On reaching the plantation the pigeons fell at first to leeward; then, bracing up, the leading portion of the flock dashed into the trees, the others passing round to leeward again. The falcon tried time after time for outlying birds; but after many turns round the wood the last few birds found sanctuary, to the discomfiture of the falcon.

In the spring months a pair of mated falcons sometimes hunt together, and the bird must be a strong one to escape the stoops of both falcon and tiercel. A rock-pigeon, pursued in my sight by a pair of haggards, was scratched only by one of them, so that it lost some feathers; then dashing against the window of a cottage, it broke the pane of glass and fell dead inside. Some teal flushed another day attracted the same couple, which had their nest at no great distance from the Moss. Both hawks poised for a time at a great height above the teal, which, aware of their danger, moved in ever-shortening circles above the sheet of water. The tiercel now dropped to a much lower plane than his mate (about sixty yards above the teal), then turning over, he came down comparatively slowly in a slanting direction, and apparently passed the bird he had singled out without touching it; but the teal struck the water as if propelled from a catapult, so that the movement of the hawk in striking was evidently too quick for the human eye to follow—a fact I had previously noted. Both hawks circled above the dead teal for some time, the female eventually snatching it; while her mate, that had done the work, went off at great speed in a fresh quest for his own dinner.

The largest birds I have seen killed by the peregrine have been herring-gulls and blackcock. A flight at a herring-gull by a hungry falcon of unusual size ended in the quarry being 'putdown' in an open field, where the falcon continued stooping at it for some time, eventually binding to it on the ground, and after a struggle killing it. Four white-fronted geese were one day treated to a stoop or two by a falcon, which, coming from the Mull hills on the assumption, possibly, that these small specks she saw in the distance were mallard, did not like to retire without having a cut at them. The geese displayed comical perturbation at the unwonted attack, evading the hawk's half-hearted stoops with somewhat clumsy efforts and loud cackling.

Perhaps the most curious flight seen in my experience on the moors was that by a haggard tiercel, the quarry being a kestrel. A feature of

this flight was the immense height to which the falcon threw up after each stoop, and the extent of country covered before another took effect, owing to the good use to which the smaller hawk put its wings while the larger one was mounting. After each stoop, which took, or, rather, nearly took, effect some sixty yards in the air, the tiercel, aided by the great momentum of his downward flight, still with wings motionless, except for their occasionally altered curve, continued to follow each turn and twist of the kestrel, which only escaped, when the tiercel's acquired pace was expended, by a rapid side-shift and complete reversal. This flight passed out of sight; but as the kestrel was screaming after each narrow escape the result seemed a little doubtful.

The Iceland falcon has been shot at least once in Kintyre, the specimen obtained being an immature female, much larger than a pergrine, more loosely built, and curlew-coloured, with slate-coloured feet instead of yellow. Its movements seemed much slower than those of its British relation; and, while it was observed, its prey was chiefly sea-gulls, though it was in pursuit of a covey of partridges when shot.

A KNIGHT ON WHEELS.

CHAPTER XXIX. - DIPLOMACY UPON THE HIGH SEAS.

I.

THE liner Bosphorus, after a comfortable nap of some eight days in the Mersey, was making a reluctant effort to tear herself from the land of her birth and face an unfriendly ocean upon her seventy-eighth voyage to New York. Motive-power for the time being was supplied by four fussy tugboats, three of which were endeavouring to speed the parting guest by valiant pushings in the neighbourhood of her rudder, while the fourth initiated a turning movement at her starboard bow. An occasional rumble from the engine-room announced that the tugs would soon have no excuse for further officiousness.

The cabin passengers were leaning over the rails of the upper deck, surveying the busy landing-stage. They were chiefly males—their wives were down below, engaged in the unprofitable task of endeavouring to intimidate stewardesses—and were for the most part Americans. Philip stood apart, watching the variegated farewells of the crowd.

The etiquette of valediction at the sailing of a great ship varies with the three classes of passenger. The friends of cabin passengers accept a final drink, say good-bye, leave the ship, and are no more seen. The friends and relations of the second class—and they are all there—line up along the landing-stage and maintain a running fire of chaff and endearments until the ship

has been warped out into the stream and the engines begin to run. The steerage and their friends, being mainly aliens, and knowing no better, weep and howl.

Philip knew that the second-class passengers were on the deck below him; but since he could not see them—though he could hear them—his attention wandered to the throng which was engaging them in conversation. They were of many types. There were people who shouted cheerfully, 'Well, send us a line when you get there!' and then, after a laborious attempt to discover another topic, cried despairingly, 'Well, don't forget to write!' And so on. 'Give my love to Milly when you get to Boston,' commanded a stout matron in bugles, 'and say I hope her cold is better.'

Farther along, a girl with tears raining down her cheeks was more than holding her own in an exchange of biting personalities with a grimy gentleman at a porthole—apparently her fiancé—whom she had come to see off. A comic man, mistaking a blast upon the siren for a definite indication that the moment of departure had arrived, took out a dirty pocket-handkerchief and wept loudly, periodically squeezing the handkerchief dry and beginning again. But it was a false alarm; the ship did not move; and his performance, which was to have been the crowning effort of a strenuously humorous morn-

ing, continued perforce to halt lamely along for another ten minutes. Finally, in response to an urgent appeal from a matter-of-fact lady friend to refrain from acting the goat, the unfortunate gentleman, submitting to the fate of all those whose enterprises are born out of due time, put his handkerchief into his pocket sheepishly, and took no further part in the proceedings.

At last the *Bosphorus* swung clear. There was a jingle of bells deep down in the engineroom, followed by a responsive throb of life throughout the hitherto inert mass of the great

vessel. The voyage had begun.

The crowd on the landing-stage broke into a cheer, which was answered from all parts of the ship. As the sound died away a girl stepped forward and waved her handkerchief for the last time. She was a short girl, with a pleasant face, and wore glasses.

'Good-bye, Lil dear!' she cried.

There was an answering flutter from directly below where Philip stood, and a clear voice

replied, 'Good-bye, May darling!'

Philip scrutinised the girl on the landing-stage. 'Who on earth is that?' he said to himself. Then he remembered. It was Miss May Jennings, sister of Miss Lil Jennings, typist at the office in Oxford Street.

II.

Having taken part, with distinction, in the free fight round the person of the second steward, which our great steamship companies regard as the only possible device by which seats at table can be booked for a voyage, and having further secured a position for his chair and rug from the deck-steward, Philip took stock of his surroundings. Transatlantic ship's company is never very interesting. The trip is too short to make it possible for the pleasant people to get to know one another; only the bores and thrusters have time to make their presence felt. On this occasion the saloon appeared to be divided fairly evenly between music-hall artistes and commercial travellers of Semitic origin; so Philip, wrapped up in a rug, addressed himself to the task of overtaking some of the arrears of sleep due to him after the recently completed Joy-Week.

Next morning, experiencing a desire for society, Philip descended a deck upon a visit to the second class, feeling tolerably certain that here,

at least, he would find a friend.

He was right. Miss Jennings was sitting by herself under the lee of the boiler casing, perusing a novel.

'Yes,' she said, after an exchange of greetings, 'I dare say you are a bit surprised to see me. I'm a trifle that way myself. I only settled to do it a week ago.'

'I did not even know you had left the Britannia Company,' said Philip, sitting down.

'Tell me about it.'

'Well,' explained Miss Jennings, 'there isn't

much to tell. I got tired of Oxford Street. It didn't seem to be leading to much, and I wasn't getting any younger; and just about six months ago I had had a letter from a girl friend of mine who had settled in New York, saying that a good stenographer could do twice as well there as in London. So I decided to go, if only for a bit of a change.'

'What about your mother and sister?' asked

Philip.

'Oh, you haven't heard? Poor mother died over a year ago, when you were away at Coventry. I'm just out of black for her now. May is married. I have been living with her and Tom for some time back. I didn't like it much. Makes you feel inferior-like, living in a house belonging to a married sister that's plainer than yourself. That's all about me. I hope you are very well, Mr Meldrum. You are out on the company's business, I suppose?'

'Yes,' said Philip. He explained the nature

of his trip.

'They were saying at Oxford Street,' pursued Miss Jennings, with the air of one who is anxious to avoid all appearance of asking for information, 'that you were going to be made a partner.'

'It was talked about,' said Philip, 'but nothing came of it. They wanted me to risk rather more capital in the business than I happen to

possess.

'Don't you worry about capital, Mr Meldrum,' said Miss Jennings. 'It's your brains they're after. Bob Br—a gentleman I know—told me that he had heard from some one behind the scenes that they don't mean to let you go at any price. They can't afford to have your inventions taken up by other people. It was just a try-on telling you you must put a lot of money into the business. Next time they mention the matter, you name your terms, and stick to them!'

Philip thanked her.

'Of course I've no call,' admitted Miss Jennings, 'to be giving you advice. But I wasn't born with my mouth sewn up, and you never were one to put yourself forward, were you?'

Philip admitted that possibly this was true, and the conversation passed to the inevitable

topic of old times and old friends.

'How is Brand, by the way?' asked Philip.

'He was an admirer of yours, I believe?'

'Brand?' said Miss Jennings carelessly. 'Oh, the mechanic? I believe he is getting on very well. First foreman, then manager of the garage; and now that you are gone he and Mr Rendle pretty well own the earth between them, so I gather. Brand is quite the gentleman now. I hear he has given up making a spectacle of himself in the Park of a Sunday. Mr Rendle is the same as ever. He misses you at the flat, though.'

'You seem to know all about our domestic

arrangements,' said Philip, much amused.

'Nobody that wasn't born deaf and dumb,' said Miss Jennings with decision, 'could see Mr Rendle six hours a day for six days a week without knowing every blessed thing about him, and a jolly sight more, from his own lips—his young ladies, and everything! He brought one to Oxford Street the other day. He told me afterwards'——

'What was she like?' asked Philip instantly.

'I didn't notice her particularly. She was in the showroom looking at motors most of the time, and only stepped into the office for a minute. She was quite simply dressed, it being the morning, but her clothes were good all through. I picked up two or three ideas for myself straight off. Shoes, for one thing. Hers were the neatest I ever saw—brown suède with silver buckles. No cheap American ready-mades, or anything of that kind. As for her coat and skirt, you could see they'd been cut by a tailor; and her hat was one of those simple little things that fit close to the head and look as if they could be put together for half-nothing; but I know better. It came out of'——

'What was she like?' repeated a patient

voice

'I'm trying to tell you,' replied Miss Jennings, a little offended.

'Yes, but her appearance? Not her clothes.'
Miss Jennings pondered. 'I didn't really
have time to notice her appearance,' she said
at length; 'but she was what I should call a
middling blonde. She was wearing one of those
new blouses, with a V-shaped'——

'I think it must have been Miss Falconer,' said Philip, with an air of great detachment.

'Yes, that was the name,' replied Miss Jennings. 'Mr Rendle told me he was very sorry for her. He said thousands of gentlemen were in love with her. You know the silly way he talks'——

'Yes,' said Philip with a gulp. 'Well?'

'But she could never marry any of them.'

'Why, I wonder?'

'Because of her father,' explained the everready Miss Jennings. 'She won't ever leave him, him being a widower, and very peculiar in his manner, and unable to look after himself. A bit silly-like, from all accounts. Seems to me to be asking a good lot of a girl to stay at home to look after an old image like that. That's only supposing, of course, that she wants to marry one of these thousands of hers. She's welcome to the lot, so far as I'm concerned.'

'Yes, rather!' agreed Philip absently.

So that was the reason! And he had never guessed. Well, it made his own chances no brighter, but it took a load from his mind. Peggy was back on a higher pedestal than ever, and her silent Knight could now worship her without reservation. She was acquitted for all time of the charge of being hard, or callous, or unfeminine.

III.

The Bosphorus was rolling heavily when Philip rose next morning, but his sea-legs were good, and he proceeded to his toilet with no particular pangs save those of hunger. After shaving he put on a dressing-gown and staggered along an alleyway in search of a bath. Presently an illuminated sign informed him that he had reached his destination. He turned into the first empty bathroom, where a man in a white jacket was tidying up after the last occupant.

'Bath, please,' said Philip. 'Chill just off.'

The man turned his back and set going a spouting cataract, and the bath was half-full of salt water in less than a minute. There are no corporation restrictions or half-inch pipes in oceanic bathrooms; you simply open a sluice and let in as much of the Atlantic as you require. The man next lowered a long hinged pipe into the bottom of the bath, and gave a twist to a little valve-wheel upon the wall. Straightway a violent subaqueous crackling announced that live steam from the boilers was performing its allotted task of taking the chill off.

'That will do, thank you,' said Philip presently.

The bath-steward turned off the valve, and the crackling ceased. Philip sat down upon the edge of the bath.

'Well, Brand,' he said, 'how does the Bosphorus

compare with Oxford Street?'

He held out his hand, and Mr Brand, having overcome his surprise, shook it resentfully.

'I suppose you are surprised to come across

me here?' he remarked defiantly.

'Not altogether,' replied Philip, thinking of the second class; 'but I did not expect to find

you swabbing bathrooms.'

'I wasn't going to waste good money travelling as a passenger,' said Brand sullenly. 'I tried to get taken on in the engine-room, but they wouldn't look at me without marine engineering experience; so I had to be content with this. It's only for a week.'

'You aren't coming back, then ?'

'It depends,' said Brand shortly. 'Not at present.'

'Have you given up the Britannia Company?'

'Yes; handed in my resignation Friday afternoon.'

'What on earth for? You were climbing to the top of the tree there.'

'I preferred to be on the ground,' said Brand oracularly.

Philip decided not to press for information. 'Still, I'm sorry,' he said.

'Why? I wasn't fired, if that's what you mean,' said Brand swiftly.

At this moment another passenger came tacking down the alleyway, and Brand departed in the further execution of his official duties.

There are no facilities upon ocean liners for promoting social intercourse between bath-

stewards and cabin passengers, so Philip did not see Brand again until the same hour the following morning.

'By the way, Brand,' he said, as he waited for the proper adjustment of the bath's temperature, 'there is a mutual friend of ours on board, travelling second class. Did you know?' 'Yes,' said Brand thickly, 'I did.'

He swung the steam-pipe savagely back into its clip, flung two hot towels down upon a seat, and departed, banging the door behind him. That was the beginning and end of the second day's conversation.

(Continued on page 516.)

ARGENTINE FRAGMENTS.

By W. WHYTOCK.

AY de mi / el gaucho, he will soon be a thing of the past, the only memento of him to be found in poems like those of Don José Fernandez, who relates the adventures of one Martin Fierro. The gaucho class has produced some remarkable men—for example, Rosas, one-time President of the Argentine Republic, a man with little or no education in the ordinary sense of the word, but, like Porfirio Diaz of Mexico or Artigas of Uruguay, with a natural instinct for the management of men and means at critical times.

In 1852 Rosas, after defeat by Urquiza, fled to England, and lived as a farmer near Southampton for many years, where the famous gaucho leader was esteemed by all who knew him. The late Colonel George Earl Church, in his very interesting book entitled Aborigines of South America, mentions that in 1832–33 Rosas marched southward from Buenos Ayres, crossed the Colorado, and reached the Rio Negro, massacring the Indians by hundreds along his route, and inflicting on them a blow which they long remembered, but from which they slowly recovered, and repaid with their customary savage ferocity. Colonel Church gives an excellent description of one of these raids at which he was present in 1859:

'Suddenly an alarm-gun from the fort awakened the drowsy denizens of the town, and the troops rushed in disorder to the *plaza* and the streets, armed with old Tower muskets and sabres. The Indians were almost naked, but a few had shirts on. They were mounted barebacked on superb horses bridled by a thong tied round the lower jaw. Their arms were long lances and *bolas*.

'Thus far they had done their work with stealthy quietness, so as to give as much start as possible to the captured herds; but when the alarm-gun sounded their tactics changed, and they let loose the spirit of revenge "for wrongs unpunished and for debts unpaid." With shout and whoop and infernal yells, and quivering lance and swinging bolas, the wild warriors charged down the streets toward the plaza, where I soon found myself taking part in what resembled, from its irregularity, a vast tiger-fight. It seemed as if all the fiends from hell had broken loose; and, to add to the terrors of the night, the savages had fired the town, and the lurid flames and smoke, mingled with the moonlight, threw uncanny lights and shades over the scene. It was a hand-to-hand fight, where quarter was neither asked nor given nor expected. How splendidly the Indians rode and fought! Several times I stopped to admire their courage and horsemanship, which almost irresistibly impelled me to take sides with them. The battle lasted till daybreak, when they retired to the base of an amphitheatre of hills within sight of the western outskirts of the town. There they halted to rest. They had left sixty-two of their number dead in the streets and plaza, but had taken all of their wounded with them.

'They were supposed to be under the leadership of the renowned chief Calficura. certainly handled his forces with skill and forethought, and the fact that he remained resting for several hours within easy reach of the town, as if challenging a fight in the open, shows the contempt in which he held his foe. We saw his warriors take their midday meal-about twelve hundred of them, as nearly as I could judgetheir horses feeding near them. They evidently delayed their departure to give as long a start as possible to the detachment which was driving their booty inland. About mid-afternoon all of them mounted their horses, and in open order faced the town in a long single line. We thought that it meant another assault; but no, they gave us the best circus performance I have ever witnessed. The two wings faced inward to the centre, and at a given signal each wing rode past the other at a tearing gallop. Then they reversed the movement, and returned to their original line. This manœuvre they repeated several times with bolas whirling and lances waving as if preliminary to a charge. Sometimes the riders were erect on their horses, and at others only the head of the Indian could be seen under the horse's neck, his body being completely concealed. After this display of fine horsemanship the whole line broke to the rear in twos from the centre and rode over the hills to the west. Slowly the mysterious desert seemed to absorb its wild children and put its protecting arms round them; and as the last one disappeared across the threshold of his home, a far-off memory told me that, as I had become civilised, I had left behind me not a few savage virtues and many grand sensations.'

The favourite weapon for war or the chase was

the bola. Colonel Church mentions it in the scientific expedition he made in 1858:

'I took many lessons from the gauchos in the use of this weapon, and realised how formidable it might be in expert hands. It was at the time of the conquest used by all of the tribes which occupied the open areas of the Plata country, from its northern frontier to the Strait of Magellan. Later it was adopted by the Argentine cowboy, the gaucho, as a most efficacious arm for capturing

any quadruped.

'The bolas were also extensively used by the Indian tribes of Uruguay and the southern part of Rio Grande do Sul in Brazil; and in these districts the grooved bola is occasionally found. It is a sphere or spheroid with a groove cut round it, and it is often met with on the plains of central Patagonia, where, when it is found, the Indians treasure it as a weapon used by their ancestors. There were many forms and sizes of bolas, but in general they may be reduced to three, and consisted of three thongs made of hide, or ostrich or guanaco sinews, plaited in four plaits, and about seven or eight feet in length. At one of the ends of each thong a globular stone, about the size of a billiard-ball, was suspended in a hide bag, and the other ends were united. This set of bolas was used principally for hunting the guanaco, deer, puma, and any large game. By holding one bola in the hand, the others were swung round the head with great velocity while the gaucho was running or on horseback, and from a short distance launched at the animal it was sought to capture. I have seen a powerful gaucho bring down a horse at a distance of fifty yards or more. The weapon when it leaves the hand revolves in a circle, each thong one hundred and twenty degrees distant from the others, the circle thus covering a diameter of from fourteen to sixteen feet. Whenever one of the balls is arrested by an obstacle the whole three wind so tightly round it that it is frequently quite difficult to disentangle them. A wild bull or a horse having his legs thus entangled drops helpless to the ground. For hunting the American ostrich a single thong with a bola at each end is used. It is no uncommon feat for an Indian to bring down an ostrich at a distance of more than seventy yards. A third form was the bola perdita (the lost bola), because it was generally used but once. It is a sharp-pointed stone covered with hide, except the point, and attached to a thong about three feet long, with a knot at the end, so that it might not slip from the hand. It is a deadly missile in the hands of a skilful savage, and principally used in warfare.'

The horse was first introduced into the pampas of Buenos Ayres by the great expedition of Pedro de Mendoza (1535–36). Five mares and six stallions were turned loose, and, together with others which were lost or strayed, multiplied very rapidly, and before the end of the sixteenth century vast herds of them roamed over the plains. Padre Falkner comments

on the marvellous increase in their number: 'The wild horses have no owners, but wander in great troops about those vast plains. They go from place to place against the current of the winds; and in an inland expedition which I made in 1744 they were in such vast numbers that during a fortnight they continually surrounded me. Sometimes they passed by me in thick troops at full speed for two or three hours together, during which time it was with great difficulty that I and the four Indians with me preserved ourselves from being run over and trampled to pieces by them.' In these times a horse could be bought for about a shilling and a mare for threepence.

For a description of these horses one cannot do better than turn to Mr Cunninghame Graham: 'That which specially attracts the attention of all those who see them for the first time is the great difference to be observed betwixt them when in motion and at rest. Saddled with the recado, the American adaptation of the Moorish enjalma -the heavy bed on horseback, with its semi-Moorish trappings—standing patiently before the door of some gaucho's house from morn till sunset, they appear the most indolent of the equine race. But let the owner of the house approach, with his waving poncho, his ringing spurs, his heavy hide and silver-mounted whip, and his long, flying black hair; let him by that mysterious process, seemingly an action of the will, and known only to the gaucho, transfer himself to their backs without apparent physical exertion, and all is changed. The dull, blinking animal wakes into life, and in a few minutes his slow gallop, regular as clockwork, has made him and his half-savage rider a mere speck upon the horizon.

'In a country where a good horse costs a Spanish onza (£3, 15s.—a rise in price since 1744), it is not wonderful that all can ride, and all ride well. In a country where, if you see a man upon a plain, you are certain that he will be on horse-back; in a country where the great stock-owners count their caballadas by the thousand—Urquiza, the tyrant of Entre Rios, had about one hundred and eighty thousand horses—a horse on the pampas is as essential as a boat on the water; you would as soon expect to meet a man swimming in mid-ocean as walking on the pampas.'

The pampas—pampa signifies space—those huge plains, are indeed the kingdom of silence, and their very vastness seems to render the inhabitants, human and animal, sad, taciturn, joyless; the birds never sing; and what more sad than the whistle of a young ostrich? But the 'call of the wild' is in the blood of us all. Dwellers on the pampa or the veldt know this; and although at times it is a hard life, and ofttimes monotonous, we say, with the American poet, Whitman:

I want free life, I want fresh air, And I sigh for the canter after cattle; The green beneath, and the blue above, And dash and danger, and life and love.

FORTUNE AND MR PETERSTON.

CHAPTER II .- MR PETERSTON AT A SECRET SHRINE.

MR PETERSTON did not meet Mr Butterworth on the following morning. He had intended to do so, and to rally him upon the failure of the great joke; but though he had handled the emissary with signal success, he knew that in an exchange of banter he was no match for the chief jester. He decided, therefore, to wait a day or two, until the matter had lost its freshness. As I have said, Mr Peterston did many things timorously.

There is no difficulty in avoiding an acquaintance in the great concourse that streams citywards every morning from Forest Gate, and he reached Cannon Street unmolested. There he plodded through the routine of the morning with his usual diligence, only pausing in the march of his work when half-past twelve had struck. Then he laid aside his pen, changed his office coat, and went down to Ludgate Hill for

his modest and solitary lunch.

This took only twenty minutes to-day, for Mr Peterston had other purposes to carry out within the hour. Crossing the Hill, he turned into Pilgrim Street, threaded the groups in New Bridge Street, and so passed down to the Embankment. His was always a sufficiently modest little figure in its shabby black, and with the well-worn silk hat that obstinately refused the perpendicular; but on this occasion there was also something furtive in his air and carriage. He was engaged upon a secret errand of which he felt himself slightly ashamed.

Yet there seemed to be nothing sinister in his course of action. When he reached the riverside near Blackfriars Bridge, he continued his way until he found himself just opposite the City of London School. There he halted, and, leaning against the wall, stood for some five minutes gazing steadily westward, toward Waterloo Bridge and Westminster.

'Ah,' he said at last, under his breath, 'it is

still there!

As he spoke he glanced over his shoulder, as if alarmed at the expression of his own thought; but there was no one near him, and in any case his voice would have been lost in the screaming of the gulls which were being fed by the dinner-hour loungers a little farther down. So Mr Peterston, reassured, turned again to his long gaze westward, concentrating his attention upon the hazy outlines of Whitehall Court.

From where he stood, the airy pinnacles of this building seemed to rise from the centre of the river, shrouded in the mists of the winter day. The whole appearance was curiously unsubstantial but distinctly beautiful, as though some castle from Fairyland had been mysteriously projected into the vista of London river and

warehouse. It is to be doubted, indeed, whether such an effect is to be seen anywhere else in London. The view of St Paul's dome from the windings of Fleet Street is more imposing and majestic, and Mr Peterston had often admired it; but this river scene was of a different character, and had had a special and intimate value in his life. It touched a phase in his disposition which had never been revealed even to his closest friend. And the way of it was this.

Thirty years ago, during the strenuous days of his first settlement in London, he had wandered down to the Embankment one afternoon, and had unexpectedly come upon this river scene, with the fantastic palace showing in the mist beyond the bridge. Strangely attracted at the time, he had never lost the impression of that first discovery. He could not have explained it, but there was no doubt that this scene appealed to some curious vein of the romantic in his make-up. His work was a monotonous routine; but here he saw a suggestion, as it were, that sometimes marvellous things might happen, that there was a realm of the beautiful-fantastic that occasionally did impinge upon the world of matter of fact, just as that thing of fairy pinnacles was found in a vista of muddy water and grimy warehouse. So sometimes in the darkest and dreariest days of Cannon Street he had strolled down to the Embankment to see this thing once more, going away often with a new and most unreasonable sense of pleasure.

Of late years, however, his visits had been less frequent, for various reasons. His work had tested him more severely than of old, and fantastic possibilities had faded into a farther distance. To-day the old spirit, touched by Butterworth's jest, had been aroused once more, and he had resolved to revisit the scene. His conviction was that its glamour had been magnified by the imagination of youth, and that the reality would prove totally unlike his recollection. His surprise was considerable to find that there was actually no difference. Even the winter mists helped the picture, and on this gray day the effect was more beautiful than ever. Hence his remark, followed in a while by the pertinent reflection, 'It looks the same, certainly; but naturally it doesn't move one in the same way now. One grows too hard and too old to weave fancies around facts. It was glamour, my boy—glamour; and that doesn't last till you're fifty-two. You've dropped it somewhere in Cannon Street, and you won't pick it up again.'

He remained some moments longer, lost in reflection that was entirely free from bitterness, even if it was far from cheerful; then he became aware of the flight of time, the chill of the turgid river, the harsh screaming of the gulls. He turned his back upon the magic picture and

made his way eastward again.

'And now,' he said, with a sigh—'now to forestall friend Butterworth! They shall be nicely sold if they come round to that address at four, expecting to see me about there. I believe the fellow smelt a rat at the last, but still they may come. Let me see; the number was 95, wasn't it?'

He glanced at his shirt-cuff, and found that this was correct. By this time he was in Queen Victoria Street, and he passed up its broad avenue till he found the number he had mentioned.

'Here it is,' he said to himself. 'Why, I have passed the door a thousand times. If such a name as Lisle had been there I should have noticed it.'

Most definitely and distinctly, the name of Lisle & Lisle was not there. There were two suites of offices upstairs; but one was occupied by a civil engineer, and the other by an estate agent and surveyor. Quite satisfied and almost pleased, but resolved to make sure, Mr Peterston made a thorough survey of the locality, reexamined his shirt-cuff, verified the number, and then entered the office of the civil engineer.

A young man who came to meet him was obliging but business-like. 'No,' he said, 'I don't know Lisle & Lisle. There's no such firm in this block.'

'Are you quite sure?' asked Mr Peterston.

'Rather!' said the young man.

'And you have heard nothing of that name?'

'Nothing!'

Mr Peterston nodded. 'Ah,' he said, unwarily, 'it is just as I thought! I knew they wouldn't be here.'

Whereat the business-like young man betrayed signs of agitation. There was nothing in Mr Peterston to command his respect. 'Then why on earth do you bother me?' he asked vigorously. 'Do I look as if I enjoyed answering questions—eh?'

'You'll never be a civil engineer, anyway,' said Mr Peterston pleasantly; and with that and a mild 'Good-day,' he left the building. But as he went out he observed that the estate agent and surveyor on the second floor bore the suggestive name of Trapp, and he smiled again. Butterworth was a clever fellow!

Nevertheless, it was with a sense of depression that he passed up under the shadow of St Paul's into Cannon Street, for he had been unable to check entirely the play of fancy. He had seen, for instance, some of the things that would have happened if this impossible story had been true. He had seen the face of his wife, full of a glad wonder that had transformed it. Then the girls' faces—those two healthy girls with the insufficient boots—he had seen their faces also turned to him and to his amazing story in speechless

delight. And now—yes, he was certainly depressed. He remembered again that he was fifty-two, and that he had never been able to save. He still had to take extreme care of his clothes, and his wife still had to 'contrive.'

At half-past one he was back at his mahogany desk, with his best air of diligence and attention. No man guessed that he was in reality a cherisher of fantastic fancies, and that he had that day paid a stealthy visit to the shrine of his earlier years, with a timid attempt to recall its almost vanished worship; but doubtless the marblehearted City knew, and Mr Peterston's doom was already pronounced. The cashier, his nearest neighbour, younger by fifteen years, glanced at him now and again with unusual interest, but generally when Mr Peterston's attention was He noticed the droop of his senior's elsewhere. shoulders, the grayness of his head through the glass screen, and once or twice he shook his own head solemnly. He wondered if Mr Peterston had saved much.

But on Friday evening the cashier had little time to spare even for his next neighbour. From half-past-four to five a long queue of men and women, boys and girls, passed before the desk at which he stood, each to receive a small square envelope, light or heavy according to circumstances, and bearing not a name but a number. Thus the City coldly gave them the price she placed upon their time, and sent them shuffling down the floor with the means to maintain their labour for another week. And through all the noise Mr Peterston toiled on at his invoices, trying to forget his depression in work.

Soon after five the procession had passed, and the room was comparatively quiet again; always remembering, of course, that it vibrated all day with the thunder of wheels and the echo of carters' voices in the street below. It was then that a bell rang with a sudden and imperative note. It came from a room with a glass door, at the end of the double line of mahogany desks.

Every one stirred at the sound, and one lanky boy seemed to be jerked into life. All in one breath, he slipped from his stool, tapped at the glass door, opened it, and introduced his head. Then he came over to 'Invoices.'

'It's you,' he said briefly.

Mr Peterston took a moment to comprehend. Then, with quite remarkable celerity, he laid down his pen and ruler, and slipped from his high seat. With one hand he adjusted his tie; with the other he brushed his vest. Another quick movement shook from his wrists two paper cuff-protectors, and then he moved quickly toward the glass door.

On ordinary occasions this little programme would have been watched by half the room with interest and amusement. There would have been a little good-humoured chaff, perhaps the exhortation to Mr Peterston to 'look pleasant,' or to part his hair in the middle. But to-night there

was no sign of amusement. From the cashier downward, every one seemed gravely occupied, and not a smile passed. And after Mr Peterston had disappeared the silence seemed to become deeper than before.

But the face of the cashier seemed to express something. It was hard and set, with a look which the lanky office youth had learned to fear. There are hard realities in the City—things that really do happen. But it is not pleasant to find them at your very elbow.

CHAPTER III .- THE OLD LADY IN THE CITY.

MR PETERSTON returned to his desk and resumed his work. He had still certain invoices to prepare for post, and for a few minutes, by a great effort of will, he proceeded with them. Were the others looking at him? No; but they were all watching him! He remembered the curious hush which had fallen when his call had come. At the time he had not realised it, but now he knew its meaning. Perhaps he had been the only person in the room ignorant of what was to take place. He felt sick and dazed with shame.

The general manager had been kind, as kind as a man may be when he must first be firm and uncompromising. 'Occasionally,' he had said in his thoughtful way, 'a step becomes unavoidable which on many grounds is to be regretted. Retrenchment is necessary in these days of keen competition and declining profits.' Mr Peterston had been with the firm a number of yearsyes, almost twenty-seven-and when he sought another position his old employers would be able to speak without reserve as to his character and his service. They would not suggest to him that he might retain his post at a reduced salary; that suggestion had been made at a meeting of the Board, but in fairness to his experience and qualifications it was not one they could adopt. They were anxious to consult his interests as far as possible, and he could yet retain his desk for six months; but if he preferred to be free at once to seek other employment, he would receive a half-year's salary as a token of the esteem in which he was held.

And Mr Peterston had been so impressed that he had left the room with a faintly uttered 'Thank you!' But now he grew hot as he thought of that 'Thank you!' and a storm began to rise within him. He was not a man of storms, and it would take a very great deal to sweep him out of that mild, good-humoured, and inoffensive attitude of mind which all his friends knew so well. It had happened at least once, when he had seen a man struck down in the dark, and three unspeakable brutes battering him with their boots. Then the storm had made a hero of Mr Peterston, and his daring had amazed even the police. But now? Oh

no, not now! The fires had gone too low. Seventeen years had passed, and much had been ground out of him in that time. In a few moments the storm was gone, though the shame remained.

Six months—and after that? He saw the pavements of brass trodden without hope by hundreds of the City's cast-off slaves, month in, month out. He was fifty-two, and the House would save at least a hundred a year when he was gone. The City would not inquire where he had gone. Now that the thing had happened, he saw how natural it was. Indeed, it had suggested itself to him in a vague way more than once, but not as an immediate possibility; it had been a cloud on the horizon, which he had regarded cynically rather than seriously—only a sort of a shadow.

He persevered with his writing for a space, it it soon became too difficult. Then he sat but it soon became too difficult. staring at the white paper, and waiting for the time to pass. To-night he would go home at six. He saw, with new clarity of vision, that the cashier was very careful not to glance in his direction. Of course he knew; but he was a good sort. With this new clarity of vision Mr Peterston saw, too, his own insignificance. At times he had felt a certain pride in his place in the City; but how vain and childish it had been! In Forest Gate he was but a street-number to the tradespeople, and to the Great Eastern Railway he was just a Season Ticket. In the City he had been 'Invoices,' and now he was cast aside even from that. What was that curious phrase in the Bible about dust in the balances?

Then his self-contempt took another direction. In a vague way he had indulged the idea that 'something might happen' some day—something that would fulfil the symbol of the turgid river and the misty pinnacles above it. How ridiculous! How fortunate that he had never told any one, that no one knew him as a secret votary of fantastic Fortune! It was proved to him now beyond dispute that there was a rigid Order of Things, and that there was no break in it. The Order was work, work, work, till you are worn out, and then give up your place to a cheaper man. The City was too strong, too relentless, to have its Order flouted. This was the thing that must happen—this was the reality.

Then he thought of his wife. What a finish to her years of loyal contriving! He could not tell her this; but what should he tell her? He must work out his six months so that the blow might be postponed; and perhaps, before the term had expired, something would hap'——

He gave a short laugh that was almost a groan. Here was that same old fancy again, popping up its head persistently even in this hour of doom. Something might happen? Why, something had happened; everything had happened!

Impatient with himself, he dipped his pen in the ink as if to resume his work. But he had lost the power to concentrate upon an invoice. His head and heart throbbed fiercely, and his hand was nerveless. The shock had been too much for him.

Then came a diversion. It began with a conversation at another desk, which he heard only because his name was spoken: 'Mr Peterston here?'

'Third desk from the end-invoices.'

'It would not be invoices long,' he reflected absurdly, forgetting that the designation would cling to him here as long as they remembered him at all. Then came a brisk footstep, and a face that looked at him, or seemed to look at him, over the glass screen.

'Good-evening, Mr Peterston!'

Mr Peterston tried to remember the speaker, but failed to recall any details connected with him. And the owner of the voice went on, a trifle nervously in spite of his tone of easy assurance, 'You did not keep your appointment this afternoon,' he said. 'Perhaps—undoubtedly—you were prevented. Mr Lisle fully expected you; in fact, he is still expecting you. When you failed to come we tried to reach you on the telephone, but the line was engaged. So he asked me to come over, and, if possible, bring you back with me. He will wait for us, for it is important that he should see you to-night. He has to report to the trustees in the morning.'

Mr Peterston gazed at the speaker with furrowed brows. He was trying to place him, to decide what part he played in this confused skein of recollection and impression. The visitor, who was perfectly human and genuine, showed signs of increased nervousness. He did not like that glassy stare; it was too unkind a reminder of last evening. Then Mr Peterston saw the collar of the man's top-coat, and perceived that it was brown. So his impressions began to arrange themselves, and he made a husky, broken protest. 'Look here,' he said, 'don't you think this affair has gone far enough? Aren't you driving it to death?'

'I beg your pardon?' said the visitor, in

apparent surprise.

"It is too much,' continued Mr Peterston, with agitation. 'I—I object most strongly to being annoyed in this way! Nor would you do it if you knew all—I'm sure you wouldn't. There ought to be a limit even to a joke. Leave me now, and tell Butterworth, if he is outside, that he carries things too far. Anyway, it's exploded now, and you are wasting your time. Instead of going at four I went at one, just to nip the thing in the bud.'

The cashier and several others turned to see what Mr Peterston was growing so excited about. There was so much strain in his voice. As for the visitor, his face was expressive of the most

complete bewilderment.

'Went at one instead of four!' he repeated.
'To nip the thing in the bud! My dear sir'-

'Yes,' said Mr Peterston, 'I was there at one.' Then he glanced angrily at his shirt-cuff. 'No. 95 Queen Victoria Street. As you see, I forestalled you.'

A light seemed to break in upon the visitor's mind, and his amazement was mingled with a dawning comprehension. One word had done

much to help him.

'Queen Victoria Street?' he cried. 'No, no, my dear sir, not Queen Victoria Street, but the other—Victoria Street, Westminster. What a simple mistake! Still, you could easily have found us in the Directory, under Solicitors, or in the Law Lists, or—or in half-a-dozen other places!'

For a long pause the two men stared at one another—the one striving to understand; the other a little amused, but greatly relieved. Yesterday Mr Peterston's conduct had given him the impression that he had had to deal with a lunatic, and it was a relief to find him simply stupid. The mistake was such a childish one! Then the significance of the situation came home to the weaker of the two, and overwhelmed him. He clutched the edge of his desk with his nerveless fingers.

The watchful cashier ran to support him, and a hush fell upon the room. It was followed by

a murmur, 'Peterston's fainted!'

When he recovered, it was the cashier who helped him into his shabby top-coat, while another man handed him his well-worn hat. Though still dazed and breathless, he was otherwise none the worse, for it is one of the favourite maxims of the Old Lady that joy never kills. 'He will be better when he gets into the air,' said the ambassador from Victoria Street, S.W. 'Is there anything he need wait for now?'

'If your story is true,' said the cashier dryly, 'there is nothing that should keep him here!'

So they led him toward the door; but he was not to go so lightly, after all. By this time the whole house knew the story, and it had an amazing effect. Men and women crowded up the stairs to see; all order was broken; those in the same room crowded after to shake hands with Mr Peterston, to slap him upon the back, to wish him good-luck and good-bye, even to touch him, as though there might be magic in the touch. In that wonderful hour convention was utterly forgotten. Had there been room on the stairs they would have carried him down, and for a time the pressure was so great that no one could get down at all. Then they blocked the pavement, and slammed the door of the taxi-cab so many times that the driver was obliged to make emphatic protest. And they finished all with a rousing shout, 'Good old Peterston—God bless you!'

The cab turned westward, but the City streets were thronged with evening traffic and with hastening home-goers. So in a few minutes the driver turned down New Bridge Street, and on to the Embankment. Then the way was clear, and they swept on past the Temple Gardens, toward the fantastic pinnacles that stand beyond the Bridge. And as they raced on Mr Peterston saw vaguely that the old Order was gone for the time, and that a new Order had come in. The silent river was lined with golden lights, and even the turgid waters laughed with a thousand stars upon their bosom. Every bridge was a rope of ruddy gold, and every building was a palace illuminated for high festival. But as he sped through that realm of the fantastic and the beautiful, he found himself thinking of that day thirty years ago, when he had first seen the symbol through the mist; and he said under his breath a hundred times, 'It has happened! It has happened! It has happened!

Returning to his mahogany desk, the cashier tried to recover his poise, to return to the order of things. But it was extremely difficult, and at last he laid aside his pen. There was a spirit of unrest everywhere, and not one of the slaves of the pen could settle down. Nay, they would never again settle down into the rut of yesterday.

For suddenly, in her imperial way, unexpected and unheralded, the Old Lady had entered the very citadel of this hard City, scouting its laws, outraging its conventions, laughing in the face of the Order of Things. A humorist greater than Butterworth, she had taken a hand in Mr Peterston's affairs, and, undeterred by his repulse of her ambassador, had brought them to her own fantastic issue. From afar she had seen that simple soul go often to her secret shrine, and with a whimsical warm-heartedness, with mingled laughter and compassion, had vowed to vindicate his faith. She had waited till that faith was little more than a memory, for it is her way to play even with her favourites. She had seen him brought to the City's judgment-seat and condemned; but in that moment, making good her ancient claim to go where she willed, she had snatched him from the bar, had torn his sentence into shreds, and had proclaimed her age-long authority to be and to do. And her passing had left a stir and a murmur, not for an hour, but for all the hours to come; for no man in that house would ever think of Peterston again without hearing the rustle of her skirts.

Then she had swept on her course, a course unmeasured and uncalculated even by the most daring of our Butterworths. When she pauses again, may it be on your threshold—or mine!

THE END.

THE IDEAL COUNTRY HOUSE.

RURAL residence is believed to be associated with many shortcomings as compared with living in town, especially in connection with such conveniences as lighting and heating. But a telling example of what can be done in this direction has been completed recently. S House, County Dublin, has undergone reconstruction and considerable extension, when the opportunity was taken to install one of the most comprehensive electric systems that has ever been contemplated in connection with country houses. A complete electric generating plant, together with a storage battery, is placed in an outbuilding, and the current thereby obtained is turned to a thousand and one purposes. Electric lighting is used throughout the mansion, farm, and stable buildings, while current is utilised also for auxiliary heating and power purposes. There is a stationary vacuum plant, driven by an electric motor, for cleaning carpets, floors, and furnishings. installation is accommodated in a basement apartment, whence piping of two inches in diameter is led to nozzles fixed to the wall skirting-boards on the several floors. Flexible hose, with suitable vacuum cleaning tools, are connected to these nozzles, while means of access for cleaning adjoining rooms by this method are provided. Electric

bells and telephones are distributed throughout the house, communicating with servants' quarters both in the basement and on top floors; while separate telephone systems are provided between the housemaids' rooms on each floor-landing, farm, stables, and outside servants' dwellings.

The water-supply is derived from a spring well about four hundred and twenty yards from the house, a petrol-engine-driven pump being requisitioned to lift the water to an elevated tank of twelve thousand gallons capacity, which is erected at a point adjoining the house, and which supplies the latter by gravitation. This source of watersupply is available also for fire-extinguishing purposes, the pressure being augmented by an electric pump connected to fire-mains around the house, and fitted at intervals with hydrant valves for hose attachment. The fire equipment is employed also for cleaning windows and watering the grounds, such use affording a complete guarantee that the system will be found in perfect order when required for an emergency. An electric automatic pump, operated by floatswitches on tanks in spaces on the roof, supplies rain-water from a storage-tank of fifty thousand gallons. Electric energy is used for a variety of other purposes, such as driving a sawmill, horseclipping, hay-cutting, oat-bruising, and winnowing machines.

The heating and hot-water supply is likewise of a very complete character. The heatingchamber in the basement contains a sectional type of boiler with accessories for the supply of low-pressure hot water to the distributing pipe system and radiators distributed throughout the mansion, and is designed to maintain a temperature of fifty-five degrees Fahrenheit in the public-rooms, and fifty degrees in other apartments, when the outside temperature is thirty degrees Fahrenheit, and the air changes do not exceed two per hour. Special arrangements are incorporated for heating drying-cupboards. The whole system is divided into four sections, each independent of the others, so that certain portions of the house may be heated A siphon automatic separately as desired. damper-regulator is fitted to the boiler, and further regulation of the temperature is secured

by a regitherm placed in the hall, and set to maintain a constant temperature. Two separate systems of hot-water supply are installed to serve (1) the kitchen and servants' premises, and (2) the remainder of the house, the latter being out of service when the house is not occupied by the owner. Each system consists of a separately fired domestic boiler and storage cylinder, connected by flow-and-return pipes to main circulating pipes led from the cylinder, with branches to the various draw-off taps.

This is one of the most up-to-date and interesting systems of its character which have been installed in country houses, and it serves to illustrate how convenient a rural residence may be made—quite as perfect as a town house—and also indicates the diverse uses of electricity in such applications. The whole of this installation was designed by an eminent firm of Glasgow engineers, who have made a speciality of country-house lighting and heating by electricity.

A BOER'S TWO TERRORS.

By Douglas Blackburn.

THE plot of this true story can hardly fail to appear improbable to the average reader, because it is difficult to imagine any human being passionately refusing to avail himself of a legitimate and simple opportunity to become rich. There are thousands of true stories of men who have committed or attempted murder in the effort to attain wealth, but probably this is the solitary true instance of an otherwise sane man deliberately risking his own life, certainly his liberty, in an attempt to kill the man who wanted to enrich him. Therefore this paradoxical, even Gilbertian, situation needs explanation.

Strange though it may appear to those who judge all human nature by their own standard, it is nevertheless a fact that in the early days of the gold discoveries on the Rand many of the elderly Boers had a deep-rooted objection to the existence of gold on their farms being proved. It is now a fact of history that one of the chief grievances of the Uitlanders against the Kruger Government was that it placed difficulties in the way of those who would exploit the gold. also now well known that the existence of payable gold on many farms was carefully concealed or denied up to the very last. No clause in the Transvaal Gold Law was passed with more difficulty than that giving the Government power to proclaim a goldfield without the consent of the owners of the land; and only the year before the war a lawsuit was instituted for the purpose of testing it.

The objection of the Boers to admit the goldseeker was not so unreasonable as it may seem to us. Whatever may be said to the contrary, the old-time Boer was not a money-grubber. His sole idea of wealth was cattle and land to rear them on. He was attached to the land, and the idea of parting with it at any price was as repugnant to him as it is to the owner of an historic estate in Britain; it was even more so, because it was no longer easy to acquire a new home where he might wish to settle; therefore the price he might get for his land was of very little consequence to him. Then there was a fear that the gold-seeker would rob him, and unfortunately the suspicion was sometimes well grounded. Some of the most infamous frauds in history have been resorted to in order to trick ignorant Boers out of their property, and the memory of these wrongs is evergreen. An appreciation of the Boer attitude in the matter will render this story intelligible.

It was in 1897, when I was editing the well-known Transvaal Sentinel. My numerous conflicts with the Government and the mining magnates had thrust upon me a certain notoriety, and by many Boers I was credited with an authority on matters appertaining to the Gold Law that I was not strictly entitled to; but whenever my assistance was asked I gave of the best I had, which now and then proved satisfactory to both advised and adviser.

Among the applicants for my assistance was a young Cape Boer, the nephew of one De Vries (pronounced De Frees), who owned a six thousand acre farm on the East Rand. He showed me a fairly good sample of gold quartz that had been found on his uncle's farm, and his object in coming to me was first to help him to locate

the reef, then to persuade his uncle to consent to the discovery being turned to account. His faith in my ability to influence the uncle was based on the circumstance that the old man had taken an interest in one of my fights with a mining company, and had formed a favourable opinion of me. Consequently he would be more likely to listen to me than to any other rooinek.

We arranged terms, and, under pretence of a little shooting, visited the farm. As the sequel will show, the fact that Nephew De Vries picked me up en route at the Johannesburg smallpox lazaretto, where I had been week-ending as the guest of the medical officer, proved an important circumstance in this adventure.

The old Boer received us with characteristic nonchalance, and after the usual hour wasted over coffee and gossip, with long pauses, we got away in quest of our treasure under the pretext of looking for guinea-fowl, that the old Boer assured us it was useless to expect until near sundown.

Our plan of campaign was this. We had first to find the reef whence the sample had been taken. The finder of the specimen was a herd 'boy' employed on the farm. He knew gold quartz at sight, having worked for a prospector; but when, delighted at the prospect of reward, he had shown the sample to his master, he was threatened with all sorts of fearsome penalties if he spoke a word of the discovery to a soul. Consequently he was dumb, and we were thrown upon our own resources. Having found the reef, we should have to take away sufficient samples to ensure a reliable assay. This would necessitate working secretly at night with the aid of Kafirs, for the nephew was emphatic in his assurance that his uncle would not permit any investigation, as he was one of the most violent of the anti-gold Boers. I don't think that the nephew knew the extent and possibility of his uncle's violence, anxious though he was to impress me with its terrific intensity. Our scheme was, if the assay proved good, and my efforts to persuade the old man failed, to go to one of the many syndicates who at that time were buying gold claims more wildly than at any period in the history of the great goldgamble, and get them to put the law in motion, and have the ground proclaimed, in spite of the owner's wish.

Looking back on the affair with the eyes of experience, I fully recognise the outrageous injustice of the thing. But, by way of an excuse, I cite the fact that one of the crimes alleged against the Boers, and often quoted as a proof of their unfitness to be masters in their own country, was that they retarded the gold industry by refusing to sell their land to the gold magnates.

We located the reef within an hour. It was the ordinary quartz outcrop common at that end of the Rand; the only question for us to solve was the extent and direction of the reef. The value of it was for the assayer to determine.

Most evil schemes come to grief through some stupid oversight. Our calamity was the result of the nephew bringing the gun but leaving the cartridges when we came out to shoot guineafowl that were not due for many hours.

The suspicious old Boer read the signs aright, called for his horse, and rode after us. At the moment of his unobserved arrival I was busy taking measurements of the outcrop, which the nephew was entering from my dictation into a surveyor's note-book. It did not need the gift of second-sight to show that, whatever our quest, it was not guinea-fowl. De Vries did not waste time in asking what we were doing. He simply jumped to conclusions, and took no chances. He began with his nephew, and within a minute I had been provided with oral evidence that the nephew was the basest and most infamous villain on earth, or that Mynheer De Vries was a slanderer without compeer. When my turn came to have my character read, I wondered how I had escaped hanging, or at least penal servitude, years before.

Further disguise being useless, like the foiled villain in the play we became frankly bold and nonchalant. I admitted that we were seeking a gold reef; and, encouraged by the sudden calming down of the old man, I used my most persuasive Biblical phraseology to impress upon him the wrongfulness of hasty judgment, the letting of the sun go down upon his wrath, and one or two more or less appropriate Bible quotations, which had the intended effect, or would have had if I had not made a hideous blunder. He had listened without protest while I had shown with scriptural authority that it was the duty of a godly man to acquire wealth legitimately, in order that he might help the Church and his fellows. I drew a picture of him as rich as Paul Kruger, and a generous supporter of the Dutch Reformed Church. I did not know that De Vries was a stern Dopper. The nature of my blunder can best be realised by imagining the effect of complimenting a very zealous High Churchman on being a Calvinistic Methodist.

De Vries changed his manner in a moment. He resumed his abuse, and ordered us off his farm.

It was then I perpetrated my second and worst blunder. I bluntly told him he was a fool not to take the chance of becoming a rich man by selling right out to a syndicate, and I added what was true, but foolish to have said, 'If the farm is proclaimed a goldfield, you will only get a fraction of what you would if you were sensible and sold to a syndicate. Anyhow, you will have to sell, whether you like it or not.'

The effect was instantaneous. He glared at me savagely, gasped something unintelligible, and rode off rapidly in the direction of the house. Before his nephew and I had decided

on our programme, De Vries was back, carrying his Lee-Metford rifle. He withdrew the magazine, calling on us to note that it was fully loaded, replaced it, and ordered us to go to the house and sit on the *stoep* (veranda); adding impressively that if we tried to leave the farm he would shoot.

As nothing was likely to come of resisting, we quietly walked the mile or so to the house, De Vries riding behind in silence. On reaching the house I called to the stable-boy to harness our horses. De Vries interposed with an emphatic assurance that neither of us would leave the farm for seven days.

Why seven days? It was not until all was over that we understood. De Vries had somehow got the erroneous idea that if a gold discovery were not announced within three months of the extraction of the first piece of gold the ground could not be declared a public goldfield. It wanted seven days to complete the period since this reef was found, so if he could keep us from Johannesburg for a week he would have nothing to fear in the future.

I was inclined to make a fuss, but on the whispered advice of the nephew I agreed to wait till supper and prayers had put the old man into a more Christian frame of mind. It may appear somewhat pusillanimous on the part of two ablebodied men to submit passively to the bullying of an elderly Boer, but a knowledge of the peculiar conditions will explain much. At that period the Transvaal Boer was on the top wave of his domination. Not only was Andries de Vries an influential Burgher, but a notoriously courageous and truculent representative of the Anti-Englander party. We both knew well that if he, in his anger, shot one of us, the chances were all in favour of his escaping any penalty. It would have to be a very strong case to induce a jury of his fellow-countrymen to convict an influential and 'oprecht Burgher' like Andries, and we knew that he also knew it. Then the knowledge that one's murderer will be hanged is, after all, very small inducement to provoke him, just to see if he has the courage of his boastings. During the war Andries fully lived up to his character for courage of the mad, impulsive type. He was shot in a reckless single-handed attempt to rescue a party of captured Boers.

So, recognising the folly of irritating an irritable man who had just cause for imagining himself aggrieved, we lounged on the stoep, smoking and reading an old paper, and waiting for that something to turn up which is the solace of the adventurer. Meanwhile our captor dozed in his arm-chair in the sitting-room, having us in full view through the open door, his rifle on the table at his elbow. We noticed that a Kafir servant lay down in the veld fifty yards in front of the house, and remained there till we were called in to supper.

We found, as the nephew had prophesied, Oom much cooler, if not exactly amiable; and as reference to gold was purposely avoided, the meal passed off quietly—in fact, too quietly. The old man expressed himself mainly in grunts, and his wife and family of seven big boys and girls were too fearful of their grim, dour father to respond to my attempts to enliven the gloom by a few mild jokes. It was a dreary ordeal, and the prospect of having seven days of it would have stirred me to action even if I had not had a hopeful view of the future.

I had unfolded my plan in drowsy tones to my fellow-prisoner during the hours we spent on the stoep. It was to play upon the terror Oom and every other Boer has of the smallpox. A very severe epidemic of the disease was passing through Johannesburg, and I had been visiting the lazaretto in a journalistic capacity, collecting data for an inquiry that was held later.

The nephew and I had arranged that when the question of sleeping accommodation arose, as it must, he was to inform his aunt in confidence of the danger incurred by having in the house a man fresh from the fountain-head of infection. The nephew was certain that I should not be permitted to stay, but he was a little bit apprehensive as to whether his violent uncle might not assist my departure with a bullet. The same fear was felt by his aunt when, after prayers, he took her aside and imparted the awful news. She was at first for saying nothing, lest in his wrath her lord should 'do something wicked with his gun;' but her concern for me was only temporary, so she decided to consider her family first, and give her husband the information. 'If he shoots,' she said, 'I shall be sorry; but it will serve the Englander right for bringing the pest here.

The nephew at this stage exhibited a readier wit than I gave him credit for. He assured his aunt that it would be more dangerous to shoot me than to leave me alive, because dead bodies gave off the plague more than living ones. I don't know whether she used this argument on Oom; but it seems that I had read her husband's character correctly, for when she broke the news to him in the bedroom he showed more terror than fight. The nephew and I were in the sitting-room, only a thin partition dividing us from the bedroom. We could hear plainly all that was spoken loudly, and I have never heard such abject terror as this ferocious Boer expressed. He began to yell for the boys and girls to go into the kitchen and stay there, shouted for the stable Kafir to find our horses, which had been driven far into the veld to prevent our escape, and amid torrents of abuse ordered me to leave the farm before I was We heard the sound of scuffling, which in the after-time we learnt was produced by Oom dragging his wife from the door to get

her farther from infection. She, thinking he was trying to get at me, very considerately resisted until overcome by superior force, by which time we were out of the house, trying to induce three drunken Kafirs to find our Our Kafir groom had smuggled in two bottles of the deadly rum sold by the illicit liquor dealers to the mine Kafirs, and the lot of them were helplessly drunk in the hut of the

The nephew and I had to wander into the veld in the darkness, and spent two hours in the search. It was past ten before we drove off without the formality of saying 'good-bye.' We left our groom to get sober and return the best

way he could.

The night was moonless and cloudy, therefore This and the not unnatural exciteverv dark. ment attendant on our departure probably accounted for our finding ourselves brought up by a wire fence about the time we ought to have been at the gate. This farm, like most of those in the High Veld, was a vast expanse of level veld, with nothing to distinguish the road except that it was less grass-grown. I got out and followed up the fence for a long distance The nephew tried the opposite without result. direction, and eventually found a road, which we led the spider into, after some rough struggles with the numerous ant-hills that corrugated the veld. We had driven about five hundred yards, when the nephew suddenly pulled up with an exclamation, 'We are coming back! Look at exclamation, 'We are coming back! Look at that boulder!' We knew that we had returned to within a quarter of a mile of the house.

Nothing is so deceptive as the veld at night. However familiar one may believe one's self with a locality, it is only needed to turn and twist a little off the track to lose one's bearings.

I suggested that we should make certain before turning again, and my companion got out to examine the track more closely. In the faint light of the stars I saw him stoop over the stone, and at that moment the sharp report of two rifle-shots came in quick succession. distinctly heard the bullets strike the stone.

'He is shooting at us! I thought he would,' the nephew observed with mild surprise. 'Better

lie down for a little.'

Before I could get out of the spider two more shots sounded, accompanied by a piercing feminine scream.

We lay in the grass, waiting for something else to happen, but it came not

'Aunt has taken the rifle from him. get on now,' my companion suggested; and we

We were six hours on the return journey. We had plenty of time to make plans, and we made them.

A week later the nephew called on his uncle for an explanation and the Boer equivalent of an apology. As no member of the family had

succumbed to smallpox, and no Government hint of proclamation had been heard, Oom was fright-He did not deny the shooting, which he justified by the belief that we had returned to get samples from the reef. He could not see us, he said; but his keen ears told him we were near the boulder, where the ground was hard. He had fired at random, and was as proud of having hit the boulder as if he had taken first prize at a rifle contest. That was all the explanation and apology we got.

After Oom's death his son offered the farm to The result of the prospect a mining company. and assay was a report that the reef was only payable in small parts, and the offer was declined. So, like most worries, that of Oom De Vries

proved to be a waste of good energy.

IN THE VALE OF YARROW.

OH fair is the world at morning prime, When the skies are blue with a sweet breeze blowing;

There's a way to wend, there are hills to climb, Where Yarrow clear is flowing. And this is the song the river sings,

And this is the song the river sings,
As I walk by it to-day:
'My voice is the voice of healing springs,
When the heart is young and gay.
My voice is one with the loved and lost,
When the head is bowed and gray;
But what is the odds? And what life's cost? There is love at the end of the way.'

Oh fair is the world at hushed noontide, When in all the fields there are rustics reaping, When on all the hills, in their purple pride, Shadow and shine are sleeping. And this is the song the Yarrow sings,

As I walk by it to-day 'Oh human souls, with faltering wings, I have yet my ancient sway!

My voice is the voice of a deathless grief,
I tell of a dreary load;

Yet I whisper of joy beyond belief:
There is love at the end of the road.'

Oh fair is the world at sunset-time When Yarrow is bathed in a golden glory, With a mystic light that seems to climb From the very heart of a fairy-story. And this is the song sweet Yarrow sings, As I walk by her to-day:

'From the years of eld my glamour wings
To the heart that is young and gay. My woods are lovely, my flowers and ferns
Are peopled with elf and fay;
And most of all for the hearts that yearn For love at the end of the way.

Oh the world is fair at even-time, When caller winds on the hills are blowing; In every valley are bells that chime, And flocks that are homeward going.

And this is the song that Yarrow sings, As I follow her winding way,

And ever its lilt in my memory rings,
Whilst an amethyst sky turns gray:
'Remember, child, the joy that springs
From a bravely carried load;

"Managher icht shell awallow my beautif

Though night shall swallow my beautiful things,
There is home at the end of the road.'

A VIS.

SAFETY OF LIFE AT SEA.

LEGISLATIVE RESULTS OF THE INTERNATIONAL CONVENTION.

By STOPFORD H. RYLETT.

THERE is a melancholy coincidence in the fact that almost at the same moment as the world's humanity was staggered by the news of the terrible disaster which had overtaken the Canadian Pacific Railway's great liner, the Empress of Ireland, there was published the text of the Merchant Shipping (Convention) Bill. The object of the Bill is to make such amendments of the law relating to merchant shipping 'as are necessary or expedient to give effect to an International Convention for the Safety of Life at Sea,' signed last January in London. As all the world knows, the convention resulted from the Titanic catastrophe.

The Governments of Britain and Greater Britain, Germany, Austria, Belgium, Denmark, Spain, America, France, Italy, Norway, the Netherlands, Russia, and Sweden, in the words of the first preamble in the first schedule of the Bill, 'having recognised the desirability of determining by common agreement certain uniform rules with respect to safety of life at sea,' decided to conclude a convention to that end. Each country appointed as its plenipotentiaries—there were fifty-six in all—men of well-tried ability and pre-eminently fitted for the task. Needless to say, the results of their labours, especially in the light of the recent appalling tragedy, are intensely interesting.

The provisions of the convention apply practically to all 'the merchant ships of any of the States of the high contracting parties which are mechanically propelled, which carry more than twelve passengers, and which proceed from a port of one of the said States to a port situated outside that State, or conversely.' It is my object in this article to give as simply and briefly as possible these provisions, so far as they are covered by, and embodied in, the Board of Trade's Merchant Shipping (Convention) Bill.

The Bill is divided into six parts, and contains five schedules. The first part deals with ice and derelicts, navigation of the North Atlantic, and response to, and use of, distress signals. In the Mersey report on the loss of the *Titanic* there was a certain extract from one of the publications known as Sailing Direc-

tions, which are compiled by the Hydrographic Office at the Admiralty. It referred to the ocean passages of the large transatlantic mail and passenger steamers, and ran: 'To these vessels, one of the chief dangers in crossing the Atlantic lies in the probability of encountering masses of ice, both in the form of bergs and of extensive fields of solid, compact ice, released at the breaking up of winter in the Arctic regions, and drifted down by the Labrador current across their direct route. . . . These icebergs are sometimes over two hundred feet in height and of considerable extent. have been seen as far south as latitude thirtynine degrees north; to obtain which position they must have crossed the Gulf Stream, impelled by the cold Arctic current underrunning the warm waters of the Gulf Stream. That this should happen is not to be wondered at when it is considered that the specific gravity of fresh-water ice, of which these bergs are composed, is about seven-eighths that of seawater; so that, however vast the berg may appear to the eye of the observer, he can in reality see one-eighth of its bulk, the remaining seven-eighths being submerged and subject to the deep-water currents of the ocean. . It is, in fact, impossible to give, within the outer limits named, any distinct idea of where ice may be expected, and no rule can be laid down to ensure safe navigation, as its position and the quantity met with differ so greatly in different seasons. Everything must depend upon the vigilance, caution, and skill with which a vessel is navigated when crossing the dangerous ice-bearing regions of the Atlantic

Ocean.'

The convention has come to grips with this aspect of the North Atlantic navigation problem. In Articles 6 and 7 of the convention, the high contracting parties 'undertake to take all steps to ensure the destruction of derelicts in the northern part of the Atlantic Ocean east of a line drawn from Cape Sable to a point situated in latitude thirty-four degrees north and longitude seventy degrees west. Further, they will establish in the North Atlantic with the least possible delay a service for the study and the observation

No. 190.-Vol. IV.

[All Rights Reserved.]

JULY 18, 1914.

of ice conditions and a service of ice patrol. For this purpose, two vessels shall be charged with these three services. During the whole of the ice season they shall be employed on ice patrol. During the rest of the year the two vessels shall be employed in the study and observation of ice conditions and in the destruction of derelicts; nevertheless, the study and observation of ice conditions shall be effectively maintained, in particular from the beginning of February to the opening of the ice season.' While the two vessels are employed in ice patrol the high contracting parties, to the extent of their ability and so far as the exigencies of the naval service will permit, will send warships or other vessels to destroy any dangerous derelicts if this destruction is considered necessary at that

The Government of the United States is invited to undertake the management of these three services, and Austria, Belgium, Canada, Denmark, France, Germany, Great Britain, Italy, the Netherlands, Norway, Russia, Sweden, and the United States each undertake to contribute a certain proportion of the expenses.

Further, vessels meeting with, or being informed of, any dangerous ice or dangerous derelict, or any other imminent and serious danger to navigation on or near their course, are to be made bound to report the fact as soon as possible to other ships in their vicinity and to the shore. For omitting to do this the master of a British ship is made liable in respect of each offence to a fine not exceeding fifty pounds. What is still more important, when ice is reported on or near his course, the master of every ship is bound to proceed at night at a moderate speed, or to alter his course so as to go well clear of the danger zone. The penalty for not complying with this regulation is a fine not exceeding one hundred pounds.

As everybody knows, the gravest feature of the *Titanic* disaster was the fact that, in spite of repeated warnings from other vessels informing him of the presence of ice in and about the course of his ship, Captain Smith never reduced her speed in the slightest degree even at night. Had he moderated the vessel's rate—she was tearing through the water at a speed of twenty-two knots when she struck the iceberg—there is every reason to suppose that the *Titanic* could have been saved from destruction.

In the light of these new regulations, Lord Mersey's remarks in the *Titanic* report on the question as to what the master, Captain Smith, ought to have done under the circumstances are particularly interesting. 'I am advised,' he says, 'that, with the knowledge of the proximity of ice which the master had, there were two courses open to him. The one was to stand well to the southward instead of turning up to a westerly course; the other was to reduce speed materially as night approached. He did neither.

. . Why then did the master persevere in his course and maintain his speed? The answer is to be found in the evidence. It was shown that for many years past-indeed, for a quarter of a century or more—the practice of liners using this track when in the vicinity of ice at night had been in clear weather to keep the course, to maintain the speed, and to trust to a sharp lookout to enable them to avoid the danger. This practice, it was said, had been justified by experience, no casualties having resulted from it. I accept the evidence as to the practice and as to the immunity from casualties which is said to have accompanied it. But the event has proved the practice to be bad. Its root is probably to be found in competition and in the desire of the public for quick passages rather than in the judgment of navigators.' Whether a fine of one hundred pounds is a penalty which will deter masters from following this bad practice is a doubtful question.

Needless to say, it is made obligatory on all masters, on receiving a wireless distress call, to proceed as quickly as possible to the vessel in trouble. In view of the fact that the horrible disaster to the Empress of Ireland may have arisen from the navigators of the Storstad not clearly understanding the whistle signals given by Captain Kendall, the convention's regulations for an international code of Morse signals is especially important. These signals may be made at night or in thick weather, either by long and short flashes of light or by long and short sound signals (whistles, foghorns, &c.), or during the day by hand-flags. The question whether those in command of the Canadian or those in command of the Norwegian vessel did not understand the true meanings of the exchanged signals has not been answered at the time of the writing of this article, but it may be the key to the reason of the awful calamity.

Incidentally it is interesting to note that, in the suggested international code for wireless calls, the wireless distress call is still S.O.S. repeated at short intervals; whilst the danger call is TTT, repeated at short intervals ten times at full power, the call to be followed after an interval of one minute by the message repeated three times at intervals of ten minutes.

Part 2 of the Bill deals with the manning, construction, and equipment of passenger steamers, and greatly strengthens and improves the existing regulations with regard to these matters. For instance, at the present time the number of lifeboats which an ocean liner must carry is calculated according to the tonnage of the vessel. How inadequate this basis of calculation is can be gauged from the fact that the *Titanic*, with a total complement of over two thousand passengers and crew, was only compelled to have boat accommodation for about a thousand people. As a matter of fact, she carried boat accommodation

for over eleven hundred. In the course of his report on the ill-fated vessel Lord Mersey said: 'The gross tonnage of a vessel is not, in my opinion, a satisfactory basis on which to calculate the provision of boat accommodation. Hitherto, I believe, it has been accepted as the best basis by all nations. But there seems much more to be said in favour of making the number of lives carried the basis, and for providing boat or raft accommodation for all on board.' The Board of Trade have adopted this view, and in the new Bill it is laid down that 'the accommodation provided on a passenger steamer which is registered in the United Kingdom, by lifeboats and -to the extent to which they are allowed in substitution for lifeboats in pursuance of rules made under this section—by pontoon life-rafts, shall be at least sufficient for every person on board the ship.

One of the sad features of the Titanic disaster was the fact that there had been no proper boat drill or muster either on the ship or before she set out on her first and only voyage. The result was that when the vessel struck neither the officers nor crew were familiar with their lifeboat stations or duties. The consequence was confusion in the launching of the boats. In his report Lord Mersey stated that 'there had been no proper boat-drill nor a boat-muster. It was explained that great difficulty frequently existed in getting firemen to take part in a boat-drill. They regard it as no part of their work. There seems to be no statutory requirements as to boat drills or musters, although there is a provision (Section 9 of the Merchant Shipping Act of 1906) that when a boat-drill does take place the master of the vessel is, under a penalty, to record that fact in his log.' The new Bill drastically deals with this evil. Under its regulations, there must be for each boat or raft required a minimum number of certificated lifeboatmen. In order to obtain the special lifeboatman's certificate provided for by the convention the applicant must prove that he has been trained in all operations connected with launching lifeboats and the use of oars; that he is acquainted with the practical handling of the boats; and, further, that he is capable of understanding and answering the orders relative to lifeboat service. 'An officer, petty officer, or seaman shall be placed in charge of each boat or pontoon raft; he shall have a list of its crew, and shall see that the men placed under his orders are acquainted with their several duties and stations. . . . Musters of the crew at their boat and fire drills respectively shall be held at least once a fortnight, either in port or at sea. An entry shall be made in the official log-book of these drills or of the reasons why they could not be held.'

The Bill also widens the scope of the State's interference with the construction of British ships by giving the Board of Trade power 'to

make such rules as appear to them necessary or expedient to carry into effect' the comprehensive provisions of the convention with respect to this matter.

Before leaving this part of the Bill I should like to express my own regret—a regret which, I know, will be felt by many people of experience in the shipping world — that no compulsory regulation has been formulated for the provision of searchlights, on great liners at least. Among the questions put to the Titanic court of inquiry were the following: 'Had the Titanic the means of throwing searchlights around her? If so, did she make use of them to discover ice? Should searchlights have been provided and used?' The answers to these questions were in the negative; but, at the same time, the court expressed the opinion that 'searchlights may at times be of service.' To my mind, searchlights can be of inestimable service in preventing disasters at sea. For instance, who can doubt that if either the Empress of Ireland or the Storstad had had searchlights, and had used them to find the other's position when they realised their proximity, the recent horrible accident could have been avoided? Who can question the fact that in rescuing at night people who have been wrecked, a ship would be greatly assisted in the work if she possessed a searchlight with which she could illuminate the scene of the disaster?

Whilst touching on this matter it is well to point out that most probably the Empress of Ireland disaster, with all its attendant loss of life, might have been avoided had the great liner been able to let off flashlights intermittingly from the moment she was aware of the approach of the Storstad. A considerable time elapsed between the moment when the two ships exchanged signals and the time that the accident happened. Flashlights would have revealed to the Norwegian vessel the exact position and whereabouts of the Empress of Ireland. Surely, under these circumstances, the heart-rending calamity could have been avoided.

Part 3 of the Bill deals with wireless telegraphy, one of the greatest blessings the worldespecially the seafaring world-enjoys. Subject to the rules and exceptions laid down in the regulations of the convention, ships carrying fifty or more persons are compelled to be equipped with a wireless telegraphy installation. merchant ships belonging to any of the contracting States, whether they are propelled by machinery or by sails, and whether they carry passengers or not, shall . . . be fitted with a radiotelegraph installation if they have on board fifty or more persons in all.' However, the Government of each of the contracting States, if it considers that the route and the conditions of the voyage are such as to render such an installation unreasonable or unnecessary, may exempt from the above requirements the following ships: '(1) ships which in the course of their voyage do

not go more than a hundred and fifty sea-miles from the nearest coast; (2) ships on which the number of persons on board is exceptionally or temporarily increased up to or beyond fifty by the carriage of cargo-hands for part of the voyage, provided that the said ships are not going from one continent to another, and that during that part of their voyage they remain within the limits of latitude thirty degrees north and thirty degrees south; (3) sailing vessels of primitive build . . . if it is practically impossible to install a radiotelegraph apparatus.'

Part 4 of the Bill sets up a system of 'safety certificates,' the effect and scope of which can be best gathered from the following article of the convention: 'A certificate, called a "safety certificate," shall be issued, after inspection and survey, to every ship which complies in an efficient manner with the requirements of the The inspection and survey of ships, so far as regards the enforcements of the provisions of this convention and annexed

regulations, shall be carried out by officers of the State to which a ship belongs; provided always that the Government of each State may entrust the inspection and survey of ships of its own country either to surveyors nominated by it for this purpose or to organisations recognised by it. In every case the Government concerned fully guarantees the completeness and efficiency of the inspection and survey. The safety certificate shall be issued either by the officers of the State to which the ship belongs, or by any other person duly authorised by that State.'

The two remaining parts of the Bill treat of general matters, such as the application of the Bill to foreign ships, exceptions for ships compelled to take refuge by stress of weather, and

It is to be hoped that the splendid fruits of the International Convention will be supplemented by certain navigators exercising greater care and sanity in the management of their ships in the future than they have done in the past.

KNIGHT ON WHEELS.

CHAPTER XXIX.—continued.

PHILIP saw nothing of Miss Jennings during the next few days, for the weather continued to be boisterous, and that lady—unlike other and less considerate members of the ship's companypreferred to endure the pangs of mal-de-mer in the seclusion of her own cabin. It was not until the fourth day out that he saw her again. She was reclining languidly in a chair, convalescent, but obviously disinclined for conversation. Philip passed her by.

The fifth day broke bright and sunny, and the Bosphorus, clear of the Newfoundland Banks with their accompanying fogs and ground-swell, became a centre of social activity. Vigorous couples tramped up and down, snuffing the breeze. pleasant children ran shrieking round the deck, galloping over the same sets of toes at regular intervals. Elderly gentlemen played interminable games of deck-quoits and bull-board. In the smoking-room enthusiastic alcoholists gathered, to splice the mainbrace and bid in the auction sweepstake upon the day's run. New York was only twenty-four hours away.

Philip, descending to his cabin for a book, passed Citizen Brand polishing cabin door-handles

with fierce energy. He paused.

'Brand,' he said, 'I want to have a palaver with you. Can you come and see me in my cabin this evening?'

Brand considered. 'I shall get a telling-off from the second-steward if I do,' he said. 'Regular cossack, he is. This ship's full of rotten rules and red-tape. Still, after all, he can only sack me, which will save me the trouble of deserting. All right, I'll come.' He appeared in Philip's cabin at ten o'clock that night, and consented to drink whisky-and-water out of a

'Well,' inquired Philip, lighting his pipe, 'what are your prospects in the States? a berth ?

'Not yet,' said Brand.

'I am going on a visit to some of the big establishments out there. If I come across anything that would suit you, shall I put it in your way ?'

Brand thanked him gruffly, and said, 'I don't know. I don't know what to say. fact is, I don't know where I shall have to live

yet.'

'Have to live?'

'Yes, have to live. I can't settle anything. I-oh, damn it, I don't know! Leave me alone! He sat staring savagely at the floor, with his head in his hands.

'Brand, my friend,' remarked Philip, puffing at his pipe, 'you and I have been acquainted for a considerable time now, haven't we?' Brand nodded, and Philip continued: 'I'm going to assume the privilege of an old friend, and inquire into your private affairs.'

'Fat lot of information you'll get,' was the

gracious reply.

'Very well, then,' said Philip cheerfully, 'I won't inquire; I'll assume. Having assumed that everything I meant to ask about is as I

think it is, I'll tell you something. It's this: you are a pretty good chap.'

Brand's gloomy eyes turned upon Philip suspiciously. 'What do you mean?' he snarled.

'I mean this. You have done a pretty fine thing. If the information interests you, I may tell you that you have taught me a lesson; but that's beside the point. Last Friday you were in a comfortable berth, doing well, and rising rapidly. To-day you are a bath-steward, without any status or prospects. Why?'

'Because I'm a blasted fool,' replied Brand.

'No, I don't think so,' continued Philip. 'I prefer to look at it differently. You have sacrificed everything, and staked your whole future—on what? On an Idea—a single Idea. I call that a pretty fine thing.'

'What Idea?' snapped Brand.

'A very pretty little Idea,' said Philip. 'She is now sleeping peacefully two decks below this.'

Brand sprang to his feet, his eyes blazing. 'And why not?' he demanded. 'Do you deny my right to follow her, and look after her, and see she comes to no harm, whatever she may think of me or do to me? I love her! Do you understand what that means? I love her! Gentlemen like you and Rendle, you don't know the meaning of the word. With you it's just: "Fine girl—what? Come and have supper at the Savoy to-night!" That's what you call love!' Brand's arms were waving; he was rapidly lapsing into his old Hyde Park manner. 'When you've finished with one girl, or the girl is finished with you, what do you do? Kiss your hand and get another! Bah!'

'And what do you do, Brand,' inquired Philip imperturbably, 'when a lady gives you up?'

'I give up my job—I give up everything, so as to be free; and I follow her. That's what I do. She's a child; she's not able to look after herself.'

'Now, my impression of Miss Jennings' character,' said Philip, 'is exactly the opposite. I have rarely met a woman who seemed to me so

well-balanced and self-possessed.'

'Up to a point, and in a manner of speaking,' agreed Brand, conversing more rationally now, 'you are right. But that's a woman all over. She may keep her head for months at a time, and snap her fingers at man after man; and then one fine day a fellow comes along that's no better than fifty others she's turned down, and what does she do? She goes potty! She crumples up! She crawls round him and eats out of his hand! Why is it? In God's name, sir, why is it?' His head dropped into his hands again.

'When did this happen?' asked Philip gently. He felt strangely awed in the presence of this

elemental soul.

'I'll tell you,' said Brand. 'It'll do me good.

She and I had been getting on pretty well of late. We weren't exactly engaged, but she allowed no other man near her but me. I gave up a lot to please her. I gave up speaking in the Park because she said it wasn't gentlemanly. I joined the Church of England—me that's been a Freethinker ever since I could think! I gave up being a Socialist, because she said it was low. I cut my wings, and clamped myself down, and dressed myself up like a Guy Fawkes, all to please her. I let her order me about, and I liked it! I liked it! That's pretty degrading, ain't it! I felt degraded and in love at the same time, if you know what I mean. That's a rotten state to be in, I don't think!'

Philip was listening intently. Somewhere in the back of his mind he felt that he had heard this story before. Then he remembered Uncle Joseph, and realised that all human experience appears to run upon much the same lines.

'Well, we were happy enough,' continued Brand, 'for a matter of two years or so. The only trouble was that when I suggested marriage she said she was very comfortable as she was, and did not want to lose her independence. They 're all for independence nowadays. I don't know what causes it—Board Schools perhaps. In her company I was too pleased with life ever to argue about anything, so I didn't press it. But there was one big risk that I overlooked, and that was the risk of another man butting in. And that's just what happened. A feller came along. He had everything that I hadn't-fine manners, and plenty of silly talk, and nasty little love-making ways. He put the come-hither on Lil; as I told you, in a fortnight she was eating out of his hand. I'm not the man to take that sort of thing lying down. I asked her straight what she meant by it. She flared up, and asked when I had been appointed her keeper. I said we was engaged. She said we was no such thing. I said if we wasn't, it was about time, considering all things, that we was. She asked what I meant by that. I said if she had any sort of notion of fair-play she would know. After that she told me she never wanted to see me again. I said she was only anticipating my own wishes, and we parted. We ain't spoken since. That was six weeks ago.'

'What became of the other man?' asked Philip.

Brand smiled grimly. 'Him' I went to him next day, and told him if ever he spoke to Lil again I'd push his face in.'

'What did he say to that?'

'He was most gentlemanly about it. Oh, most gentlemanly!' Brand assumed the mincing accent which he reserved for his impersonations of the aristocracy. 'Told me he had no desire to come between a man and his future wife. Said he was not permanently interested in the lady! He got no further than that, because that was where I did push his face in.

He was a nasty sight when I'd finished with him. He never went near Lil again, though—the rabbit! Since then not a word has passed between her and me, except when business required. Then, last Friday, I saw her going round the office and garage saying good-bye to everybody—except me, of course—and telling them she was going to America. I waited till the dinner-hour; then wrote to headquarters, resigned my job, and went straight to Liverpool, where I managed to get signed on aboard this boat. That's all.'

'What are you going to do when you get to New York?' asked Philip.

'I don't know. It depends on what Lil does,' replied single-minded Citizen Brand.

٧.

'Well, how do you like the prospect of New York to-morrow, Miss Jennings?' asked Philip.

They were leaning over the taffrail in the warm darkness, watching the phosphorescent wake of the great propellers.

'At the present moment,' confessed Miss Jennings frankly, 'I don't like it at all. It's a way things have when you get right up against them. They don't look so nice as they did at a distance.'

'You are not in your usual spirits to-night.'

'No,' said the girl, 'and that's a fact. I'm not. Worst of being a woman is that you can't trust yourself to be sensible all the time. You do a thing, and you know you're doing right, and you go on knowing it was right for weeks on end; and then, just when you want to feel that you were right most especially, you go and feel that you've been wrong all the time. Silly, I call it! Sometimes I want to shake myself.'

'You feel you wish you had not left London?

Is that the trouble?'

'Ye-es,' said Miss Jennings reluctantly.

'I'm surprised,' said Philip, cautiously opening fire, 'that you were ever allowed to forsake your native land.'

'Who by?' inquired Miss Jennings swiftly.

'Well, there are a good many thousand young men there, you know. It doesn't show much enterprise on their part'——

'Mr Meldrum,' remarked Miss Jennings frankly, 'if you start making pretty speeches the end of the world must be coming. A good many thousand young men, indeed!'

'Well,' persisted the abashed but pertinacious Philip, 'let us say one young man. Surely there

was just one?'

Miss Jennings was silent for a moment. Then she replied, 'Yes, there was one.'

'More than one?'

'No. At least, there was only one that I really fancied. It was a queer thing that I should have cared for him at all. It's all

over now, so there's no harm in my telling you about it. We were always having words one way and another. We had nothing in common really. Very stuck on his opinions he was, and always laying down the law. His ideas weren't very gentlemanly either. He was a Socialist, and didn't belong to the Church; but I cured him of that. I must say I improved him wonderfully.'

'Was he grateful?' asked Philip.

'He was, and he wasn't. He would do anything I asked him; but if it went against the grain with him to do it he would say so before he did it—sometimes all the time he was doing it; and that rather spoils your pleasure, doesn't it?'

'I should have thought it would increase it,' said Philip. 'It would show your great power over him that you should be able to compel him

to do things against his will.'

Miss Jennings deliberated. 'Perhaps you are right,' she said at last. 'I hadn't thought of it that way. Still, his back-chat used to worry me to death. And his temper! It was so fierce, I was frightened of him. He would carry on something dreadful at times.'

'In what way?'

'Well, supposing I made an appointment with him, and changed my mind and didn't go'----

'Did you do that often?'

'Oh yes, sometimes. It's a good thing to do,' explained the experienced Miss Jennings. 'If you don't act like that sometimes—promise to meet him somewhere, and then forget—a man begins to think he's engaged to you. If a girl doesn't respect herself, who else will? That's what I say. Then his jealousy—my word!'

For a moment Miss Jennings' cheerful little Cockney voice grew quite shrill. Then came an expressive silence, which Philip construed as an aposiopesic allusion to the young gentleman whose face had been pushed in.

'Still,' he persisted gently, 'you were fond of him?'

Miss Jennings did not answer immediately. 'I suppose I was,' she admitted at last. 'But I think I was more sorry for him, if you know what I mean. He didn't know how to look after himself; he was like a child, he wanted a nurse. But if ever I did try to do anything for him he took it up wrong. He thought I was getting soft on him, and before you could turn round he was trying to lord it over me. No, this affair never came to anything. It never could; we were made too different, both of us. Forget it!'

Miss Jennings ceased, and surveyed the long moonlit streak of foam astern rather wistfully. To-night the land she knew and the man she had been sorry for seemed to have receded to infinity; over the bow of the ship the unknown was creeping, hand over hand, inexorably. She sighed, and then shivered. She was realising the truth of her own dictum on the subject of a woman's inability to be sensible all the time.

Then the voice of Philip broke the silence, expounding the simple philosophy of his simple 'Do you know,' he said, 'I think that all things are possible to two people who are prepared to make allowances for one another? You and the man you speak of both possess strong natures. You both wanted to be master. You both hated conceding anything. He regarded the acts of worship that a woman expects of the man who loves her as a form of humiliation; his idea was to make good by more material homage—presents, theatres, and so on. So he, when he made actual love to you, did so reluctantly and half-heartedly, didn't he?'

'I should think he did!' affirmed the epicurean

Miss Jennings.

'While you, afraid of being put under an obligation, could never accept his gifts and his arrangements for your entertainment without just a little-what shall we say !-- a dash of vinegar.'

The girl nodded. 'That's it,' she said.

'Now,' proceeded Philip, too much immersed in his subject to be surprised at his own fluency, 'when two people who love one another reach that stage they must get over it at once, or there will be friction, and finally disaster. Each must learn at once to consider things from the other's point of view-make allowances, in fact. Brand ought to'

Who?' inquired a sharp voice at his side.

'Brand. It was Brand, wasn't it?'
Miss Jennings nodded. 'Yes,' she said simply, 'it was Brand. Go on.'

Brand,' continued Philip, 'ought to have remembered that you were a woman, with all a woman's reserve and instinct of self-defence; and that you could not be expected to wear your heart upon your sleeve.'

'Yes, he ought to have remembered that,' agreed Miss Jennings. 'But what about me? What should I have remembered?' She appeared

almost anxious to be scolded.

'This,' said Philip, 'that Brand was a proud, passionate man, of very humble birth, terrified of showing you his heart and being laughed at for his pains

The girl nodded again. 'Yes,' she said, 'you are right. I ought to have remembered that. forgot his feelings sometimes. Poor Bob!' she

added pensively.

'So you see,' concluded Philip, thankful to feel that his homily was almost delivered, 'if only you two could get accustomed to regarding one another in that light, the barrier would be down for ever. A barrier can never stand for a moment when it is attacked from both sides. Make allowances, Miss Jennings! Make allowances! Get to know one another; study one another; appreciate one another! Then Brand

can pour out for you all that shy worship of his without fear of indifference or ridicule, and you can surrender with all the honour of war. Will you try?'

'Will I try?' echoed Miss Jennings wonder-

'Isn't it a little late in the day?'

'Well, would you try?'

'Would I?' Miss Jennings' voice suddenly 'What's the use of my trying?' she demanded chokingly. 'Bob's on the other side of the world now, taken up with another girl as likely as not. What's the good of asking me what I would do when I can't do it?'

She was crying in earnest now.

'Supposing — just supposing' —

Philip.

'Oh, stop your supposing!' the girl blazed out passionately. 'Don't you see I can't bear it? I want him! I'm frightened of everything, and I want Bob! And it's too late!'

'Stay exactly where you are for about five minutes,' commanded Philip; and he disappeared

in the darkness.

A few minutes later Bath-Steward Brand was incurring the risk of ignominious expulsion from the service of the merchant marine by trespassing upon a portion of the deck strictly reserved for passengers.

Philip went to bed.

Philip, leaning over the forward rail of the boat-deck and surveying the silhouette of New York, rising like a row of irregular teeth upon the distant horizon, talked to himself to keep

his spirits up.

'Theophilus, my lad'—he liked to call himself by that name, because Peggy had sometimes used it-'so far, your scheme of fresh fields and pastures new has turned out a fizzle. You took this trip in order to see new faces and make new friends, and generally put the past behind you. The net result is that you have not made a single new acquaintance. Instead, you have devoted your entire energies to interfering in the affairs of a second-class lady passenger and a bathsteward, neither of whom can be described under any circumstances as a new friend. You must make a real effort when you land.'

But fate was against him. He descended to the saloon, and having there satisfied an immigration official, sitting behind a pile of papers, that he was neither a pauper, a lunatic, nor an anarchist; could read and write; and was not suffering from any disease of the eyeball, purchased one of the newspapers which the pilot had brought on board in the early morning, and retired to a sunny corner to occupy himself, after a week's abstention, in getting abreast of the news of the day. He unfolded the crackling sheet.

It was his first introduction to that stupendous

organ of private opinion, the American newspaper. When he had recovered his breath, and the shouting scare lines had focussed themselves into some sort of proportion, he worked methodically through the entire journal, discovering ultimately, to his relief, that nothing very dreadful had happened after all. He had almost finished, when his eye fell upon a small paragraph at the foot of a column, with its headlines set in comparatively modest type:

'CUPID GETS BUSY IN THE STUDIO.

WELL-KNOWN BRITISH PAINTERS WED.

LOVE COMES LATE IN LIFE

TO MONTAGU FALCONER,

ASSOCIATE OF BRITISH ACADEMY,

AND JEAN LESLIE, FAMOUS WOMAN MINIATURIST.

'We cull the following from the London Times:
"FALCONER—LESLIE.—At St Peter's, Eaton
Square, on the 4th inst., Montagu Falconer,
A.R.A., to Jean Leslie, only daughter of the
late General Sir Ian Leslie, V.C., of Inverdurie,
Inverness-shire."

A quarter of a column followed, expatiating upon the fact that the wedding took place very quietly at ten o'clock in the morning, and that reporters had met with a discouraging reception

from the bridegroom. Then came a list of Montagu's best-known pictures. But Philip did not read it. He threw the paper down on deck, and started to his feet.

The Bosphorus had come to a standstill at the opening of her berth, waiting for the tugs to turn her in. Protruding from the next opening was the forepart of a monster liner, from whose four funnels smoke was spouting.

Philip inquired of a passing quartermaster,

'What ship is that, please?'

'The Caspian, sir. Our record-breaker!' said the man, with proper pride. 'She sails for Liverpool at noon.'

Half-an-hour later Philip found himself and his belongings dumped upon the continent of America.

A minion of the rapacious but efficient ring of buccaneers which controls the entire transport system of the United States confronted him. 'Where shall I express your baggage?' he inquired.

inquired.
'You can put it on board the Caspian,' replied

Philip.

'Gee!' remarked the express-man admiringly.
'You are some hustler, ain't you?'

'I am,' said Philip—'this trip! Get busy!'

(Continued on page 532.)

THE MOUNTAIN WILDERNESS OF SOUTH WALES.

By A. G. BRADLEY, Author of Highways and Byways in North Wales, Highways and Byways in South Wales, The March and Borderland of Wales, &c.

THE average Briton has usually a more or less clear impression that, for physical beauty and distinction, North Wales and the Lake District stand, so far as England and Wales are concerned, in a class by themselves. Unlike many other impressions, this one is of course absolutely justified by fact. Sometimes, however, an aberration seizes him. He forgets all about these outstanding regions, and writes to the halfpenny press as a correspondent or essayist to assure the world that the county in which his more or less suburban home is situated-Surrey, Kent, Herts, Sussex, or what not—is the most beautiful in England! You may be tolerably sure that this type of 'positivist' spends most of his holidays abroad, and only his week-ends in exploring his native land. But between the pleasant, low-pitched, over-built, over-populous, and rather waterless home counties and the sublimity of the two districts above named there is a prodigious gap. Within this gap lie hundreds of square miles of various regions that the Londoner and the 'Greater Londoner' who between them do so large a share of the writing and talking in modern England know next to nothing about. I allude chiefly to that class of country which approximates in varying degrees to the two first-named famous districts; which belongs,

in short, to the type that finds in them its highest expression. Devon and Cornwall, though of the type, are exceptions to this blankness of mind. They have been prodigiously 'written up,' and the enterprising railroads which lead thither have supported the fertile pens of their patriotic illuminators with all their might. Among those Londoners and south-countrymen who do not go abroad as a matter of course for their holidays, and who belong to any grade of the writing profession, Devon and Cornwall have indeed become something of a cult. For continuity of noble seacoast they stand beyond doubt unrivalled. But inland Devon, about half of which is beautiful—and I know the whole county—with a much higher standard of beauty than any other southern, midland, or eastern county, is nevertheless the subject of a good deal of immoderate and illconsidered gush by journalists and novelists other than those admirable native writers of fiction in which the west has been so prolific, and to whom the patriotic note is natural.

But how many of these south-countryfolk who make such professions of knowing and of loving their own land have any familiarity with, say, the Yorkshire dales, the Cheviots, and the Border country; with Central and South Wales, or the lovely bordering regions of South

Shropshire, Hereford, and Monmouth? The three last named are beautiful not merely in portions, like Devon, but all over. Their wild, heather-clad moorlands rise higher and bolder than Exmoor or Dartmoor. The hilltops of their enclosed lower districts, averaging the altitude of those of the West of England, are not always bare and criss-crossed rectangularly with bank fences, as those of the west nearly always are, but are usually draped to the summit with rich deciduous That peculiar brilliancy of colouring due to a soft, moist climate, which the man of southeast England is not used to, and does not miss as the westerner does instantly upon going east, is common, of course, to the whole of West Britain. The rivers of Devon are charming. But the Dart, their acknowledged queen, which I have known all my life from its source to its mouth, is not comparable to the Wye nor equal to the Usk, though Breconshire claims the best of the lastnamed. How should it be? Where on its lower portions is the like of Symons-Yat or the Wyndcliff? Holne Chase, too, is beautiful. But for over fifty long miles, from its birth in old Plinlimmon, the Upper Wye surges through a blend of wild moorland, woody vale, and craggy mountain whose uninterrupted glories never for a moment fail. Where, again, is a river in the West of England that an impartial soul who knows both districts (that is the trouble!) could honestly class with those twenty odd miles between Brecon and Abergavenny, where the Usk in its wide rocky bed foams through luxuriant woods and parklands overhung upon both sides by mountains of from two to nearly three thousand feet in altitude? Yet few outsiders, save a certain number of scurrying motorists who get a mere glimpse of them, know anything of the Wye and the Usk and their many lusty and lovely tributaries.

Having thus brought the reader to the Wye and the Usk, we have arrived at the immediate subject of this paper, which, for want of any concrete designation, I have labelled 'The Mountain Wilderness of South Wales.' Perhaps Central Wales would be a more strictly accurate definition; but the counties of Radnor, Brecon. Cardigan, and Carmarthen are South Welsh by habit, temperament, traditions, and speech (where the old tongue exists), and are all south of the line which, with nowadays no particular significance, divides the Principality in half. Portions of Montgomery—which county roughly covers the old Kingdom of Powys, but is generally ranked nowadays as North Wales—lie, to be sure, within the area above indicated; but such precision is of trifling import to our purpose here.

Now railroads, prosaic though the method be, can be best utilised for delimiting this wild upland country for the simple reason that they have never achieved a passage through it, and so skirt its edges. In brief, then, the North-Western line, after crossing the broad, impetuous

Wye at Builth Junction, and ascending the exquisite valley of the Yrfon to the high pass of the Sugar Loaf, to run down thence to the lower Vale of Towy and Carmarthen, forms its southern boundary. The Cambrian, which has come up from Brecon and the Black Mountains, following the Wye through the wonderful gorges of Abereddw and Erwood, here at Builth Road station takes up the eastern delimitation of our Wilderness, and traces it accurately through about thirty-five miles of most lovely scenery. till at Moat Lane it strikes at right angles the main line of its system, which English tourists bound for Aberystwith, Barmouth, and the west coast watering-places know so well. The northern boundary of the parallelogram which the Wilderness roughly forms is now taken up and run by this familiar rail-route, down the Dovey valley to Machynlleth and the sea. All to the north or right of this line is the North Wales of popular knowledge; all to the south of it, save a few trifling fringes and one mountain, is a terra incognita to the English tourist, and indeed to most Welshmen. From a point on this line, say Machynlleth, to a point on the North-Western line, say the small spas of Llanwrtyd and Llangammarch, at the southern extremity of the Wilderness, is about forty miles as the crow flies. But even a stout walker who knew the interior would think twice before undertaking to cover the distance in two days, so rough, steep, and severe is the walking, so numerous and farspreading are the bogs, so tangled the wiry moorland grasses over vast areas where the sheep's tooth rarely bites, so lacking in paths or trails but those faintly traced by the shepherd or the turf-cart. It used to be said quite lately that you could travel from the Dovey valley to that of the Usk ten miles south of our southern boundary, in all about fifty miles, across the grain of the hills without encountering a fence or even a wire. I think you might almost do so still.

Only one road worthy of the name goes through these mountains from the English side to the long, crescent-shaped county of Cardigan and the seacoast. This road alone has faced the forty miles of barrier which has as yet defied railroads, and made of Cardiganshire for all time a sort of 'back of beyond' country, intensely Welsh, but Welsh of a type of its own, and no bad one either. Any Welshman can tell a 'Cardy' almost at sight. This single bisecting road crosses 'the mountains of Elenydd'-as Giraldus Cambrensis, seven centuries ago, called our Wilderness, which has now no concrete name-nearer its northern boundary. It runs up the westward-bending Upper Wye to its sources, and then, climbing at one thousand three hundred feet the toe of old Plinlimmon, drops down towards Aberystwith and that lovely north corner of Cardiganshire which a great wateringplace has long ago made its own, and cut off

from the placid, unvisited isolation of the rest of the long shire. In coaching times this was a famous, well-graded, though narrow road. A dozen years back it was in parts grass-grown, and chiefly used by sheep-farmers or their wives jogging pony-back to Rhayader or Llanidloes market. Now it is a popular motor-track from England to Aberystwith and the west coast. About two hundred cars and heaven knows how many lesser but noisier fry go tearing over it every August day, waking the echoes of the high solitudes to the right and left, of which not a passenger among them all knows, or appears anxious to know, anything. And I speak from uncommon opportunities for prolonged observation. queer twenty-foot-wide streak this of dusty, humming, discordant life shricking through an area of four hundred square miles that is elsewhere absolutely silent but for the sheep's bleat, the call of curlew, or the plash of streams; a country of whose inwardness and character scarcely one of all this hurtling throng through all the summer days and weeks has even the dimmest conception.

Into its eastern fringe the Birmingham Corporation, to be sure, has thrust a chain of reservoirs; in effect, however, lovely mountain and hill-girt lakes, fed by the clear waters of the Elan and the Claerwen, upon whose sources in the heart of the wilds scarcely a human eye but that of the shepherd ever rests. A single well-made road skirting the lakes terminates for wheel traffic at their head. Motors from distant centres ramp along it at twenty odd miles an hour, spend five minutes at the top dam, and tear back again. But behind the lakes the wild, silent uplands roll away westward to Cardiganshire untrodden and unknown. Here and there, in the interior valleys, the small white homestead of a large sheep-run, amid a thin screen of foliage and a splash of green paddock, stands at the stream's edge; little oases of humanity that only serve to emphasise the solitude, and where the English tongue is but ill understood. There are no fences anywhere. The sheep, as in Cumberland, range where they will, but by habit and instinct regard the unmarked boundary of their neighbours, perhaps five miles away, with the same curious precision as those of the northern fells. These are the poorest Highland pasturespoorer than those of North Wales—outside the most Alpine parts of Scotland. From the sterility of the soil, the boggy nature of both glen and hilltop, it takes more acres to carry a sheep than in most other British uplands. A flock of three or four thousand require a much wider range; while the little-horned, white-faced sheep themselves are the smallest and hardiest, and have a tougher fight for their living than any known to me. It is from this country that the best Welsh mutton comes. Ponies, too, are freely bred in this Wilderness-little, shaggy, wild brutes that scuttle away at the sight of man, or pose unconsciously upon the tops of hills or crags with picturesque effect.

Sheets of heather blaze here and there upon the higher steeps amid the green and russet of the bog and moor grasses, while at times great brakes of gorse or bracken in their respective glories of blossom and decay illuminate the scene. Many a noble cliff and leaping cataract unknown to fame lies hidden here. Tarns or llyns that no outsider but an occasional angler of the hardier kind ever sees nestle sombrely in some mountain shoulder or glimmer brightly between the folds of smoother hills. The grouse, though indigenous, are so few and scattered that sport in a commercial sense has never exploited these Highlands. So for forty miles, from north to south, there is practically no keepering. Hence this country has become pre-eminently the last refuge of the greater birds of prey, a fact the English egg-stealer knows only too well. Fortunately the Ornithological Society is alert, and means are taken, through the agency of sheep-farmers within and naturalists just without, to watch the Here alone, save, I believe, in parts of wilder Scotland, the kite still breeds, while ravens and buzzards abound.

Many rivers, including those famous ones, the Wye and Severn-of which anon-find their birthplace and spend their infancy in these wilds. The Towy, born in the heart of them, urges its impetuous waters for miles and miles through the winding troughs of the hills. Cutting deep gorges through the dark silurian rock underlying wild peaty glens, it eventually breaks away into the fringes of civilisation, and runs its enchanting course to Llandovery through the wooded mountain vales of Ystryd-ffin and Newadd-fawr. The Teivy, rising in its two remote natal tarns, finds ultimately its way out into the sylvan beauties of Cardiganshire by the ruins of Ystradfflur, that once great abbey where lies the dust of the ancient princes of South Wales. The Elan and the Claerwen, till throttled by the great lakes they have been forced to feed, run the same wild, impetuous course. So too the Doethea, the Ystwith, the Yrfon, the Cothi, and many a smaller stream; and as they leap down out of the Wilderness into the beautiful pastoral scenery of South Wales what scenes are here! East or west, north or south-Cardigan, Carmarthen, Brecon, Radnor, or Montgomery, it matters nothing-are rich mantling woods and wild crags, green timbered parkland and heathery heights, swirling salmon-pool, and embowered homesteads, all and always in delightful blend. A country for the gods, but known of few mortals outside its borders.

A few words must be said of that lesser portion of the Wilderness which lies to the north of the above-mentioned Aberystwith road—in other words, between the Upper Wye and the Dovey—comprising roughly a third of the whole. For old Plinlimmon here raises her two summits;

and, though not 'popular,' a few people every summer drive up from Aberystwith, ascend one of them, and drive back again. An occasional enthusiast even visits the sources of the Severn, Wye, and Rheidol, all of which rivers, the schoolboy is supposed to know, spring from the bosom of Plinlimmon. So this northern portion, mainly in Montgomeryshire, is not quite such a terra incognita as the mountains to the southward. But here again is a fine waste of moorland and mountain! Purple and tawny, russet and green; and, as seen from Plinlimmon, twinkling with tarns and with the brief flashes of impetuous streams hurrying toward the sea, it covers an area of some hundred and fifty or two hundred square miles into which few travellers penetrate. I have stood on Plinlimmon under many conditions of weather and season, and regard it as in some ways the most inspiring view in the whole Principality, for it commands both north and south, the world-famous mountain ranges of the one, the unknown mountain ranges of the other, and indeed much more. For at a glance you can see the iron coast of Pembroke craning far and dimly seaward, and beyond the lateral ridges of the Wilderness on whose western edge Plinlimmon stands, the blue peaks and caps

of the Black Mountain ranges fifty miles away closing the entire southern horizon. It is something, too, to be able to trace from their very cradle at your feet the twisting valleys of the Wye and the Severn; the latter, to where those noble pillars of the gateway into Powysland and mid-Wales, the Breidden, mark the entry of the by now lusty river into England. While as for the Wye, you can easily follow its course, if you know your Wales, through its maze of hills and mountains to that remoter gateway of South Wales where the eastern heights of the Black Mountain (two thousand six hundred feet) frown across the verdant vale of Glasbury to the opposing grouse-moors of Radnor Forest, and the opulent charms of Herefordshire receive into their embrace the queen of all English rivers.

'Is South Wales pretty? Dear me! I didn't realise that,' says one's table neighbour, who has just been gushing about Surrey commons or the Weald of Kent. Pretty! What can one say to such banalities except that it is something a good deal more than that; and add, perhaps, that the glamour of a romantic past, historical and Arthurian, lies all over it, expressed even to the dullest senses by a wealth of medieval castles unequalled elsewhere in Britain?

HISTORY REPEATS ITSELF.

By W. G. LITT.

PART I.

'AND why are you wearing that piece of diseased oak-tree?' I asked, pointing to the oak-apple in Dick Peterson's button-hole.

The famous scout smiled at his wife before he answered, 'Oh, because it's Oak-ball Day.'

'What rubbish!' I ejaculated. 'I'm not much of a hand at history; but even I know that the proper day on which to wear that product of the *Cynips* insect is the one on which the third Stuart king'—

But he interrupted me with, 'That's another anniversary; this is the date Nancy and I celebrate. Did you never hear the story, Litt? Well, as you're so keen on history, you shall have it; maybe it will call to your mind various episodes that appeal to youth.'

It would hardly be fair, and certainly not permissible, to record here exactly the remarks which Captain Peterson, D.S.O., addressed to the huge airship that winged its way, like some huge, buzzing insect, toward London. Yet there was every excuse for the scout's language, since the mastery of the air had given, as years before all the careful observers had known it must, the mastery of the earth as well; and now the Westrian forces were drawing ever closer the noose about London's throat.

Time and again had General Sir Arthur Bollies attempted one of those sorties for which his name will always be famous in military annals. Ever had there hovered above his troops those terrible new engines of war, dealing death and destruction to the helpless soldiers beneath. Nor was that all; for, furnished with ample warning of the British attack, and with a knowledge of its numbers and objective, the Westrians were able to oppose an overwhelming force.

But close as was the Westrian ring, it had proved quite inadequate to prevent Dick Peterson from passing out under cover of darkness. Now he was waiting upon the river-bank until night should once more allow him to move. But, for all that, he was keeping a keen lookout along the white road, whose length he could see for some two miles, save where, half a mile away, it passed within a patch of woodland.

Suddenly he leapt to his feet with an exclamation of astonishment. Away down the road a figure upon a bicycle had come into view, and was scorching madly in his direction. In a moment he had raised his prismatic glasses to his eyes; but his astonishment was rather increased than lessened when he realised that it was a woman who rode toward him.

Obviously there must be some reason for that

frantic haste, and the cloud of dust that rose some distance behind her supplied him with the explanation.

'Somebody's after her—horses, I fancy, from the dust,' he muttered. 'If she's English—what else should she be'—it can only be Westrians that ride them. Whoever she is,' he continued, 'she's bringing them right on the top of me.'

For a moment he thought of getting away whilst yet there was time; but then the curiosity that always mastered him at the sight of anything that required an explanation which he failed to find mastered him, and he remained watching.

Soon his eyes told him that his surmise as to the Westrian soldiers had been true enough, for he could see some half-dozen of them spurring madly after the girl. She herself was drawing very close to him—how close he failed to realise until he heard her scream and the crash of her falling bicycle.

Before the words were out of his mouth he was upon the road, and, stooping over the girl, helped her to rise. There was a nasty cut upon her forehead, and she swayed and would have fallen again but for his arm around her.

'Steady, steady!' he said soothingly; 'there's no hurry.' A remark that was hardly true; for, though luckily the Westrians were for the moment out of sight, there was most urgent need of haste.

The girl seemed oblivious of everything save that he wore a British uniform and must be a friend. 'Listen,' she gasped. 'There's a huge petrol-store two miles from here. Now get off and leave me, or they'll catch the two of us.'

He looked swiftly round him before he answered with a monosyllable, 'Come!' and, picking up the bicycle with his free hand, brought her through the gap in the hedge.

'But they're bound to search, and the bicycle will tell them I'm not far away,' she objected.

'Well, so much for that tell-tale article,' he laughed, and, with a heave, flung it into the muddy stream. 'I'm sorry if it's yours,' he added; 'but, in any case, it was badly damaged.'

Amazed, she glanced at the man who in the stress of that moment could be calm enough to speak of trifles.

But in a moment he was speaking rapidly. 'Can you climb? Good! Well, then, up this tree you go. I'll help you as much as I can.'

In Peterson's own words to me, 'It was one of the most awkward jobs I ever tried. It wasn't at all an easy tree to climb, and to get a half-stunned girl up it in something less than a minute was smartish work. But, once we were up it, it wasn't at all a bad hiding-place, for there was a great mass of ivy amongst the

higher branches, amidst which we perched like a couple of sparrows. I'd often wondered what pheasants must feel like when the covers are being beaten. Well, I hadn't long to wait before I knew.'

Of course the marks of the accident must have been fairly clear upon the road, and the Westrians reined up. Then, catching sight of the fresh blood, they got down from their horses and spread around.

Suddenly the hearts of the two listeners in the ivy leapt to their throats, for they heard a man's voice crying, 'You, Bartoff, get up one of these trees and find out if there's anything to be seen from there.'

Looking down the trunk, Peterson realised that in hiding where he had done he had made a serious mistake, since, naturally, being the highest tree, it was the one the soldier made for. There was now no means of rectifying that blunder; so, with a philosophical smile at his own foolishness, the scout drew his automatic pistol softly from its holster and watched the Westrian's upward progress.

In a few more feet the man must have detected them; indeed, he would probably even then have caught sight of them had he looked carefully; but he was hot and stiff from the saddle, and rather fat for such exercise; so he kept his eyes fixed upon the branches he was clutching. At last the ivy caught his gaze, and he paused suddenly.

A more impetuous man than Peterson would have fired then, but the scout's motto of 'The greater haste the less speed' restrained him. Besides, when one comes to think of it, the pistol-shot would have betrayed the hiding-place even more effectually than the Westrian's voice.

But, as it happened, the soldier had seen nothing, or rather, having noticed the ivy, had hailed its presence as a welcome excuse for not climbing farther.

'There's nothing but ivy above me,' he shouted down. 'If I get into that I sha'n't be able to see anything.'

'Well, then, look about you from where you are,' came the reply.

For a few moments the man obeyed the order, then, seeing nothing, slid awkwardly down to earth again.

It was then, when everything seemed running smoothly, when the pressing danger was over for the moment, that the girl almost fell. Out of the corner of his eye Peterson saw her sway, and clutched madly at her. For a moment they hung in the balance before he managed to steady himself and the fainting girl.

The Westrians were clearly far from satisfied with the results of their search; but at last, to Peterson's intense relief, they got mounted once more and went clattering down the road.

Immediately Peterson made haste to get the girl into a more secure position, and finally con-

trived to strap her firmly to a branch by means of the leathern belt from off his waist. he pulled out his flask and held it to her lips.

Gasping with the taste of the neat brandy, she opened her eyes and looked wildly round. 'Where am I?' she questioned. 'Oh, of course I remember now. You came out into the road suddenly, and '-

'Yes,' he smiled, 'I didn't think you knew much of what you were doing. But we're safe enough here for the present. Your friends have

Thank God!' she said. 'I'm not frightened of what they might do to me, but I've found out something that may be very valuable to the British, and I was trying to reach them.'

The thought occurred to Peterson's mind that her chances of ultimately reaching her objective must have been extremely slight, since, fleeing from the danger behind, she must have ridden straight upon the rear of the Westrian outposts. But he only said, 'Yes, you'd found out something about a petrol-store.

'You know? Oh, I suppose I must have muttered something about it as you bent over me. Yes, there's a huge store of petrol only

about two miles away.

'Where the airships get their supplies?'

'Yes; it's the aircraft depot. There must be thousands and thousands of gallons there. I managed to get quite close to it during the night.'

'Hardly a woman's job,' he remarked with a

'Oh, I know you'll think it foolish that a girl should do a thing like that; but, oh, I wanted to do something that mattered! Other girls have taken to hospital work, but I couldn't bear the sight of blood and wounds.'

'I see,' he nodded.

'I thought perhaps they wouldn't suspect a woman, even if they saw her. I was successful up to a point, for I got right up to the iron fence about the place, and in the moonlight I could make out a lot of the hangars, as well as the mountain of petrol-casks.'

Peterson whistled softly. 'So that's where their airships roost, is it? You stumbled on a

big thing. What sort of a fence was it?'
'I know what you're thinking of. Unfortunately it's quite unclimbable. It's about fifteen feet high, with sharp spikes on the top, and the bars are only a few inches apart.'

'I know the sort of thing. It's the kind of fencing you sometimes see round parks, eh?'

'Yes, that's just it. Well, I was done then, for there was only one entrance to the place; and a company of soldiers was on guard there. It was getting light, too.

'Pretty well protected!'

'Yes; and these men were very wide awake. They nearly caught me; but I managed to reach my bicycle, and then I rode'—— She stopped suddenly, for Peterson seemed to be paying no further attention.

He was not, for all his thoughts were centred on that petrol-store.

'What's the ground like on the other side of the fence, supposing one did manage to get over it?' he asked presently. 'Is there long grass or bushes that would conceal a man?'

She shook her head. 'No; it's just bare earth.

He laughed. 'Rather smart of them; but then they 're all that. They don't mean to run any risk of the grass being fired. So the ground's quite smooth—quite? I don't want much to conceal me.'

'It's as smooth as a billiard-ball,' she said, 'except for occasional little channels about six inches wide and deep. I noticed that they ran from the casks to the fencing. I suppose they are to drain away any petrol that leaks, or the rainwater. But you certainly won't be able to crawl up one of those gutters. Besides, you can make up your mind that the fence is quite unscalable.

'Very well, I'll give up that idea, as you're so definite on the point. How far apart are the railings ?

'I could get my hand through, but the thick

part of my arm wouldn't pass.'
'I see. Thank you very much. I wonder if you'd mind if I were to smoke? I always think better when I'm doing that.'

'Of course I don't,' she laughed, and watched him fill and light his pipe. Then he seemed to forget her presence, for his eyes were fixed on vacancy, and once or twice when she spoke to him he did not answer.

So the long hours dragged slowly on. casionally, uncomfortable as was her position, she dozed, but ever and anon when she opened her eyes and glanced at him he was puffing hard at his pipe or knocking out the ashes preparatory to filling it again.

It was only when the shadows of night fell that he roused himself from his reverie and once

more became his own alert self.

'I'm so sorry you've had such a dull time,' he said apologetically. 'Why, I don't even know your name ?'

'Nancy Rollies.'

'The same name as the General's!'

'Naturally; I'm his daughter.

'My name's Dick Peterson. Can I give any message to your father? I shall be seeing him to-night.'

'Can't you take me with you?'

He shook his head decidedly at that. 'Quite impossible. I've got to get through the Westrian outposts before I reach London, and then I've got to get back here again. But you'd be of the greatest possible assistance to me when I return if you wouldn't mind waiting. I hope to be back at about one o'clock.'

'Of course I'll wait. So you think you can make some use of the knowledge I've given you?

Do you think '——
'I don't know,' he said, 'but I'm going to try. So far, I've not even decided what can be done: but there's bound to be some solution of the puzzle if one could only come across it.'

'Give my love to my father. Take great care of yourself, King Charles,' she said, and breaking off an oak-apple, stuck it in his button-hole.

- Oh, I see! Hiding in an oaktree, eh? Yes, I'll take care. Good-bye until a little after midnight.'

She saw his figure reach the ground and slip into the undergrowth. Then she was alone.

Dick Peterson strode swiftly along the road to London; but when his quick ears warned him of men moving in front of him, he left the road

and took to the open country.

His experience of last night had told him exactly where the Westrian outposts were. Passing through the sentry groups from the rear presented little difficulty to the scout, since those groups were only watching for an enemy from their front; and if the little stream, with its four inches of water, was an uncomfortable path to travel, at any rate it offered ample concealment for his purpose.

Luck seemed to be favouring him. For at the headquarters of the commander of the British outpost line he found the General's A.D.C. just

about to start his motor.

'Hallo, Peterson!' that officer exclaimed.
'Hallo, Tyans! I say, you're just the man
I want. Get me back to the General at once, will you!'

Captain Tyans smiled. 'Right-o; jump in. Always in a hurry, aren't you, Peterson? You're the most impatient devil I know, always excepting the old man, who to-night is even more impatient than usual.'

Oh!'

'Yes. I say, you've not missed much, or,

rather, you've missed a great deal to-day. infernal airships have been playing Old Harry with London. Most of the imposing modern residences are now in ruins; and, though you could hardly include the Bank of England in that category, the Westrians have been paying considerable attention to it. Their bombs were quite effective on its flat roof. I never knew before what good burning material bank-notes

By now they had crossed Hampstead Heath and were dipping down the long slope of Haverstock Hill into Kentish Town. Presently they swung round the bend of Park Street into Regent's Park, where Captain Tyans pulled up the motor before a group of tents that faced the entrance to the Zoological Gardens.

With a nod to Peterson, he hastened to the General's tent, and came back directly to say, 'The old man will see you in ten minutes.'

'But I'm in a hurry, man.'

'My experience of Generals does not incline me to advise you to thrust yourself upon Artie before he wants you. I say, whilst you're waiting, come and have some cold monkey.'

"Eh?"

'Yes; I'm a bit of a forager, and it struck me that there was a nice little larder over the way, so I went to prospect this afternoon. The same idea seems to have occurred to other brilliant intellects, though, and I believe monkey's now "hoff." Lion is thin and rather scraggy, and I don't recommend it. I say, Peterson, there are plenty of nice, fat, poisonous snakes still left. They don't seem to be in much demand, though I dare say one couldn't tell the difference between them and eels if they were stewed, eh?'

'I'm sure I don't know,' Peterson said. rather conservative in my tastes.' But, for all that, he munched gladly at the monkey-steak until the ten minutes were up, and slipped a

couple of army biscuits into his pocket.

GATEWAY OF THE WEST. THE

By HAROLD BENTLEY, Author of Shipbuilding To-day, &c.

WITHIN the massive walls of a newly constructed administration building, looking out over the busy estuary of the Mersey, throbs the heart of one of the greatest ports in the

It was not until the early part of the nineteenth century that the geographical advantages of this port, which is the natural western gateway to the great industrial districts of Lancashire and Yorkshire, began steadily to raise her from little more than a harbour of refuge to her present enviable position in the world of commerce. Since that date, however, Liverpool's progress has been as phenomenal as it has

been continuous. Her export trade has grown to such dimensions that it is now greater than that of any other port in the United Kingdom, whilst her import trade is second only to that of London, and vastly exceeds that of the other leading British ports. As an illustration of the magnitude of her trade it need only be mentioned that 90 per cent. of the cotton imported into Great Britain passes through Liverpool, and such valuable commodities as tobacco, grain, wool, sugar, provisions, and fruit are handled in large quantities.

It is beyond question that from a geographical point of view Liverpool stands without a rival in the world. Her broad, deep estuary forms a safe and convenient harbour for vessels of every size and description, from the mammoth Atlantic liner to the small coasting-steamer, from the huge four-masted sailer to the humble fishing-trawler. Her magnificent deep-water docks are shut off from the river by solid granite walls pierced here and there by ponderous gates of seasoned greenheart and stoutest steel. Once within the seclusion of these walls, where the water is maintained at a fairly constant level, ships can remain affoat for any length of time without being affected by troublesome tidal variations.

As we approach the mouth of the estuary from the sea almost the first objects which arrest the attention are two military forts which lie one on each side of the river entrance, set like sentinels to guard the commerce of this great gateway of the sea. One of these, known as the Perch Rock Battery, is built on an isolated rock, abreast of New Brighton, on the Cheshire shore. The other, called the Seaforth Battery, forms a fitting frontispiece to the long, unbroken line of docks which stretches for a distance of over eight miles along the Lancashire side of the river. Sailing up this side of the river, we are soon opposite the large modern docks, whose wellshedded quays, served by innumerable lines of rail, bristle with up-to-date appliances for the rapid and economical handling of cargoes, and where the great Atlantic liners, such as the Lusitania and Mauretania, are berthed to receive and discharge their immense freights; then come the smaller central docks which are used by medium-sized craft and coasting-vessels.

At this point we are confronted by a long rectangular building of colossal dimensions, with its narrow end abutting towards the river-front. This structure, which is the largest of its kind in the world, is the great tobacco warehouse belonging to the port authority, wherein are stored thousands of hogsheads of the fragrant weed. For the benefit of those who are familiar with Liverpool, it may be mentioned that if St George's Hall in Lime Street could be lifted bodily from its present position and dropped through the roof of this warehouse it would disappear from view, and there would still be room for one or two picture palaces in addition.

The famous Landing-Stage and Riverside Railway Station adjoining, so much patronised by American passengers passing through the port, are the next most important objects which meet the eye. The stage, which is constructed on floating pontoons, is nearly half a mile in length, and is connected with the shore by strong iron bridges, one of which, known as the Floating Roadway, is used for vehicular traffic. The largest transatlantic liners come alongside this stage on their arrival at, and departure from, the port at all states of the tide, and embark and disembark their passengers, baggage, mails, specie,

&c., thus avoiding the inconvenience which formerly existed of transferring them to a tender in mid-stream and thence to the shore. It may be here mentioned that Liverpool's ocean-going passenger traffic is greater than that of all the other British ports combined.

Opposite the southern extremity of this great landing-stage, but set well back from the riverfront, rise the grim, gray granite walls of the Royal Liver Building, the head-offices of the well-known friendly society of that name. gigantic edifice, built on the ferro-concrete principle, is distinctly American in appearance. and has been described as the first European skyscraper. It has no less than eleven floors under the main roof, and the domes of its two clock-towers rise to a height of nearly three hundred feet above the pavement-level. A short distance to the southward are the new offices of the Mersey Docks and Harbour Board, to which allusion is made at the beginning of this article. Surmounted by a dome over its centre and a minaret at each of its four corners, the beautiful exterior of this building contrasts strangely with the commercial aspect of the Liver offices. the exception of the Government offices in Whitehall, the Dock Board building is probably the finest of its kind in the United Kingdom. Two handsome statues worked in stone, and respectively representing Industry and Commerce, stand one on each side of its main doorway; whilst two large spheres, on which maps of the world are picked out in gold relief, form appropriate ornaments over the granite pillars of its outer entrance-gate.

Moving farther up the stream, we pass great warehouses filled with tea, coffee, sugar, tobacco, wool, and such-like commodities, and shortly arrive opposite a tall red-brick silo built on the quay of one of the southern docks. This building, known as the Coburg Granary, is capable of holding enormous stocks of wheat, and is only one of several similar storehouses within the precincts of the port.

Away in the distance, high on the summit of one of the city's slopes, the new cathedral, which is at present in course of construction, is plainly visible from this part of the river. This noble edifice, of which Liverpool has just reason to be proud, is being built after the designs of Mr Gilbert Scott and the late Mr G. F. Bodley, R.A., and will, when finished, be one of the finest and largest ecclesiastical buildings in the The Lady Chapel, which forms a beautiful miniature cathedral, and is a splendid reproduction of fourteenth-century Gothic architecture, has already been completed, and the construction of the choir, transepts, and chapterhouse is now proceeding. The fact that the cost of this cathedral, which will eventually amount to several millions, is being largely defrayed by the generous subscriptions of Liverpool's merchant princes is a striking testimony to the wealth of the city resulting from its vast

Continuing our journey, we soon reach the terminus of the Liverpool docks, where, isolated from the dock-system proper, huge tanks have been constructed for the storage of petroleum and other oils.

On the Cheshire side of the river the Birkenhead docks, which are included in the Port of Liverpool, present features at once striking and unique. Here we see great water-spaces bounded by well-shedded quays, used chiefly by vessels trading to India and the Far East; here are colossal coaling-cranes, filling the bunkers of foreign-bound vessels; here also are great lairages, at present used for the reception and slaughter of cattle from Ireland; here too are located enormous flour-mills, whose output is so great that it enables the Mersey port to boast of being the second largest milling centre in the world, pride of place in this respect being held by Minneapolis in the United States. Mention should also be made of the great shipbuilding yards of Messrs Cammell Laird & Company on the foreshore of the Birkenhead side of the river, where vessels of the largest class are constructed.

No account of Liverpool's maritime greatness would be complete without a passing reference to the vastness and variety of her oversea traffic. A myriad vessels of every type and size ply between this and the other great ports of the world. Here it is that the argosies of nations meet, richly laden with the produce of the globe -East India merchantmen, whose fleecy cargoes of finest wool from far Bombay and Calcutta are soon to be turned into cloth in the textilemills of Yorkshire, and whose dusty cargoes of Karachi wheat are destined to be ground into flour in the numerous corn-mills of the port; steamers and sailers laden with similar commodities, and with frozen meat from the River Plate and the far-flung ports of the Antipodes; schooners of the huge four-masted type bringing nitrate of soda from the Chilian ports of South America, and others whose freight consists of grain from the Pacific slopes of North America; large steamships laden with monster packages of provisions, tobacco, timber, leather, and other products from Canada and the United States, and with bales of raw cotton from the great Gulf ports of the Southern States; vessels with silks and cereals from China and Japan, rice and timber from Rangoon, sugar from Java, Germany, and Cuba, barley and other grain from the Black Sca, fruits from the Mediterranean, brandy and liqueurs from Bordeaux and Charente, rubber from the Brazils, palm-oil and palm-nut kernels from the West Coast of Africa, and copper and silver ores from Callao and other Peruvian ports; tank-steamers, specially constructed for carrying oil in bulk, bringing thousands of gallons of that useful lubricant from American and Russian territories; tramp steamers that have sailed uncharted seas, with nondescript cargoes from wherever they can find a freight; fishing-trawlers with their finny freights from neighbouring waters and Icelandic seas; and last, but by no means least, the great Atlantic liners for which Liverpool is noted, for it is from this port that the largest, finest, and fastest steamers engaged in the North Atlantic trade start on their journey to 'the other side'—the Lusitania, the Mauretania, and the latest giant of them all, the Aquitania, which has just been added to the Cunard fleet. As a port, Liverpool has always reigned supreme in this service. Sometimes no fewer than six of these stately ships, each with its complement of passengers and cargo, drop down the tideway on a single afternoon, and swing out through the great gateless gateway of the port en route for the land of the setting sun.

On the picture-screen of the world no other shipping scene is thrown to match the splendour of this wonderful transatlantic traffic; the ships that are engaged in it are facile princeps—in size, in speed, in magnificence—and it forms the most outstanding feature of the life of this favoured port.

AVIEMORE.

CRAGS where the eagle's nest is flung, Lakes where the osprey rears her young; These thou shalt find at Aviemore, These thou shalt come and see.

Forest and moorland, strath and hill, Thundering torrent and ice-cold rill; These we have found at Aviemore, These we shall share with thee.

Air like a bath of wild sea-waves, Or softest whisper from ocean's caves; This thou shalt breathe at Aviemore, These thou shalt share with me.

Hills with the snow-wreath on their breast. Mountain-passes thy strength shall test; These are the boasts of Aviemore, These thou shalt scale with me.

Through the Larig's black jaws we'll go, Drinking the water cold with snow; Past the Lurcher's rocky wall Like a wave restrained ere its final fall.

The vast lone slopes, with heather clad, Make the soul sane and keep it glad; Bracken and heather shall bid thee lie Close to the earth 'neath the open sky.

There I shall join thee, there shall give Love that shall lend thee strength to live, Love like the pine-tree on the plain-The new leaves bud while the old remain! This thou shalt find at Aviemore, This thou shalt share with me!

ROSINA FRANCES CRAIGMILE.

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, Yesterday. THE case of cricket is curious, and it is a little Here a month ago one of the great modern problems of games, as to what are, or should be, the diversions of the open air in summer days, was considered, for these really have come to be problems of deep general importance. It is not enough for persons who are not closely associated with these matters to dismiss all questions affecting games with a kind of airy contempt, saying of the subject, in the standard phrase, 'It is only a game, after all.' It might have been right, and it might have been better, if games had remained games in the sense that is implied in this remark, that they should be kept down and regarded as among the little things of life, the soft things with which to fill up the gaps in days when there is 'nothing else to do.' But a combination of circumstances has certainly raised the leading games far above this level, so that now they are, and for a long time past have been, more than games, mere diversions. It was in the middle and late Victorian period that they first began to rise. It was then, in the most glowing days of empire, when no war in the distant South had shaken the nerves and drained the blood of the country, when there was no Germany rushing us on to a mad waste of battleship-building, and when life without motor-cars and wireless messages was easy and smooth enough, that we had time for a serener contemplation of things than there ever has been since; and what more natural, then, that in a good self-conceit and pride the people should have taken stock of their superiority and quality, and purred that the greatest and most fateful of battles had been won on the playingfields of Eton? At some future time, when all games have been killed and abandoned, and man has no time for anything except to spin a coin with a wager of a million pounds depending on it, and half-a-million breathless spectators watching this momentous sporting affair, there may be historians who will state facts in sequence, and then in the proper historical way will discover causes and set forth deductions, and these wise men will surely determine that among the foremost causes of the beginning of the decline of games was the acceptance and establishment of that remarkable suggestion that the battle of Waterloo was won on the playing-fields of Eton

school. It seized the imagination of a good, healthy, and supremely honest people, who were full of a reasonable pride. It was better, it seemed, that victories should be gained and empires made by the good stuff that came from the training of eye, hand, and limb, and character with them all, as displayed in simple games, than by meaner ways-as by cunning crafts of statesmanship or by the exertion of some other extraordinary strength coming only from the mind. Games were so simple and so There was in them that touch of the animal way to which we cling as man recedes farther from the animals-things with blood and hearts-in the direction of machinery and living nerves. Of course the battle of Waterloo was not won in this way at all, nor is a shade of the meaning that is implied at all justified. Much more true is it that the playing-fields of the country were one of the results of battles like those of Waterloo, which afforded us the means for pursuing certain ideals of life, a fair physical fitness and some love of sport among them, without any undue worry from a fear that other nations were about to annihilate us through a process of scientific discovery. However that phrase pleased, it justified an inclination that seemed to need a little justification at the time that it was popularly established-which was really long after the overthrow of Napoleon.

* * *

Now in this summer season they have been celebrating the centenary of Lord's, the hundredth year of occupation of the famous cricket-ground in St John's Wood. Lord's is in many, perhaps in all, respects the most splendid sporting institution in the world. If cricket, like the others, is 'only a game,' here at any rate is an achievement on the part of a game, which is a very wonderful and magnificent thing—a veritable national institution which has much of the dignity of a house of peers, and stands for the highest character of gentlemanly sportsmanship in any country. Like most other such great institutions, its origin was slender. A Yorkshire cricketer named Thomas Lord came to London and attached himself to an old cricket club known as the White Conduit, and there he became associated with certain noblemen and

JULY 25, 1914.

gentlemen, lovers of the game, including among them Charles Lennox, afterwards fourth Duke of Richmond, the Earl of Winchilses, and the celebrated Rev. Lord Frederick Beauclerk, who put the suggestion to him that if he made a private cricket-ground he would gain handsome support. This he did, and the first Lord's cricket-ground was established on land which is now Dorset Square. In a little more than twenty years this ground had to be given up, and another one which was secured was soon lost; but in 1814 the present ground was opened, and it has been the home of the Marylebone Cricket Club-which was started as soon as Thomas Lord entered upon his venture ever since. There cricket has flourished through its palmiest days. There the gentlemen of the early times of the game played in tall hats, there they wagered extensively on the matches that were arranged, and there the game gradually grew in importance and public interest until it seemed to reach its zenith with the early matches against the Australians. Surely there never was a game which in every respect was so splendid as cricket was then; and it suited its age so well. It was full of good, plain, simple sporting feeling; it was serene and contemplative, leisurely. it was just quick enough for real sport. splendidly pure, it was most unselfish, and especially it was not over-organised.

* * *

There has been a great change in things since then. In a sentimental and historical sense it may be said that cricket is still the national game of the country, but hardly in any other. The counties do not breed young players for the game as once they did; the county cricket clubs are mostly bewailing the fact that they cannot make their financial ends meet, and that something must be done or they must give up their present systems. It is being complained that the gentlemen will not take part in the game as once they did; they play golf instead. When the boys leave school they also take to golf. And, very important, 'the attendances have fallen off.' The public seems to want some other kind of entertainment, so it is suggested, and baseball is hinted at. Mr Noble in Australia has just declared that cricket in that country, where the game first took strong root out of England, is fast losing its popularity, and he says plainly that the Australians want baseball of the American kind. Baseball! I have seen this game of baseball played on the wonderfully equipped grounds at New York, Boston, Chicago, and other places in the country where it has made its name and fame, and it is indeed a wonderful spectacle. But there is as much wonderful spectacle. difference between the baseball of America and the cricket at Lord's in the middle Victorian days as there is between any two things on earth that can be classified under one head. Great skill and much of what is referred to in these matters as 'science' are undoubtedly required in baseball. In certain respects it is a fine game. It is fast, it is enormously organised, it is gorgeously supported by the public in the financial way, and is a great commercial undertaking, with many interests involved, and to some considerable extent it represents the new spirit that has lately arisen in games.

* * *

It is the 'fans,' as they are called, who make the wheels of baseball go round. Who are these fans? One day, at the polo-grounds at the far end of New York city, I saw forty thousand of them, young and old, men and women, sitting in the form of a great human horseshoe, row behind row in great ascending tiers, watching the big baseball game that was more to New York at that time than any Presidential election, and not watching it only, but behaving in such a peculiar and yet methodical manner as no other sporting crowd in any part of the world ever These fans are at their best, or worst, at such a match as this, the first of what are known as 'the world's series,' the fight between the champion sides of the two big leagues. Why do they call them fans? That is a question which the best American authorities on sporting matters cannot answer with any confidence, and most of them were prepared to accept my suggestion that it might be because they fan the interest and excitement and make them increase, or because they are fanciers of the baseball game, as being as good as any they had heard of, and much better than most. But it would be absurd to call those forty thousand people who watched the contest by the British cricket and football title of 'spectators,' because they are no ordinary crowd of sporting sightseers. Our football crowds, even though they be fifty or sixty thousand strong, are a smooth and placid throng in comparison with a gathering of fans who have made of their spectatorship a science and an art. You do not understand what it is to watch a game and be a part of it until you have seen one of the greatest trials for baseball honours; and in this I do not mean that the part is that of assailing the referee and throwing ugly missiles towards the players in the arena, as is done in some places when the fans do not like what is going on. In a world's series match they are properly behaved, though they The open end retain their regular customs. of the horseshoe is occupied by a mammoth scoring-board, on which is indicated not only the state of the game that is in progress, but, by continual telegrams, the state of all other games of first-class importance that are being played on the same day in other parts of the United States. Then round the curve are the fans of different Farthest from the players and at the back of the all-important pitcher are the humble but enthusiastic 'bleachers,' called by that name

because they pay the minimum fee and have to sit on seats unprotected from the sun. All the other fans are on covered stands, and they may pay anything from the American equivalent of four shillings up to three or four pounds for their seats, high prices having to be given when tickets have all been sold once and must be bought again. At an important time like this large bodies of fans stand outside the gates all night before the game, so that they may get the best of the unreserved seats as soon as they are admitted. The first to begin this vigil are two English girls engaged in a vaudeville performance, who in their one season of New York life have become most enthusiastic and well-educated fans. There are fifty Cubans who have come up from Havana to see the show, and a number of Chinese. By eight o'clock in the morning ten thousand fans are in line outside the gates, and, the day being now well grown, they begin to argue about the merits of opposing players, and from argument proceed to blows. But these are not the best fans. Those who make the baseball world alive are to be found on the covered stands. Their money does tell. To the eight games of this series they and the others subscribe in gate-money the equivalent of one hundred thousand pounds. Of this big sum the owners of the two competing clubs take some fifty-eight thousand pounds. These socalled clubs are chiefly run by individuals who pay all the costs and take all the profits and make as much as they can. The owner of the 'White Sox' team of Chicago made seventy thousand pounds out of them in one year re-cently. Yet these proprietors are sportsmen, after all, and though they are controlled by hardly anything but public opinion, the fans' opinion is a very powerful thing. Find the proprietor firing a player if the fans like the man! And when the fans like him the player raises his price, and the proprietor pays. is why some of the players receive as much as two thousand pounds a year for six months' play, and many of them receive from five hundred pounds to one thousand pounds. manager, or captain, of one of the biggest clubs will receive three thousand five hundred pounds. So the fans' opinion is an enormous force. the one hundred thousand pounds that comes from the fortnight's special games in the world's series, the players themselves who take part in them get thirty thousand pounds. Each of the twenty-two men who played for the winners in the series that I saw received eight hundred pounds, and each of the losers five hundred pounds. Many fans thought that one of the men on one side was very stupid, and the fans belonging to his own set thought him mad, and were very angry with him when he let fall an easy catch which would have won the whole series for his side. That missed catch made a difference of one hundred and fifty pounds to

each man of his own team. About ten thousand pounds is taken by the National Commission which manages this big event. So we see here the money-power of the fans.

* * *

Their critical and demonstrative powers are equally impressive. They have special means of letting it be known to all what they think. They concluded long since that promiscuous and irregular clapping of hands, like the gentle ripple floating from the benches on a summer afternoon at Lord's when there is a piece of smart fielding done or a batsman drives to the rails, is a poor thing, and so they clap in a new and well-organised way. How they work it nobody exactly knows, for instinct has much to do with it; but when they desire to make a special demonstration of satisfaction, somewhere among the great body a kind of Morse-coded clapping is begun-two claps in quick succession, then a pause, next a longer pause, and after that the series over again and again. The whole crowd takes its time from the beginners, and in a few seconds the forty thousand fans are doing their clap-clap . . . clap . . . clap. A weird effect is produced. Then there are isolated and peculiar demonstrations. Beside me is sitting an elderly gentleman dressed in the most sober black. He has a thin, tweaky face; he seems a little indifferent to what is going on, and he converses occasionally in an undertone with a lady who is with him. I suspect that they talk of their children or their chapel-meetings, for they do not look like real burning fans; but all in a moment, without any warning, this gentle person explodes. He rises in his seat, waves his arms about, stamps his feet wildly, and shrieks out towards the field of players his views on something that has been, or should be, done, and then, quivering with excitement, he sits down again and continues his whispered conversation with the lady, who is not at all surprised. Nobody is surprised; nobody takes any notice; it is the usual and the proper thing. He is a real fan. Meyer comes in to bat, and Meyer is a full-blooded Indian. Consequently a body of fans celebrate the occasion by such a true Indian war-whoop as the Iroquois of old would have thought worthy of them. Then there are special societies or brotherhoods of fans, and notably there are the famous Royal Rooters of Boston, the staunchest supporters of their side. Some three hundred of them, an exclusive and exalted body, they sit together in a conspicuous place, each of them with a crimson flag, the Boston colour. When something bad for Boston happens, the flags are waved wearily at the half-mast; but when Boston does well, then you should see those crimson banners floating high and hear such royal rooting as these people can best perform! Once the Royal Rooters were offended, and they stayed away. The management knew that

the noise they made would be sorely missed, and to make up for it they distributed several thousand rattles among the other fans that they might bang them against the backs of seats and make a special din. It is the fans who spur the players to their supreme and mysterious accomplishments—make Wood, the pitcher, as they say, 'burn holes in the air,' and another man perform his famous 'fade-away throw,' the ball leaving his hand like a bullet and reaching the hitter, a few yards away, like a falling snowflake—or nearly. And when the fans are thoroughly well pleased with one of their men, they take care to show it substantially. Sometimes they will give him a first-class motor-car. The baseball community is a very wonderful one; it is quite different from any other of the sporting kind. I have said nothing in the way of description of this extraordinary game; that has been done before. This is the kind of thing they are said to want at many of the leading cricket places, including Australia though not at Lord's.

* * *

The truth of the matter is that the people seem to want to be fans in these days, and to work their games on the system of the fans.

There has been talk of an attempt to enliven cricket to cure it of its sickness; but poor cricket, which was nourished to its greatness in gentler times, could never stand such drastic association with the fans. Only baseball would do. And, to answer a thought that will be in the minds of many people, let it be said our football crowds, demonstrative as they are, yet are canary-like in comparison with the fans. Cricket in its full dignity must remain, even if it fails by more and more thousands to please and to attract. It is, like so many good things of those Victorian days, a victim of time and changing circumstances. If it has in some measure failed, it is because it has been led away from much of its earlier simplicity. It has been over-organised. There has been too much science and individualism imparted to it, and the game has lost much of its early life. Money-making matters have become too important considerations, and now the game is enfeebled for lack of money. overseas contests have had a most unhealthy effect upon it. Nothing is as it was, and the people who now fly in the air and sail under the sea are in their tastes and desires and instincts barely thinkable descendants of the men who won the battle of Waterloo and those who founded Lord's.

A KNIGHT ON WHEELS.

CHAPTER XXX.-THE FIRST EPISTLE OF THEOPHILUS.

' PRETTY hot stuff this port of yours, old son —what?'

'Take some more,' grunted Philip.

'Thank you! That was the situation I was endeavouring to lead up to,' said Timothy, and helped himself. 'It's a blessing to see your honest but homely features once again,' he continued, lifting his glass; 'especially when you signalise your return by replenishing the wine-cellar. Chin-chin, old thing!'

Philip, sitting on one chair with his feet on another, and smoking a briar pipe, grunted again. Timothy rose and lit a cigarette with a live coal from the fire. Matches were never a conspicuous feature of a bachelor establishment, however well regulated. As he did so, his eye was caught by a pair of tall and hideous vases—of the kind which is usually given away at certain stores to customers who have been rash enough to accumulate a certain number of coupons—standing one at each end of the mantelpiece.

'Oh, my dear old Theophilus,' moaned the sesthetic Timothy, 'do you mean to say you have resurrected the Bulgarian Atrocities?'

The ornaments in question had been a Christmas present from Mrs Grice. 'I bought'em just before closing-time at a sale of work what my married sister in the Wandsworth Road was interested in, sir,' she had explained. 'A sale

of work in aid of the Bulgarian Atrocities it was. I said to Grice at the time that they would brighten up your room something wonderful. There they are, sir, with our respectful Christmas wishes—one from Grice and one from me. Oh, thank you, sir!' Hence their name.

'Yes,' said Philip, 'Mrs Grice got them out of the cupboard as soon as I returned, and they were duly washed and put up this morning. I was hoping she had forgotten about them; but they will have to stay there now. We mustn't offend the old lady. You are a tremendous swell to night Tim. Going out?'

to-night, Tim. Going out?'
'Yes,' said Tim importantly, 'I am.' He produced a pair of white gloves and began to try them on, surveying Philip's aged dinner-jacket and black tie with tolerant indulgence. 'I must now pull myself together,' he announced—turning to survey an appallingly tight white waist-coat with immense satisfaction in the glass over

the mantelpiece—'and pass along quietly.'
'You needn't go yet,' said Philip, filling another pipe.

'Despite your frenzied entreaties, old son,' replied Timothy, 'I simply must. There is going to be dirty work at the cross-roads to-night,' he added mysteriously.

Philip, who gathered that a confidence of some kind was on the way, waited. It was good to

see Timothy again. His company was always exhilarating, and at the present juncture it was extra welcome; for Philip found himself at an unexpectedly loose end. He had landed from the Caspian a week before, determined this time to put his whole fate to the touch, only to find that his Lady was not in London. Friends in Hampshire—he knew neither their name nor address, and was much too self-conscious to inquire at Tite Street—had snatched her away directly after her father's wedding, and the date of her return was uncertain. Therefore he leaned at this moment upon Timothy.

Presently Tim inquired, 'I say, Phil, ever

been in love, old friend?'

This was a familiar gambit, and Philip gave his usual reply. 'Occasionally.'

'Anything doing at present? Anything fresh?' Nothing to write home about, thanks.

Timothy surveyed his friend critically. wonder,' he said musingly, 'if Romance could ever really find a lurking-place in that gearless, valveless, little heart!'

'Afraid not,' said Philip. 'Romance gives

old fossils like me the go-by.

'Don't talk rot of that kind, Phil,' replied the boy quickly. 'Any woman would be proud to marry you. Fool if she wasn't!' he added with real sincerity.

Philip responded by waving his glass in his friend's direction. 'Mr Rendle, your health and sentiment!' he remarked gravely. He drank, laid down the glass, and sat up. 'And now, my son Timothy,' he remarked briskly, 'get it off your chest! Own up! Who is she? When do the banns go up, eh?'

'Get what off my chest?' inquired Tim, with

a great appearance of surprise.

'This great secret. Cough it up! Who is

the lady?

One of Philip's greatest virtues in the eyes of Timothy was that he never, under any circumstances, ended that particular question with 'this time.' But he was genuinely surprised at Philip's penetration.

'Great Scott! it must be written all over me if you can spot it, old Bartimæus!' he said, not altogether displeased. 'Yes, you are right. It has happened at last.'

'What?'

'It / I'm in love.'

'It comes to us all, sooner or later,' remarked Philip tactfully.

'And I am going,' announced Tim with great firmness, 'to bring it off this very night.'

Philip glanced at the clock. 'Quarter to ten,' he said. 'A bit late to begin a job of that magnitude to-night, isn't it? Are you going to apply personally, or by letter?'
'What's that?' inquired Timothy, emerging

from a rapturous reverie.

Philip repeated the question.

'Letter!' exclaimed Tim with infinite scorn—

'a letter? Write? Write a letter? My sainted aunt, write?' He gazed indignantly upon the automaton before him that called itself a man. 'My dear old relic of the Stone Age'-

'In the Stone Age,' observed the relic, 'they

couldn't write.'

Timothy made a reference to the Stone Age which was neither seemly nor relevant, and continued: 'Do you expect me to sit down and write—write to her—upon such a subject as that? Write—with a three-and-ninepenny fountain pen, on silurian notepaper at a shilling a packet? It's not done, dear old soul; it's simply not done!'

Timothy, carefully hitching up the knees of his faultlessly creased trousers, lowered himself on to the sofa, the picture of reproachful scorn.

'If it takes you that way,' replied the unruffled Philip, 'why not use cream-laid vellum and a gold nib?'

Timothy merely made an alarming noise at

the back of his neck.

'Or a typewriter, with the loud pedal down and all the stops out?' pursued the facetious

'Phil,' announced Timothy, with a pathetic attempt to look extremely stern and dignified, 'let me tell you that I am in no mood for this sort of thing. Dry up, man! dry up! Do you think I could get all I have to say upon this occasion within the limits of an ordinary letter?'

'Under the present postal regulations,' explained Philip, 'you can send four ounces for a penny. In fact, if you leave the ends open '-He caught sight of Tim's tragic face, and concluded his entertainment. 'Sorry, old chap!' he remarked, suddenly contrite. 'I don't know why one should try to pull a man's leg on these occasions. God knows, the business is serious enough.'

'Thanks,' said Timothy gratefully. 'To tell you the truth, I am feeling pretty bad about it. You don't know what it is to be hard hit by a

woman, Phil.'

'No. I should have remembered that,' said

Philip apologetically.

'I know you consider me a young blighter who is always in love with some little piece of goods or other,' continued the chastened Timothy; but this time it is serious. This is the end of all things. Never before have I got sufficiently fond of a girl to ask her to marry me; but I am going to do it to-night.'

'I wish you luck,' said Philip with feeling.

'Thanks, old friend,' responded the boy grate-

fully. 'I'm in a terrible twitter.'

'Why not write?' reiterated the methodicallyminded Philip. 'A letter has its points, you know. I understand that in verbal interviews it is a little difficult to keep one's head. Metaphors get mixed, telling points are omitted, and the peroration halts or misses fire.'

The feverish Timothy eyed his friend with

amazed compassion. 'I should like to remind you,' he observed, 'that we are discussing love-

letters, not election addresses!

'All right,' said Philip pacifically; 'have it your own way. All I wanted to bring home to you was the fact that once you get your sentiments safely down on paper, the lady is bound to get the hang of them in the long-run. On the other hand, if you stake everything on a single verbal encounter you may find yourself in the tumbril. The G.P.O. may be unromantic, but it is safe.'

But Timothy was not listening. He had put on his greatcoat, and was now adjusting a white silk muffler. 'I'm going,' he announced in rising tones, 'to let her have it hot and strong. I'm going to carry her off her feet. I'm going—— The devil of it all is,' he added disconsolately, 'that one never knows how to begin; when to chip in, in fact. You know! One can't very well get to work while shaking hands; there has to be a little preliminary chit-chat of some kind. Then the conversation goes and settles down to some rotten, irrelevant tepic; and before you can work it round to suit your plans the next dance strikes up, or some criminal comes and interrupts you, or else it's time to go home. And there you are, outside on the mat once more, kicking your-self to death!' Timothy cocked his silk hat upon his sleek head with great precision, and concluded, 'But I am going to do it to-night, or perish. Give me five minutes in the Freeborns' conservatory between waltzes, and she has simply got to have it! Good-night!' He bounced out of the room, and was gone.

'I wonder who the charmer is this time,' mused Philip, getting up and knocking out his pipe.

'I might have asked him.

He rang the bell, and presently Mrs Grice glided respectfully into the room after the manner of a cardboard figure in a toy theatre. She was followed by her husband, struggling with his

"Ave you rang the bell, sir?" queried Mrs

Grice.

'Yes,' said Philip. 'Will you clear away, please? I want that table to-night, to write at.'

During the turmoil which now ensued, Philip sat upon the padded leather fire-guard and lit another pipe. Presently he said, 'Mrs Grice!'

Mrs Grice, engaged in a bout of what looked like a game of catch-as-catch-can with Mr Grice and the tablecloth, immediately extricated herself from her damask winding-sheet and came respectfully to attention.

'Sir?'

'Mrs Grice, when you received your husband's proposal of marriage, was it by letter or word of mouth ?'

Mrs Grice, needless to say, was quite overwhelmed with maidenly confusion. Coming from Timothy, such a question as this would have

surprised her not at all; for Timothy was one of those fortunate persons who may say what they like to any one. But as uttered by her grave and reserved patron Mr Meldrum it sounded most alarming. She replied, breathlessly, 'Was you referrin' to Mr Grice, or to my fust 'usband,

''Ow should Mr Meldrum know you ever 'ad a fust 'usband?' inquired a husky voice from the sideboard.

Mrs Grice, having now recovered her mental poise, countered with a lightning thrust. 'Knowing you as 'e does, Grice,' she retorted, 'is it likely Mr Meldrum would dream of regardin' you as my fust choice?'

Philip broke in pacifically. 'Let us say your

first husband, Mrs Grice.'

'Well, sir,' began Mrs Grice readily, ''e did it by word of mouth. Leastways, not precisely. Partly by deputy, if you take my meanin', sir.

Philip made an apologetic gesture. 'Not

absolutely,' he said.

'Well, sir,' continued Mrs Grice, beginning to enjoy herself, 'we'd bin walkin' out for some time, and it didn't look like ever comin' to anything. So my brother George, 'e said it was time the matter was took up proper. George was a brewer's drayman. There was eleven of us altogether'

Not quite so much of it!' advised Mr Grice, who had left the sideboard to join the symposium.

'Get back to your fust.'

Needless to say, Mrs Grice took not the ghtest notice. 'Well, sir, George told me to slightest notice. tell 'Enery-that bein' 'is name; Grice's, as you know, bein' Albert'-

'Keep to the point, do!' groaned Mr Grice.
'George told me to tell 'Enery—'Enery 'Orbling his full name was—that if 'im and me wasn't married inside of four weeks George would come along and knock 'is 'ead off. I told 'Enery what George 'ad said, sir,' continued the old lady in a tone of tender reminiscence, 'and I became Mrs 'Orbling in three weeks and six days exactly. That's what I meant when I said that my courting was done by deputy. 'Orbling died fourteen years ago, in Charing Cross

Hospital. 'Is kidneys are still'——
'I see,' said Philip hurriedly. 'Grice, when you asked the future Mrs Grice to become your

wife, how did you set about it?'

'Was you referrin', sir,' inquired Mr Grice, with a respectful wheeze, 'to this Mrs Grice or to my fust wife?'

'Let us say this Mrs Grice,' said Philip,

beginning to feel a little dizzy.

Mr Grice, who had been assisting his second choice to load glasses and spoons on to a tray, once more desisted from his labours in order not to confuse his brain, and began, fixing his wavering eye upon a point on the wall just above Philip's head: 'I met 'er at a birthday party at my late fust's married sister's, sir. I gave 'er

a motter out of a cracker, which seemed to me to sum up what I wanted to say in very convenient fashion, sir. It said: "If you love me as I love you, then let's begin to bill and coo," sir. Very andy and compact, I thought it.'

'And what did you say to that, Mrs Grice?'

asked Philip.

'I told 'im to give over being a silly old man, sir,' replied Mrs Grice, with extreme gratification.

'And did he?'

'No, sir,' replied the simpering Mrs Grice. "E would 'ave me! 'E got 'is way." She smiled roguishly at her all-conquering spouse, who gave her a look of stern reproof. Will there be anything further, sir?

'No, thank you,' said Philip. 'Good-night!' His aged retainers having withdrawn, Philip

sat on, staring into the fire.

'We all have our own ways of setting about things,' he said aloud. Philip had a bad habit of talking to himself, especially at moments of When scolded by Peggy mental concentration. he had pled that it helped him to think. is a personal interview in the conservatory. Grice's is a motto out of a cracker. Mrs Grice's is a big brother. Mine

He rose, and crossed the room to a locked bureau. From this he extracted an old leather writing-case which had once belonged to his This he laid open upon the table, beside a green-shaded reading-lamp. After that he turned out all the other lights and made up the fire to a cheerful blaze. Finally, from the pocket of the writing-case he extracted a fat envelope. It was addressed, but not fastened. Philip drew up his chair to the table and pulled out the con-These comprised many sheets, the last of which was not finished.

He read the letter through as far as it went, alowly and seriously. Occasionally he made an erasure or a correction, but not often. Then, when he reached the unfinished page, he charged his pen, squared his elbows, uttered a heavy sigh, and addressed himself to the labours of composition.

More than once he tore a page up and began

again, but finally he seemed to be satisfied, and the letter was finished.

He leaned back and read the whole epistle right through again. Then he folded its many sheets in their right order and put them into the envelope.

'I think the occasion calls for sealing-wax,' he

said.

He found an old stump in the writing-case. and sealed up the envelope, impressing it with his father's seal. Presently the deed was done. The Epistle of Theophilus lay on the table before its author, signed, sealed, addressed, and stamped. Philip looked at the clock, and whistled. It was a quarter past twelve.

He drew aside the curtains and inspected the The plate-glass window had become mysnight. teriously opaque; so he raised the sash, to lower it again with all speed, coughing. A thick brown fog, of the brand affectionately known among its habitual inhalers as 'London particular,' was lying in a sulphurous pall over the choking city.

'All the same, my lad,' decided Philip, 'you had better trot out and post it. It will be delivered at Tite Street to-morrow morning, and perhaps some Christian person there will forward it. Jean Leslie, I dare say. Wish post myself too, he added wistfully. Wish I could 'Hallo, what's that?'

From the little lobby outside came the sharp rat-tat of a knocker—low, clear, and rhythmical. To judge by the sound, the outer door was standing open, and some person unknown was indulging in a playful little tattoo.

'Officers' wives get pudding and pies, Soldiers' wives get skill-y!' it said.

Philip's heart almost broke from its moorings. Hastily he picked up the shaded lamp from the table and turned its light to illuminate the door-

Next moment there came a soft and familiar step outside. The door of the room opened gently, and there appeared, radiant and dazzling against the blackness behind, a Vision.

'Peggy!

'Yes, just me!' replied the Vision demurely. (Continued on page 551.)

OBSERVATIONS BY CLYDE FISHERMAN. Α

By ALEXANDER DEMPSEY.

SHAKESPEARE says 'there are more things in heaven and earth than are dreamt of in your philosophy.' This quotation is apposite in referring to matters pertaining to the sea and its denizens. For instance, how do lobsters, living in from eight to fourteen fathoms of water, know that the wind has changed, or that it is going to change in a few hours, not even to a gale but only to a breeze, with waves from

two to three feet high, which cannot cause disturbance more than a few feet deep? What subtle sense do the creatures possess that tells them that this change is going to take place? Lobsters can drop their big claws as readily as a person can drop a hot poker. Scores of times I have seen them do so; they are severed with a peculiar muscular action at the joint that connects the claw with the body, and the lobster immediately proceeds to grow another. When they are examined after this dismemberment there is just the faintest appearance of moisture. I told this to a friend, and he repeated my statement to a member of the medical faculty, who pooh-poohed the idea; but I could give ocular demonstration of the fact. Years ago I read in Chambers's Journal that the sea, even with the most violent gale of wind, was never disturbed more than thirty or forty feet below the surface, yet I have had lobster-creels in twelve or fourteen fathoms of water so broken up that they appeared as though smashed with a forehammer.

Lobsters, contrary to the very general opinion, have no particular season for spawning, but do so at any time during the year. I have found from experience that the proportion of lobsters in spawn in the day's catch is on an average the same the whole year round. Neither do they cast their shells annually, or how could we account for lobsters that look as old as the hills, with their black pitted shells and barnacles

growing over them

In opening aerated-water bottles we notice the bubbles caused by the liberation of the gas. Herrings cause similar bubbles, which fishermen call 'putting up.' The men believe that the herrings are swimming when they do this, and there is a good foundation for the belief, as it is not always visible. Trawl or seine-net fishing is entirely different from drift-net fishing. The former, I believe, makes a bigger call on the perspective faculties than the latter. Seine-net fishing is confined to the Firth of Clyde; nowhere else, so far as I know, is it in general The fishermen must have evidence of the presence of herring before shooting their nets. Sometimes the solan geese diving for them as food are guides to their whereabouts; at other times their presence is shown by the fish 'putting up,' or 'playing'—that is, jumping out of the water. At night the shoal is found in the season when the phosphorescence is on the water—which the fishermen call 'burning.' The learned aver that this appearance is caused by microscopic animalcules. The phosphorescence makes its appearance in this latitude, about fifty-two degrees north, near the middle of March, gradually gaining in strength and reaching its maximum brilliancy about the middle or end of August, and is almost gone by the end of October, thus corresponding almost exactly to our sowing, growing, and harvest seasons. Are these animalcules living or dead when giving out the phosphoric gleam, which can hardly be seen unless the sea is disturbed by some agency such as a wave breaking, the movement of a vessel, or fish swimming? Is it caused by the friction of the bodies of the animalcules being knocked against each other? Coleridge's beautiful lines in the Ancient Mariner suggest friction:

> Within the shadow of the ship I watched their rich attire; Blue, glossy green, and velvet black, They coiled and swam; and every track Was a flash of golden fire.

It will be noticed that 'every track was a flash of golden fire.' In writing this Coleridge was using no poetic license, but stating a plain fact. The track was illuminated where the disturbance had been. Do the bodies of the decaying animalcules get broken up by the friction and liberate particles of calcium carbide, which, on coming into contact with the water, give off a luminous gleam?

On quiet nights in the summer and autumn, nights that seafarers call pets, they know for a certainty from the appearance of the sky that a heavy breeze of wind from the south will be on before many hours. On such nights peculiar noises, like a soft whistle, emanate from the atmosphere. The duration of the sound never exceeds two or at most three seconds.

In conclusion, I would say to the sceptical that corroboration can be easily had, on affidavit if necessary, from scores of fishermen; or, better still, let them pass a few weeks as fishers.

HISTORY REPEATS ITSELF.

PART II.

SIR ARTHUR ROLLIES listened attentively to the scout's tale, and only marked his surprise by a faint lifting of the eyebrows and a deeper furrowing of the lines of care about his mouth when Peterson mentioned his daughter's name.

'So that's where their airship depot is!' he said at length, when the scout had finished.

'I thought, sir, if it could be destroyed we might still have a chance.

'We should have,' the General said. how are you going to get over that fence? Fly?'

'No, sir. The British aren't much use at

flying; but I've just had an idea which, if it comes off, will pretty effectually cut the Westrians'

wings.'

Now the General knew Peterson, and realised the scout's invariable reluctance to say what he purposed doing when it was in the nature of an experiment; so he said, 'Well, I'll have Robinson's division mustered behind the northern outposts in case it does come off. Is that what you want?'

'Yes, sir; and perhaps you'll tell them to wait for a signal about dawn. It'll be a bonfire

The General smiled grimly. 'Bonfires have been lit ere now in the hour of Britain's peril. See that this one is big enough.'

Peterson nodded. 'I'll go now, sir, unless

there's anything else. Good-night.

The General caught his hand and gripped it hard. 'Good-bye, Peterson, and good luck. I—I've tried to keep the father underneath, and to be only the soldier; but, Peterson, take care of that little girl of mine when you reach her again. I daren't think of her being hurt.' For an instant the General's voice faltered; then his jaw set firmly, and an iron grimness settled upon his mouth whilst his voice rang like steel. 'Yet, if she can be of service, if she can help Britain, even by her death, don't hesitate to use her.'

Peterson nodded silently, for somehow there seemed to be a great lump in his throat. Then he sought out the artillery staff-officer, and to him

he spoke rapidly.

'Yes, yes,' the gunner said when at last the scout paused. 'Yes, I think I can do that for you. What you want is a fuse and a nice little charge of powder; it had better be a time-fuse, eh?'

'Yes, certainly. Can you fix me up with it?'
'Oh yes. I'll be about half-an-hour over the job. I've got to go across to the guns for the materials.'

'Right. I'll be ready by then. You might tell Tyans to have the car ready for me, will

you?'

As the gunner set forth upon his errand the scout stepped across the road to the Zoological Gardens. That Mecca of childhood was now deserted, and he failed to discover any keepers there; but, though he had been but a little boy when last his feet had trodden those paths, his memory did not play him false, and he found what he sought, and came back to headquarters with a little bag under his arm.

He found Captain Tyans at the driving-wheel of the car; so, learning that the gunner's contrivance was safely deposited in the tonneau, he hoisted his bag beside it, and leapt into the car

with a 'Let her rip, Tyans.'

Swiftly the powerful motor swung itself up the long ascent to Hampstead, over the crest of the Heath, and down into the valley beyond, and had soon deposited the scout at the British outposts once again.

Peterson picked up his appliances, and, scrambling out with them, tossed a farewell over his shoulder in answer to Tyans's 'Good-night.'

It almost seemed as if the full moon were in league with Peterson, for her face was veiled with heavy clouds, and in that friendly darkness the scout quickly traversed the debatable ground between the hostile armies. Presently, for the third time within twenty-four hours, he was creeping so close to a Westrian sentry that he could hear the man's heavy breathing.

Of course it takes time to make one's way

through an enemy's outpost line. But if a man can give that, and has had plenty of practice, he should find it no insuperable task; though in the nature of things there can be no 'If at first you don't succeed, try, try again,' about it, since for the man who fails to succeed on the first attempt there will be no further opportunity of trying.

But if ever there was a man who knew his job, that man was Captain Peterson, and he passed with no more noise than a snake, always upon the lowest ground and amidst the darkest shadows, whence he could perceive any danger

against the sky.

When, some hour or two later, he reached the foot of the oak-tree, he failed to get any answer to his whispered greeting. He dared not raise his voice, for he knew not what other ears might hear him, and with a heart full of anxiety he set himself to climb the tree. But he need not have feared, for Nancy Rollies was safe enough, and, despite her cramped, unnatural position, very fast asleep.

She awoke with a start as he touched her, but in a moment was all enthusiasm and delight.

'Oh, you've come back! How splendid! And have you decided what to do?'

'Well, I've decided what I'm going to try to do, and I want you to come with me.'

'If you'll unfasten me I should be glad,' she said, 'for my fingers are very cold.'

He did as she asked and gently helped her down.

'I saw your father and gave him your message,' he said when they stood upon the ground once more.

'And he said'——

'I think he was very proud of his daughter; I know he was. But he didn't say very much, for he was busy with other things. Only just as I left him he asked me to take care of you.'

'As if you need reminding of that!' she smiled.

'Well, what are we to do now?'

'I want you to guide me to this petrol-store, and, if you can, show me exactly where one of those little channels you spoke about reaches the fence. Can you?'

She nodded.

'Then let's start at once, and we'd better go across country; it's safer than the road. Oh, I say, I forgot! I've brought you a couple of biscuits; but they're only army tack, and toughish stuff.'

'I'm hungry enough to eat nails,' she said, as she fell to munching them.

'Then I wish I'd brought you some of that monkey-steak of Tyans's. But eat the biscuits as

we go along.'

Though they encountered none of the enemy, the numerous hedges that required negotiating sadly impeded their progress, and when at last they gazed down at their objective there was more than a hint of dawn in the darkness.

The girl gave an exclamation, for in the dim light it was just possible to see that guards were pacing outside the fence.

'It's quite impossible for you to do anything

now,' she said despairingly.

Had there been hither to any doubt in Peterson's mind as to whether, after all, he would dare to use the means he purposed, it vanished now at sight of that huge laager.

'Oh, no,' he said grimly. 'It only makes it rather more difficult, that's all. Whereabouts

is there a channel?'

'I know one reaches the fence exactly where that little bush is,' she told him after a careful

glance.

'Good!' Peterson exclaimed. 'That's so much in our favour.' Though, if the truth be told, he was rather doubtful on the point. Then he put out his hands and grasped hers tightly. 'You must go back now,' he said. 'Go right away, and hide safely. You'll soon know if I've been successful. Good-bye.'

But he still held her hands. Perhaps it was because human vitality is always at its lowest ebb at dawn; but, somehow, for the first time in his life, he hesitated to do his duty. That must have been the reason, for it could not have been that he hated parting from a girl of whose very existence he had been ignorant less than twenty-four hours ago!

'I—I want to say this,' he whispered. 'It's not my place to thank you for all you've done; others will do that if I succeed; and if I don't—well, it won't matter. I—I always thought that a woman was rather useless to a soldier, and '——He broke off suddenly and crushed her hands to

his lips.

'And I've shown you you're wrong? Well, good-bye, good-bye. Oh, you won't fail, because it's for Britain's sake. But if you do—if you do—I shall be waiting for you,' she finished

rather incoherently.

Perhaps, despite the darkness, in that moment of stress his eyes read more in hers than they would have done in happier circumstances, for all at once he was his own calm self again. In another moment he had left her and was crawling down the slope to where the Westrian sentries paced, to where Death seemed to beckon with a leer upon his ghostly features.

One can hardly blame those sentries if they failed to mark the scout's downward passage, because even the girl's staring eyeballs lost sight of the man, although the rapid approach of dawn caused him to move more hastily than he would

have chosen.

So at last Dick Peterson came undiscovered to that bush; but not a moment too soon, for hardly had he sunk beneath its shelter before he heard the footsteps of two converging sentries.

Holding his breath, he waited. He heard the Westrians greet one another over him, and was hardly surprised when one of them said with a chuckle, 'Merely a matter of form; but I'll shove a bayonet through the bush.'

I rather fancy Peterson had welcomed that steel within his heart, for, you see, he greatly dreaded what he must do thereafter. Yet he stiffened himself to bear the thrust, and in spite of the agony of it made no movement or sound as the weapon shore through the muscles of his left forearm.

That examination must have satisfied the sentries, for they faced about; but almost before their backs were turned the scout had drawn the fuse and charge from his pocket. A moment later he had slackened the fastening of his bag, thumping upon the bottom of it until presently a diamond-shaped, evil head shot forth. That was a task such as a snake-charmer might well have dreaded, yet Dick Peterson caught the serpent deftly enough about the neck and held it securely the while he struggled to fix the explosive to its tail. But, considering the wound in his arm, and the gloom and the cramped position in which he crouched, it is hardly surprising that, before he had quite finished, the snake succeeded in writhing itself loose from the feeble grasp of his left hand. Wildly he clutched at it; but though he caught it again, the deadly head was still loose, and an instant later its poison-fangs had sunk deep into his knee.

For a moment the scout paused, shuddering violently; then he gritted his teeth and slipped the snake within the bars and into that little channel leading toward the petrol-casks.

Dick Peterson's task was finished. All now depended upon the snake, on whether that frightened reptile would seek to escape along the concealment offered by the gutter.

Many times in those few seconds that seemed hours to him the scout concluded that the fuse had failed. Indeed, I think the last vestige of hope had vanished from his heart before his ears

caught the sound of a tiny explosion.

So far, so good. But had it burst among the casks? Another moment, and his eyes saw that the price exacted of him had not been too great, for a little flame licked about one of the barrels—for an instant only a glimmer; then, as the spirit caught, a surge of flame went leaping heavenward. A crazy laugh burst from the scout's blue lips. The signal was given, a bonfire lit such as even Armada times had never seen.

But a deadly numbness was creeping up his limbs. Somewhere he seemed to have read that neat spirit was good for snake-bites, and he gulped down the contents of his flask. Was there nothing else he could do—nothing else! Why, yes—exercise!

He then got himself upon his feet and ran, lurching and staggering, up the slope. Half-way up he fell, and where he fell he lay.

Of course it could be but a fantasy of delirium, that girl's face bending over his! Oh, certainly

he was delirious, for the girl herself must be far away ere now! But through the growing dullness of his brain he seemed vaguely to hear her saying something about his being hurt, something about a blaze, and at that he fought himself back to consciousness for a moment.

'Ay,' he gasped, 'that snake and I both die in a blaze of glory.'

'Snake! What snake? What do you mean?' she cried.

But he took no notice. He was muttering something about King Charles.

She caught him about the neck and shook him violently. 'What about the snake?' she screamed.

'Oh, do leave me alone,' he yawned. 'I want to sleep so very badly. Why, the snake that carried the explosive tried to eat my knee, and—I—thought—snakes—only—ate—oak-apples.'

Maybe the Westrians' eyes were blinded by the glare of that huge furnace; or maybe, even if

they saw those two figures upon the slope, they heeded not. Certainly there were matters of more moment that claimed attention, for from the direction of London there came the distant boom of artillery, growing ever more frequent.

A long, long interval, and then the British infantry surged over the rise and down into the blackened hollow. Then presently—it seemed ages later-there came stretcher-parties and a surgeon. He might have been prepared for something unusual when, in the forefront of a battle, he found a wounded officer whose head lay upon a woman's lap. But then he was in no mood to take notice of a girl who, distraught at the sight of blood, raved something about having sucked the poison from a snake-bite. So, when he noticed the skilful bandage on the scout's arm, and found the pulse firm and steady, he turned away to where there was more need of him amidst the other gleanings of war's grim harvest.

THE END.

NOTES FROM AN ALSATIAN VALLEY.

THE country I write about, acquired by Germany from the French in 1871, is surely not the least lovely part of a great empire. The Vosges Mountains, which fill up so large a part of it, present a series of lovely landscapes of hill, lake, forest, and valley. The backbone of the range, Les Hautes Chaumes, which forms the frontier between France and Germany, runs from north to south, and is thus nearly parallel with the Rhine Valley and the Black Forest. Its average height is about three thousand five hundred feet, the loftiest peaks rising to considerably over four thousand; and it throws off numerous valleys at right angles.

The Münstertal, one of the best known of these valleys, extends from Colmar, gradually narrowing, to Münster, where it divides—one portion running to the Schlucht, one of the passes which occur at intervals in Les Hautes Chaumes; the other to Metzeral. In the lower part are extensive market-gardens and vineyards, extending up the mountain-sides, where they are not covered with dense forests; whilst higher up are many little farms. The base of the valley is filled with busy villages and dotted with cloth and linen factories, which, whilst employing large numbers of the inhabitants, do not spoil its beauty. Industrial conditions here, though not perfect, are much better than in many other places.

On the open mountain-side feed innumerable herds of goats and black-and-white cattle, to the musical sound of many bells and the yodling of the cow-boys. Sheep are unknown, though there seems no reason why the hardy horned breeds of the Scotch and Welsh mountains should not thrive in this climate. Potatoes are

cultivated in every available space, while the mild cheeses of the district are famous.

Some of the views obtained are exceedingly beautiful, and in certain lights strongly remind one of the traditional Japanese landscape. . The Bernese Oberland, the Jura, and the Black Forest are often clearly discernible. The afterglow at sunset on autumn days is very remarkable, and a curious natural phenomenon of a long dark shaft of mist stretching right across the hills is occasionally seen. The cathedral arches of the pine-trees, the natural fern grottos, the long vista of gray wold, the tiny red farmhouses, the vivid green of the pastures, the mistfilled valleys, the lovely range of hills, peak succeeding peak, glimmering away into the distance—such sights may be met at every turn, and present a different aspect with varying lights -light and dark, azure blue, or filmy gray. over the hills are curious circles of gray stones, Druidical remains surely, the supposition being borne out by the word Ballon-a name used for some of the peaks, and said to be connected with the worship of Baal.

What of the Alsatian peasantry? They are a hardy, kindly, generous race of people, whose principal characteristic is thrift. They will cultivate every available bit of land to the full, and whole families—men, women, and children—work in the fields. They have a curious language of their own, which, though really a dialect of Low German, contains many French words. The German sound oi, as in Deutsch, they pronounce 'ee,' a as in 'da,' and o, short, as in the English 'not.' Their language, except for some plays and folk-songs, is not a written one,

and is capable of such variations that the different valleys have words peculiar to themselves.

One cannot help noticing that the effects of the war of '71 have not yet wholly died down. Whilst the Germans are doing splendid work, such as harnessing the mountain lakes and laying down tramways to develop the country, they cannot be said to be very happy in their relations with the peasants, and one hears many stories which, if true, seem to speak of brutal treatment. German officialdom obtrudes itself everywhere, and one seems, for example, continually reminded that this, that, or the other thing is forbidden. The commotion caused by the arrival of a train at a country station—the clanging of bells, the blowing of trumpets, the opening of barriers, the inspection of tickets—is in direct contrast to the somewhat happy-go-lucky French methods. One almost imperceptibly notices the difference immediately after crossing the frontier.

An excellent thing, however, is the number of signposts everywhere, on all the mountainpaths, making it almost impossible to get lost. Paths leading to where good views can be obtained are carefully pointed out, and the heights above sea-level of certain points given. Then there is an abundance of pure water everywhere, tree-trunks being often hollowed out to form troughs, and the tiniest hamlets having their own reservoirs. Germany is often spoken of as an expensive country; but some things, at any rate, are remarkably cheap. Hotel accommodation is little more than half the price it is in England; and if you travel by slow train and fourth class you can go anywhere on the railways for very little more than a farthing a mile.

Alsace is essentially a country of rural towns, if the expression may be forgiven. In the Münstertal, for instance, the only town which in England would have urban powers is Münster itself, a quaint old place with leafy streets and gardens. But there are several that are beyond the indignity of villages—charming little places, full of artists' nooks. You enter by a picturesque gateway, surmounted by a squat spire, upon which a stork has built an untidy nest, and the chief street, or grasse, opens out before you. Every house is old, with a delightful doorway or overhanging balcony; there is an ancient castle on a hill, frowning down on you; a big-limbed, dun-coloured ox labours past with a clumsy country cart; while that totally indescribable smell, so typically Alsatian-or shall we say German?—of sour pickles and stale beer invests the nostrils.

Of the three large towns of Alsace, Strassburg, with its cathedral, its clock, and its ramparts, and Mulhausen, near the Swiss frontier, with its busy cotton-mills and machine-shops, are perhaps too well known to require description; but of Colmar, which is the size of Colchester,

a few words may be said here. Colmar is one of those comparatively rare places which combine all the features of a thoroughly up-to-date manufacturing town with the charm of a medieval city, and avoid both a startling show of newness and the forlorn appearance of decadent old age. Its factories are situated unobtrusively on the outskirts of the town. Its old cathedral, its convents, hung with the finest of Grünewald's paintings, such as the 'Kreuzigung Christi,' its almost Delftian canals, quaint streets, and houses with their slated turrets, carved fronts, alcoves, pozzias, and balconies, take one right back to the Middle Ages; while its fine boulevards and squares, hotels and shops, can surely be surpassed by few towns of equal size. Colmar has two natives of whom it is very proud: Rapp, the famous general of Napoleon's time; and Bartholdy, who designed the New York Statue of Liberty.

In matters of creed, Protestant and Catholic seem about equally divided in Alsace. One village will have a Protestant church; the next, a Catholic. The people are singularly devout, and the churches are very well filled, as is so often the case where a rural population largely predominates. The most famous of the shrines scattered over the country is that of Drei Achren. It is related that, in 1491, when a blacksmith was making his way to the little town of Urbeis, lying in the next valley northwards from the Münstertal, the Virgin appeared to him, holding in one hand three ears of corn, to signify the reward of the just; and in the other a lump of ice, to signify the punishment of the unrighteous. The blacksmith was told to proclaim in Urbeis market-place what he had seen, but was afraid to do so, as he feared he might not obtain credence. The sack of corn which he had brought there, and was carrying home, remained unmovable, however, till he had delivered his message. convent was erected on the spot where the Virgin appeared. The place is now one of the most frequented resorts of the Vosges Mountains, and is approached by a mountain railway.

As a last word about this charming country, may I point out its advantages as a holiday playground? It offers attractions of many kinds to the sportsman (especially in winter, when ski-ing and sledging may be had), to the naturalist, to the lover of country life and mountain air, to the antiquary, and, not least of all, to any one in search of health. The climate is dry and bracing, and at any height of over two thousand feet—that is, above the mists of the valleys—remains singularly warm right up to the end of October. Hotels, good and cheap, there are in abundance; whilst, owing to the excellent system of railways and tramways, all the very finest parts of the country are easily accessible from England, via Dover, Ostend, and

Strassburg.

THE MONTH: SCIENCE AND ARTS.

A SIMPLE MUD-GUARD FOR PUTTING-HOLES.

THE remarkable vogue of golf is reflected in the activity of inventors. One of the latest manifestations of this ingenuity is a simple mud-guard for putting-holes that has been placed upon the market. Its avowed purpose is to prevent the golf-ball becoming soiled by contact with the liquid mud that so frequently collects at the bottom of the hole in rainy weather. The guard itself comprises a metal flange or cap which is slotted at three points of its periphery, each cut section being bulged to a round or spring form. Consequently when the guard is slipped into the hole the spring pieces of the flange bear upon the walls of the hole, thereby holding the guard in any desired position. In this way it may be set clear of the mud and water in the hole. The guard is pierced with a central orifice, which is large enough to receive the ball, and yet will prevent it falling through to the bottom of the The guard is readily withdrawn when it is desired to clean out the hole, while at the same time it need not be used except in wet weather. It is substantially made of zinc, so that it will withstand rough wear and tear; while it is also rust-proof.

DASH-BOARD ACETYLENE-LIGHT SWITCH FOR MOTOR-CARS.

While acetylene gas constitutes an excellent illuminant for motor-car lamps, there is one pronounced drawback. This is the necessity to leave the seat and to light each lamp separately. For this reason electric lighting has come into wider favour, since it can be switched on and off from the driving position. But electric lighting is expensive to install, and requires careful and vigilant maintenance. An effort to remove the disabilities in connection with acetylene lighting has been made, and the resultant device is highly effective. It has been in use for some three or four years upon the other side of the Atlantic, and has recently appeared in this country. The contrivance comprises a gascontroller, which is mounted upon the dash-board, and from which a pipe extends to the gas-generator and to the lamps respectively. The controller is fitted with two needle-valves, one of which is set to permit the gas to flow to the burners at the proper pressure to give the most efficient light. The second valve is provided with a handle, and is used to turn the gas on or off completely, or to adjust the flame to any intermediate height, according to conditions. The controller also carries a small electric pushbutton, which completes the electric circuit between the battery and the lamp-burner. This electric circuit includes a vibrating coil, while the leads extend from the battery through the coil and controller to the burner. At the burner the circuit is broken, presenting two points not unlike the terminals of a sparking-plug. Therefore, when the gas-handle is turned on and the push-button is pressed, a powerful high-tension current passes to the secondary posts at the burner. The current, jumping between the posts, creates a spark, which, passing through the jet of gas, ignites it. The outstanding feature of the lighter is its flexibility. The flame can be adjusted to any desired height, according to the degree of illumination required. Thus, when the car is travelling over country roads on a pitch-dark night, the flame may be raised to its maximum by moving the handle to its full degree of travel; but when it is passing through well-lighted thoroughfares of a town or city, where a brilliant ray is not necessary, and indeed constitutes a source of danger, the flame may be lowered by shutting off the handle. This central control-system, while it renders acetylene lighting as convenient as electric lighting, because it can be manipulated from the seat, has a great advantage over its rival, since the light can be adjusted through an extremely wide range of intensity.

LUMINOUS INDICATORS.

The recent tragic disaster to the Empress of Ireland has once more recalled the need for some subsidiary lighting system to guide passengers through the labyrinth of corridors when the electric-lighting system fails. In this disaster all illumination was extinguished within a minute or two of the collision, owing to the steam-raising plant and dynamos becoming immersed. Consequently the passengers below had to grope blindly in the dark to discover ways and means of reaching the decks. terrible confusion might have been mitigated, and possibly additional lives saved, had luminous indicators been placed upon the walls of the corridors and companion-ways to guide the passengers. The perfection and reliability of the Balmain luminous paint or cold light, to which we have drawn attention previously in these pages, would have sufficed. The active ray compound is sealed hermetically in a glass tube, and any desired wording, guidingmarks, or indicating signs may be set up therewith. This invention is applicable throughout a wide range, such as upon underground railways, picture palaces, theatres, and even private apart-It can be utilised to indicate the position of electric-light switches, bell-pulls, door-handles, lifts, fire-alarms, and so on. It is only necessary to place the sign at some point where it may receive a certain amount of daylight; or should this be absolutely impossible, a lamp held quite close to the sign for a few minutes at regular intervals will impart the requisite activity to the light-shedding compound. Owing to the fact that luminosity is not dependent upon combustion or phosphorus, and is perfectly safe, once installed it lasts for years. It may even be used in the dark galleries of a powder-magazine, signs being laid on the floor at intervals of a few feet to guide the men working in the dark. Even in coal-mines it has a decided value, and would prove of service to miners and rescuers after an explosion.

TURNING REFUSE INTO WEALTH.

The problem of the economic disposal of household and street refuse is a difficult one in towns The dust-destructor has superseded and cities. the dangerous process of dumping and distributing the malodorous matter upon open land; but while the heat generated by combustion may be turned to useful account in the production of power, the disposal of the clinker is another problem. The dust-destructor is far from being an economic method of refuse disposal. The domestic dust-bin is a heterogeneous collection of debris, ranging from vegetable and animal waste to tins and other metallic odds and ends. The civic authorities of San Francisco have recently installed a plant and system for the purpose of extracting all economic matter from the waste, and subsequently turning the residue itself into a marketable article. Oil in various forms abounds in general refuse, and its reclamation is profitable. The authorities have introduced a service of motor-driven collectingvans, each of five tons capacity, whereby the refuse is collected during the night. Upon arrival at the plant, the trucks, which are detachable, are released, and raised to the top of the building, and the contents are dumped into huge kettles or hoppers, to be subjected to a boiling process for five hours. The pulp then passes into huge presses, where all the greasy matter and water is expressed. The oily matter collecting upon the surface of the water is skimmed off and retained. As the pressed matter is by no means dry, it is driven on a helical screw through rotary boilers, whereby Then the mass all moisture is evaporated. passes to other tanks charged with petrol, which dissolves and absorbs all the remaining grease and oil. The macerated mass is then submitted to a drying process, and passed along a conveyer beneath powerful magnets, which extract all the metallic materials, such as nails, pieces of tins, nuts, screws, &c. The pulp is now shot into pulverisers, where it is ground up, mixed with chemicals, and exuded in a finely divided form, somewhat resembling powder. As bones and other valuable fertilising agents are crushed in this action and combined with the other matter, the residue constitutes an excellent fertiliser, which finds a ready market. The petrol, laden with greases and oils, is subjected to a simple distillation in a refinery, whereby the petrol is reclaimed to be re-used, while the oils and greases are separated or divided into their commercial values.

TRANSLATING LIGHT INTO SOUND.

An interesting instrument, 'The Type-Reading Optophone,' invented by Mr E. E. Fournier d'Albe, D.Sc., was described recently before the Royal Society by Sir Oliver Lodge, F.R.S. By means of this instrument the action of rays of light is translated into sound, and light is thus rendered recognisable to the ear. The apparatus has been devised essentially for totally blind persons, so that they may be able to read the type of ordinary printed letterpress. A disc, perforated with several concentric circles of holes, is placed before a Nernst electric lamp, which has its filament stretched radially across the This perforated disc is rotated rapidly, so that the light shining through the holes is broken up into regularly recurring flashes. When a suitable frequency is obtained, these can be detected by means of selenium and a telephone. An image of this line of intermittently luminous dots is projected upon the type which it is desired to read, and the light diffusely reflected from the type is received on a selenium bridge. With an ordinary high-resistance telephone receiver, type a fifth of an inch in height may be read quite easily in this manner.

ASBESTILITE, A NEW BUILDING MATERIAL.

This is the age of cement, and one of its latest applications is for tiles for roofing, as well as a lining for walls and ceilings. The cement is mixed with asbestos, and the combination is so effectively accomplished as to yield a homogeneous and impervious article. For roofing purposes the tiles are made in red, blue, or brown, and when laid present an artistic appearance. The cement ensures solidity and protection against the weather, while the asbestos renders the material absolutely fireproof. The material may be used for ordinary constructional purposes if desired. desired. It possesses one desirable The material being a non-conductor feature. of heat, a building so constructed is cool in summer, as the solar heat is unable to radiate into the interior; while in winter it is warm, because the internal heat is kept within. The tiles are lighter than those made from clay or slate, are inexpensive, and have the additional quality of being imperishable. Asbestilite, as it is called, has been utilised in Canada for constructional purposes with unique success; and bearing in mind the trying character of the North American climate, with its violent extremes of temperature, according to season, it should be useful in the United Kingdom and also in tropical countries.

BLEACHING BY OZONE.

An interesting bleaching-plant has been completed recently in this country for whitening the beeswax of which the candles used in the Russian Orthodox Church are made. branch of manufacture is a monopoly of the Church authorities, and extreme care is observed to secure absolutely pure beeswax for the purpose. The wax, as it is received, has the peculiar nut-brown tint characteristic of a skep-hive of honey, so that the bleaching process is somewhat difficult, as may be imagined, since the resultant product must have a beautiful creamy whiteness, comparing with that of the ordinary wax candle. In this latest development ozone is the bleaching agent employed, the process being the projection of continuous streams of ozone through the molten mass. The idea of utilising ozone for this purpose was recommended owing to the powerful oxidising properties of this gas. Hitherto chemical action has been adopted, but the results are not comparable with those obtained by the ozone method. The wax so treated is hard, while no losses arise from the operation; the process is simplified, is more economical, and there is less risk of deleterious matter being left in the wax. Bleaching by means of ozone has been utilised in the soap and oil industries upon a limited scale, especially for the treatment of palm-oil, tallow, and The success of the process in connection with beeswax, however, is unique, and doubtless will result in the wider application of the idea.

A NEW SAFETY-LOOK.

An interesting lock, which will appeal particularly to motorists, has been placed upon the market. It offers a complete protection against theft or the unauthorised use of the vehicle. The lock is similar to the Yale in its broad principles, being manipulated by a paracentric key. Picking is impossible; while the fact that no fewer than fifty thousand combinations are possible, guards against the possibility of in-advertent opening of the lock by another key. The whole of the mechanism is enclosed in a strong brass box, and the lock acts upon the fuel-pipe supplying petrol from the tank to the engine, and also upon the electric circuit for ignition. In the lock is a fuel-plug to which the feed-pipe is connected, while a suitable make and break for the ignition is also incorporated. By inserting the key in the lock, giving a quarter turn, and then withdrawing it, the fuel-plug is closed, while the electric current is broken simultaneously. Consequently it is absolutely impossible to start the motor, as both fuel-supply and ignition are inter-The mechanism is fitted with two 'security-raccords' for the connection of the fuel-tubes. The chamber of the electric contact is securely separated from the fuel-plug chamber, to prevent explosion when the current is switched on.

A POCKET COLD GREENHOUSE.

While the amateur gardener always strives to raise seeds and produce out of season, lack of facilities denies him the opportunity to gratify his wishes. A cold frame meets the situation, but occupies space; while a greenhouse is an expensive luxury. A recent innovation which meets this end very completely is the 'handiframe.' It comprises two long, narrow, glazed frames hinged together, so that when not in use they may be folded and packed away, occupying the minimum of space. For seed-culture the device may be set in A-form upon a small wooden base having closed ends. As both sides are movable, either may be raised to secure ventilation, and to any desired degree. The adjustments of the two hinged sections are extremely varied, so that any condition of culture is fulfilled; while the maximum volume of solar heat may be trapped therewith, and turned to useful purpose in nurturing the seedlings beneath, and at the same time sheltering them from the winds. The 'handiframe' is made in units, so that, if desired, a continuous length may be laid down. The frame can be adapted to any part of the garden with equal facility. By picking it up, it can be folded and packed away upon a shelf; while it can be set up in a few seconds when it is required. The frame is light to carry, although of substantial construction. The panes of glass, about five to a frame, are not fixed with putty; so that when a breakage does occur the amateur is not troubled. He purchases a new piece of glass of the requisite size, and sets it with ease in a few seconds.

HEALTH AND HEIGHT.

Our ancestors did not often trouble themselves about the healthful amenity of town or village sites, or situations for residential homes in the country. Very often these last were planted low down by the bed of a stream for convenience in getting water, shelter, or other reasons. Now, from a series of articles and correspondence in the Times containing the reasoned opinions of medical men, we find that those who reside some four or five hundred feet above sea-level, and whose homes get a free sweep of the winds, have the best chance of healthful conditions. A medical man has said that London people should live above London. The heights around London from two hundred to four hundred and fifty feet above sea-level are said to be actually the healthiest places on earth. Thus Hampstead Heath (four hundred and fifty feet above sea-level) may be taken to possess a health-value nearly equal to that of Royat in Auvergne, and the same applies to Highgate (four hundred and ten feet), and Muswell Hill and Shooter's Hill (each four hundred feet). After these come Upper Sydenham, Upper Norwood, and the Crystal Palace neighbourhood (three hundred and seventy feet), Harrow-on-the-Hill (three hundred and forty feet), Chislehurst (three hundred and thirty feet), Putney Hill, Wimbledon Common, Finchley, and Hendon. These places all afford a degree of stimulation—' bracing effect'—met with in other countries only at much greater altitudes. The high village is found to be the healthiest, the higher altitude increasing the red blood of anæmic patients and speeding up the system. With this testimony to the value of height it is pointed out how little hotel or house accommodation there is over one thousand feet in Great Britain. The Scottish and Welsh Highlands might, if properly opened up, 'provide an unrivalled pair of lungs for jaded England.' At present our tourists go to France and Germany to find what they might get at home. Professor Gaule, of Zurich, has pointed out, however, that there is an altitude of happiness and of unhappiness. An unreasonably high altitude may bring on nervous irregularities; and Alpine hotels are not all adequately ventilated.

WIRELESS TELEPHONY IN CONNECTION WITH COLLIERY WORK.

What is considered to be a system of wireless telephony is at present being introduced into a coal-mine in Fifeshire. The inventor of the system is M. Reineke, of Boehm, Westphalia, who is also the engineer of the Reineke Wireless Company, London. Recent mining legislation has enforced the use of telephones on all underground haulage roads exceeding one thousand vards in length. In the ordinary system of telephony in mines the conducting mediums are two copper wires insulated from each other, both being enclosed in an outer casing of steel wire, called armouring. A heavy fall of roof practically always puts this system out of commission by breaking or short-circuiting the conducting wires, communication between the two sides of the 'fall' being often impossible. In this new system the insulated wires are entirely dispensed with, and use made of the rails, water-pipes, old wire ropes, ropes on haulage, and even waterways; and it is not necessary that these conductors should be insulated from each other, as electricity of adequate potential has a tendency to flow into conductors of larger superficial area, selecting the path of least resistance. The resistance between the two conductors must be twenty-five ohms, which can be easily maintained in colliery work. electric energy is supplied by a fifteen-volt The voltage is augbattery of the dry type. mented by a transmitter and a transformer to a much larger pressure, and the electric magnetic tones produced in the conductors have a very strong influence on the specially constructed re-

ceivers. It is intended to fit up this new system at all important points underground, while portable sets will also be provided. The value of this system in connection with rescue work cannot be overestimated. In the event of men being entombed instructions can be given through the wireless phone. The company has also a contrivance on the market to fix to shaft cages, so that messages may be given to the engineman, which is a very important innovation in connection with shaft repairs. The instruments are only hired from the Reineke Wireless Company, who erect them and guarantee the efficiency of the system and the maintenance of the instruments in satisfactory working order during the term of contract. In consequence of the admitted advantage by this system in saving lives in mines, the Home Office has under consideration a proposal to extend the date by which these telephones must be fixed, so as to allow of their adoption.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

NUT-GATHERING.

OH heart o' mine! there's sound of happy laughter

From lovers roaming in the woodland lanes; Somewhere a wild bird flutes a moment after, Though a sad stillness on the moorland reigns.

Oh heart o' mine! though hazel-nuts are falling, O'er rock and boulder see the mists and spray; Like a sad dirge each brooklet small is calling To wild clematis wreathed in silver-gray.

Oh heart o' mine! the beech-woods now are dreaming—

Dreaming sad dreams of sunshine-laden days; Out in the west the evening star is gleaming, Whilst all the moorland hides in purple haze.

Oh heart o' mine! the birchen boughs gleam whitely,

Pensive the oaks in tawny dress alone.

Let us away, dear heart. Ah, hush! tread lightly;

Woodlands are weeping. Summer days have
flown.

MOLLIE KENNEDY.

. TO CONTRIBUTORS.

1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3rd. To secure their safe return if ineligible, ALL MANU-SCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.

4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

THE HOUSE OF LADDO.

By CHARLES HILTON BROWN.

CHAPTER I.

BELIEVE that when a man sets himself to the telling of other folks' affairs, it is customary for him to allege some reason or pretext for such a proceeding, with some pretty apology for his deficiency in the art of writing, or for the insignificance of such part as he has himself That this is mere pretence played in the events. I am very nearly convinced; and I suspect that a thing called by the learned the cacoethes scribendi lies behind it all, and so you shall have none of it here. My name is David Lechmere; it is a name better men than I have borne, and you may take it or leave it. As for my powers with the pen, I'll warrant that when these disgust you, you will drop the reading soon enough—the which I give you full and free permission to do.

My father, John Lechmere, held the venerable position of minister of the parish of Birkiea most God-forsaken and wind-swept place on the north slopes of the Pentlands. You may read his name to this day on a headstone in the kirkyard if you have wind enough to scale the dreary eminence on which it stands. I should think, poor man, he is very happy to be there. I remember him as a small, starved-looking creature, with unkempt black hair, always irritated because he had not the strength of character to be really angry, and always amazingly ineffective. I am aware that this is no dutiful or filial description; but if I speak of him with levity or bitterness, it is because he thought of me only as an encumbrance. I can still hear him rolling out in his prayers that it was of the Lord's mercies we were not consumed, and cocking his eye at me the while, as if he thought inwardly that, so far as I was concerned, it was rather a thousand pities.

My early days are all bound up in my memory with howlings of winds, clouds scudding across a cold sky, dreadful pelting rains, and the intolerable muddy mess made by the hens my mother attempted to rear. Our manse was of fairish size, but how it held together Heaven alone can tell. I do indeed remember a portion of it coming down with a run in some gale, and my father sitting Marius-like among the ruins, calling down a thousand curses on the Church of Scot-

land and those who put him into it. It appeared from his talk on such occasions that he had designed himself for a factor or some such thing, but this occupation had not been deemed sufficiently genteel; and in all times of stress he hearkened back to this early disappointment with a vehemence that exceedingly ill became a minister of the gospel.

All this has really no bearing on the genuine matter of this tale, but it brings us to that notable year of grace 1745, and the sixteenth year of my existence. When I come to think of it, indeed, I see that the manse did play a part in the starting of me upon my adventures; for it was in an autumn gale of that year that the east stack of chimneys was blown down in slaughtering ruin upon the hen-run. I remember the clean-washed morning that followed, with the bare trees still tossing, and the three of us gathered round the fallen stones, my father protesting that he could never find money to repair the damage, and my mother maintaining that we must have chimneys, or we should be smoked out of the house. Having roundly anathematised the Church and his own ill-fortune, my father

turned, as usual, upon me.
'David here,' said he, 'ought to do something for himself.'

'John,' said my mother, 'what could the poor

'Judging by his looks,' said my father, staring at me with something like disgust, 'little enough.'

'He would be well enough if he were dressed,' said my mother.

'Which is what he cannot be,' said he. And then, after a few minutes' cogitation, 'He shall go to his uncle at Laddo. I called him by David's name,' said he fiercely; 'and, damme! he shall fish for David's money.'

'David has two sons of his own,' said my

'I know it well,' said he. 'But one is driven from the house, and the other is scarce wise enough. Come, it is worth the trying; we should at least make enough to build up this rickle I have to live in. David can spare it, if he will. I will write this afternoon.'

No. 192.-Vol. IV.

[All Rights Reserved.]

AUGUST 1, 1914.

This project he proceeded to put into effect with more than his usual energy; and after an interval, there came a morning of mighty rejoicing when a very short note arrived from my uncle David, saying he would have me to stay with him. I know now that he must have written that letter without either thinking or caring what it implied; but at the moment I thought only what a kind man my uncle David must be I do not suppose I was much grieved to turn my back on Birkie, and I suspect my parents of no other feeling than a shamefaced relief. Be that as it may, my mother cut my hair with a pudding-bowl; I was got into my best suit of clothes, and away I tramped down to the Granton pier to catch the ferry for Fife.

The House of Laddo stands on that extreme eastern promontory of the county known as the Ness or Neuk of Fife. I have learned since that it has been in the hands of the family of Lechmere for a very considerable period, and even in my grandfather's time was a house of some note in the countryside. This grandfather of mine begat but the two sons, both of whom displeased him exceedingly; but, on mature consideration, he concluded that my father was the greater fool of the pair, and put him accordingly into the Church, while he left the house and money to my uncle David. This patrimony my uncle was supposed to have in some way greatly augmented, though the precise means he had adopted were held the most deadly secret. My father spoke of him as a kind of Crossus, but I much misdoubt if he were, in truth, more than averagely well off. I had, as you will hear, some occasion to study this man; my grandfather's dislike of him I can consequently understand, but I cannot at all imagine how he came to suppose him a

Until my journey to Fife I had never been outside the parish of Birkie; but by virtue of my utter helplessness, and the great fool I made of myself on every possible occasion, I contrived to travel very tolerably on a public diligence the length of Anstruther, and there to procure a ramshackle conveyance to carry me the remainder of my way.

It was now verging into the late afternoon, and as we drove over some high ground belted with young fir, I could look down on the country spreading darkly away before me into the east. A bitter wind came off the sea, which was breaking angrily on the low cliffs in which this part of the world ends; and there was a sense of dismalness in the air, for which even this dark and vacant prospect did not seem wholly to account. Presently, however, we descended on to the more level land of the promontory itself, and, after jolting over some execrable by-roads, drew in to a big square house standing not a quarter of a mile from the sea.

Although lights shone in two of the windows,

some little time elapsed before any answer came to my assault upon the door. At length, however, some shuffling steps were heard, and a man of about fifty, very shabbily dressed and carrying a stable lantern, made his appearance. He looked me all up and down, holding the lantern in different positions, craning forward his white face the better to take stock of me, and wrinkling up his face in a girn that showed his blackened and irregular teeth. Finally, he set down the lantern with a bang, and stepped back a pace.

'Ma name's Rintoul,' said he. 'What is 't?'
'I am Mr David Lechmere,' suid I. 'Can I
see my uncle?'

'Man,' said he, 'ye can try;' and picking up the lantern again, he signed to me to follow him.

This was scarcely the welcome I had been led to expect, but I went groping after him in silence down a couple of pitch-dark corridors. Rintoul came to a halt before a heavy oak door, and here he seemed to consider his mission at an end.

'Awa' in wi' ye,' said he. 'Gang forrit t' the table, an' bide there till ye're bespoke.'

In some trembling I pushed open the door, and found myself in a chamber of enormous size; such at least was the impression it conveyed, for it receded into infinite possibilities of darkness on every side. In front of me stood a large table, littered a foot deep with papers; and by the light of the lamp it carried I saw two men, seated one on each side. The one who sat opposite me raised his head with a curious bird-like sharpness as I came in. He was small, round-faced, and clean-shaven, gray of hair and of eyes. I was about to speak, when I saw that his gaze was perfectly vacant; and, indeed, just as the words came to my lips his head dropped again, and he became once more immersed in the papers before him.

Mindful of Rintoul's advice, I stood, first on one foot and then on the other, for what may have been five minutes; then the bird-like head flashed up again, and this time he saw me. His chin shot out in hostility and his eyes leapt.

'Who the devil are you?' he cried in a voice like cracking wood.

At these words the other man, who had apparently not heard my entry, turned a dark face of questioning upon me. He was of an almost swarthy complexion, with heavy and aggressive features; yet the same suggestion of a light shining behind the face—I can put it no better—made me set him down as the other's son—that son probably whom my father had described as 'scarce wise enough.' He turned a pair of huge black eyes on me with the vacant yet searching expression of some cattle beast; and beneath this double scrutiny I was hard put to it to speak.

'I am your nephew David, sir,' said I at

'Good God!' cried my uncle fiercely. 'What

are you doing here?'

I was so dumbfounded at this that my speech left me altogether; but I produced his letter of invitation, which I providentially carried with me, and laid it before him. He glared at it for a moment, and threw it across the table to his son.

'Steenie,' said he, 'this is your hand.'

'You dictated it,' said the other sulkily.

'Very like,' said he-'very like. And what matter, anyway !- Rintoul!' he cried, raising 'Rintoul! take this boy his high voice. away and give him a room. I cannot be disturbed with nonsense like this. If Cockburn comes I will see him, but no one else-no one else.

Next instant I found myself again following Rintoul's lantern down the dark passages of this extraordinary house. He led me into a small and very uncomfortable apartment, which I judged from certain odours to look out upon the yard; and setting down his lantern on the bed, treated me to another of his disconcerting inspections.

'Bidin' lang?' said he at last.

'Heaven alone knows!' I cried. 'I am at a

'Mphm!' said he; 'jist that. Aweel, mony are called, but few chosen. It's no for a man t' say.'

This sort of conversation I felt to be beyond

me, so I preserved a discreet silence.

'A queer, queer place,' he went on presently.
'd fain be ooten't. The ass knoweth his 'I'd fain be ooten't. master's crib. I'll gie ye se bit hint,' said he, rising. 'Dinna ask questions, an' haud nae speech wi' strangers.'

On this he seemed about to take his departure, and I thought fit to ask a plain question.

'Tell me,' said I, 'what makes my uncle so busy?

He stiffened on the word, and an ugly expression of mistrust crept into his eyes.

'Supper will be at sivven,' said he, and with

that left me to my own devices.

At seven o'clock, sure enough, the supper was served—a very tolerable meal, and notable in my eyes by the presence of wine, a beverage I had scarcely seen in all my fifteen years. Rintoul waited upon us with an amazing clumsiness, to which no one seemed to make any objection; and as, with one notable exception, not a soul took the faintest notice of me from first to last, I was the better able to observe the company.

These numbered more than I had anticipated, for besides my uncle and his son there was present that Cockburn of whom he had spoken -a long, thin, silent man; a writer, I believe, or some such thing, in Anstruther. We had also at the table two ladies, of whom I shall speak

My uncle sat at the head of the table, with

Stephen Lechmere on his left; on his right was a vacant place fully laid, and in connection with this an odd incident occurred.

We had reached the second course, and I was speculating as to the nature of the expected guest and the cause of his delay, when my uncle, who had scarcely spoken so far, cried out to Rintoul, 'Remove Mr Robert's things; he will not come to-night now.'

The things were taken away in silence, and the incident passed without comment.

Of the two ladies who were present I must now speak in some detail. One was very tall, dark, and handsome; she kept up a continuous fire of vivacious conversation, directed, in the most open manner, almost solely at Cockburn, who now and then put in an ungracious or halting word like a man ill at ease. I was at a loss to think who she might be; but I ascertained presently that she was Miss Rose Chalmers, my uncle's ward, given into his charge, I hope, in a day when he was more fitted for the post. It was she who conferred upon the domestic side of Laddo such management and supervision as it could boast, which, as I found, was one week very efficient and the next little short of scandalous, according to her humour. I thought her the most charming and handsome of mortals—an opinion which was greatly enhanced when she at last inquired who I might be; and on being sullenly informed by Steenie, addressed to me a few very kind and gracious remarks.

The remaining member of this curious company was little more than a girl; and, by the family resemblance, I had no difficulty in placing her as my uncle's daughter, Alice, of whose existence I had vaguely heard. I have described this family resemblance as 'a light shining behind the face; 'but in her this trait, secondary in her father and brother, became salient and dominant. It was emphasised, I was quick to notice, by the vacancy of her gray eyes, which stared forth like those of a statue over a finely cut nose and mouth; but so well did she comport herself that I had puzzled for some time over the cause of this before I realised she was stone-blind. She wore always the curious listening expression that rests on the faces of those so afflicted; she spoke very little, but from time to time a smile of singular beauty would light up her features. I remember that, boy as I was, a passionate sense of injustice went through me at the thought that one whose nature was so evidently beautiful should have her life spoiled by a misfortune so devastating.

When the meal was over, all these people went their several ways-my uncle, Stephen, and Cockburn to strict consultation, and the ladies to some apartment upstairs. As there seemed little for me to do and the hour was yet early, I set out in search of Rintoul, and presently came upon him washing dishes with a great din, to the accompaniment of the most mournful singing.

'Are ye no' in yer bed?' said he on my

'I am too unsettled for sleep,' said I, 'and

there are things I must know.'

'The young are headstrong,' said he sadly;

'The young are headstrong,' said he sadly; 'but we live and learn. Weel, weel, what ails ye?'

'I like this house very little,' said I, 'and am

far from sure I should stay in it.'

'I'm wi' ye there,' said he. 'I dinna like it ava', an' nivver did. But I bide. An' what for no'? Ye get yer mate an' a bield ower yer heid, an' the ways o' the Lord are mysterious.'

'I had not thought to be treated thus,' said I,

near upon tears with wounded dignity.

'Wha's meddlin' wi' ye?' said he, surprised.

'Why, no one,' said I; 'and that is just what hurts.'

He stopped clattering his dishes, and, straightening himself up, wagged a dripping finger at me.

'Be ye thankfu',' said he solemnly. 'Them as is least noticed gets maist peace. The less he'—with a fearful emphasis on the word—'looks at ye the better ye are.'

'Tell me, then,' said I, 'who is Mr Robert, and

why did he not come to-night?'

He shook his head sadly, and fell to his dishes again. 'Ye sud ha' said, "Who was Mr Robert?"' said he; 'then I cud ha' gi'en ye an answer. He was the maister's eldest. A prood spirit—ay, a prood spirit—that goeth before destruction. Mr Lechmere pit him till the door three year syne; an' who or where Mr Robert is, is beyond ma power t' say.'

'But the place that was laid?' said I.

'It always is,' said he, 'an' aye will be. When he pit him t' the door Mr Lechmere says, "There'll be a place set for ye every nicht," says he. "When ye've gotten sense, come in for 't." But he'll no' come. Na, na. The

fleshpots o' Egypt. The husks that the swine did eat.'

'But what had he done?' I asked.

'Weel,' said Rintoul, 'whiles he drank and whiles he played cairds, but that was a' kind o' forgivable. Youth will have its day, an' a contrite spirit can aye mend. But he did a waur thing nor that—ay, a waur, waur thing nor that.

'What?' said I, breathless.

Rintoul turned on me a face of extraordinary solemnity, and spoke in a voice like a minute-bell. 'He turned Jawcobite,' said he.

Now this was a question on which I knew more than you might suppose; for I had read much and keenly of that stirring year of the 'fifteen, and the Chevalier St George, and of that splendid young Charles Edward who was just come to claim his own. And whether it was that my father hated the sect—which would have been sufficient in itself to commend them to me—or whether it was a mere boyish love of the romantic and the rebellious, I had found all my sympathies to incline to the side of these outlaws; with the result that, at Rintoul's solemnity, I burst into laughter.

'Oh, come,' I said, 'that was none so very

bad.'

His face assumed an expression of horror, as though I had uttered some frightful blasphemy. He recoiled from me as in a kind of awe. Had he been a Papist, I am certain he would have crossed himself.

'Keep's a', lad!' said he at last, 'ye maunna speak like that; ye maunna, maunna speak like that. The dawmnable Jawcobites! But mebbe I forget yer years. I thought as a child, I spake as a child. Ay, ay. Awa' t'yer bed, an' no more such words.'

After so serious a blunder I deemed it well to act on his advice; but as I was going he still gaped after me, wagging his finger.

'We dinna haud wi' Jawcobites here,' said he.

(Continued on page 568.)

THE COUNTRY GENTLEMAN: THEN AND NOW.

By Sir George Douglas.

LIKE almost everybody else, within recent years the country gentleman has undergone the process known as 'speeding up,' and, to own the truth, he stood in need of it more than most people; for, though leisure is an excellent thing, he had too much of it. So his time ran to waste for lack of method and of organisation; he lived below himself, and paid the penalty of his privileges by his failure to get enough out of life. For example, I remember once hearing a small landowner repeat twice or thrice in the course of an evening that he had a meeting to attend in the county town the week after next.

Now, doubtless it was quite right that he should regard his own attendance at a meeting as important; but that a meeting ten days ahead should loom so large on his horizon argued a certain blankness in the interval. This was perhaps an extreme case. Yet none the less is it characteristic of those who, not having enough to do, are apt to lie low or rest upon their cars, anticipating as a supreme effort that which a fully occupied man would take in his stride and make no bones about. And hence there is loss of power and of service to the community. But the principal loser is, of course, the individual

himself. Nowadays we have changed all that, or at least we are fast changing it; and, perhaps, as often happens, we are going to the opposite extreme.

For, after all, their shortcomings notwithstanding, they were grand old days, those days I have alluded to-days which represented, I have no doubt, a golden mean between the modern rush and those remote times depicted by George Stubbs of Liverpool, when men went shooting or played cricket in tall hats-in a sort of full dress. They were the times when partridge-drives were as yet unknown; when sportsmen asked nothing better than to walk their birds up, or to shoot them over dogs; when muzzle-loading guns were just going out of use, and ejectors were as yet undreamed of. And yet, to those who took part in it, the sport of those days never seemed slow, it may be because at that time patience was still one of the virtues exacted of a sportsman; but in one respect, at least, the bags of those days were generally heavier than they are now, for that was before the action of the Hares and Rabbits Act of 1880 had so greatly reduced the head of hares throughout the land. Then might heavily laden farm-carts be seen plying to and fro between the fields and the homestead where the dead hares were deposited—a sight one does not often see nowadays. And yet, if I remember rightly, it was not until after the passing of this contentious Bill that one first began to hear complaints of the great and wanton damage wrought by hares on turnip-crops-whole rows of the roots being wasted by just a bite or two from tiny teeth. In explanation of this apparent inconsistency it must be borne in mind that in the earlier times the Squire had many more hares to give away, and that hence both farmer and labourer were in general kept well supplied with game of the variety which they liked best. Few landed-proprietors sold their game before 1880. And in those days it was always the Squire and his friends who shot over his own ground, where now it is the shooting-tenant, or the members of a shootingsyndicate. Then the mere exercise of walking over turnips was considered a part of the day's sport, and there were guns who would ask for a post at the end of the line for the sake of the extra walking they would get when the line swung round. Somewhat different this from reclining at the back of a butt with pipe and newspaper! Where, I wonder, did the pheasants come from in those days? Excepting, I suppose, upon large estates, there were many fewer handreared; and yet they did not lack. It is true that folks were less ambitious then, and were content to shoot with one gun. Per contra, half-fledged birds, scarcely able to rise to the height of a high park-wall, were things unknown.

Those were the days, too, of early starts and of long rides through all sorts of weather to attend distant meets of foxhounds, for in those simpler times the use of the railway, or even of a carriage, for hunting purposes was exceptional. John Leech's illustrations to Surtees's novels bring back the once familiar scenes. They were likewise the days of very much smaller fields, almost purely local in their composition, when men hunted, not because it was the fashion, but solely from love of the sport, and when a woman who followed the hounds was as yet a rara avis. In such wise, then, and amid such surroundings, did the Old Squire 'take his pleasure sadly.' Or so, at least, did I once hear the New Squire put it, using a classic phrase satirically.

A very great man indeed is he, this same New Squire, who has bought out the Old Squire. Not a squire by descent, or by inheritance, from time immemorial in the countryside; and yet, if not exactly a good imitation of the real article, at least a fair substitute for it. For, though his working life has been spent in busy towns, and is still spent there, the love of country sport is in his blood; and that is the first essential to the making of a squire. To be a good landlord is important; to attend well to county business is desirable; but to be a sportsman is indispensable. For, though businessmen and landlords may be made, a sportsman must be born.

But if the New Squire possesses this saving grace, and is, besides, a good fellow—as I gladly acknowledge that he is-what remains to differentiate him from the old race which he is supplanting! The difference is, after all, a somewhat subtle one; yet I believe that the veriest yokel rarely fails to detect it at a glance, though for a townsman I cannot answer. It is, in fact, then, a matter of self-consciousness-of lack of simplicity; in certain cases, of pretension. To express myself somewhat otherwise, the Old Squire acts as to the manner born; the New Squire plays a part. Yes, he is always conscious that the eyes of the world are on him, even when this is least the case. And is it not inevitable that he who plays a part should play just sometimes to the gallery? Remember there is every excuse for him. It is all so new—this sumptuous mise en scène, these possibilities, this deference extended to him at every turn! Now, to the Old Squire all this meant nothing, or at least only what he had always been accustomed The New Squire is unmistakably happyunmistakably pleased with himself. The one trouble lurking in his mind is an occasional doubt whether all men realise what a wonderful man he is. It requires imagination to do that. For though they see him here in all his glory, still they only see one side of him. And he is every bit as wonderful in Manchester as he is in Fairford Chase. Sometimes I have suspected him of jogging his hearers' memories, of giving them just a little help towards grasping the full import of the situation. For example, his English is slightly more bookish than was the Old

Squire's, and there is one phrase in particular which he is fond of using when describing some one of his acquaintances who is in a position similar to his own. 'He wields a large amount of influence,' he will say. The phrase is as true of himself as of his acquaintance, and I for one can never help fancying that he remembers this as he pronounces it. But I am nothing if not malicious. Certainly the Old Squire 'wielded no influence' whatever, except perhaps at Petty Sessions. Neither had he anything whatever of obvious delight in himself and his possessions. Of an essentially kind nature, he was rather melancholy than otherwise.

Not for the New Squire are those candlelight toilets, or those lantern-lit mountings, to ride over half the county to meet a horse sent on the day before. The motor-car has abolished all that. Certainly the New Squire is an early riser; a business life has taught him to be that. But then he will dictate a score of letters to a typist before donning his pink coat and entering the high-power car which is to whirl him to the meet. The squire of the older generation did not write a score of letters in a week.

Nor are the differences between the old order and the new less conspicuous in the social than in the sporting department. The Old Squire, for example, made the best of such society as Heaven had vouchsafed him. And a rarely good thing that best would sometimes be. Yes! a neighbourhood was a neighbourhood in those days, and there were many of its inhabitants who scarcely looked beyond it. Born, reared, matured upon one well-beloved tract of land, they had traditions, recollections, esprit de corps in common. Their interest in one another was much more than merely conventional. Family friendships flourished among them from generation to generation; likewise sometimes family feuds. Perhaps they occasionally saw too much of each other for comfort; but that, I believe, was exceptional. At least their breeding as ladies and gentlemen generally kept their relations with one another dignified, if it did not always keep them amicable. And what good things at their best were their mutual respect, regard, and affection! With infinitely easier social intercourse, there is nothing quite like it nowadays
—nothing quite so fine perhaps. Yet I know that those old country-house dinner-parties of twelve or fourteen, with soup helped by the hostess and joint and game carved by the host, would be voted dull to-day; whilst the ballad by

Virginia Gabriel, or by Claribel, sung by the débutante in the drawing-room afterwards, would excite not sentiment but satire.

The New Squire's entertainments are more sumptuous and lavish. But then he has other sources of revenue besides his rent-roll. He is not dependent on the neighbourhood for social intercourse, for he imports his own society. He has made a substantial addition to the mansionhouse, and there from October to April one house-party succeeds another. It would be too much to expect that the bonds between himself and his guests should be either very firm or very lasting. Que voulez-vous? He is a man of the world, his guests are men and women of the world, and they know how to fleet the time to their own satisfaction. What if no two members of the company are perhaps likely to meet again, or were known to each other six months ago? Were they not all of them in London during last season, and at Cowes, at Homburg, in Scotland afterwards? So that, where they lack traditions and interests, they have at least topics of conversation in common. And for natures which are not generally very deep that is surely enough. At the Hunt Ball the arrival of the New Squire's party is one of the incidents of the evening. And if diamonds and Paris frocks can of themselves be held to contribute brilliancy, then that party is as brilliant as need be. There are a few of us, however, who look to the poise of a head, the turn of a neck, the modulation of a voice, to bearing, gait and carriage, to confer distinction on a scene, and such, I fear, remain unsatisfied with the latest arrivals. They are happy, good-natured, and on pleasant terms with one another; but, at least, to an eye that may possibly be prejudiced, they still leave something to be desired. What is that something? It is difficult to define, but may perhaps be compared to the quality of old wines, old lace, old paintings, or old china-in fact, to the virtue of any article which, originally fine, has mellowed and matured by keeping. In the New Squire, quality of this kind is conspicuous by its absence. And if this is so superficially, are we not justified in surmising that there are corresponding qualities, lying below the surface, in which he is equally defective? But time will cure all that. In the meantime he has the energy, and, not less important, the sinews of war. And the Old Squire, some say, is played out. There are others, however, who maintain that he will come

A KNIGHT ON WHEELS.

By IAN HAY, Author of The Right Stuff, A Man's Man, Happy-go-Lucky, &c.

CHAPTER XXXI. - THE SILENT KNIGHT.

PEGGY walked to the fire and warmed her hands delicately. She was wrapped in a dark-blue velvet opera-cloak trimmed with fur. One corner had fallen back, showing the pink silk lining. Presently she slipped this garment off, and, throwing it across a chair, sat down upon the padded top of the fire-guard with a contented sigh and smiled seraphically upon her host. The clock struck half-past twelve.

'Peggy,' inquired the respectable Philip severely, 'what on earth are you doing here?'

'I came to see you, Theophilus,' replied Peggy. 'Aren't you glad to see me?'

'Such conduct,' observed Philip resolutely, 'is most reprehensible.

'Yes, isn't it? But I was at a dance close by, and I thought you would like to see my new frock. Do you think it is pretty?

Philip merely gaped. He was all at sea. Peggy regarded him covertly for a moment, and spoke again.

'When a lady,' she said reproachfully, 'takes the trouble to climb up four flights of stairs to show a gentleman her new frock, it is usual for the gentleman to say something appreciative.'

'I think it is beautiful,' said Philip, feasting his eyes upon her. Peggy, noticing this, decided to divert his attention from the wearer to the garment.

'And yet,' she said, 'if you were asked to describe it to-morrow, you would not be able to remember a single thing about it.'

'I should remember every detail,' replied Philip; 'but I should not be able to describe it. There's a difference, you know.'

'Try-now,' suggested Peggy.

Philip meekly fell in with her mood. He knew enough of the character of the girl before him to be quite certain that she had not visited his flat at midnight in order to show him her new frock. She wanted him for something. Perhaps she was in trouble. Well, she would tell him in due course. For the moment. extenuating irrelevances were to be the order of the day. 'Miss Peggy Falconer,' he began conscientiously, 'looked charming in a white silk '-

'Satin,' corrected the charming one.

'Satin creation, which was partly obscured from view by a sort of kilt'-

'A tunic.

'A tunic of pink gauze.'

'Of rose-coloured chiffon.'

'Thank you. Miss Falconer wore the neatest little white satin shoes, tied up with ribbon, and white silk '-

'They are not usually mentioned.'

'Sorry! Miss Falconer wore long white gloves'

'They are taken for granted.'

'Well, anyhow,' persisted the harassed Philip, 'round her hair Miss Falconer wore a band of some stuff or other'-

'Of tulle.'

- 'Of tulle, which very cleverly matched the lour of her ki—tunic. Over her shoulders she colour of her ki—tunic. Over her shoulders she wore a filmy scarf, of the same stu—material. Her waistband, which she wore rather high up, contained a small bunch of carnations. Finally, her appearance caused considerable gratification to one of her oldest friends, who did not know that she was in town.'
- 'I only got back this afternoon,' said Peggy, who by this time had risen to her feet and was inspecting Philip's lares et penates. 'By the way, your front-door was ajar, Philip. Your last visitor must have left it open. Very careless! last visitor must have left it open. You might have been robbed.'

'I expect it was friend Grice.'

Peggy babbled on. She was speaking vivaciously, and rather more rapidly than was her wont: another woman would have said that she

was talking to exclude other topics.

'It is more than a year since I was in these rooms, Philip. They are as snug as ever, but horribly untidy. Why do you always keep books on the floor? And your mantelpiece tragic!' She ran her finger along the edge, and held it up reproachfully. 'Look! Filthy!' The tip of her glove was black. 'I shall have to take my gloves off, I see, to keep them clean.'

'You have dropped 'I apologise,' said Philip. in just before our annual dust-up. Most un-

fortunate!

'Are these your household gods?' continued Peggy, coming to a halt before the mantelpiece.

Yes.

'Yours or Timothy's?'

'Mine. Tim keeps his in the other room across the passage. We usually feed here and sit there.'

Peggy gave a little cry. 'My dear Philip, when did you get those awful vases?'

Philip explained, with more apologies. 'And what is that queer thing there?'

'That is a model of the Meldrum Carburettor.'

Peggy nodded her head. 'I remember,' she said. 'I have met it before. I suppose you say your prayers to it. What is in that cracked jar?' 'Tobacco.'

'I thought so. As for these old pipes, you ought either to send them away to be cleaned and revarnished, or else get a new set altogether. No, I don't think much of your taste in mantel-

piece ornaments, Philip. Now, if I were an eligible young bachelor, I should sweep all these hideosities away and substitute a row of photographs of fair ladies.'

'I'm afraid I haven't got any,' said Philip.
Peggy regarded him coldly. 'Indeed!' she

Peggy regarded him coldly. observed. 'I have an idea that I once presented you with my portrait.'

'Here it is,' said Philip. He pointed to the open bureau. There stood Peggy's photograph

in a large round silver frame.

'H'm!' said the original, with her head on 'The darkest corner of an old bureau! I thought as much. I suppose this empty space in the middle of the mantelpiece is reserved?'

'Reserved! What for?' inquired the mystified

Philip.

Peggy pointed an accusing finger.

'Whose photograph,' she inquired, 'does a man eventually plant in the middle of his mantelpiece? Hasn't she come along yet, Theophilus? You must hustle, you know. You are getting on. You must not be left on the shelf! She put her head upon one side in the manner which Philip loved, and smiled provocatively up at her sere and yellow devotee. Then, without a moment's warning, her mood changed. 'Philip, my friend,' she said caressingly, 'forgive me. You are an angel of patience. I did not come here to-night to show you my new frock, or torment you.

'I gathered that,' replied Philip gravely. 'Won't you sit down?'

He drew up an arm-chair to the fire, and the girl sank into it luxuriously, extending her

flimsily-shod feet to the blaze.

Philip stood with an elbow upon the mantelpiece, looking down upon his love. All his life he never forgot the picture that Peggy presented at that moment, enthroned in his old arm-chair in the dimly-lit, smoke-laden room, in her shimmering ball-dress, the firelight tingeing her bare arms and shoulders, and her brown eyes and honey-coloured hair glinting in its rays. 'Can I help you about anything?' he asked bluntly.

'Yes, Philip, you can. I want to tell you something. I—I have just had a proposal!'

'Where? When?' asked Philip involuntarily. 'At the Freeborns' dance, on the top of a flight of stairs, about three-quarters of an hour ago,' replied Peggy with great precision.

'Not in the conservatory?' 'Conservatory? No. Why?'

'I had a kind of notion,' said Philip lamely, 'that these events always occurred in a conservatory. You know-Chinese lanterns-distant music-exotic atmosphere-and so on! Was it a good proposal?'

'Fair to middling, so far as my experience

goes.'

'Did he—carry you off your feet?'

'No,' said the girl soberly, 'he didn't. I maintained my equilibrium; it's a way I have. But you mustn't think I didn't enjoy it. It was most thrilling.

'Quite good, in fact, for a first attempt?' 'First attempt!' Peggy's eyebrows went up. 'How do you know it was a first attempt? Have you guessed who it was?'

Philip nodded.

'Perhaps he told you!'

'No. I have only just guessed.'

'How upsetting of you! I wanted it to be a

surprise.'

'It is. He was dining here to-night, obviously on the war-path, and bound for the Freeborns' dance. But I never guessed you were the objective. I didn't know you were in town, for one thing. So you came here to tell me your news?'

'Yes,' said Peggy. 'Not altogether,' she added slowly. 'I-I want to consult you, Philip. It's a big thing for a girl to have to decide on a plunge like this—the biggest thing she ever does. It rather—rather frightens her at times. If she has no mother, and no brothers or sisters, and and a dad like my dad, it becomes a bigger thing than ever. Her best course, then, is to pick out the whitest man she knows, and ask him to advise her. That is why I am here.'

There was a long silence.

Then Philip said, 'I am very proud that you should have come to me. But I doubt if I am the right person. Why not ask a woman to

advise you?

'Because,' replied Peggy with great vigour, 'women are such born matchmakers. If you go to a woman and confide to her that you are wobbling on the brink of matrimony she won't advise you; she will simply step behind you and push you in! That is why I can't consult Jean Leslie-Jean Falconer, I mean-although she is my best friend. She is far too romantic to be No, I must have a man, Philip; and practical. I have picked you. You are the best sort I know; you have seen a good deal of life, and you are absolutely unbiassed. You know me, and you know Tim. Now, shall I marry him?'

Philip sat down rather heavily upon the fireguard, and pondered. 'May I ask you two or three obvious and old-fashioned questions?' he

said presently.

Peggy nodded. 'Do you—care for him?'

Peggy wrinkled her brow. 'He's rather a lamb, you know,' she said, 'and I am fond of him. But I don't quite know how much of it is the real thing and how much of it is gratitude. I think you know'—she hesitated—'that things have not always been too easy at home '-

'Yes, I do know!' said Philip with sudden

'Sorry! Go on!'

'And Tim could take me away from that. He has been very good to me, always, and I have not too many friends. I find friends rather difficult to keep. I fancy dad may be the reason. You, for instance, have given us up'-

Philip made a sudden movement, but did not

'In fact, you have hardly been inside our

house since you left it after your illness.'

This time Philip could answer. 'I felt rude and churlish,' he said earnestly; 'but it seemed the best thing to do. You see, one of the last observations which your esteemed parent made to me was to the effect that he wished to congratulate me upon having got through my illness so inexpensively! After that'-

'I know,' said Peggy, smiling, 'but I need not cologise. You know what dad is.'

apologise.

'He furthermore added'said Philip,

flushing.

'Yes, I know what he added,' interposed Peggy 'He shouts, rather, when he is making quickly. And you, poor thing, being his honoured a point. guest, could not answer back! The fact is, the old gentleman contracted the gravest suspicions of you the first time he found me washing your face! After all, some one had to do it. He was always inclined, too, to regard you as a malingerer, though I kept explaining to him that a compound fracture of the tibia could not be simulated. Still, the long and the short of it all is, Philip, that you don't come about the house any more. Tim does, though; apparently dad regards him as harmless. Tim has been very, very good to me, and, as I say, I am grateful.

'And you are thinking of marrying him ?'

'Frankly, I am thinking of it.' 'But you have not said yes?'

'No. Next question, please?'

'You are sure that Tim cares for you?'

'Well,' said Peggy cheerfully, 'to judge by the way he went on upon the top step I should call him a pretty severe case.

But does he love you?' persisted Philip doggedly. 'A woman is always supposed to

know that.'

'Yes, Philip,' assented Peggy quietly, 'she usually knows.

'Where is Tim all this time, by the way?'

'I left him at the ball. He was particularly anxious to have a farewell waltz with a certain girl. You see, he is by way of burning his boats to-night.'

'Who is the lady?'

'Her name is Babs Duncombe. He told me all about her. She is one of the only other girls he ever loved. I gather that she is about the pick of the "also rans." I told him he could have half an-hour to close his account with her, and then he could come along here and call for me. There's one' o'clock striking! Now, Phil, what shall I say?'

Peggy's eyes met Philip's, and they were full

But Philip asked one more question. He thought it permissible, under the circumstances. 'I just want to ask this,' he said. 'Are yousure there is no one else?'

Peggy shook her head. 'There can be no one else, she said deliberately. 'Tim-and youare the only men I have ever known really well. There can't be any other.'

She rose to her feet and stood before Philip, slim, fragrant, and wistful, and laid her hands on his broad shoulders. The hands were trembling. 'Advise me, friend,' she said. 'I will go by what you say. Be a big brother for a minute. Tell me what to do. Shall I marry him? I-

I'm rather lonely sometimes.

Philip looked up into her face, and all hesitation left him. The fight within him ceased. In its place had come the rarest and most wonderful thing in human nature—Love that takes no account of Self. For the moment Philip Meldrum had ceased to be. All he saw was Peggy-Peggy happily married and properly cared for. Very gently he drew the girl's hands from his shoulders and held them in his own. Then he said, 'Yes, marry him. And I hope you will be very happy, Peggy dear.

'Thank you, Philip,' said Peggy quietly, one had almost said listlessly. She was very white. She sank down into the chair again, and Philip

released her hands.

'And now,' he said with great energy, 'I'll go out and look for a cab for you. There's a fearful fog outside, and there is no saying when Tim will turn up. In any case, you can't stay here till the milkman calls. I will see if I can find some kind of fiery chariot for you. suppose I can't offer you a whisky-and-soda?' pointing to the tray on the table.

'I'll take a little soda-water, please,' replied

Peggy faintly.

She lay back gazing silently into the fire until her host supplied her needs. Then she spoke again, in her old steady, clear tones. 'You are a good sort, Philip. You ought to marry some day; you are wasted at present. And when you pick a wife show her to me first, and I will see you're not imposed on.'

'Taxi?' interposed Philip, almost roughly.

'I'm not particular,' said Peggy. 'You had better be quick, though, because I am going to explore this room and meddle with all your'-

But Philip had gone.

Presently Peggy rose and began to wander round the room. She arrived at the bookcase.

'Engineering-seven bound volumes. That's not very exciting. Kipling'-surveying a long row—'that's better. He loves him, I know. Stevenson, Jacobs, Wells.' She took down a green volume. 'The Country of the Blind. So that's where you were brought up, mon ami!'

Peggy restored the book to its place with a quavering little laugh, and turned to the table. Then she stopped dead. Before her, in the circle of light formed by the rays of the lamp, lay a letter—a bulky letter—ready for post. It was addressed to herself.

(Continued on page 563.)

THE DESCENT OF THE RHONE FROM LYONS TO PROVENCE. By LIDDELL GEDDIE.

THOSE who have sailed down the Rhone from Lyons to Avignon with one accord declare that the voyage immeasurably surpasses the journey down the Rhine from Mainz to Yet every year sees the Rhine steamers Cologne. thronged with tourists, while the Rhone passenger-boats had to be withdrawn some five or six years ago for lack of traffic. That old frontier of civilisation, the Rhine, has become the inevitable parade of orthodox excursionists and jaded globe-trotters of every nation, and the Rhone, the historic highroad by which civilisation first made its way through France into Britain and northern Europe, remains neglected and unvisited by the people of the lands which owe it so much. Those travellers who do pass down the Rhone valley are bound for Marseilles and the Riviera, and as they speed southward in P.L.M. trains-de-luxe they have no eyes to follow, no yearning to explore, the Rhone's impetuous course. Surely some of these migrants could spare a day or two from the Mediterranean coast to view the wonders of Rhoneland. Let them but once break their journey, no matter where 'twixt Lyons and Arles, and the Rhone will do the rest, for he who has once heard the Rhone crunching the gravel of its bed-

Lou tafori

Dou Rose tourmentau que manjo lis auvas—will be under its spell for life, and will not rest till he has been carried swiftly through fairyland on its strong back. And then he will be added to the happy few who know that for historic, romantic, and scenic interest the crowded Rhine cannot compare with the unfrequented Rhone.

To study the treasures of the Rhone—Rhone-gold—in detail and at leisure, you must go from trove to trove on foot, by rail, or motor-car; but to know the Rhone aright in all its panoramic splendour, to hear it tell its own tale, there is but one way, and that is to race between its banks, to dive beneath its bridges, a breathless journey, more exhilarating, more entrancing by far, than your descent of the Rhine. Happily there is a prospect of the passenger service from Lyons to Arles being resumed in the near future. In his latest report the British consul at Lyons states that a scheme is afoot with this end in view, but that twenty thousand passengers a year must be mustered in order to ensure a profit.

To think that the Rhone, the whilom highway of the nations, should have to tout for passengers!—the Rhone, which in bygone times has seen such countless hosts of invaders: Hannibal's men from across the Mediterranean marching to victory at Cannæ; hordes of Teutons and Barbarians from the far north, who but for Caius Marius would likewise have poured into

Italy across the Alps; Cæsar's legions advancing up-stream to the conquest of Gaul; Gallic tribes pressing down-stream in rebellion against Roman rule; ruthless Saracens, from Spain and Africa, carrying the Crescent into the heart of France; gallant Crusaders hastening to the Holy Land. Throughout the Middle Ages and modern times endless companies of soldiers, churchmen, pilgrims, merchants, peasants passed up and down the Rhone; and not till the nineteenth century brought railways and decent roads did travellers forsake the river for its banks. But it was left for the twentieth century to rob the Rhone of the last vestiges of its human freight, and interrupt the procession of two thousand years and more.

Such a disgrace as the suspension of the Rhone passenger service cannot be allowed to continue, and erelong we may look for renewed bustle in the early mornings of summer and autumn on the Quai de la Charité at Lyons, whence Le Gladiateur used to put off for Avignon and the sunshine of Provence. Let us anticipate that happy day, and try, if we can, to hasten its coming by recounting some of the sights and sensations that unrivalled trip affords. If the renewal of the passenger service is delayed, a visit to the Rhone valley need not on that account be postponed. (On both banks a railway and a good road run parallel to the stream.) If once you go there, you are sure to go back again the first chance that offers. What there is to see cannot all be seen in one visit, and what you do see must be seen a second time. Besides, for a considerable portion of the year the state of the river forbids the descent being made by boat.

The Rhone, you see, is not a river to be trifled with. It boasts the swiftest current in Europe, 'that deuce, that devil of a Rhone,' to quote Madame de Sévigné (who died at Grignan, near its banks), 'that furious Rhone, which frightens one and all, and fills me with frenzied terror.' From its source in a Swiss valley it rushes down to the Lake of Geneva. It courses through the lake, and issues, clarified but unpacified, at Geneva, whence it speeds east and south through France to the falls of Bellegarde; then on to Lyons, where it meets and 'marries' the Saône, and at last condescends to become navigable. In true French fashion, the Rhone, having had his fling before entering the bonds of matrimony, settles down to make as rangé and steady-going a husband as his temperament permits. The Saône, whom he takes to share his bed, sets him a noble example in industry and docility, and under her restraining influence he abandons his hitherto erratic course, turns definitely toward the south, and makes for the Mediterranean. The nearer he

comes to his goal the more does he relax his pace, until at last he creeps wearily into the sea through the forlorn delta of the Camargue, which for centuries he has been making in order to prolong yet awhile his parting from the fair land of France. There is something strangely human in the career of the Rhone, which thus spends its frolicsome childhood in Switzerland, its irresponsible youth between Geneva and Lyons, its best, maturest, and most useful years between Lyons and Arles, and its old age between Arles and its grave in the Mediterranean. In each of these stages the Rhone has a character and fascination of its own; but that which we now propose to trace, its period of manhood, is infinitely the most eventful and alluring.

Save those on business bent, it is extraordinary how few people go to Lyons. There is no monograph in English, history or guide book, devoted to the city which disputes with Mar-seilles the right to rank next to Paris in the French Republic; Lyons, the great European centre of the silk industry, with a population of from five to six hundred thousand; Lyons, which was famed among cities long ere Paris and London emerged from villagehood and obscurity; Lugdunum, the ancient capital of Gaul, advance-post and stronghold of civilisation, birthplace and home of Roman emperors. But apart from its proud place in history, secular and ecclesiastic, its fine Roman and medieval remains, Lyons is worth visiting if for no other purpose than to see the Rhone, brightest and most precious of its many jewels.

The Rhone and Saône—what other city has two such rivers in its midst? Right into the heart of Lyons run these two great arteries, the patient Saône and the surging Rhone, emblems of the twofold nature of this strange, intriguant city, Lyons the industrious, Lyons the revolutionary. Their waters are enclosed by twenty miles of medieval and modern enbankment, and spanned by twenty-five bridges,

old and new. By a great engineering feat their junction has been fixed at the southern extremity of Lyons, amid surroundings exasperatingly prosaic for so romantic a trysting-place.

You have no sooner passed the confluence and quitted Lyons than you notice a characteristic feature of the Rhone valley. The right bank has the grandest scenery; the left bank has the prettiest scenery. The finest sights on the right bank are the work of nature; the finest sights on the left bank are the work of man. The right bank is shut in by hills and neighbouring mountains—the Monts du Lyonnais, the Mont Pilat range, the Monts du Vivarais, and the Cevennes. Lofty peaks, three thousand to six thousand feet high, raise their majestic heads not many miles from the riverside. Toward these the Rhone's natural inclinations ever seem to turn. But, mindful of his spouse's tastes—the Saône loves flat and fertile ground—the

Rhone for a time keeps a rich, wide plain on his left hand. Away beyond this to the east may be seen the snow-topped heights of the Dauphiny Alps, and, a hundred miles off, on a clear day, from certain view-points, Mont Blanc itself can be descried. On the right the Rhone is joined by numerous short streams, mountain torrents dashing through gorges and over falls. On the left it receives two or three tributaries of goodly length and size—the Isère, the Drôme, and the Durance. Up the precipitate slopes of the right bank climb venturesome vineyards, but beyond this cultivated fringe are bare mountainsides. The left bank is a great smiling orchard. There are few towns of moment on the right bank; on the left stand Vienne, Valence, Avignon, Tarascon, and then Arles. Here, there, and everywhere on the right shore ruined towers and castles dominate the Rhone, medieval strongholds and têtes-de-pont. The left bank also has its castles and its ramparts; but it boasts monuments more venerable by far, monuments of Rome's pleasures, piety, pride, and prowess, theatres and amphitheatres, temples, tombs, and triumphal arches. You need not go to Italy to realise the grandeur that was Rome. It is to the Rhone valley you must turn if you would see the best preserved Roman theatre, the most beautiful Roman mausoleum, the most perfect Roman temple, the most magnificent Roman aqueduct extant.

It is not unfitting that during the first stage of the voyage down the Rhone you steer straight for Le Mont Pilat, a mountain whose name has been confused with that of Christ's callous judge; for the Rhone is a channel of Christianity as well as a Roman road. Few rivers have witnessed such religious strife and persecution as the Rhone; few rivers figure so prominently in early Christian legend. At its mouth, the story goes, landed the Three Maries (Mary Magdalene, Mary Salome, and Mary Jacobe), Martha, Lazarus, and other friends of Jesus, who, after the crucifixion, had been set adrift by the Jews in an open boat, without mast, sail, anchor, oar, rudder, or provisions. To Vienne, not a score of miles down the Rhone from Lyons, Pontius Pilate, according to Eusebius, was banished after his disgrace in Judea, and tradition has unwarrantably but none the less inseparably linked his ill-omened name with medieval remains and antique monuments as well as with the eternal hills near Vienne, just as it has involved in the legend of Les Saintes Maries places and things which date long before or long after the dawn of the Christian era. Thus the pyramid at Vienne which archæologists have identified as a unique relic of the spina of a Roman circus has been called the Tomb of Pilate, and the ruined square tower of Philippe de Valois, built six hundred years ago, on the right bank of the Rhone opposite Vienne, is popularly known as the Tour de Mauconseil,

the spot from which the wretched Pilate threw himself down to his doom. As a matter of fact, the tower was erected as a tête-de-pont to guard the French end of the old bridge, for Vienne at the beginning of the fourteenth century was not yet a permanent part of France. For hundreds of years the Rhone formed a natural boundary; and, to this day, when boatmen steer for the right bank the cry is Reiaume (Realm of France), and Emperi (Empire) when they put over to the eastern shore. A suspension bridge now unites Vienne and Sainte Colombe. A medieval bridge here was swept away in 1651, and traces still are found of the wonderful ancient bridge built, it is thought, by Trajan, the only stone bridge across the Rhone in Roman times between Lyons and the sea.

We might tarry long among the Roman and medieval remains of Vienne; but the Rhone brooks no delay, and we must be content merely to mention among the things which repay a pilgrimage to Vienna Pulchra, quondam capital of the Allobroges and of southern Gaul, the temple of Augustus and Livia, one of the finest antique monuments in existence, Roman roadways and stairways, aqueducts, and sculptures

of the choicest kind.

From Vienne to Valence (some fifty miles) the Rhone carries you between famous vineyards-the Côte Rôtie, Roussillon, Hermitage, and St Péray, where they make delicious sparkling wine. Since the Roman conquest of Gaul this portion of the Rhone valley has been renowned for its vintages. Sheer from the riverside rise limestone crags crowned with timeworn castles and chapels whose rugged walls it is often difficult to distinguish from the solid These bare cliffs, scarred and cave-eaten, these grim ruins, and the frowning gorges through which the Rhone races ever and anon, contrast strangely with the sunny vineyards, orchards, and fields which also line its banks. Graceful poplars and willows, all in rows, give place to terraces of vines and trees ablaze with pinkand-white blossom or laden with delicious fruit. Then come nettle-trees and mulberries that pay tribute to Lyons, the Silk City; and as you get farther and farther south more and more dark, dusty olives are seen, for 'A Valence Le Midi commence,' and the olive takes posesssion of the land. Each turn of the river has its surprise in store-romantic donjons and quaint townships perched upon the hilltops: Châteaubourg proudly fronting the valley of the Isère; the Château de Crussol, dizzily balanced on the verge of a limestone cliff over against Valence; lofty Rochemaure, where Catholics found a safe retreat in the religious wars; and Viviers-sur-Rhone, with its fortress Cathedral of St Vincent.

The list could be indefinitely prolonged, and of each castle could be told stirring tales of 'old unhappy far-off things and battles long ago.' way of variety comes the venerable Pont Saint

Esprit, which the Frères pontifes built in the thirteenth century. The most exciting moment in a long, exciting voyage is when you shoot precipitately beneath one of its many arches. But the Rhone reserves its pièce de résistance for the very end; and when at last, toward sundown, you swing round one last bend in the river, and Avignon bursts upon your sight-Avignon, with its towering palace of the Popes (who dwelt here from 1308 to 1378), its girdle of fourteenth-century ramparts, its ruined twelfthcentury bridge of nursery rhyme fame, its Tower of Philippe le Bel, and Fort St André, and all its other medieval marvels on both sides of the Rhone-you feel that an entrancing journey has reached a sublime conclusion.

At Avignon the descent of the Rhone appropriately ends. True, you can pass down the river by Beaucaire, Tarascon, and by Arles, where the Rhone splits in twain and the delta begins. In olden times at Avignon, and above it, rudely shaped coffins used to be entrusted to the waters of the Rhone, which carried them safely and solemnly down to Arles for burial in the Alyscamps, and no dead ever had a more majestic cortège than these simple biers, accompanied by no human mourners. From Lyons to Avignon the Rhone's music is an exultant march of triumph, from Avignon to the sea a plaintive The slogan dies away into a funeral dirge. The banks below Avignon are as enchanting as anywhere in the whole valley, but the Rhone itself is sadly changed. Its pace slackens to a pathetic crawl. All its old verve and vigour are exhausted, and in the waste lands and stagnant pools of the Camargue it pays at last the penalty of an unbridled youth and an

over-strenuous prime.

It is well, therefore, to alight at Avignon and continue on dry land one's exploration of the Rhone Valley. 'To stop at the gates of Avignon,' says the old chronicler, 'is to stop at the gates of Paradise.' Now Avignon is the gateway to Provence, and Provence is a paradise indeed. From Avignon as headquarters you can make delightful excursions in every direction. You can go north a score of miles and visit Orange. Orange can show you the finest antique theatre in the world, a theatre which once rocked with laughter at the plays of Plautus, and which to this day affords a stage for classical drama enacted by the Comédie Française. Its vast façade is some three hundred and forty feet long and one hundred and eighteen feet in height, and its walls are full thirteen feet thick. No wonder Louis the Fourteenth declared it la plus belle muraille de son royaume / No wonder Addison affirmed that the remains of this Roman theatre are worth the whole principality of Orange! Yet no principality has spread its name so broadcast o'er the world. This little townlet near the Rhone has given its title to a line of princes in Holland and a royal house in Britain, to political

parties in almost every part of the Englishspeaking world. A great river carries its name right across South Africa, where also it has a namesake state.

Or you may go east to the beautiful Fountain of Vaucluse, where Petrarch lived and loved and sang of Laura. Or, crossing the impetuous Durance, you may make southward for St Rémy, with its Antiquités—a precious funeral monument and an Arch of Triumph dating from the Augustan Age, all that is left of ancient Glanum; and so over the scented slopes of the Alpilles to Les Baux, the uncanniest spot in all Europe, a blasted city, bleak and desolate, perched on a mighty rock near the crest of the range, overhanging a valley which resembles a petrified stormy sea, and which Dante had in mind when he depicted his Inferno. Then you wind your way down and along the southern side of the Alpilles, past the old mill whence Daudet penned his inimitable Letters, past the gloomy ruin of the fortress-abbey of Montmajour, whither as many as one hundred and fifty thousand pilgrims used to come on the day of Pardon of St Peter, till you meet the Rhone again at Arles, with its enormous Roman Arenæ, its fragment of an antique theatre, its sacred burying-ground of the Alyscamps, its Cathedral and Cloisters of Trophime, where St Augustine, apostle of England, was consecrated toward the close of the sixth century. But Arles's most precious and enduring heritage from antiquity is the classical beauty of its women.

From Arles you can return to Avignon by Tarascon and Beaucaire, where Hannibal crossed the Rhone en route for Italy: Tarascon, where St Martha subdued that devastating monster the tarasque; Tarascon, where in the fifteenth century the good King René had his Rhone-lapped castle and held his Courts of Love; Tarascon, whence the immortal Tartarin set out on his exploits; Beaucaire, whose beleaguered castle Simon de Montfort vainly strove to relieve; Beaucaire, once

famed throughout Europe for its Fair; Beaucaire, where Aucassin loved Nicolette the débonnaire.

And if you go west from Avignon you come to Nîmes, a favourite resort of Roman emperors, Nemausus, with its exquisitely proportioned Maison Carrée, its huge Amphitheatre, where bull-fights still are held, and its baths, to feed which the waters of the Eure were carried across the valley of the Gardon a dozen miles away by a three-storied aqueduct which for nineteen centuries has defied wind and weather, the glorious Pont du Gard, the greatest wonder of all in that wonderland of the Rhone.

Here, then, within easy reach of England, is a rarely frequented holiday-ground with unique and superb attractions for travellers of all tastes. Here the historian and the archæologist may reconstruct bygone ages with the aid of eloquent contemporary stone witnesses. Here the architect and the engineer may study masterworks as old as the Christian era. Here Protestants may see Orange, whose name is interwoven with their faith; here Catholics may see Avignon, whose name is bracketed with Rome; and both may visit scenes of Saracen triumph and defeat, Crusaders' pomp and devotion, scenes of long, fierce religious wars and persecutions which cost Provence and the Rhone valley many a valuable life, many a beautiful work of art. Here the horticulturist, following in Arthur Young's footsteps, may find a land of famous roses, vines, orchards, mulberries, and olives, a favoured garden of plenty. Here the artist, the poet, the littérateur may revel in the beautiful home of the Troubadours, and make pilgrimage to spots identified with Dante, Petrarch, and the Good King René, Madame de Sévigné, Daudet, Mistral, and the Provençal Félibres, with Aucassin and Nicolette, Pantagruel, Tartarin, and Mireille. To these and countless other treasures the Rhone will be your guide and chariot in one. All roads lead to Rome, but the royal Rhone is the grandest of them all.

SOME STORIES OF THE LEGION.

By VERE SHORTT.

THE French Foreign Legion has always been the happy hunting-ground of the novelist and writer of fiction generally in search of a picturesque background. Since Ouida wrote Under Two Flags, probably dozens of ill-used heroes (in fiction) have exchanged the scarlet tunic of the British officer or the silk hat and frock-coat of a man about town for the blue capote and red trousers of the legionary, and, after suffering incredible hardships and brutal punishment, have at last emerged triumphantly to the music of wedding-bells, with their names cleared, and the Legion nothing but an unpleasant memory. This plan was quite ideal from the

novelist's point of view. No one knew much about the Legion, nor for that matter did the novelist; Algeria was a long way off, the surroundings were picturesque, and, given a certain amount of imagination and a fluent pen, the Virtuous Hero could be made to have quite a satisfactorily bad time before he came into his own again.

Now, as an ex-legionary, I may as well say at this stage that there is very little romance indeed to be found in the Foreign Legion. Ruined lives there are, probably hundreds of them; but the possessors do not talk about them, and as a rule only wish to be forgotten and left

to themselves. The great majority of men in the Legion have come there because of some slight offence against the laws of their own country, or else from pure love of soldiering and adventure. Some three years ago I met a man in Paris—a journalist—who had been in my company of the 1st Regiment Etranger, and in the course of conversation he told me that he joined the Legion for no reason at all except that after finishing his three years' compulsory service in the French army he did not like civilian life, and that he would be glad to have the experience over again. The life and the discipline are hard, and necessarily so, but not hard enough to break either a man's spirit or his self-respect. The Foreign Legion is above all a fighting force, and cowed or broken-spirited men would be the very last material in the world to do the work which the Legion requires of its members. are many men of good family in the Legion, and occasionally a letter bearing an historical name arrives at one of the Legion's stations, and is eventually claimed by the legionary Jean Dubois; but the majority are much the same type as used to fill the Cape Mounted Rifles and Matabeleland Police in the old days-that is to say, military adventurers pure and simple. Still, when one has served in the Foreign Legion incidents come under one's noticesometimes humorous, and sometimes tragicand some of these may be of interest to the reader.

First of all it must be stated that the cause of nine-tenths of the unusual occurrences in the Legion is le cafard, or, in other words, unbearable ennui with one's surroundings. When a man has been for some time in a place, seeing the same faces day after day, and with a dozen palmtrees and miles of sand for his sole outlook, he is more than apt to develop cafard, and it depends entirely on the man's nature what form the cafard is going to take. It may break out in the shape of what practically amounts to homicidal mania, or it may express itself in the form of more or less elaborate practical jokes. I have known a man to arm himself, for no apparent reason, with his rifle and ammunition, and keep up a fusillade on every one within reach; finally explaining, when captured and disarmed, that he was bored to death, and wanted some excitement. There have been many similar cases in the Legion, and unless it is absolutely necessary to kill the victim of cafard before he will allow himself to be captured, he is usually treated more as though in need of medical attention than as a criminal. Almost all the long-service soldiers of the Legion are cafards in one form or another, and so long as their cafard does not bring them into direct conflict with authority they are treated with great forbearance.

The following is an instance of the other form which cafard sometimes takes. About six years ago the battalion of the 1st Regiment Etranger

stationed at S. was notified that a certain Commandant M. from the 2nd Regiment would arrive on a certain day to take up command. Now Commandant M. (a stranger to his new battalion) possessed what every officer in the Legion possessed, an ordonnance or soldier servant, and also what every officer did not possess—that is to say, a reputation for extreme austerity of life and conduct. On the day that he was supposed to arrive at S. to take command, Commandant M., not feeling very well, decided to stay at a small station about forty miles up the line, and sent on his ordonnance with his This man belongings to take over his quarters. was an ex-officer of the Austrian army, and had seen about fifteen years' service in the Legion. On arrival at S. he took his master's belongings to his quarters, then dressed himself in the commandant's uniform, and proceeded into the town. On his way down he passed several officers, and, as he looked just as a commandant ought to do (or rather more so), was saluted punctiliously by them. This was at about 10 A.M. At lunch that forenoon in the lieutenants' mess an officer arrived from the town in an intense state of excitement, and asked the assembled officers generally, 'Have any of you seen our new "old man"?' (the word used in the Legion among juniors for the commanding officer). Two or three men said that they had seen him that morning, and that there seemed to be no noticeable difference between him and other officers commanding battalions. But the new-comer was still excited. 'Well,' he said, 'you had better mind what you're about. He's in the town putting every non-commissioned officer he sees under arrest for being drunk or improperly dressed, or something, and he swears that this battalion is the slackest mob he has ever seen, and that he'll bring it under discipline if he has to break every officer in it!

The officers were much impressed by the keenness of their new commandant, and departed in various directions to worry their companies up to the required pitch of smartness. The next we heard of the new commandant was that he had been retrieved from a low café in the 'Village Negre' at 3 A.M. the following morning while performing a triumphal dance among the débris of the furniture over the bodies of the proprietor and customers, whom he had scientifically 'knocked out' with a chair. I believe the man received a term of imprisonment; but Commandant M.'s reputation for austerity never recovered. He was reduced to a state of frenzy for months afterwards by various undesirable characters presenting bills, &c., which his understudy had run up. Eventually he exchanged into another battalion.

Another occurrence, this time a tragic one, which was at first put down to cafard, but which was in reality due to other causes, occurred at S. A batch of recruits had come in, and, according

to custom, were distributed among the companies. A certain Lieutenant B. mentioned casually to a comrade that two of the new draft appeared to be already afflicted with cafard. He said that they were sitting on their beds looking at each other like 'two mad cows,' and expressed his intention of keeping an eye on them. However, in the meanwhile the two men in question had procured a couple of flissas, or Arab yataghans, and in rear of the mule-stables, and in the presence of their admiring company, had literally carved each other to pieces, one of them surviving just long enough to decapitate the other. This was highly unusual even for the Legion, and every one was extremely excited and astonished—that is to say, everybody with the exception of the dead men's captain. latter was an Albanian, and he explained that the deceased were also Albanians with a blood feud, and if two men with a blood feud were put together, what could any one expect? His whole attitude conveyed the idea that to interfere with gentlemen's private quarrels was a piece of gross bad form, of which he personally would never be guilty. Well, the men were dead, legionaries were cheap, it was not very apparent what was to be done, and so far as I know nothing ever was done in the matter.

When the Legion is not on active service the life is apt to be monotonous to an appalling degree, and this, and the miserable pay-rather less than a penny a day—lead to many desertions, or, rather, attempts at desertion, as they are very rarely successful. To desert is, in the slang of the Legion, aller en pompe ('to go on pump'); and in the Legion, when one hears the cry, 'Voilà les pompistes,' it means that deserters have either returned of their own accord or been brought back by Arabs. There is a standing reward of twenty-five francs for every deserter brought in, and the Arabs are very keen on earning it. Desertion is much more rife in the southern stations than in the more settled parts of Algeria. Many of the stations there are quite close to the frontier of Morocco, and Morocco to the legionary is a land flowing with milk and honey, or, rather, wine and wives; and in spite of the ghastly photographs of the mutilated corpses of legionaries, and the certainty of the same fate if they are captured by the tribesmen, the men are constantly making attempts to desert.

I know of only two cases of desertion which were at all successful. One was that of an Irishman named O'Reilly. He deserted from his station, and about ten miles out in the desert came across a camp of Taurags. He then waited until nightfall, and by some means or other managed to elude the sentries, got into the camp, and stole a rifle and ammunition. Then he crawled to where the camels were, killed the camel guards with his bayonet, took a swift mehari or riding-camel, and rode hard for the Moroccan frontier, about thirty miles distant.

He managed to get into Morocco, joined the army of one of the local pretenders, of which there were half-a-dozen at the time, and now I believe holds high rank in the army of the present Sultan. The other case was that of a mild, spectacled creature who was known as Lunettes, or, in vulgar English, 'gig-lamps.' This man had a perfect passion for desertion. He used to march out of barracks about once a month, seemingly with no very definite idea of what he meant to do, and invariably he was brought back again. The local Arabs got to know his times and seasons, and used to have a sort of competition among themselves as to who could lay hands on him first. After a while this was recognised as Lunettes' special form of cafard, and he was more or less leniently dealt with; but at last it was discovered that twenty-five francs a month for recovering Lunettes was not a paying proposition, being as a matter of fact about ten times the amount of his pay, and it was settled to give him a change of air and scenery by sending him to Tonkin. However, at Port Said, while en route, Lunettes, seeing the gang-plank down, in a fit of absent-mindedness walked ashore, and so severed his connection with the Legion for good and all.

The ethics of the Legion are peculiar to itself. The theft of tobacco, money, &c. will be punished summarily by the thief's comrades in such a way as to qualify him for weeks in hospital; but to 'decorate one's self'—that is, to take any articles of kit, &c., which may happen to strike one's fancy—is regarded as being rather meritorious than otherwise. I have heard of a recruit being taken to the canteen by two old legionaries and filled with wine, which he discovered too late came from the proceeds of a pair of white trousers of his own with which his hosts had 'decorated themselves' and turned into cash. The idea seems to be that some one has to pay for the 'decorated' article, and that so long as it is not one's self it is all right. A legionary would be much shocked if this practice was referred to as stealing. 'Decorating one's self' is a regimental custom, and, like many other customs, has

grown respectable from antiquity.

When a legionary takes his discharge, which he does at the expiration of five years' service, he is given a suit of clothes and a ticket to any town in France he likes to name, also a franc a day for subsistence on the journey. A man invariably asks for a ticket to Calais or Dunquerque, as being the farthest away, and departs vowing that he has done with the Legion for ever. He generally receives a sum of about ten francs; and as it is a poor legionary who cannot 'decorate himself' with the necessities of life after five years' service in the Legion, he generally arrives at his destination with the money more or less intact. He then proceeds to have as good a time as possible, and at the end of a day or so, finding himself penniless, goes to the nearest barracks and re-enlists in the Legion, to be sent back to Algeria at the expense of the French Republic. An officer will congratulate himself on having got rid of le plus mauvais garniment ('the worst character') of his company, and on inspecting a batch of recruits a month later be horrified at the sight of his old familiar legionary back again. Many men refer to this as their 'holiday,' and do it regularly at the end of each five years' service, instead of re-engaging in the normal way, with the certainty of increased pay. However, the only people who suffer are the taxpayers and the men themselves, and so the practice continues.

There are three methods of obtaining a commission in the Foreign Legion. An officer may be seconded from his line regiment after three years' service in France, and join the Legion with his full rank; or a non-commissioned officer may be sent to the infantry school at St Maixent, and after a period of instruction receive his commission as second lieutenant. The third class is that of foreigners who have been officers in their own armies, and join the Legion in the same capacity. This is fairly easy to do, provided that one can make a certain amount of interest at headquarters, and there are many foreigners serving in the Foreign Legion as officers who obtained their commission in this way. For exofficers who wish for a commission, and who cannot make the necessary interest, or for various reasons may be under something of a cloud, it is necessary to join the Legion as a private. If a man can prove that he has been an officer in his own country he is made élève caporal ('pupil corporal') almost at once, and if he is efficient and well-behaved, is sent to St Maixent in due course. Many of the older officers obtained their commission in this way. One lieutenant-colonel was a Russian peasant who found himself stranded in Marseilles during the Franco-Prussian war, and joined the Legion as a private. A great many of the older men took part in that struggle, in which the Foreign Legion suffered very severely. In the officers' mess at Sidi-bel-Abbès is a chassepôt rifle with a strange history attached to it. During the Dahomey expedition in 1895 a certain Captain P. was fired at by a Dahomean marksman ensconced in a tree, and returned the shot with his revolver, bringing the man down. On examining the Dahomean's rifle the captain was astonished to find by the number on it and by certain marks that it was the identical rifle which he had carried as a private in the Franco-Prussian war. The rifle had passed out of service and found its way to Dahomey, and had narrowly missed killing its former owner. Captain P. obtained permission to keep it, and it is now in the regimental museum. Among other exhibits in this museum is the embalmed hand of Captain Danjou of the Legion, who, with his company, at the battle of Camaron, during the Mexican war,

was cut off in a house by an enormously superior force of the enemy. Five times the men of the Legion were summoned to surrender, and five times they refused defiantly, and in the end died to the last man. The museum of the Legion is full of objects of this kind—tattered uniforms, and flags, rifles, swords, and bayonets—almost all with a tragic history.

The officers' mess at Sidi-bel-Abbès, where the museum is situated, was built and designed entirely by legionaries. It is in the form of a Chinese pagoda, and is one of the most striking buildings in Algeria. The mural paintings, which are very fine, were executed entirely by two legionaries, one a captain and the other a private. There is hardly any trade or profession which can be mentioned members of which are not included in the ranks of the Legion. After a fight in the desert it is no uncommon occurrence to call for men with medical knowledge to look after the wounded, and to find three or four highly qualified surgeons in one company.

As I said above, the great majority of the men are of the class of which a professional army is always formed; but, on the other hand, it is absolutely impossible to discover what social grade a legionary may have occupied in his former life. Some years ago a private of the Legion died, and his body was claimed by the German Government and taken back to Germany in a warship with the honours paid to a royal prince. All that was ever known about him in the Legion was that he was a German, and a very smart soldier.

Romance of the type of the popular novel there is none in the Legion, but of romances of real life there are plenty. Most of these, however, will never be given to the world. The heroes or villains of them—and there are both in the Foreign Legion—prefer to keep them to themselves; and whatever errors these men may have committed in civil life, as legionaries at least they have never failed to die like heroes for the honour of their regiment and France when the need has arisen.

DREAMS GROWN OLD.

OH, skies of blue! I used to think I'd reach your fountains cool, and drink; But here, where falls your pitying dew, I loiter still—how far from you,

Oh, skies of blue!

Oh, mirror true! 'tis you alone
Who know how long the years have grown;
You keep the grim reflection true—
None mourn with me but only you,
Oh, mirror true!

Oh, hair of gray! what dreams grown old Once slumbered 'neath your gleams of gold! Was it worth while to face the fray? What has it given to us to-day,

Oh, hair of gray?

MARY ADAMSON.

PHIZ.

By S. M. ELLIS.

N these days of Dickens devotion, when it is possible to run successfully a monthly magazine dealing entirely with the cult, there is perhaps some danger of forgetting how largely the great Victorian novelist was aided by Hablot K. Browne in the popular immortalisation of that vast gallery of characters created by Dickens, but visualised, nearly all, in the mind's eye by The two Wellers, Stiggins, Squeers, Quilp, Mrs Gamp, Chadband and Joe, Captain Cuttle, Mr Micawber, and, above all, Mr Pecksniff-when any of these names are mentioned. how at once there flashes to the brain the figure in one of Phiz's plates rather than any passage from the novels. Of course that is the great advantage an artist always possesses over an author; he is able to convey the desired impression of dramatic or pathetic or humorous momentariness in a few strokes of his pencil, whereas the writer has to prepare the mind of the reader for the climax by wordy toil with description and detail.

The world-known figure of Pickwick was not drawn originally by Phiz; it was the pictorial creation of Robert Seymour, who, discarding his first design of a long, thin man, drew the portrait of a short, stout one from the description by Edward Chapman of an actual person he, the publisher, knew at Richmond. It was the suicide of Seymour in 1836 that gave Phiz his great opportunity, for at the age of twenty-one he was selected to fill the vacant post of illustrator to Pickwick (then appearing in monthly parts), mainly on the merits of an excellent and humorous drawing of John Gilpin's Ride, which had won for young Browne a medal from the Society of Arts in 1833. Such was the happy chance (though arising from a tragedy) that brought Dickens and Phiz into a conjunction destined to produce such brilliant and imperishable fruits. Phiz very skilfully continued Seymour's conceptions of Pickwick and his three friends and allies, and of Jingle; all the other prominent characters of the book were his pictorial creations.

On Dickens's long and happy association with Browne some interesting and valuable side-lights have recently been thrown by the artist's son, Dr Edgar Browne, in a pleasant, discursive book called *Phiz and Dickens*. It makes no pretence of being a biography, for a full biography of

No. 193.-Vol. IV.

Phiz would hardly be possible. His life, apart from his work, was uneventful and secluded, and documentary material would be scarce, for Phiz was guilty of burning all his correspondence and many of his own sketches and memoranda on the occasion of his removal from Croydon. In this appalling auto-bonfire perished invaluable letters from Dickens, Ainsworth, Lever, and many other notable Victorian writers whose works were illustrated by Phiz.

Consequently, Dr Browne's picture of his father's quiet life at Croydon, which then had all the amenities of country within easy reach of London, in those good, solid, unpretentious, comfortable early-Victorian days, gives much assistance to a comprehension of the artist. Phiz was typical of his time. He delighted in riding, roast beef, and good port, though he lacked the gregariousness appertaining to the authors he most successfully illustrated. was ever shy of strangers, and did not participate in the conviviality dear to his pictorial compeer, George Cruikshank; his life was spent in his studio, and this, to a great extent, saved him from being involved in the quarrels that so often temporarily rent the loving bonds of camaraderie in the literary circle he worked for. All his authors held him in affectionate regard, and his amicable business relations with those fiery, impetuous spirits preserved an unbroken sequence of satisfaction on all sides. In all the work he executed for Dickens there was only one plate, apparently, that gave real dissatisfaction to the author-that of 'Paul and Mrs Pipchin,' in Dombey and Son, concerning which Dickens wrote to Forster: 'I am really distressed by the illustration of Mrs Pipchin and Paul. It is so frightfully and wildly wide of the mark. Good Heaven! In the commonest and most literal construction of the text it is all wrong. She is described as an old lady, and Paul's "miniature arm-chair" is mentioned more than He ought to be sitting in a little armchair in the corner of the fireplace, staring up at her.' However, Dickens was just then in a state of nervous irritation and emotion at the approaching death of Little Paul, and his comments on this plate were hypercritical; for, after all, the only divergences from the text are that Paul is seated in a child's high chair with a foot-[All Rights Reserved.] AUGUST 8, 1914.

rest instead of a 'little arm-chair,' and that the delightful black cat is sitting on the hearthrug instead of being 'coiled upon the centre foot of the fender'—but he is 'purring egotistically and winking at the fire' all right. But, as Dr Browne appositely observes, 'to show that the most intimate acquaintance with the text will not always preserve even the author (let alone the illustrator) from making small slips, we find Dickens himself describing old Sol "squeezing both the Captain's hands with uncommon fervour." Well may we say "in the commonest and most literal construction of the text it is all wrong," as everybody knows Captain Cuttle had only one hand and a hook.'

It is interesting to note that Phiz was indictable of far greater divergences from Boz's text (than in this matter of Paul's arm-chair) which, it would seem, neither he nor Dickens ever noticed. For instance, in Dombey and Son also, Susan Nipper, 'the short, womanly girl of fourteen,' is drawn as a very tall, thin adult. Captain Cuttle's hook was attached to his right arm according to the text, and is so depicted in eight illustrations, but in two others (the vignette and 'Solemn reference is made to Mr Bunsby') it appears on the left arm. Again, in chapter lviii. of Barnaby Rudge, Joe Willet is described as having lost his left arm, and is so represented in Phiz's drawing in chapter lxxi.; but in chapter lxxviii. Browne shows Joe embracing Dolly Varden with his left arm, and his right sleeve empty. In the 'Consecrated Ground' plate of Bleak House it is not clear how the dismal burial-place would be entered, for the railed 'gate' has no hinges. Much controversy has raged over the point whether Peggotty's Hut stood on its head or its heels, so to speak. Phiz drew it with the keel on top, but Dickens speaks of the boat being 'roofed in;' the artist's conception was the more picturesque in result. In Martin Chuzzlewit, though Dickens laid stress on Pecksniff's 'white cravat,' Phiz throughout gives him a black one, and advisedly so; Pecksniff is perhaps his most successful creation, the symbolic figure of unctuous humbug which rises to the mental eye when the adjective 'Pecksniffian' appears in speech or print. In the same book occurs Browne's most serious departure from the text. In that magnificent passage of Dickens where Jonas Chuzzlewit and Montague drive out from London into the night and the advancing thunderstorm, when poor Montague feels the premonition of his coming fate in every incident of the journeytheir horses, maddened by the storm, finally 'dashed off wildly down a steep hill, flung the driver from his saddle, drew the carriage to the brink of the ditch, stumbled headlong down, and threw it crashing over . . . Jonas . . . presently observed that Montague was lying senseless in the road . . . he ran to the horses' heads, and pulling at their bridles with all his force, set them struggling and plunging with such mad violence as brought their hoofs at every effort nearer to the skull of the prostrate man.' And later, 'with the aid of his knife they . . . disengaged the horses from the broken chariot, and got them, cut and bleeding, on their legs again.' That is Dickens's description. But in Phiz's illustration of the scene, one horse is lying in the ditch, and the other, quite free of the carriage, is rearing and being forced backward by Jonas toward the senseless figure, lying in the road, he seeks to murder. But apart from desire for meticulous accuracy in detail, the plate is fine and dramatic.

As good as the Dickens illustrations were those Phiz executed for the dashing, yet often pathetic, novels of Charles Lever. Mickey Free, Tipperary Joe, Corny Delany, Darby and Tom Burke, The O'Donoghue and his brother-in-law Sir Archy M'Nab, The Knight of Gwynne how all these figures stand out from memory's background, and not only amid the rollicking escapades of Lever's merry moods. For terrifying horror, few pictures can equal that of 'The Death of Shaun' in Jack Hinton—that stark, half-naked, blood-stained body (visualised agony), with the ghastly bandage round the head, falling back upon the wretched bed beside which kneels the priest. And then those wonderful night scenes Phiz drew for Davenport Dunn, such as 'Going Home' and 'A Saunter by Moonlight,' which rank with the similar dark or moonlit pictures he designed for Bleak House and Little Dorrit and Ainsworth's Mervyn Clitheroe-'The Duel,' 'My Adventure in the Haunted Chamber, and 'The Stranger at the Phiz was pre-eminent in presenting the glooms and mysteries of woods and waters by night, and the effect of moonlight on landscape and building or peeping through a wrack of clouds.

Phiz did much other good work for Ainsworth's Crichton, Old St Paul's, The Star Chamber, The Spendthrift, Ovingdean Grange, and, in particular, Auriol, that strange fragment of nightmare romance wherein the artist found full opportunity for depicting the bizarre. Some of his plates for this work—'The Elixir of Long Life,' 'The Ruined House in the Vauxhall Road,' 'The Seizure of Ebba,' and 'The Chamber of Mystery'—are certainly the most extraordinary, in the weird sense of the word, that he ever drew. G. P. R. James also furnished Browne with an opportunity for some impressive scenes in his ghostly romance, The Castle of Ehrenstein, and others of a more varied nature in The Commissioner. For Frank Smedley's Lewis Arundel and Harry Coverdale's Courtship Phiz designed many delightful plates in his own most characteristic style-country scenes with plenty of horses, and domestic interiors with the characters and their actions skilfully contrasted. But the former work also contained

some powerful dramatic illustrations, such as those in the Venetian portion of the tale.

It is not possible to notice here all the writers who benefited by Phiz's pencil. Enough has been said to demonstrate that, with the exception of Thackeray and Lytton, the best of the early-Victorian novelists are indissolubly associated with H. K. Browne. And how pleasant it is, after a surfeit of impressionist fiction and futurist art, to sit down by the fire and glance through a favourite book illustrated by Phiz, and renew old memories and ancient delights with those figures as familiar as friends in the flesh. As Punch wrote after Browne's death:

The lamp is out that lighted up the text Of Dickens, Lever—heroes of the pen; 'Pickwick' and 'Lorrequer' we love, but next We place the man who made us see such men. What should we know of 'Martin Chuzzlewit,' Stern 'Mr Dombey,' or 'Uriah Heep?' 'Tom Burke of Ours'? Around our hearths they

sit, Outliving their creators—all asleep. No sweeter gift ere fell to man than his Who gave us troops of friends—Delightful Phiz.

He is not dead! There in the picture book He lives with men and women that he drew; We take him with us to the cozy nook
Where old companions we can love anew.
Dear boyhood's friend! We rode with him to
hounds;

Lived with dear 'Peggotty' in after years; Messed in old Ireland where fun knew no bounds; At 'Dora's' death we felt poor 'David's' tears! There is no death for such a man; he is The spirit of an unclosed book—Immortal Phiz.

Phiz died on 8th July 1882. His place as a book illustrator-known equally to fame with the authors interpreted—has never been filled, and his method is a lost art. As a man, his qualities were fine and simple, for though he achieved world-wide celebrity he remained Always unpretentious, his entirely unspoilt. reserve and shyness were lifelong. He was devoted to animals, particularly to horses and cats. He was very independent, disliked being waited upon, and was reluctant to ask for anything. He was influenced by weather-glorying in sunshine, but depressed by gloomy daysand even more so by scenery; he was a great lover of the sea and all that was wild and grand in nature, and this trait was reflected in his art. Such was delightful, immortal Phiz.

A KNIGHT ON WHEELS.

CHAPTER XXXII.-THE ELEVENTH HOUR.

'THIS Week's Society Problem,' mused Peggy.
'A., an unsophisticated young spinster, finding herself alone in the residence of B., an eligible bachelor acquaintance, notices upon B.'s dining-room table a letter in B.'s handwriting, addressed to herself, and stamped for post. Problem: What should A. do? Answer adjudged correct: Leave the letter where it is and wait until the postman delivers it. Answer, adjudged incorrect: Open the letter and read it.'

A minute later the seal was broken and Peggy was composedly extracting the folded sheets.

'I'm afraid I never did have the instincts of a real lady,' she said. 'But perhaps the postman would never have delivered this letter. I will salve my conscience by picking off the stamp and saving a penny.'

She did so. Then, sitting down at the table and drawing the lamp a little nearer, she smoothed out the crackling pages and began to read:

'This is the letter of a man who suffers from an impediment in his speech. I have been able to talk to you on many subjects, but never on this the thing that matters most in all the world.'

Peggy drew her chair a little closer.

'I might have told you all about it long ago,' the letter continued, 'for I have been ready to do so ever since you gathered me up from under the car at the foot of Wickmore Hill. But I never did. Twice I have nearly done it, and

twice I have drawn back—the first time because it seemed too soon, the second because it seemed no use. If details would interest you, the first time was in the early days of my convalescence at Tite Street. I came hobbling into your drawing-room one afternoon, and you had been crying. I suppose your father had been inconsiderate again. Not that you showed it, but I happened to sit down in the same chair with your handkerchief, which was soaking. If necessary, I can produce the handkerchief as evidence.'

Peggy gave a half-hysterical little sob.

'The second time was on Chelsea Embankment. I don't suppose you remember.'

Then followed Philip's version of what took place on Chelsea Embankment. Peggy smiled indulgently. She could afford to smile now.

'But now that the reason which kept you from marrying any one—and I think it was fine of you—has been removed, I want to re-open the subject in earnest. First of all, let me talk about the beginning of things.'

Peggy looked up. 'I wonder why men always want to go back to the Year One when they make love,' she mused. 'Tim did it too. I suppose it is a man's idea of showing how firmly founded his affection is. "Established eighteen-seventy-six"—that sort of thing!'

Then she returned to her letter. It was a

lengthy epistle, this Epistle of Theophilus. Primarily it was a love-letter; but when you have never written a love-letter before, and never intend to write another, a good deal of secondary matter is apt to creep in. This letter contained the whole of Philip's simple philosophy of life, his confession of faith, the thoughts that a deeply reserved and extremely sensitive man sets down just once, and for one eye only. He felt that Peggy was entitled to a full and complete inventory of his thoughts about her; so he set them all down, page by page, line by line; not knowing that a woman as often as not chooses a man as she chooses a house, not because of the stability of the foundations or the purity of the water-supply, but because a quaint, old-fashioned sundial in the garden has caught her fancy, or some oddly shaped room in an out-of-the-way turret strikes her as the one and only site for a little private and particular retreat of her own. But Peggy read on.

The letter covered wide ground. It went back to their first wonderful meeting, and recalled childish conversations which Peggy thought she had forgotten. It told of knightly dreams, and of the Lady whom the Knight was one day to meet and marry—not realising that he had met After that came more recent her already. history—the second meeting, and the rapturous convalescence at Tite Street. The black months that followed the tragedy on Chelsea Embankment were sketched very lightly. Finally came the story of the momentous voyage upon the

Bosphorus, and the race home.

The letter closed with a passage which need not be set down here. This is in the main a frivolous narrative; and there are certain inner chambers in the human heart from the threshold of which self-respecting frivolity draws back with decent reverence.

The clock struck two. Simultaneously the outer door of the flat opened with the rattle of a latchkey; and next moment Timothy burst into the room. Peggy was curled up in the big armchair before the fire, apparently half-asleep. 'That you, Timmy?' she inquired.

'Yes, dearest!' replied Timothy.

Inflated with the enormous pride of possession, he leaned over the back of the chair and gazed fondly down upon his prospective bride.

'Don't bother me just now,' said Peggy.

rather sleepy.'

'Darling!' responded the infatuated Timothy. 'Stop blowing on the top of my head, and help yourself to a cigarette, there's a good child,' suggested the darling soothingly.

Timothy obeyed, a trifle dashed. 'I don't think, little girl,' he remarked, lighting the cigarette, 'that that is quite the way in which a man expects to be greeted by his fiancée.'

'His what?' asked Peggy.

Well, dash it all, Peggy!' exclaimed Timothy impatiently—he was naturally somewhat tightly strung up to-night-'don't be a little pig. Here I come hareing along from the dance in search of you, as full of beans as-

'Bean-pod?' suggested Peggy helpfully.
'No! Yes! All right! Bean-pod, if you like!' cried the sorely tried youth. 'But give a fellow a chance. As I say, here I come, red-hot on your track, just overflowing with—well, I can't describe it—and you greet me as if I were a Rural Dean.'

'I should never dream of addressing a Rural Dean as "Timmy," Timmy,' Peggy replied.

'Well, you know what I mean,' insisted Timothy, not in the least appeared by this soft We have both been 'Just think. passing through the greatest crisis of our lives, the most thrilling moment of our joint existence '-

'Have we?' asked Peggy in simple wonder. 'I didn't know.'

Her incensed swain, grappling heroically with his feelings, began to stride about the room.

'Peggy,' he said in a stern voice, 'let us understand one another clearly.'

For reply, the unfeeling Miss Falconer rose to her feet and struck an attitude. "Tush!" cried the Marquis, pacing the floor of the bijou boudoir like a caged lion,' she recited.

Timothy uttered an impatient ejaculation, and

dropped upon the sofa.

'Then, with a superb gesture of contempt, he turned upon his heel and flung himself into the depths of an abysmal divan,' continued Peggy. 'Careful, Timmy! I heard the sofa crack.'

'I suppose you know, Peggy,' announced Timothy in a very ill-used voice, 'that you are breaking my heart? Also destroying my faith in women? Mere details, of course, he added in what was meant to be a tone of world-weary cynicism; 'but they may interest you!' He rose, and, leaning gloomily against the mantelpiece, glowered his disapprobation of his beloved's ill-timed levity.

Once more, just as in her conversation with Philip, Peggy flashed into another mood. She put out an appealing hand, and touched Tim caressingly. 'Timmy dear,' she said, 'I'm sorry! There! Will you forgive me, please?'

'Yes, I forgive you,' replied Timothy, reassuming his air of possession at once. 'But it

must not occur again.

'All right,' agreed Peggy meekly. Then she looked at Timothy with a troubled expression. 'Tim,' she said, 'I want to talk to you like a mother. I have been thinking.

'And you have come to the conclusion that you don't love me!' exclaimed Timothy in a 'I know. Don't explain! That tragic voice. is a woman all over. A couple of hours'-

'I wasn't going to say anything of the kind,

Tim,' interposed Peggy quietly; 'but I have been thinking.' She fingered the buttons of 'I have been Timothy's immaculate waistcoat. wondering if a man like you ought to marry at present. What lovely buttons!' She played a little tune on them to show her appreciation.

'Don't treat me like a child, please,' said

Timothy stiffly.

'At this moment,' replied Peggy, 'that is just the way I am not treating you.'

'You think me too young, I know,' insisted

Tim.

'I wasn't thinking of you at all,' said Peggy.

'I see,' said Timothy in a hollow voice. 'Yourself? Quite so!' He laughed sardonically.

'No,' replied Peggy patiently, 'of something bigger. Something bigger than either of us. was thinking—well, of the nation at large.'

'Peggy,' inquired Timothy, entirely befogged but considerably intrigued. 'What are you

talking about?'

'Sit down, and listen,' replied Peggy.

Timothy obeyed, and the girl continued, 'It's this way, Tim. Many a man of promise has ruined his prospects by an early marriage. are a man of promise, Tim.'

'Oh, rot!' protested Timothy, kindling none

the less.

'If you were to marry now,' continued Peggy in the same thoughtful voice, 'you would settle down into a contented, domesticated husband.

Tim nodded. 'It's about time I did,' he said. 'No,' countered Peggy; 'not yet. You are a man of action, Tim. You ought to be free, at present-free to fight, and climb high, and become famous'-

'By Jove!' cried Timothy, despite himself.

'And to reach the great place you are entitled to. If I were a man I would let nothing come between me and my career. A career! Would between me and my career. A career! Would you sacrifice all that, Tim, just to get married?'

'To get married to you,' replied Timothy.
'Besides, you would help me. At least, you wouldn't be a bit in the way.'

'You do say kind things to me, Tim!' replied Peggy gratefully. 'But it would never do. Even a man of your personality would find it hard to get on without friends and without influence; and very young married men have few friends and less influence. They are back numbers; nobody wants them. It's the rising young bachelors who go everywhere, and can command interest and popularity and fame. A wife would be a dreadful drag. She might make shipwreck of your life.'

Tim drew in his breath, and was on the point of making a gallant interjection of protest; but Peggy concluded swiftly, 'So you must establish yourself in the public eye before you settle down.

Don't you agree with me?'

She lay back in her chair again, looking interrogatively up into Timothy's perplexed countenance.

'There's a good deal in what you say, Peggy,' he admitted. 'But I simply could not leave you in the cart, after'

A sudden inspiration seized him. 'Look here! I have it!' he cried. 'Supposing we get married

in five years from now? What?

Peggy was silent, and Tim waited impatiently for her to make up her mind. At last she spoke. 'It would be a very difficult five years for you, Tim. Imagine yourself going about this big world, meeting all sorts of famous and influential people, and growing more and more famous and influential yourself. Girls would be falling in love with you'-

'Oh, I say!' cried Timothy, much confused.

'Yet all the time,' continued Peggy in a tragic voice, 'you would be able to give them no encouragement, because you felt bound to come at the end of five years and marry me-me-getting on for thirty! It wouldn't be a very comfortable five years for either of us, would it?

By this time Timothy was once more striding about the room. But he was not posing now; he was thinking hard. Peggy sat motionless. Her face was serene, but her hands gripped the arms of the chair until her pink finger-nails grew Once she wondered where Philip was. She did not know that he was walking up and down Sloane Street in the fog, fighting with all the devils in hell.

At last Timothy appeared to arrive at some decision. He came and sat down upon the edge of Peggy's chair.

'Peggy,' he announced, 'you have a sense of proportion quite unusual in your sex. You are the most far-sighted woman I have ever known.'

'I believe I am,' said Peggy.

'And the most unselfish,' added the youthful Grand Turk on the arm of her chair.

I'm not so sure of that,' said Peggy.

'What you say about my making a career, and all that,' continued the newly awakened Timothy —'well, there is something in it, you know! By gad, there's something in it! I rather see myself in Parliament, letting some of those chaps have it in the neck! Wow! wow!' bubbled enthusiastically. Already, with the simple fervour of the hereditary ruling class, he felt himself at grips with the enemies of the 'And I am sure you are right, too, about my not tying myself down to an early marriage. I consider it a jolly sporting and unselfish view for you to take. Still, I must not allow you to suffer.' He laid his hand upon Peggy's arm. 'Look here, Peggy, if I come to you in five years from now and ask you to marry me, will you?'

'Yes,' said Peggy.

'Cheers!'

'On one condition.'

'And that is?

'That neither of us has married any one else in the meanwhile,' concluded Peggy sedately. Timothy laughed loudly at this flight of fancy.

'You can set your mind at rest on that point, Peggy,' he said. 'I will stick to you.' He was a single-minded egoist, was young Timothy. 'Then it's a deal?'

Peggy, knowing well what was coming, nodded. Timothy bent over her.

'I think we might signify our assent in the

usual manner, ch?' he suggested.

'We agreed upon five years, not five seconds!' said Peggy, laughingly releasing her hand. She slipped out of the chair and stood up. 'Now, Tim, you trot off to the ball again; it's not much after three. Philip will take me home; he is out getting a cab now. You go and perform a similar service for Babs Duncombe.'

'Oh, I say, come!' observed Timothy scornfully. 'Babs Duncombe!'

'Why not? She is a very nice, pretty girl, and her father is a very influential man. Remember, Tim, you have got to spend the next five years getting to know influential people. Begin on Babs. If you hurry up you may be able to catch her for an extra or two.

Already the pliable Timothy was putting on

'You are right, Peggy,' he said. 'You are always right. I believe you know what is best for me better than I do myself.'

Peggy, surveying him indulgently, mentally allotted to him a maximum of six further months in the single state.

'I shouldn't be surprised,' she said. 'Good-

night, Tim!'

'Good-night, Peggy. You are quite sure about— Well, perhaps you're right.—Hallo, Theophilus, old son! Got back?

'Yes,' said Philip, putting down his hat.
'It's lucky I caught you. I can't find a cab
high or low. You had better take Peggy home

in yours.'

'Tim is going back to the ball, Philip,' interposed Peggy. 'He has one or two duty dances to work off. I will share his cab as far as the Freeborns', and take it on home. I shall be quite safe.

'Well, hurry up, Peggy,' said Timothy, now ready for the road. 'I should look a bit of a mug if I got there and found the place shut —what, what?—Good-night, Philip, my lad. Don't sit up for me. Half-a-minute, Peggy! I think I had better have a fresh pair of gloves.'

He dashed out, across the hall, and disappeared into his own room, where he could be heard opening drawers and banging cupboard doors.

Philip picked up Peggy's velvet cloak and wrapped it round her. 'Shall I come too?' he asked, 'and act as subsequent escort; or should I find myself a member of the ancient French family of De Trop?

Peggy picked up her gloves, fan, and handkerchief from the table, and said, 'You would never be de trop at any time, Philip. But I am not going to drag you to Chelsea to-night. Look, the fog is lifting!' She drew back the curtain Twinkling lights were disof the window. cernible in the street below.

They shook hands.

'Have you given him his answer?' Philip blurted out. He could not help it.

'Yes.

'Can I—guess it?'
'I don't know. You might. It's an even chance, isn't it?'

Timothy appeared at the door. 'Peggy, I am waiting,' he mentioned coldly, and disappeared. 'Coming, Tim,' replied Peggy. 'Good-night,

Philip!'

'Tim seems to have rather taken command of things,' said Philip, as he escorted Peggy to the top of the stairs.

He is in a hurry, poor dear, that's all. He hasn't completed his evening's programme yet.

But I must fly.

She turned to go, then paused. 'It's as well you came in when you did, Philip,' she said. 'Two minutes later, and you would have found me gone.'

'I am glad I got back in time,' replied Philip

gravely.

Suddenly the girl looked up squarely into his face. 'Do you know, mon ami,' she said with a whimsical smile, 'you have a habit of running things rather fine.

'Have I!' replied Philip dully.

'You have. Talk about the eleventh hour!

'Pegg-ee!' The voice of the fermenting Timothy came booming up the staircase. Peggy did not hurry.

'Good-night, Phil!' she said softly.

'Good night, Pegs!' replied Philip. He touched her hand awkwardly. They had not addressed one another thus since childhood.

He watched her out of sight down the winding stair, and then turned heavily away. As he paused to close the outer door of the flat his ear caught the sound of light feet. He looked out.

Peggy was standing at the top of the staircase. 'Phil,' she said, rather breathlessly, 'don't forget to post your letter!'

Then she fled.

One second later Philip was standing by the lamplit table. His letter was gone, and another had taken its place. It was addressed to 'Most Excellent Theophilus.' He took it up, dizzily, and turned it over. On the back was written: 'I have saved you a stamp by reading your letter before you posted it. P.S.—You will find the stamp on the inkstand.'

Finally he opened the letter. His own had occupied many pages; this, the answer, consisted of three words. Philip read them through.

Then, rocking on his feet, he read them again and again. Finally he raised his head and gazed dumbly about him. His eyes fell upon a twinkling circular object lying in the pool of light where he had found the letter.

With a swelling heart he snatched it up, and strode to the hearthrug. There, with one devastating sweep of his arm, he rendered the mantel-piece a solitude. Everything went with one

glorious crash — pipes, tobacco-jar, cigarettes, Bulgarian Atrocities—all. Last, but not least, with a heavy thud, went the Meldrum Carburettor. The day of Things was over.

Then, in the very centre of the desert that he had created for her, he reverently planted a portrait—the portrait of a Lady, in a large, round, shining silver frame.

THE END

A SMALL TRAGEDY.

By S. HANSLER SMITH.

SOMETHING stirred in the sun-parched sand at the foot of a palmetto; there was a buzzing of little wings and a waving of little legs, and, as the antagonists rolled over and over, a small cloud of dust arose over the scene of the struggle: Going closer, I saw a big spider at grips with something I took for a humming-bird. Bang! and the book I carried squashed both flat. I was only twelve years old, and in my youthful indignation I sacrificed victim and oppressor.

On disentangling the bodies, my humming-bird resolved itself into a large black wasp, with violet and bronze-tinted wings, and I regretted having done the spider out of an honestly earned meal. I know better now; my regrets were misplaced, and if I had waited I should have witnessed an amazing sight. For the bold wasp would have mastered the spider, in spite of the latter's superior size and weight and its venomous fangs.

Some years later, when I knew more about insects, I sought to witness such another struggle. But the season for the wasp's operations is very short, lasting only during the two weeks or so of the egg-laying period; and only the female wasp attacks the spider. In it she recognises the one source of support for her brood, and no other provision will suit her. The wasp herself lives on flower nectar and fruit, and why a sudden impulse leads her to furnish her young with animal food is one of those queer instinctive traits for which we know no answer. The result of this idiosyncrasy is a lingering death to as many spiders as the wasp has eggs. Each paralysed spider has an egg glued to its body, and the young larva, as soon as hatched, knows how to consume the big ration so cunningly, that while a few drops of nourishment remain life does not become extinct. The provision is thus preserved from decay, the products of which would quickly kill the wasp larva.

After many unsuccessful efforts to witness the duel in the open, I resorted to artificial means. Here, again, countless trials resulted unfortunately, for it meant catching the pepsis just when she was ready to operate, and introducing her to a mygale which exactly suited her. Even then she did not always lay an egg and store the spider, something in the locality, or the prey, not being

to her liking. The results may be condensed as follows.

Four o'clock in the afternoon, and a red-hot, cloudless July day. I am lying flat on my stomach in the dust of the sun-scorched pampas. The thermometer registers one hundred and twenty degrees Fahrenheit in the shade, and a big white umbrella only affords a feeble protection, and none at all against the swarms of biting flies which hover around. Before me is the dark, web-lined tunnel of a big mygale spider. Over the hole is a glass cake-cover, under which a fine pepsis wasp is moving about with quivering wings. Down in the depths the eyes of the spider shine like little brilliants.

After making many circuits of the glass, the pepsis enters the tunnel, walking over the threads with the same alert, confident steps with which she treads the ground. Neither wasp nor spider is visible; but there arises a great buzzing of wings, and Mrs Mygale is presumably giving the intruder what's what. Then suddenly out pops the spider. Stopping at the entrance, she rears up on her hind legs, waves the front ones wildly, and opens her fangs menacingly. Has she killed the pepsis? Does this attitude denote triumph?

But no. Slowly and calmly the impassive face of the wasp emerges from the tunnel just as if it were an everyday affair for her to turn fierce mygales out of their strongholds. A government inspector of household premises could not act more confidently in exploring a tenement. The spider is quivering with some emotion. Is it fear or indignation? Will she run away? Nothing like that, for, like a flash, she pounces on the wasp, and, closely clasped in a deadly embrace, they roll over and over on the web. Eight legs versus six, two poisoned fangs against a sting! It looks odds in favour of the spider.

But Mrs Pepsis is some gladiator—she has a punch in each leg, and is a past master of all the wrestling holds. The struggle lasts but a few seconds, and Mrs Mygale is thrown flat on her back. Pressing her body against that of her opponent, the wasp holds the spider's legs powerless with her wiry ones, and grips her thorax firmly in her jaws. The spider's fangs are wide open, and poison-drops glisten on the sharp

points. Though overthrown, her fighting powers are still formidable; for she has only to bite once, and the wasp would be annihilated. Why doesn't she do it?

I take off the glass cover to use a magnifying-

glass to better advantage.

The pepsis is curving her body forward, unsheathing her sting. Slowly, very slowly, she brings it right up to the spider's jaws. It is pitiful to see the big, strong mygale so inert when mortal danger threatens. Hey! Wake up, Mrs Mygale! Now's your chance! Bite! Bite hard for your life! But no, this owner of the tunnel that so boldly challenged the intruder just now acts as if hypnotised; does nothing but make faces. The wasp's sting enters between her jaws.

All is over in a flash. The terrible nippers close suddenly, for ever incapable of biting. The mygale is lost. Calmly the pepsis withdraws her weapon, and inserts it behind the last pair of the spider's legs. These wave feebly as the poison

gets home, then relax. They will never run

Releasing her victim, the wasp strokes her wings, waves her antennæ, combs her body, and polishes her eyes. This toilet over, she grasps a leg of her big prey, and drags the helpless mygale down into the tunnel. In the spider's own fortress the audacious wasp stores the paralysed one. Safely cradled on the soft web of her own making, the mygale will remain securely hidden, alive but inert, while the wasp's egg hatches and the grub appears for whose consumption this fat ration is destined. Let us draw a veil over the possible feelings of the spider.

Madame Pepsis comes out of the tunnel and gathers bits of gravel and other rubbish to stop up the entrance. I have not replaced the cover, and after closing the hole she spreads her wings and flies away. She has earned her freedom and the right to continue her maternal duties at her

own time and place.

THE HOUSE OF LADDO.

CHAPTER II.

IF I were to weary you with anything of a detailed account of my life in this extraordinary household, I fancy you would at this stage cast my writing from your hands; thereby missing, as I hope, much that might have entertained you. Indeed, I confess my memory serves me downright ill on the matter; for one day was so little different from its neighbour as to become, at the end of the week, completely merged in it. The day was bad or the day was good, and there was an end of it. So if I can but keep the order of the main events I shall be content.

You are to conceive me, then, as going about the house, fields, and policies of Laddo about as important a being as one of my uncle's sheep. People would throw me a remark in passing, but no one evinced any degree of surprise or interest in my presence, or, so far as I could see, speculated at all as to how I came to be there. estate was really little more than a good-sized farm, and utterly neglected at that; however my uncle made his money, it was certainly not by his handful of starved sheep or his straggling The whole work of the house potato patches. and garden fell upon the unfortunate Rintoul, and had he attempted to perform one-half of it he would have dropped dead within a week; but he very prudently refrained from any such endeavour. There was no other servant about the place, the ladies attending on one another as best they might; and not even a gangrel or a tinker came near us. And while I liked the sea, as all boys are ready to do, the inland country-side was as tedious a place as may be. I was immensely tired of it, but, as Rintoul had said, I got my meat and a roof over my head; moreover, I was

free from the unceasing annoyances and privations of the manse of Birkie, and so I counted myself, if not pleasantly, at least endurably, placed. But when I took thought of the object on which I had been sent—the ingratiating of myself with my uncle for his money's sake—it

would set me laughing by the hour.

My worthy uncle I rarely saw; and this was as well, for had he been normal I think I should have died from sheer lack of interest. But he was always there, brooding over a mountain of documents, with his ox-eyed son for company, and sometimes that lean lawyer Cockburn. As was only natural, I grew into a habit of speculating as to what all this business might be; and being blessed with a little imagination, rapidly invented a bookful of Bedlamite theories. One day, certainly, I ventured into his room when he was out, but he came back unexpectedly on some errand and found me there. He said not a word, but he gave me a look such as I have never seen on any human face—a look which sent me flying from the room and out of his sight for a couple of days to come. For the first time it occurred to me that this little, round, bird-like man might be not only mad, but also dangerous.

After that lesson I went less daringly to work, though I spied upon him a good deal all the same. He seemed to have some interest in the sea, for he would frequently stroll down to the cliffs at the Ness, with a telescope under his arm, and often he would question Rintoul as to tides and such-like matters. Then, again, it would seem that his business lay on the land side, for he would send Rintoul away to get some message

from Kembas or Ramsburn, which lie far off in the Howe of Fife, or from Balfask, which is hard by Ferry-Port-on-Craig; on these occasions he would sit biting his nails in the most evil of humours till the word was brought back. never could fathom how much or how little Rintoul knew of his master's affairs; for whenever I questioned him, he would reply in whole paragraphs of saws and proverbs, so hopelessly jumbled together that it was impossible to make sense out of them—as he no doubt intended so that, all told, I made little progress.

Two events, however, do stand out in this period—both very slight. The first took place on a windy night of December, when I was wakened by the sound of a loud crash, and my uncle's voice raised terribly in anger; then something heavy being dragged about, some further altercation, and finally the front-door slammed noisily. But when I asked Rintoul, he replied, with many aphorisms, that he had heard nothing -palpably lying. The second of these events occurred a trifle later, and was marked by the appearance of a very superior personage magnificently attired, who drove down from Cupar with a pair of horses, and was closeted with my uncle for an hour and a half. They had up a bottle of our best wine, which Rintoul and I went down to the cellar to procure, and they parted in an excellent humour with one another. But as to this day I have no notion who this person may have been (though I shrewdly suspect now what brought him there), he is, in truth, comparatively unimportant.

All this time—and this made things for me more intolerable than ever-news kept filtering in to us of great doings in the living world beyond the marches of Laddo. We heard of the coming of Charles Edward Stuart, and of that ladder of victories that led him down the Canongate of Edinburgh and into the stateroom at Holyrood; and now we heard of the great march into England that was to exchange Holyrood for St James's Palace. For the most part we heard of them with groans and execrations, for the Fife folks round us were Whigs to a man; but they stirred something in me that boys will understand—the more so, I think, because they were unpopular with those around me. Of claims and prerogative, policy and principle, I knew nothing; but I think that in those days my solicitous thoughts and my warmest emotions were with Rintoul's 'dawmnable Jawcobites!'

Of the two ladies who dwelt at Laddo I saw at first very little, and then, as the days went on, gradually more and more. It was, indeed, natural enough that they should turn to me, boy though I was, inasmuch as they could not hold much intercourse with their own servant, and there was literally no one else; nor, I think, were they greatly attached to one another. From the outset Alice Lechmere was never anything

but heavenly kind to me; Rose not always so. I have said she was a person of moods; so that for five days we would have everything in the house going perfectly, and on the sixth going just as perfectly to the deuce. In the same way she would one day call me as many kind names as one can think of, and the next scarcely nod to me in the passing. She called me 'Davy' from our first meeting, while it was long before Alice would have anything but 'David,' or even 'Cousin;' but on the day of my uncle's fury with me it was poor blind Alice who came and hunted me out in my hiding-place with something good to eat, while Rose did nothing but laugh at me. And yet, by a common perversity of human nature, I was ever more Rose's admirer and ever more at her service than Alice's.

This was perhaps because, as I picked up information bit by bit, I came to clothe her in romance, as boys—and men, too, for that matter -are fain to do. It began with a chance remark of Alice's that Rose and her brother Robert had been very good friends; and this, together with my own conclusions from it, I took to my worthy Rintoul. I suppose I did wrong to speak to him so much on family affairs, but at Birkie we had neither snobbery nor servant, and so I knew no better; and, in any case, I must needs have spoken to some one.

'Was Miss Chalmers in love with Mr Robert?' I asked him bluntly.

'Keep's a'!' said he. 'Out o' the mouths o' babes and sucklin's. Ay, dear! Weel, it's no' for me to say, an' it's nae maitter t'me, but I jalouse she was.'

'And then he was driven from his home, and

had to leave her!' said I, thrilling at the thought.
'He was a Jawcobite,' said he very sternly, as if that were enough to drive him from high Heaven itself. 'Afore he went, he says t' her, "Will ye come wi' me?" An' she says, "Bob," she says, "gin ye thocht me worth while, ye could gie a' that the go-by." "I will no'," says he, an' awa' he gaed. Ay, she grat a while; but she's weel wantin' the likes o' him. A Jawcobite! the great aboamination! A Jawcobite!

After this I came to watch the lady more closely, and to persuade myself that in spite of all her gay demeanour she was at heart unhappy. And then one day, when Cockburn had come and gone, I found her in the room with her head on the table, crying bitterly. She sprang up at my entry and forced a laugh back to her lips; but I was on the track of my romance, and I did not mean to let her off.

'Miss Chalmers,' said I, 'you are unhappy. Can I do anything?'

'Get me a friend, Davy!' she cried with a sudden extraordinary vehemence. 'Some one big and strong and kind enough to help me. Out of this place I must and shall get or I shall go mad.'

I thought of Rintoul's 'mate an' a bield,' and put my thoughts into some kind of words.

'I know,' she said; 'and I know no other place where I could get as much. But I cannot stand it. Have you ever seen your uncle when he is angry?'

I nodded, and shook at the remembrance.

'Ah!' said she, 'that is how I see him—often. He has taken some dislike to me, and he is so terrible. I do not know what I have done; 'fore God, I never meant to anger him. I cannot bear it!' she cried with a break in her voice. 'Oh, indeed I cannot bear it! I am so frightened.'

'And have you no one?' said I.

'Only Cockburn,' said she very bitterly, 'who is about as fond of me as my gentle guardian himself. It is a sad pass, Davy, when one's only hope is such as Cockburn.'

When Alice spoke to me with intimacy, it was always of her brother, who seemed to have been

her all.

'He was always kind to me, David,' she would say in her gentle little voice, 'but I do not think I shall ever see him again.' (She spoke always of 'seeing,' for on no account would she admit her blindness, and, indeed, she managed so well that one could scarce have guessed.) Then I would try to comfort her, and by a happy intuition I would speak of her brother's noble action of self-sacrifice, and the splendour of the cause for which he fought; and at that her beautiful smile would be conjured up.

'Thank you, Davy,' she would say; 'please

God, he may have done right.'

She would say no more than that; but often it set me wondering if I were indeed the only secret Jacobite in this nest and camp of Whigs.

All this weary time my chief solace and companion was the man Rintoul, and without this miserable creature I know not where I should have been. He was a man of singularly little intelligence, and by no possible means could he be roused to a share in my own romantic curiosities; yet he had silently observed much of his superior's doings, and I found him full of the most unexpected and incongruous vagaries. One day he sprang on me a most intolerable hobby of his—a collection of the genealogies of all the greater houses of Fife; and I can still see the two of us sitting in the coach-house, or some such place, poring over those atrocious

charts, through which he steered his way with the grim and earnest countenance of a deep-sea pilot. And again one day he produced for my edification a battered copy of the Pilgrim's Progress, containing a number of curious woodcuts coloured by himself; of this I remember nothing save that he had represented Apollyon in a kind of tartan, at which I laughed so immoderately that he put away the book in a fury and showed me no more. His talk was always, as I have tried to show, one-half made up of proverbs and platitudes bearing upon nothing at all; yet he had some shrewd enough observations upon life if one could but win to them.

Periodically he was struck down by a kind of religious depression—whether due to a study of the tartan Apollyon or not, I dare not say. On these occasions he would sit groaning in the corner, writhing in a shocking anticipation of the torments to come, and bemoaning a past in which every conceivable folly and misdeed appeared to have found a place. I know now that he could never possibly have brought himself to do anything; but, boy-like, in those days I tried to persuade myself that he had, and to discover what frightful atrocity he had achieved, on which occasions some such conversation as this would ensue:

'Have you done murder, Rintoul?'

'God be thankit, David, I hae dune no nurder.'

'Then, were you ever a pirate?'

'Keep's a! The bloody pirates! Na, na; I wisna that.'

'Then, what have you stolen, Rintoul ?'

'David, I am at least honest. Ye daur to suggest'—

And so on and so on, through the whole gamut

of ill-doing.

I think I know now all that Rintoul had done, and you shall hear in time; and if the old fellow is roasting for that, I for one say he has been unfairly dealt with. But I wish I could take you into his room now and let you see him huddled at the window table, with his wispy hair and starting eyes and long, lean, earnest face, tormenting himself most exquisitely with fears, and all the time fancying himself no end of a fellow, and, as I well believe, thoroughly enjoying every moment of it all.

A BURIED ESTATE.

By John Foster.

BURIED treasure is a rich seam for the unnumbered host of the diggers in romance. Lonely reef-girt islands, haunted by the eternal boom of the surf; old-time galleons in their long sleep in shoal waters; cutlass and pistol; a mysterious schooner in the offing, like enough, with

one of her swarthy crew singing 'Ho! for the Spanish Main,' out on the dizzy top-gallant-yard as the vessel heels to the Trades—who does not know these 'properties' of the treasure-hunter? But the title of this little chronicle may disappoint the romantic, for there are no pieces-of-

eight, no blood, gems, or cut-throats in the narrative. Yet it holds the quintessence of romance, for the improbable story is true, and so dramatic in its sudden little tragedy that, were it encountered in a novel, the average reader—let alone the critic—might well carp at it as clumsy and makeshift melodrama.

In a lonely spot in the Monaliadhs—the Gray Mountains—in the land of Clan Chattan, a lisping, baby Highland burn gathers strength until it broadens to a river, the beautiful Findhorn, the stream that so entranced Jenny Lind on her first sight of it that she burst into tears, and with 'I must sing the song of the river; it calls me!' enchanted the listeners with divine melody. Down its course of eighty miles to the sparkling bay at its estuary it enfolds an enchanting panorama, at first of Highland hills and moors, lonely in their brooding silences, silences that seem to suggest to the watcher character, dignity, almost comprehension. Then granite cliffs appear guarding deep pools of infinite variety, black, tawny, foam-flecked; magnificent gorges, flanked by densely wooded heights clothed from crown to water's edge with oak, beech, pines, birch, and luxuriant undergrowth, until the river reaches the rich cultivated land in the north of the fair province of Moray.

There is not a mile of the river but has had its share in moving human story. Clan Chattan, the great houses of Moray and Cumming, held and still hold land through which it flows; and the dark old time of turbulence, bloodshed, feuds, and unrest, Corsican in its elemental passions, had its theatre in the lovely and lonely valley.

In Scottish literature, as well as history, the Findhorn brings memories of goodly names—Sir Thomas Dick Lauder, Henry Mackenzie (who, writing to young Kilravock, counselled him to put on the trees this kindly inscription, 'The stranger's steps are welcome here'), the authoress of The Memoirs of a Highland Lady, Charles St John, sportsman and lover of his kind, the author of Rab and his Friends ('the romantic, impassioned, Pindaric Findhorn,' he calls it in characteristic phrase), Miss Constance Gordon Cumming, and many others.

Most of the translations of the Gaelic placenames reflect in melodious English the haunting charm of the cascades, the glades, hills, and glens by Findhorn-side. Here are a few: 'The Knoll of the Fairies,' 'The Hill of Parting,' 'The Place Hid from the Sun,' 'The Heathy Slope of the Flag,' 'The Waterfall of the Alders,' and Strathdearn, 'Fairyland' or 'The Abode of Peace.'

Seen at its best on a bright day in the heart of autumn, the wealth of colour on the forest-clad banks of its magnificent ravines is beyond description. The verdict of the great Master of Balliol still stands. 'This is,' said he, 'the most beautiful river in Britain.'

Where the river meets the North Sea, there

twice a day it fills the Bay of Findhorn. On its right bank sleeps the quaint old village of Findhorn. Its repose may well be full of dreams, for once its harbour was full of tall masts and venturing prows. The old site of the village before 1702 was midway across the channel, a busy port with shipbuilding yards; but the sands from the Culbins gradually silted up the harbour, and on 11th October 1702 the river found its way through the neck of land behind old Findhorn, cutting it off from the mainland to the east. At low water the sand-banks marking the site of the old port are exposed.

Once, long ago, one could have watched many a good ship come and go, heard the stir of commerce, the song of the sailors, the tongues of France, Spain, and Holland, for the port did a thriving trade with Rotterdam, Bordeaux, and other centres, sending out hides, salmon, malt, and other Morayshire produce, and importing wines, silks, velvets, tobacco, sugar, and sometimes mysterious kegs that had never seen the sovereign's seal. But the ghosts of these old merchant sailors revisiting the place would look sadly now on a deserted port. The voices of those who do business in the great waters are heard no more there. An occasional coaster may call now and then. The little fishing flotilla has vanished before the advent of the 'liner' and 'drifter' fleets that swarm in better and more central harbours. solitary boat remains, and the only industry is the salmon-fishing in its season. Even in the matter of salmon-fishing the old days scored The brethren of Kinloss Abbey, hard heavily. by, owned the fishings, and were the first to make artificial traps for the fish; and in 1648, the then Earl of Moray, who apparently spelled with the arbitrary ease of a potentate accustomed to make laws for himself, dutifully writing to his countess in Edinburgh, says: 'I was yesternicht at fishing and suped at the water-syd yhear we hade gud store of salmond, ther was taken out three or four dayis before my coming on the same poule I suped at it in ann nicht thirten hunder samonds and at ann draucht six and twenti skores.' The earl evidently thought that his wife might suspect him of having indulged in long-bow practice, for he adds, 'This upon my kredit is true.' Thirteen hundred salmon in one night! Five hundred and twenty in one haul! Think of it, ye syndicates, ye smoking-room Munchausens!

On the west side of Findhorn Bay lies what used to be a goodly barony, a mansion-house, sixteen farms, orchards, and a hamlet. It was once the most fertile and flourishing estate in Moray, but is now a wild waste miles long, known as the Culbin Sands. Under them lies the buried estate of Culbin.

This estate, once a barony, so long ago as the thirteenth century was owned by the great northern family of De Moravia. The name of Freskin or Freskinus appears on the old charters. He is supposed to have been a rich

Fleming, a banker and capitalist of his day. A man of outstanding importance, it seems well authenticated that in the time of David the First his family was rich and strong enough to assume the territorial name of De Moravia, the great province of Moray that extended in old times practically from sea to sea in the North. His son Hugh succeeded to broad lands, and, so far as can be gathered from the misty past, the great families of Sutherland, the powerful Douglases, the Murrays of Athole, and others, were all connected with the mysterious Freskin. Later, we find King Alexander of Scotland giving a grant of Kincorth and Kintessack (still place-names in Morayshire) to Sir Richard of Culbin, and from this date the De Moravia family of Culbin have a distinct traceable history, and their estate a defined boundary. The 'Rough Carse of Culbin' is mentioned in a deed by the Knights Templars of St John as one of the boundaries of their lands. Culbin estate reached to the sea and ran west nearly to Lochloy. The powerful family of De Moravia made Culbin their principal seat. They were friends of royalty, and doubtless William the Lion and King Alexander the Second, who loved to visit Morayshire, must often have come to Culbin with their Courts, when the old place would ring with hunting-horn and merrymaking.

In time the male line of the De Moravias—the Morays—died out, and the heiress, Egidia, married Sir Thomas Kinnaird of Kinnaird in 1440. The Kinnairds for the next three hundred years appear in the records of the district. In the kirkyard of Dyke this simple prayer can be read on a tombstone:

Valter: Kinnaird: Elizabeth: Innes: 1613: The: Builders: of: this: bed: of: stane: Ar: laird: and: lady: of: Coolbine: Whilk: Tha: and: Thars: Whane: Braithe: is: gane: Pleis: God: vil: sleep: This: Bed: Vithin:

They had parted with Kincorth, but from a rental of 1693 the Culbin estate is fixed at three thousand six hundred acres, made up of sixteen farms and farmhouses, while the rental was two thousand seven hundred and twenty pounds Scots, and certain returns in victual. One can picture the mansion-house in its fruitful plain, with its barony's privilege of a dovecot, its lawns, orchards, woods, its well-tilled farms, a fair demesne in the heart of the fair province, well deserving its name, the 'granary of Moray.'

So it was one autumn day in 1694, and lo! in a night, mansion-house, farms, gardens, and houses were brushed out like breath on a glass, and the place saw them no more.

A great westerly wind had been blowing. It lifted the sand along the coast, gathering force as it drove along, its increasing momentum sweeping great masses of loose sand along with it. This horror, scarcely imaginable, swept with irresistible force down towards the mouth of the Findhorn; it covered the fields and overwhelmed

the estate, burying swiftly, beyond hope of respite, the mansion-house, farms, and village. A smiling, happy countryside was transformed as by black magic into a wilderness of sand; and to-day, standing on one of the great mounds, the eye rests on a succession of huge billows of gleaming sand, literally a desert, some four miles long by two miles broad, bare as the palm of one's hand of vegetation, the very picture of loneliness and desolation. The titanic strength, the suddenness of the strange disaster, the pygmy impotence of man before it, seize the imagination.

In general, the ruin of places near the coast has been due to the march of the invading sea. In Edward the Confessor's time there was a flourishing port in Suffolk. The ocean swallowed up-so the story goes-a monastery, a couple of jails, and seven churches whose bells may yet ring, fathoms down, when storms stir the great Stepney Island, too, has been gradually eaten away, so that the church at Minster, which was once in the centre of the island, is now on the shore. Most of the instances of lost land have been, like that of Stepney Island, gradual processes, although the ancient writers tell us that Plato's Atlantis, opposite the Straits of Gibraltar, was a thriving, fertile country peopled by a warlike and vigorous nation until one day a marine earthquake came and demolished it. The fate of Culbin was as sudden.

So swift fell the tragedy that, to save his life, a man ran from his plough in the furrow and never saw it again. It was found years afterwards, and is now in a north country museum. Some of the bewildered folk managed to get into their houses from the east side next day and rescued a few household gods, but the demon of the storm rose again, and next morning not a vestige of man's handiwork was visible. An ocean of sand, dashing like spray in the gale, covered the land like a stormy spring tide; and when the gale and the sand-drift died down a mocking waste had taken the place of the Barony of Culbin. And there the miniature desert can be seen to-day.

Alexander Kinnaird, the luckless owner, was ruined. The poor man petitioned the Scots Parliament in July 1695 for a relief from the cess or land-tax, on a statement that 'the best two parts of his estate of Culbin, by an unavoidable fatality, was quite ruined and destroyed, occasioned by great and vast heaps of sand (which had overblown the same), so that there was not a vestige to be seen of his manor-place of Culbin, yards, orchards, and mains thereof, and which within these twenty years were as considerable as many within the county of Moray.' One is glad to learn that the old Scots Parliament granted him his petition.

It is interesting to note that the old Scots Act regarding the preservation of bent, juniper, and broom owes its existence to this disaster. The

Act runs that our Sovereign Lord the King, considering that many places on the coast having been ruined by inroads of sand 'mainly occasioned by the pulling up by the Root of Bent, Juniper, and Broom Bushes, which did loose and break the Surface and Scroof of the said Hills: and particularly considering that the Barony of Coubin, and House and yards thereof, lying within the Sheriffdom of Elgin, is quite ruined and overspread with sand, the which was occasioned by the aforesaid bad Practise of pulling the Bent and Juniper; Therefore His Majesty does strictly Prohibit and Discharge the pulling of Bent, Broom, or Juniper off sand hills for hereafter, either by the Proprietors themselves, or any other whatsomever, the same being the natural Fences of the adjacent Countries to the said Hills; Certifying such as shall contraveen this Act, they shall not only be liable to the Damages that shall therethrough ensue, but shall likewise be liable in the Sum of Ten Pounds of Penalty, the one Half thereof to belong to the Informer, and the other Half to the Judge within whose jurisdiction the said Contravention shall be committed.' The Act is still in force.

The laird and his wife did not long survive. The poor man, to retrieve his shattered fortunes, fell under the South Sea Bubble mania, and then died with many other luckless emigrants on the then fever-smitten Isthmus of Panama. A domestic servant—all honour to her—looked after the infant son after his parents' death, keeping him and herself in Edinburgh by needlework. The boy in time enlisted, and being accidentally recognised by a Rose of Kilravock, got a commission. He rose to captain's rank, and died unmarried in 1743. So the Culbin Kinnairds, like their estate, vanished.

The small part of the land which had been spared by the sand, along with the waste lands, was sold to a grandson of Adam Duff, the ancestor of the Dukes of Fife, and in the deed occurs an unusual phrase. The seller gave it over 'with his good will and blessing;' but, notwithstanding the benison in the deed of sale, the proverbial luck of the Duffs did not hold in this case, for the buyer fell on evil times and was in turn forced to sell. One of the Grants of Grant held it, then one of the Grants of Sheuglie, who left it to the Grants of Glenmoriston. They own it still. Kincorth, hard by, like many Morayshire properties, was held by the Dunbars, and latterly by a Grant from a branch of the Freuchie line, now of Seafield.

A change in the coast-line weakening the natural ramparts of the land was the chief cause of the disaster; but, like every similar calamity in older or more superstitious or more imaginative days, the overwhelming of Culbin was put down to an express visitation to punish some offence. One account—Gilbertian in making the punishment fit the crime—says that because the laird

made his people work on Sundays the Nemesis of the sands lay in wait, and decreed that he should never see crops on Culbin again. Another legend runs that a maid of Norway was stolen on the high seas by a laird of Culbin. Had he suspected that she had 'the Eye,' and was able to lay a curse on the place—as the story says she did—the squire of dames might not have been so susceptible. And the Hon. Mrs Willoughby's verses tell us how a Kinnaird made a bargain with the Accuser of the Brethren, and that the two are still playing an endless game of cards deep down in the dark heart of the highest sandhill!

For many years—a hundred or more—the house slept in its grave of sand. Storms swept the coast, now and again changing the contour of the huddled masses of sand; and one morning at the end of the eighteenth century, the astonished countryfolk saw the gray head of the old mansion rise like a pitiful ghost out of its tomb. The vagaries of the wind had given it a respite. A materialist proprietor ignored the tragedy and romance of the old house, and carted away many loads of stone, but the greedy sands again claimed their own, and to-day one may stand on a sandhill in whose deep bosom lies what was once a fine country-house echoing with human voices, and all around it trim lawns and orchards and the sheen of growing corn. A dauntless apple-tree on the edge of the waste used to struggle out occasionally in blossom, and even bear fruit, but the sand has strangled it long ago.

Farther west, on the flank of the Culbins, the Maviston sandhills, owing to a peculiar formation of their steep eastward ends, have gradually forced their way to a wood, smothering all growth as they have advanced, creeping on like a slow tidal wave. The result is a melancholy sight; the wood in the clutch of a relentless enemy. Some of the trees are covered, dead and buried; others, like skeletons, bleaching in the sun; some, doomed but defiant, are sending out their last few shoots and branches; while others show a despairing few inches out of the waste like the finger-tips of a drowning

The place—familiarly known as the Culbins—now forms a vista of huge billows of sand, some of them rising to over a hundred feet. When the prevailing westerly wind blows the air is filled with a powder of a beautiful whiteness; but if a gale rises it raises a sandstorm that permeates boots, clothes, pockets, eyes, and ears so quickly and thoroughly that the pedestrian, if he be wise, stands not upon the order of his going, but goes at once and 'at the double.' Charles St John states that he has found human skeletons in the sands, without doubt the bodies of people who had been overpowered by avalanches of sand on the Culbins.

On a still summer day the long billows of

white sand, intensifying the deep blue of the sky and the line of the dark woods by Findhornside, present a vivid picture, impressive in its colouring. An intense silence reigns. Animal life is strangely absent. There is no hum of insects, no voices of birds save perhaps the solitary note of some stray sea-bird, or a faint sibilation if a breath of wind stirs the loose particles of sand on the surface. A singular feeling of remoteness and isolation seizes the watcher. There is almost a sense of ostracism in its aloofness, in the complete and surprising silence, and a strange freak in perspective adds to the eeriness of the place, for one's judgment of distances is almost invariably at fault. A man standing on a ridge looks like some one on a far horizon, and the explorer of the sands arrives at the hill-top, seemingly miles away, in a few minutes. In winter, the great snowy ridges flanked by the dejected and threadbare woods, the melancholy voice of the wind in the lonely places, and the dark, inscrutable eyes of the lochans, make up a picture of grim loneliness. The place might be an untrodden waste in Labrador.

As if to compensate for their singular detachment, the ghostly Culbins present extraordinarily interesting features to the antiquary. The action of the sand has preserved, and unfolds now and again, many evidences of rude, savage bygone days, step by step from the Stone Age onwards. in weapons of battle or the chase, women's adornments, articles of husbandry, early attempts at, and some beautiful achievements in, artistic design, the whole making a supremely interesting record of an ancient people. Flint, bronze, iron, silver, and gold have all been laid bare. the old hunter and warrior found their flints and shaped them to their uses, and to-day, although the place has been for years the happy huntingground of amateur or professed antiquaries, the ordinary searcher, blessed with even the most moderate degree of patience, is sure to pick up some flints bearing traces of long-since vanished hands, in the shape of arrowheads, pins, knives, and the nodules from which they had been cut. Bronze articles, too, have been manufactured here. Moulds of stone cuttings and castings of the run metal, rings, brooches, studs, and other articles have been found; and in Altyre House may be seen a beautiful ancient bronze Keltic armlet, a work of great artistic merit, and the first of its kind found in Scotland. Penannular brooches have been found recently, and also a large finger-ring with the letters H S I and a small cross of stars. The numerous small rings and studs found are supposed to be the ancient forerunners of the modern hook-andeye. In the Scottish National Museum of Antiquities, Edinburgh, there is a splendid exhibition of no less than forty thousand flints found in the sands; and the minister of Dyke, in whose parish the Culbins lie, has also a fine collection.

Not the least interesting feature of the place was the finding of an ancient 'bloomery' or furnace; a sandhill now covers it, but when the land is exposed there are still to be found the rough-cast shapes of bolts, nails, fishing-hooks, and the like. The little lagoons near the shore contain iron, which no doubt was used in the furnaces. Indeed, some of the dead rushes are so crusted with iron that they are often mistaken for tubes. In primitive times the heat produced was useless as compared with the great furnaces of to-day, the slag thrown away containing forty times as much pure iron as it does in a modern furnace.

A great many coins of all nationalities have been turned up — Roman, French, Flemish, English, and Scotch, the earliest of date 21 B.C., and the latest of the reign of Charles the Second, who was on the throne just before the lands were overwhelmed.

A labourer in 1780 made a most valuable find, although not in the Culbins. Digging in the kirkyard of Dyke, he came across a hoard of silver coins. The canny man kept his secret for a time, disposed of his booty, and took a farm; but the story leaked out (he had a wife), and the then Laird of Brodie was in time to secure some of the hoard from the silversmiths. The coins were of the purest silver, and of an older date than any then existing Scottish coins, being of the period of William the Lion. Another hoard remains to be unearthed. A party of smugglers had run in with a haul of brandy, wine, tobacco, and silk. They hid them at night, but the sanddrifts swallowed them up ere morning, and there, it is said, they lie to this day.

The old furrows with their rounded ends, parts of the 'head-rig' or service road, may still be seen on the Culbins, with the actual hoof-marks of the horses and cattle made two hundred years

Along the coast, north of the sands, the artist, the naturalist, and the wildfowler may well tarry. A sheet of water, the Buckie Loch, is a treasurespot of surface and subaqueous plants. At the 'E'e,' a singular break in the coast-line, the tide flows through and transforms the Old Bar into The Bar was the old mouth of the an island. Findhorn, for the river changed its course in the eighteenth century. Ships from far seas used to anchor there; but now the place spells solitude, a haunt for innumerable wild-fowl, a breeding-place for the rich wild-bird life of the Firth. St John's Sport in Moray gives us vivid pictures of the district, for he watched with the keen and observant eye of a born naturalist the life of the shore-birds, hunted the roe in the Black Wood, and trod every foot of the Culbins and the coast-line. The roseate tern is said to breed here, but if any one has found its nest he has kept the secret well. Seaotters haunt the estuary, and the wary watcher from behind a sand-dune may see a seal loafing

contentedly in the sun on the hot sands, or, if he has luck, may admire the grace and majesty of the wild swan.

See the Culbins on a windless summer evening. The sun dying splendidly over the long blue line of hills from Ross to Caithness, nearer, the great floor of the sea, the green and gold of woods and standing corn, are all fair and familiar features of Scottish scenery. But amid this environment the Culbins sleep, detached, inscrutable, apart, the sands painted by the evening light in a delicate glowing radiance, still as a picture and as silent, a place of brooding memories of the long drama of history.

Long ago beaked triremes, with shields and helmets a-glitter, stole up the estuary round the point from their station at Prototon, supposed now to be Burghead. Here, perhaps, on the sandhill where one stands, a sentry on outpost duty sighed for sunny Tuscany as he paced the night while his picket slept round twinkling Roman camp-fires. The Norwegian Ravens, the courageous prows of sturdy square-sailed Danish longships, grounded on the shingle,

and strange, fierce men leaped ashore to fight and harry and lay waste. Their gospel of the survival of the fittest strikes a discordant thought amid the evening's hush; but even as we linger for a moment on the past, a great sound splits the silence, the roar of big-gun practice from a leviathan king's ship out on the firth. There is a momentary shudder in the air.

The echoes of the battleship's crashing voice trail off into silence. Day begins to close her drowsy golden eyes. The first twinkle from Tarbet Ness gleams across the Firth. No sound now in the Culbins, not even the faint murmur of the sea. The shadows between the sanddunes lengthen. A wedge of wild duck is graven for an instant on the darkening curtain of the sky, and vanishes like an arrow into the dusk. A pool, gray-green, reflecting its fringe of bushes in a placid mirror, is the only break in the miniature desert. The heart of the solitude broods with eternal eyes on the silent lesson of the sands, the vanishing of the years, and the gossamer dreams of mankind.

WINNING LEISURE.

By EUSTACE MILES, M.A.

THE delusive and tantalising thing that the business world seeks to-day is leisure. Many prophets and preachers there are who tell us of our need. Press and pulpit both lecture continuously about our hurry and scurry and rush and worry, and urge us at all costs to be leisurely; but there are few who could tell us how the leisure which we desire is to be won.

It is part of the practical side of the matter that I wish to discuss. Taking it for granted that we are a madly rushing people to-day, a people who stand in exceptional need of leisure—though perhaps in less need than the people of New York do—the persistent question for me is: How are we to obtain it, and how are we to keep it when we have won it?

Of course I cannot contend that my answer to this question will satisfy every reader; but it is at least an honest and individual attempt to throw a little light on a vexed problem. Nor can I give a quarter of the ideas which I might give; for the space is limited, and if in a limited space one tries to compress too many ideas quite a number of them escape notice. For example, there is a great deal that can be done in the direction of leisureliness by the continual practice of the art of deep and full breathing, and there are quite a number of other factors; but I cannot touch on these here.

To me leisure is quite different and distinct from idleness. Idleness is a condition that so easily becomes chronic and continuous, but leisure is always intermittent. It is a relaxation, and

can only come between two periods of work. Thus, just as it takes two people to make a quarrel, so it takes two periods of work to make leisure. It is important to remember the distinction. Since leisure is invariably preceded by a period of work, it follows that there is a definite and organic connection between the two states—work and leisure—to complete, as it were, one indissoluble whole; leisure begins automatically, so to speak, when work ceases. Herein lies a truth in answer to the important question raised above.

Much of the current talk about leisure is seen at once to be wide of the mark. It is wrong to insist upon the importance of leisure if leisure is merely a kind of negative state which follows automatically on the heels of well-done work. If we have no margin of leisure in our lives, the fault cannot be cured by any strenuous striving after leisure; it must be cured by re-arrangement and re-ordering of our work. It is our method of working which does not automatically result in leisure that must be essentially wrong. Intense, concentrated work we crave, and earn and secure an afterspell of relaxation or leisure. This is a physiological fact; if it were not so, the bodily mechanism would soon snap under the continuous strain. The heart rhythmically and alternately works and has leisure; and the same is true of the lungs. They work with a certain effort; then there follow automatic rest and relaxing. For example, the lungs expand, the air is held for a moment or two, then automatically the chest-walls contract. It is no effort to them to resume their normal; the effort begins only when there is a special kind of breathing, as during or after heavy exertion. A highly sensitive machine like the body, run by nervous energy, can go at full pressure only by virtue of the fact that it has spells; each part of it has spells when it is not working, and when it is taking in a fresh supply of energy for work yet to be done. So when people complain of having no leisure they are really often confessing that their work is not done so intently as it might be, but is spun out and done half-heartedly, with a great and deplorable lack of concentration upon the task in hand.

I hasten to add that the blame for much halfhearted work does not always rest with the people who complain. A good deal of work is growing mechanical and monotonous: a kind of doing by repetition some particular task that one cannot easily interest one's self in; and, unfortunately, there will not be any real leisure of the right kind at the end of such half-hearted work. And, indeed, why should there be? If there has been no intensity, no absorption in the work that one has in hand, no stretching out, what imperative physiological need is there for relaxation? Physically one finds that relaxation follows naturally after stretching and extension, while one can work indefinitely in this half-hearted fashion without overtaxing the strength of body

The first step in the cure of the 'No Leisure' disease is a greater intensity of work: short, sharp spells, if necessary, of intense work, which bring leisure inevitably in their train.

Here, again, is raised another by-question: How is this intensity and concentration to be secured? To this I see at least one satisfactory answer. A man's interest in his work depends very largely on his health. The average ill man cannot concentrate or be absorbed in his work, no matter how interesting the work may be, without a stupendous exertion. His physical state is constantly asserting itself, and is drawing his attention from the work in hand to his own bodily condition, and to the necessity for setting that right. It is hardly understood at all that, when a person feels lazy, very often it is because of his body: that wise master of the internal economy demands his energy for the purpose of curing his body, and of relieving it and freeing it from some of the clogging materials. requires the full attention; therefore wise Nature makes the person feel lazy so that he cannot attend to the things which distract his attention from the process of cure.

This is the great economic fact that lies behind the care which model employers of labour now give to the health of their workpeople. They want intensity of work, and they know they can only get this out of employés if their health is quite satisfactory, and they are consequently able

- ;;

to concentrate upon their duties. Just opposite where the writer lives, a fine building has been erected, which is intended for the employés of a large business. Every provision is being made for the comfort and well-being of the work-people, including a roof-garden among other innovations. It is well worth the while of this employer to provide these excellent means toward the preservation of the health and comfort of his employés.

Conversely, this too often explains why the man of no leisure is so often physically unfit. The unfitness is not, as some people imagine, due to a want of leisure; it is rather the unfitness that causes the lack of leisure, because the unfit man is so little able to concentrate upon the work and see his job through in that glorious spell of intense work in which the man who is more healthy loses himself for the time being, so as to earn an after-spell of relaxation or leisure.

The way to win and enjoy leisure, therefore, is not to seek it directly and deliberately so much as to consider instead how to keep healthy and fit, and how to concentrate upon any given task which one takes in hand. The old precept, to do things with 'one's might,' is difficult to supersede, if it be taken with the proper limitations. All that science has added to the precept is the knowledge that it is a physical impossibility for an ill man to obey the precept for a long time together. First get perfectly fit, and an intensity of concentration upon the work will become possible, and this intensity of work will, in turn, without question, earn its due accomplishment, accompanied by leisure.

UIST.

Over the hills and far away,
Over the Minch at break of day,
Outward bound to an island gray,
Are my wayward thoughts a-roaming.

It nestles safe 'midst the Hebrides, Between the Minch and Atlantic seas, Flat and open to every breeze From gloaming until gloaming.

South of the Harris hills it lies, Treeless and bleak to a stranger's eyes, Lonesome and drear as the corncrake's cries On the machair at the gloaming.

Uist its name, that island gray; Kind are its folks in their homely way; Hearty the welcoming words they say To the one returned from roaming.

Pleasant to see are your southern lands, But dearer to me are the western sands, And I long for a grip of the honest hands In Uist in the gloaming.

When I must go to my last long home
Let me lie in peace, never more to roam,
In Kilmuir, where the graves are fleck'd with foam
When wild winds moan in the gloaming.
M. G. M.

AN AGE OF BIOGRAPHY.

THIS is an age of biography no less than of the abounding popularity of the novel. We build the sepulchres of our fathers in the shape of ponderous and well or ill written biographies. Many of these are less true to the delineation of human life and feeling than many works of fiction. In reading the Life of George Eliot we feel that we are not so close to the writer as in her imaginative work. There is a pose in all her correspondence very different from the free and easy style of Scott, who revealed himself in all he wrote. Mr Edmund Gosse, in speaking once upon 'The Ethics of Biography, said that certain fashionable biographies of the present day deserved no other comment than the words 'A Lie' printed in bold letters across the title-page. A failure, he thought, in most modern Lives was their length; while the carelessness with which some of them were put together would hardly be credited. Material, which ought to be winnowed and sifted until nothing but the purest flour remained, was often flung in with breathless haste, without selection or arrangement, in a rough heap. A recent critic in the Times, reviewing a new book on Borrow, remarked on the enormous number of biographies manufactured out of rubble and straw that had sprung into existence in the past fifteen years. During last century the crop was greater than in any other period of the world's history. In Nelson, Wellington, Gladstone, Disraeli, Dr Arnold, Tennyson, Browning, Macaulay, Dickens, Carlyle, Millais, we have a galaxy of noble names which would have adorned any century. The year 1809 alone gave birth to more than half-a-dozen great subjects for memoirs. During 1913 amongst the Lives given to the public were those of Jane Austen, Anthony Trollope, Henry Labouchere, Francis Thompson, Lord Lyons, the fourth Earl of Clarendon, Lord Chatham, John Bright, Sir Alfred Lyall, Roosevelt, and the Empress Frederick. Sir E. T. Cook, having completed his monumental Life of Ruskin, gave us that of Florence Nightingale. Should we tire of present-day memoirs, we can always fall back upon those which are hallowed by time or have had universal approval, such as Plutarch's Lives, Boswell's Johnson, or Lockhart's We can have no misgiving here that we are not in good and great company.

For an excursion into the domain of current biography recourse may be had to such a volume

as Who's Who, with its many counterparts. For biographies of living notabilities, as well as for those who have done their work in the world, no more handy, useful, and reliable volume was ever published than Chambers's Biographical Dictionary, edited by David Patrick, LL.D., and Francis Hindes Groome. No more important biographical work exists in English than the Dictionary of National Biography, which owes its inception and completion to Mr George Smith, of Messrs Smith, Elder, & Co. Only a very wealthy man willing to sink a large fortune in the undertaking, with no hope of seeing any return in his own lifetime, could have carried What he planned in through such a scheme. 1882 has become a great and useful memorial of a large-minded publisher. If the true wealth of a nation be in life and its manifestations, then here we have embodied a vast record of achievement in every department of human effort.

The records of not a few last-century lives have overflowed into this, amongst such being The Life of Edward Bulwer, First Lord Lytton, by his grandson, the Earl of Lytton (Macmillan and Co.). In these two handsome volumes we have an admirable example of the art of the biographer, and a work of genuine family piety, judicially done and without partiality. The materials in Lord Lytton's Life are extremely well arranged and digested; and as Mr Gosse devoted much time to the work both in manuscript and in proof, it cannot surely come under that condemnation of his which we have quoted. The great novelist had left his papers to his son, with instructions that by him and no one else his Life was to be written. Two volumes of a first instalment of a biography were published in 1883; but the first earl died in 1891 ere the work was finished. He stopped just at the beginning of the unhappy period of his father's life. To explain this the present earl has utilised the autobiography and much of the material in this work; and so for the first time we have a full and frank statement of the domestic tragedy which hung like a nightmare over his ancestor. We now know all that matters regarding Lord Lytton the man and author, and his unhappy marriage, the blame for which is shared equally by husband We have a picture of him, 'with all and wife. his weaknesses and faults, his prejudices, affectations, vanities, susceptibilities, and eccentricities, and also with all his great qualities of industry,

AUGUST 15, 1914.

courage, kindness of heart, sound judgment,

patience, and perseverance.'

Edward George Earle Lytton Bulwer, third and youngest son of General W. Earle Bulwer, was born at 31 Baker Street, London, in 1803, and died at Argyll House, Torquay, in 1873. In his lifetime of seventy years he had occupied thirtyeight different residences, though the family seat of Knebworth in Herts is the one most associated with his name. C. Eliot Norton, commenting on the day of his burial in Westminster Abbey, said that his works would die with him. This is not the case, for titles of his novels appear at present in the lists of about two dozen publishers. As a boy, Lytton had a constitutional delicacy, and he often said he would never have been able to compass so much brain-work without the early athletics of the school playground. He studied metaphysics at eight, read every book within reach, and surprised his mother by saying, 'Pray, mamma, are you not sometimes overcome by the sense of your own identity?' Between nine and fifteen he was at five different preparatory schools, and he was under a tutor for a time ere he went to Cambridge University. Dinners, routs, and balls at first diverted him from serious study, and an early love affair left its mark. His marriage in 1827 at the age of twenty-four to Rosina Wheeler led to much unhappiness, and there was a separation in 1836. From the year of his marriage till 1837 he completed ten novels, two long poems, one political pamphlet, and one play, besides numerous articles in magazines and reviews. He was caught up, says his grandson, into a perfect whirlpool of activity; he touched the life of his generation at every point, and represented in his own person every phase of it-its society, literature, journalism, stage, politics, dress, and tastes. His mother's disapproval of the marriage led to her cutting off his allowance, which rendered this feverish activity all the more necessary in order to earn the three thousand pounds a year wanted for his early establishment. At his mother's death in 1843 he succeeded to the Knebworth estates, and had a bad breakdown in health. From 1831 to 1841 he was in Parliament, and combined politics with literature. There was a break, but he returned to Parliament in 1852, was Secretary of State for the Colonies for a brief period, and was raised to the peerage in 1866. In politics he was attracted by Disraeli, while his oratory was praised by Justin M'Carthy, who called his speeches literary essays committed to memory.

Robert Browning was the first man who said a good word in print about him, and for this he continued to be grateful. The receipts from his early novels were on an ascending scale. For Pelham he received five hundred pounds; The Disowned, eight hundred pounds; Devereux (1829) brought him one thousand five hundred pounds. For one of his less successful novels, A Strange Story, Dickens paid one thousand

five hundred pounds for serial use. Other payments for the story in book form brought up the price to three thousand pounds. For ten years' use of the cheap editions of his novels (1853-63) Routledge paid him twenty thousand pounds, while the bargain was continued for a further period. Some of his early novels, such as Paul Clifford and Eugene Aram, deal with crime and criminals, although he said he had a definite moral purpose in writing them. The Last Days of Pompeii has continued to be one of the most popular of these early books. Sir Archibald Alison thought highly of Rienzi and The Last of the Barons, the fruit of laborious historical study, if somewhat overloaded with facts. The Caxtons and My Novel are the most fully representative of his own age. Of Kenelm Chillingly, a posthumous novel, over three thousand copies were sold on publication. Leslie Stephen says no English author has displayed more industry, energy, and versatility, or less disposition to lapse into slovenliness. All his magazine articles, books, and correspondence were written with his own hand, and his grandson tells us that, as far as he knows, the novelist never dictated a line.

Lord Lytton had begun to write poetry in the year of Waterloo and novels while Scott was still undisputed master in that field. When Pelham, the novel which it is said has made a black coat the evening costume of an English gentleman, appeared, Scott asked Lockhart who was its author, and praised its style. This is an example of the philosophy of Lord Lytton as the experience of a life of hard work: 'I find the great thing in the voyage of life is to stop very often to take in coals, to get a complete stock of new ideas, and one only gets that by new studies and pursuits.' This was part of the secret of Lytton's continued freshness and versatility.

An interesting episode in Lord Lytton's career was a visit to Edinburgh in 1854, when he addressed two audiences with great success. His first sight of the town was in 1824, when he came on fresh from a tour in the English Lakes. In coming north on the earlier occasion he had visited the grave of his lost love at Ullswater. The novelist was keenly sensitive to the poetry of the Scottish capital, and wished that he had some Scottish blood in him and was something to the city and its people. He wrote down of that time: 'I little thought then that the day would come when literature would give the When elected honorary tie that birth denied.' president of the Associated Societies of Edinburgh University he got his opportunity. He addressed the students in Queen Street Hall and spoke for an hour on classical education, and he never halted for a word or looked at a note. There were some autobiographical touches in another interesting speech made two days later at a banquet given to him in the Hopetoun Rooms,

in which he made pointed references to representatives of Edinburgh publishing firms who were present. He complimented Messrs Blackwood, who had recently become his publishers, for their share in the elevation of the national literature; Messrs Black for their recent acquirement of the copyright of the Waverley Novels; and alluded to Messrs W. & R. Chambers in flattering terms.

We have another nineteenth century notability sketched in quite different style in the memoirs of Professor Charles Eliot Norton, whose life is unfolded by means of his Letters (Constable), with necessary comments and connecting links supplied by M. A. de Wolfe Howe, and his daughter, Sara Norton. In turning to Charles Eliot Norton, professor of the History of Art at Harvard from 1874 to 1898, we join company with a wellbeloved friend of all artists and literary men, a well-travelled and cultured gentleman, as much at home in London as in New York or Boston. He suggested the words, 'He had good friends whom he loved' for his epitaph, and was the biographer of his friend James Russell Lowell, prepared the writings of G. W. Curtis for the press, and published a selection of Ruskin's letters to himself. After Froude had done his best, or worst, in writing Carlyle's Life and editing his Reminiscences, Norton was asked by the family to correct some of the many blunders Froude had made. He prepared seven volumes of Carlyle's writings for the press, including the Reminiscences, The Correspondence of Carlyle and Emerson, of Goethe and Carlyle, and Carlyle's Early Letters. To Norton, his friend Emerson seemed the most innocent and inexperienced of men who had lived in the world, and at the same time the most cheerful and hopeful, who never had a day's illness, and was marvellously youthful at seventy-four. Norton used great plainness of speech toward John Ruskin, telling him once: 'You are, there can be no doubt, terribly provoking, so absolute, and so aggravatingly right, and at the same time so wrong-headed.' Ruskin, on parting from him at Oxford in 1872, said to Norton: 'I wonder why I always feel as if you were so much older than I, and so much wiser. Goodbye, papa.' The author of Modern Painters once said, 'I don't remember that I ever did anything in my life except from the moment's impulse, the secret of much unhappiness in his life. Ruskin impressed Norton with his tender nature, sensitive to all outward impressions, with the powers of observation and perception that belong to genius. Norton regarded · Præterita as the most characteristic thing Ruskin | that Italy afforded.

ever wrote; and A. C. Benson thought it one of the most beautiful books in the English language. 'Letters are good,' wrote Norton, 'but they are poor substitutes for the spoken word.' Edward Fitzgerald's letters he considered amongst the best in the English language, and those of Mrs Carlyle were as good as those any woman ever wrote. Charles Lever he thought resembled an old-fashioned French barber or dancing-master—very ugly, very vivacious, and very entertaining. Than George Eliot he had rarely seen a plainer woman; she had a dull complexion, dull eyes, and heavy features. Her talk, however, was that of a person of strong mind, who had thought much and felt deeply.

During his London visits, Norton was much with Carlyle, whom he thought the most striking figure there, and many of their walks and talks are recorded by the amiable American. It was through Norton that Carlyle made the bequest of his Cromwell and Frederick books to Harvard University, along with the famous Cromwell death-mask. 'My affection for him has been steadily confirmed,' wrote Norton. 'I owe him more than ever.' When Norton gave Carlyle the quatrains of Omar Khayyam, his remark was that his old friend Fitzgerald might have spent his time to better purpose than in busying himself about 'that old Mohammedan blackguard.' Carlyle called H. T. Buckle 'an inspired red-herring.' Don Quixote was to him among the very best books ever written, 'the one book that Spain has produced.' The Arabian Nights had given him as much pleasure as any other. Carlyle remembered seeing Scott driving into Edinburgh one summer night in an old-fashioned coach in which were several young girls; Scott was then an elderly man, 'the picture of a quiet, composed, prosperous and victorious life.' Not three months afterwards came the news of his tragic commercial failure. Norton was quite as much at home with the Brownings at Casa Guidi (Florence), enjoyed Robert Browning's open expression and manner, and found nothing obscure in his conversation. Browning he thought the freshest, most ardent, and most unconventional man in society. Mrs Browning seemed reserved and timid, with low voice, quiet and melancholy manner, but full of sensibility. William Morris he found combined the solid earthly qualities of the man of practical affairs with the fine perception and quick fancy of the poet; but, to Norton, he appeared to have the narrow view of the world of a thirteenthcentury artist, and preferred the rude, barbaric, elementary passion and art of Iceland to all

THE HOUSE OF LADDO.

CHAPTER II.--continued.

THE beginning or overture of my adventures came on a certain morning late in January. I date it by the Jacobite victory of Falkirk, of which we had just heard the news. It was a fresh morning, nipping keenly with frost, a rime lying underfoot, and a bluish mist curtaining the motionless sea. Something had taken me to the extreme north-west corner of the estate (which was none so far from the extreme south-east). Here the ground ran up into a bare and uncultivated knoll, surmounted by a dismantled stone dyke and a sort of pillar-like gate-post that had often caused me some speculation. Upon this dyke, and just beside the pillar, I this morning perceived a man to be seated. He was dressed in some plain brown stuff, with a cloth knotted at his neck, and no hat on his head, which was covered with crisp brown hair. He sat gazing seaward with a pensive expression, as of one who had thrown the dice with fate and thought somewhat poorly of his cast. As I made toward him for in this solitude I would have welcomed the appearance of the devil himself—he looked up at me with a very pleasant smile.

'Well, young sir,' said he, 'what news to-day?' 'Very little, sir,' said I, 'except that I am told that Charles Edward Stuart has defeated the royal forces at Falkirk.' (This was uppermost in my mind, and so for some reason out it came.)

And are the affairs of Charles Edward Stuart of great concern to you?' said he, still smiling.

'You laugh at me, sir,' said I; 'but I think it well to know what goes on; this is so dull a place.'

'You are very right,' said he, with an altered manner; 'but I had not thought a boy like you would have found life dull.

'If you know this part of the country at all,'

said I, 'you must find it so.'
'Oh, I know it tolerably well,' said he; 'and I'll venture to say there may be more in it than you think.

'I wish I could see it!' I cried; and became suddenly conscious that he was looking at me with the most acute observation, one eye halfshut, and his lips drawn tight together.

'And so you are out for adventures,' said he. 'Something of the kind,' said I, shamefacedly.

'Do you think it very foolish?'

'No,' said he; 'and, what's more, I believe I can find you some. I have my share, and can spare a handful.'

'What can I do, sir?' I cried, with such a leap of joy in my heart as I had not thought to feel in Laddo. He fell to scrutinising me again.

'Nothing just yet,' said he at last. 'But hold your tongue, and be hereabouts sometimes in the mornings, and we shall see.'

You may guess with how light a heart I set

my steps back to Laddo, and how I spent the rest of the day in a new country of romance. But this was not to last, and was broken by a very terrifying circumstance. For in the evening, as we sat at supper, Rintoul came in with a paper for my uncle, at which he had no sooner glanced than he sprang to his feet with the most dreadful violence, clashing over his glass of wine, his jaw driving forward till I thought it would crack, and his terrible eyes glaring round upon us with a look so deadly that I was like to have fainted.

'As I live,' cried he, with a great oath, 'there

is a Jacobite spy in this house!

I can see us all yet as we sat round the table -Stephen Lechmere gaping like a fish; Rose Chalmers some pale, and crumbling bread nervously; Alice listening intently. For a second I thought my uncle would have done murder, so dreadful was his expression; but on a sudden the rage died out of his face, and he subjected us one by one to that intense and searching scrutiny I have before described. He paused an instant over me, and I, with the memory of my remarks anent Charles Edward Stuart that very morning, was fit to fall through the floor. He paused again over Rose, who looked as though she would die; and then, without another word, he went out of the room, and we saw him no more that night.

We all knew with a most terrible certainty that in these few moments he had fixed in his own mind upon the culprit; but for that matter, so had I. Rose's manner had been enough to hang a saint; but I felt that this extreme fury of my uncle still called for explanation, and so on the head of this I sought out Rintoul at once.

Rintoul,' said I, 'you must tell me this. Why is my uncle so afraid of Jacobite spies?'

'He disna like them,' replied he evasively.

'Why not?' said I, sticking to it.

He sat down upon a box and fell to filling a pipe, as men do in moments of awkwardness.

'Yer uncle,' said he at last, 'is whiles known as "Hangman Lechmere." Does that convey anything tae ye?'

'No,' said I. 'It is an unpleasant name.'

'It's a' that,' said he, puffing away, 'an' weelearned forby.

'He was never a hangman, surely?' said I. 'Na,' said he; 'no' him. But eh, David, mony and mony's the lad he's sent there. An' wha wud he send there, think ye?'

'Tell me,' said I.

He thrust his expressionless face towards me, and blew out a cloud of ill-smelling smoke.

'Jawcobites!' said he.

'You mean he is a Government agent!' cried I.

'No' openly,' said he; 'no' openly. The fiscal an' the shirra an' the rest o' them gets the credit; but, by the Lord, it's Hangman Lechmere does the wark! Be prood o' yer uncle, laddie, for he's a great an' righteous man—a mighty instrument of destruction in the hands of the Lord of Hosts. Mind,' he cried, clutching my arm suddenly, 'dinna say I tell't ye; for God's sake, dinna say I tell't ve!'

'I am not likely to,' said I. 'So that is my

uncle's business!'

'Ay,' said he, 'or a pairt o't.'

'And what is the other part?' said I.

'Oh, keep's a'!' cried he, 'I maunna tell ye that. Merciful powers, that wudna dae.

Sufficient unto the day.

I was very much set up by this talk and by the whole incident, which fitted in so excellently with my romance. That the spy was Rose Chalmers I had not a moment's doubt; and with my mind running so much upon Jacobite affairs, I began to suspect the man on the hill of being also implicated in the Pretender's doings. I pictured Rose in communication with Mr Robert to save him and his friends; I pictured myself, as the bearer of messages between them, riding through incredible dangers; I began to centre myself as the hero and protagonist of all this drama, and to see how really important a personage I might become in In short, I gave full rein to my imagination, and never supposed I was clean out in the facts, a consideration presently brought home to me in no uncertain manner.

One dark February afternoon, about five o'clock, I was sitting by myself in the hall, when a sudden commotion broke out in the grounds. A gun went off somewhere with a great echoing crash, and I heard a horse pounding furiously away inland. I was half-way to the front-door, when it flew open and showed my uncle on the step.

'Steenie! Rintoul!' he roared; 'out into the grounds, and, by God, we'll have the spy

this time!

The whole gang of us were at his heels in a moment, and out into the most pitchy darkness. My uncle made for the east side of the house, where there grew a thick plantation of young fir, and Steenie and Rintoul sped after him; but I, by some happy intuition, slipped round to the

west wing, which gave on a sort of wilderness of laurel and yew. I was groping my way into this, when my heart suddenly gave a great leap, for in the shaft of light that came down from a window I caught the glint and shimmer of a woman's dress. I saw in a moment all my fondest suspicions realised; saw my way to show Rose I was of her side and to be trusted; saw the whole glorious path of adventure opening out before me. On the instant I slipped between the bushes, caught her by the shoulders, and whisked her round to the light.

'Miss Chalmers,' I began, and then stopped dead, for I was looking into the blind eyes of

Alice Lechmere.

She had given the faintest of cries when I laid hold of her, but in a moment she was quite quiet and composed; she seemed to know by an instinct that I would do her no hurt. Of the two of us, I was by far the more perturbed.

'Davy,' she said, 'thank Heaven it is you. Davy, I have been kind to you sometimes; help

me out of this.'

At this terrible moment I heard my uncle shouting on the other side of the house, and footsteps—Steenie's by their weight—running in our direction. I was in the most deadly fright; but, somehow, I picked her up bodily in my arms, and began stumbling back the way I had come. Branches crashed thunderously around me, and every footstep seemed an hour in the making, but presently we broke clear of this accursed shrubbery and made the corner of the house. As we came into the open ground there, the noise of running on the plantation side grew louder again, and my uncle's terrible voice came roaring out of the darkness; and at that I fairly ran for it into the hall, and there set down my burden.

She stood for a moment shaking dreadfully,

and then put her hands over her eyes.

'Oh, I am so helpless!' she cried piteously; 'so useless to them! But I could have got back by myself if I had had the time. Say I could, Davy-say I could!'

'Miss Alice,' said I, still smothered in the ruins of my romance, 'is it possible you are the

She turned from me with her hand still to 'God help me!' said she; 'yes!' her eyes.

(Continued on page 594.)

ANDES IN A MAIL-CART. ACROSS THE

By J. F. JESSOP WEISS.

ON one of those particularly broiling days only to be experienced in or near the tropics, I was standing on the hotel steps of Asuncion, Paraguay, languidly wondering what to do next. It dawned upon me that I was sinking into the lazy Paraguayan life, and had better rouse

myself to make a plan for future travel without delay.

A month later I was in Jujuy, in the northwest corner of the Argentine Republic, my idea being to cross the Andes, through Bolivia into Chili. The railway from Jujuy only ran to La Quiaca, which is a mile south of the Bolivian frontier; and from there I should have some two hundred miles of Bolivia to cross before reaching Uyuni, the nearest town where the railway would be available by which to gain the Chilian coast and the Pacific Ocean.

About those two hundred miles through Bolivia I could get very little information, as the passes are only open for two or three months in the year, and then are seldom used, as the cold is very great, and travellers are sometimes frozen to death. My inquiries always resulted in my being advised to return south and cross by the Buenos Aires-Valparaiso route; but I was not inclined to retrace my steps some one thousand five hundred miles, so decided to risk the pass being open, and to hope that I should be able to bear the altitude. This may seem foolhardy; but I had found that difficulties were generally exaggerated, so I took all information with a pinch of salt, and hoped for the best.

Jujuy to La Quiaca is some one hundred and eighty miles by rail, and uphill most of the way. We mounted continually between hills, winding in and out, sometimes by a watercourse, sometimes in more open country, but always hills upon hills in every direction. The scenery was not beautiful, the land being barren except for thousands of cactus plants of every description. I was surprised not to see more mountains, but there was only a succession of large hills, one rising on the top of another, and the grade was so steep in places that a second engine with cogged wheels had to be used. As evening came on, and we neared La Quiaca, breathing became difficult, and if I made the slightest exertion my heart beat fast. This surprised me, as La Quiaca is only ten thousand nine hundred feet above sea-level, and in Switzerland I have been higher without experiencing inconvenience.

On arrival at La Quiaca I went to the hotel, a sort of bungalow built of mud. But La Quiaca had no attractions. To begin with, it was never free from a boisterous wind, so that dust and grit reigned supreme. It was utterly gloomy, the huts—there were no real houses—being built of mud, and not a blade of grass was to be seen. The only vegetation consisted of two trees, and these, though very scrubby, were evidently prized, for they were carefully walled round, perhaps to keep them from being blown away! The mountains around looked like rubbish-heaps.

I inquired about my route, and found myself in great luck. The railroad on which I had come had only been open a few months, and since then a weekly mule-post service had been started during the open season to run to Uyuni; and I was glad to find that the open season would last for another month, and that a post would leave on the morrow. The hotel manager told me, however, that it was not a white man's country, and even the natives suffered from puma (shortness of breath).

Of course that mule-post did not start for another two days. It seemed to have been planned more for the amusement and employment of the driver than for the convenience of passengers. I was the more sorry for delay because the hotel was primitive in its service and limited in space, only allowing one room to four men. At all meals I found it necessary to wipe every implement before using it, as dust covered everything though the table might have been laid immediately before. Even after taking all precautions I would find grit at the bottom of my soup.

At midday the post really started. It had the appearance of an English bread-cart, and was drawn by six mules. As I was the only passenger I could choose my seat, and clambered up beside the driver. After many guttural exclamations from the driver, we dashed off in fine style, and were soon across the frontier into Bolivia. There really was no road, but simply a sandy track into which we sank a foot or more at times, while the dust was appalling. What could such a route be like during the six months of rain and snow? Utterly impassable.

After an hour on this so-called road we pulled up at a mud hut, and a woman came out carrying an earthenware bowl which she handed to us. Both being uncommonly dry, we drank deeply of its contents. It was not unlike a mild form of cider, and we found it very refreshing. As we drove on again I asked the driver what the beverage was. 'Chaicha,' he said, 'made from maize by the Bolivian women.' He then described to me the process of making. The women sit round a bowl, thrust large handfuls of maize into their mouths, chew it to a pulp and spit it into the bowl; then they add water, and allow the whole to ferment for a few days, when it is pronounced to be a cool, refreshing drink! After this singularly revolting description I felt no further desire to partake of chaicha.

We seemed now to be on an undulating tableland surrounded by mountains. There was no vegetation except some patches of what resembled scorched heather. In the course of a few hours we arrived at Mojo, where we put up for the night. This hamlet was strikingly picturesque. It was situated on the edge of a volcanic ravine, where the ground seemed to be ploughed up in huge furrows, and showed a variety of strata. All the huts, as usual, were built of mud, and what was rather interesting—the church also. The women wore very short skirts, and as they generally wore about six at once they were remarkably good representatives of ballet-girls, though their expression was not quite in keeping with the skirts. As a rule, their feet were only sandalled, though some wore boots; and for headgear they wore wide-brimmed hats.

We all had our meals at the same table—coachman, servants, and the proprietor of the inn. The conversation was carried on in

Spanish. I bought for the driver a bottle of

spirits, which pleased him a good deal.

Next morning at three A.M. I was called, and we proceeded on our journey; the driver in high spirits, being half-drunk. It was exceedingly cold and almost pitch-dark, the mules were going at full gallop, the cart was swaying from side to side, and I was clinging on with both hands, not feeling too happy. As the day dawned my fears increased, for now I could see we were dashing down the side of a valley with a steep precipice on one side. Faster and faster we went, bounding over all obstacles, large or small, the drunken driver shouting, and the vehicle creaking aloud as it jolted from side to side. The scenery seemed to fly past us, and my breath was beaten back as I gasped. Suddenly there was an ugly The driver threw himself backward, hauling at the reins; I added my weight to his, and eventually we succeeded in coming to a halt. We found that one wheel was nearly off, but we managed to screw it up again, and off we set nearly as fast as before. We passed through several villages, but this did not in any way check our speed as we went steadily downward. The only breathing-space was when the driver had another pull at the bottle of spirits which I had so foolishly given him, and then we went on faster than ever.

I was thankful when at last we found a dry river-bed which we drove along. As may be imagined, it was not an easy road, but we hopped along merrily over huge boulders, and kept the pace up as much as possible. The scenery was very rocky, and there was no vegetation; but the colouring of the rocks was delightful, a most beautiful blending of red and purple. After travelling for two days we arrived at Tupesa,

having covered fifty-four miles.

Tupesa is a long, straggling mining village, boasting a few small gardens, the first I had seen since we left the Argentine. Here again I was in luck, as I found the post to Uyuni would leave the same afternoon; and, although it had been across the pass only a few times, this was to be its last journey, as it was not proving a financial success. I was told that we should not be able to get any provisions on the way, and that the journey would take five or six days, so I hastily laid in a stock of sardines and maize-bread; the latter, by the way, hard and unpalatable when kept a few days.

Beside myself in the new poste was a very stout Bolivian woman, her husband, and a Spaniard; but, fortunately for me, I was again lucky enough to get the seat by the driver.

Our way led along a river-bed, and here the scenery was grand beyond description. On either side we were walled in by an amphitheatre of solid rock which frowned down upon us. On the right hand there appeared to be great statues of men, which may have been cut stones piled up by the peasants, or may have been the work

of volcanic nature; but the effect against the vivid blue sky was truly solemn and grand.

The time passed quickly as we climbed steadily upward. At night we put up at a peasant's hut, and I ate some of my sardines and bread. We slept all together on the mud floor of the hut, and fortunately we all had rugs, as no bedding could be obtained for love or money.

Next morning we started again, still ascending, and though we had a herd of twenty-two mules driven ahead as relays the journey progressed but slowly. The river-bed made a diabolical Most of the time I held the reins whilst the driver walked alongside. Then some large boulder would bring the poste completely to a standstill; the eight mules would be twisted first one way and then another, harness straining, driver crying out; the jerk! and we would be all but thrown out of the cart as it sprang forward with an ugly roll. This was repeated over and over again, and a hundred times we were nearly turned over. Indeed, it was a very perilous journey. I heard that an attempt had been made to clear away the worst of the boulders, many thousands of dollars having been spent over it; but the river torrents in the winter always brought down boulders equally large to replace those removed, and so the mulepost was to be given up.

We saw several Bolivian Indians. They have an exceedingly evil cast of countenance, and, being half-civilised, are mostly cut-throats. Our driver was an Indian, but I am glad to say he

was quite inoffensive.

We still followed our river-bed, and as we mounted higher the course grew more serpentine. Sometimes we passed a small island, sometimes a tributary to the main river-bed, and sometimes we had to leave the river-bed altogether and skirt what in the wet season must have been a waterfall. The only vegetation was cactus, the single-trunk type, many being fifteen feet high. In the afternoon we left the watercourse, and ascended to a tableland where the mountains were like large ant-hills dotted about, and one very lovely peak stood out looking like one of the Pyramids. I was surprised to see no snow, as it was very bleak and chilly; but apparently the perpetual snowline is some fifteen thousand feet above sea-level in the tropics.

It was during the next day that I first saw a llama. Hundreds of them were feeding on a plateau off a scrubby bush from which I feel certain no other animal could derive nourishment; they are the only animals that can stand these

altitudes for long.

The ground was very sandy, and at one place we all had to get out and walk, as the ascent was very steep; but the air was so rarefied that we were all panting hard before we had covered many paces, and I noticed that some of the mules which had over-exerted themselves bled gently from the nose. With hearts beating

wildly, we reached the top of the ridge, and here was a wonderful view. Mountains like the waves of the ocean lay at our feet, and the sinking sun's rays threw their noble outlines into strong relief; while we in our little cart on the yellow track felt very small and insignificant amidst this wonderland of nature.

On the fifth day we crossed a river-bed which I thought was covered with snow, but on close inspection I found it was borax. At one time we drove through the bed of a lake, and somehow this road through dry beds of rivers and lakes impressed me strongly; it seemed as if nature had neglected and then forgotten this part of the world, it was so unutterably desolate.

Just here Bolivia is so barren that vegetables are worth almost their weight in gold. We passed a vegetable vender with his precious wares done up most carefully in straw to protect them from the sun by day and the frost by night. He was dressed in the usual manner—tight trousers, coloured shirt, short jacket, sandals on his feet, and a poncho or rug of many colours over his shoulders.

One afternoon we came to a sandy patch which took us two hours to cross, for it was a veritable desert, and as there was a high wind we had a sandstorm. Sand got into my eyes, nose, and ears, and made me feel inexpressibly miserable. Then darkness came on, and it was not until nine-thirty that we reached our resting-

place for the night—a peasant's hut.

These Bolivian huts are built of mud and a few stones if any are to be found near. are divided into two or three compartments (you can hardly call them rooms), the main one being the kitchen. We travellers, each with a rug or sheepskin, entered such a hut by a low door, and found ourselves in a low room, ill-lighted by the fire in one corner, which was in a shallow hole made in the ground. Across the hole were two or three iron bars for kettles and pots to rest on. The smoke blinded me at first; but, when we were seated on the not overclean sheepskins which covered the floor (there were no chairs or tables), I found the smoke was above us, and it escaped, or did not escape, through a small hole in the roof, so was bearable.

Our Spaniard, who fancied himself a bit of a doctor, now began to make himself useful by prescribing for the inmates of the hut; and in exchange won for us the privilege of sleeping in a compartment where mules' fodder was stored, and so our aching bones had one night of real rest. I only longed for some other diet than sardines. My eyes were fearfully sore and smarting from the dust-storm when I woke next morning, but after bathing them I was quite glad to set off again.

We were still ascending, and about ten A.M. we attained the highest point of the pass, four-teen thousand feet above sea-level. From that point we made a rapid descent, with a precipice

on one side. Our chatty coachman kindly informed us that in the two months the post had been running two carts had gone over the edge; and after this news conversation languished, as we were not wishful to distract his attention from his team. Whilst descending this awful road it was encouraging to see in the distance a plateau surrounded by snow-capped mountains, and on it the little town of Uyuni, with the long-desired railway line stretching across the plain. A huge belt of salt ran some distance away, parallel with the railway, which looked very curious.

At midday we reached Uyuni in safety, and I felt that my troubles were now ended. I strolled into the hotel almost prepared to resume my indolent Paraguayan habits while resting my weary limbs; and I gazed about me with the languid interest of a virtuous traveller. Suddenly my attention was attracted to a printed notice saying that the Custom House would not allow any export of gold from the country, and that any one leaving Bolivia was only permitted

to carry three sovereigns.

Now it happened that I had a money-belt on me with ninety pounds in gold carefully tucked away in it, and this was really my entire fortune. I felt I must know something of the terms of exchange before proceeding, so entered into conversation with a man in the hotel, and presently mentioned the notice. He told me that the English sovereign was worth sixteen dollars Bolivian, but that the Government made a large revenue on exchange, as the banks were not allowed to give more than twelve dollars fifty cents for the sovereign, and that they were bound to notify the Government of every gold exchange and to pay it a large percentage. No wonder that the Government was so keen that no gold should be exchanged out of the country! If the Customs officials discovered any gold being exported they would confiscate the whole, receiving one-half themselves and paying the other half to the Government.

This information showed me that to exchange my gold would mean a huge loss, and to keep it unchanged an enormous risk. Which should I do? The train to Antofagasta was timed to start at six-forty-five next morning, so I spent the night in alternately planning how to get my gold out of the country and in dreaming bad dreams of evil-faced Customs officials who were dragging not only my gold but my life out of me. By five A.M. I had made a plan for secreting my gold, and proceeded to carry it out. I took out my medicine-chest and began to stuff some sovereigns into the packet of medicated wool. But then I thought no! if they are 'cute at this searching business it will be their first act That would not do. Instead, to feel the wool. I took out a small pot of pomade, and thrust ten sovereigns deep into the stuff. Next I undid my last tin of Keating's powder (these tins

had been very precious!) and covered sixteen within it; but they made the tin suspiciously heavy, so I contented myself with leaving in ten sovereigns. Then I thought the bristles of my hairbrushes would be a good place, till it suddenly struck me that if they were turned upside down the gold would drop out. So I put five sovereigns into my boot-polishing box wrapped in a filthy rag. Now I had twenty-five pounds concealed in my luggage, and I hoped if any of it were discovered it would be taken for my entire fortune, and I might escape with the rest. If, on the other hand, my person were searched I hoped the gold in my luggage might be overlooked. In my pocket I had a handful of silver, and with this I put a casual sovereign I had been to divert suspicion of my caches. told that travellers were personally searched if they showed any cause for suspicion, so I put my revolver in my greatcoat pocket well out of sight, that I might not appear to be armed against authority.

By the time I had finally decided on the best method of hiding my gold only a few minutes remained in which to catch my train, and I hurried to the station. I found I was the only first-class passenger, and that the train consisted of open corridor coaches; so I took my seat well in the middle of a corridor, thinking I should thereby look more open and straightforward; a man with something to hide would be liable to

select a corner.

At first I was alone, as I said, but at the first stopping-place three men got in. They might have been ordinary travellers, one wearing ridingbreeches and the other two everyday kit; but my nerves were on the jump for Customs officials, and I kept a wary eye on them while pretending to sleep. We were not due to cross into Chili till one P.M., and it was now only nine A.M. Never did I feel more wideawake. At the next stopping-place all three men produced enamel teapots from their bags and went into the stationmaster's room for hot water, so I knew they must be officials of some sort, and my beating heart said 'Customs.' Every now and then I noticed furtive glances being cast at me while I slept on; but how the time did drag while I lay waiting for these men to demand my gold!

Somewhere about eleven o'clock the three men came to me, and one said something to me in Spanish which I did not catch, so I produced my ticket. The man shook his head, and said 'La Aduana' ('The Customs'). Wonderful to say, my spirits positively rose, all my former nervousness left me, and I felt equal to any amount of Customs. The only thing that bothered me was that a friend once told me any one could detect me when I lied, for my face always betrayed me, and now I was going to stake my fortune on a lie. The man in leggings was a Chilian, and the other two Bolivians; they were to act as checks on each other.

I opened my suit-case, and the Bolivians took out everything, putting on one side my medicinechest, hairbrush-case, boot-box, and razor-case. Then they felt round the lining of the bag, shook the pile of handkerchiefs, took out and turned inside out my collars, took out the socks from the toes of my shoes where they were thrust to preserve the shape of the shoes; and, in fact examined my bag most minutely. took no notice of my pomade or tin of Keating, however. Being satisfied there was nothing in the bag, they handed me my medicine-chest to open for them, which I did. The first thing they examined was the cotton wool; they felt it all over, pinched it, and did everything but open it; while I nearly gave the game away by laughing, as I thought of my first plan of stowing some of the sovereigns in that very packet.

The elder Bolivian now conducted the search while the other two looked on; he gave me the razor-case to open. This I did; and he made me take out all seven razors that he might carefully feel the lining of the box. Next he took the brush-case and examined the bristles; and again my heart sang a song of thanksgiving.

But the greatest trial was yet to come, and it far surpassed the others. He took up the bootbox, examined the brush, and then to my horror put his hand on my treasured, if filthy, rag in which were hidden my five sovereigns. heart was in my mouth now, for I thought I was lost. I knew I could not have answered had he spoken to me; but, thank goodness! he did not Cold shivers ran all over me as I watched him feel and pinch that rag; but, extraordinary as it may seem, he never felt the sovereigns, and he did not take the rag out of the box. Having looked through my bags, he stood watching me as I put my things back, hoping and yet not daring to hope, that the search was over. Suddenly he said, 'Señor.' I looked up. He looked me straight in the face and said, 'Quantas libras tiene ustedes?' ('How many sovereigns have you?') I put my hand in my pocket and drew out a handful of silver with the one sovereign among it; and, looking as bold as I could under the circumstances, said, 'Tengo una, no mas' ('I have only one'). He gave a grunt, hesitated, looked as if he longed to say, 'You lie, and turned away. The other two men then departed; but for nearly an hour he sat and looked at me, for I am sure he was still suspicious. I did not dare to enter into conversation with him for fear I should somehow give myself away; neither did I dare to look at my watch, or show any signs of a perturbed spirit, and great was the trial to my powers of endurance.

At last, to my joy, he took up his bag and left the carriage. I sprang to my feet and went to the window. My eye fell on some words scratched in the sand on the side of the hill, and my spirits rose sky-high as I almost shouted them aloud, 'Vive Chile'

THE WHITE FEATHER.

By H. HALYBURTON Ross, Author of The Law Lord and Lesley, &c.

CHAPTER I.

IN his little tent in the Khodee Khal Valley, Gerald Angus sat writing, or trying to write, by the inadequate gleam of the camp lantern over his head. A nineteen days' march had brought the column into the very heart of the bleak mountainous country of northern India, with not even a glimpse of the enemy they had come so far to encounter. But now the outposts reported sounds of occupation among the hills, and an attack was hourly expected. The difficulties of the way were forgotten, even the burning heat of the sun that had been reflected back so pitilessly from the rocky escarpment of the hills as the column toiled up ridge by ridge.

Gerald Angus had been one of the principal sufferers from the latter infliction, and even now that the doctor had pronounced him cured, his head felt mazed and queer. He wanted to write to Ursula; he had never felt the need more imperatively, but the thoughts came slowly, and his writing, too, was shaky and illegible. He was almost relieved when the flap of his tent was pushed aside, and John Edgell, the captain of his company, appeared.

'I was restless. I wanted a yarn,' said the new-comer apologetically, at sight of the other's

occupation.

But Gerald put away the blurred sheet with alacrity. 'It's no use trying,' he said. head's queer still.'

'I have finished my correspondence,' said Edgell shortly; 'a line or two to the old Mater, in case'—— He broke off.

Gerald was staring before him, apparently oblivious of what the other was saying. 'God knows I'm not superstitious, John,' he burst forth suddenly; 'but I can't get rid of the thing to-night.

Edgell glanced across at him curiously; he knew enough of the fateful prophecy that overshadowed his friend's life to understand the allusion, and had always admired the other's stalwart indifference to its influence. This sudden capitulation on the eve of a probable battle appeared the more sinister.

'Oh wae's me for the Heir o' Hun And wae's me for the weird o' him; Short is his course in the licht o' the sun, And that s'all be the curse on him,

Gerald was repeating in a low, monotonous voice. 'It's not for myself,' he went on more vehemently the next moment, as if ashamed; 'but for her-Ursula. She'd feel it so horribly if anything happened.'

Edgell was silent. Like many undemonstrative people, he was at a loss in an emotional crisis. 'It's the sun,' he blurted out lamely at |

last; 'your head's touched still. Hallo, what's that?' he broke off.

An alarm bugle had sounded through the night the sound was followed by a distant crash of musketry. Edgell dashed from the tent, Gerald following him. Outside, they almost collided with a hurrying figure.

'Captain Edgell!' the orderly saluted. 'A picket of the 35th has been attacked in the ravine to the left of the camp. You are to take your company to its support.' He wheeled

round and was gone.

Edgell glanced back at his companion. Even in the darkness Gerald could see the gleam in his eyes. 'B Company's chance at last,' he 'Come on, Angus.' muttered.

Another moment and the men in single file were moving steadily in the direction of the deep watercourse to the left of the rocky hills that faced the camp where the beleaguered picket lay.

They had advanced only a short distance when the dark hillside in front of them became alive with flying forms—the picket in full retreat, closely pursued by the enemy. In vain their officer, a young subaltern, was attempting to rally them; and Edgell, fearing the effect of the panic on his own men, gave the order to fix bayonets, and himself charged through the rout. With a cheer his company followed. The oncoming Afridis, believing that the whole British force was opposed to them, wavered for an instant, but only for an instant; the next, like an avalanche, they had swept downward.

In the mêlée that ensued Edgell seemed to bear a charmed life. Still at the head of his men, fighting, cheering, he pressed onward, through the tide of waving spears and murderous fire, the savage din of battle, up and up till, as it seemed, he had outdistanced all his followers. Happening to glance round at this moment, he saw his colour-sergeant, who had been close at his elbow throughout, stumble and fall beneath the onslaught of a giant tribesman. killed the Afridi with a revolver shot; then, dashing back a few paces, he seized the wounded man by the shoulders and dragged him toward the shelter of some rocks. As he reached the coveted safety, a figure that had been crouching behind the projecting boulders started up, and with averted head began to run rapidly back toward the main body of the fighting, but not before Edgell had distinguished the pale, terrorstricken features of his friend Gerald Angus. . . . What followed he never could properly recollect. All other sensations seemed to be swallowed up in the overwhelming one of shame and humiliation for his friend. How he flung himself

into the thick of the fighting, no longer the cool, self-possessed leader, but a mad, reckless unit consumed with the lust of battle, of killing for killing's sake; how he was ultimately cut off from his followers, and received the wound that stretched him senseless, were parts of a terrible nightmare that remained hazyand blurred through all the weary months of convalescence that followed.

And now, after nearly a year, John Edgell The Orakzais campaign was had recovered. past. It had fizzled out like so many other frontier affairs with the first serious reverse to the enemy. Edgell, who had been recuperating in Switzerland, was back in London; six months of leave were still due to him, and he was seated in his club one day shortly after his return, reflecting how best to employ the time, when a letter was brought to him. It bore the Inverness post-mark; and, opening it, he saw with dismay the heading 'Castle Hun.'

The mere sight of the name recalled memories he would fain have stifled which the perusal of the letter revived with all their painful intensity:

'DEAR EDGELL,—If you can tolerate the thought of seeing me again, for God's sake come up to Hun for a few days—shooting the ostensible excuse. You are the only person in the world who can help me. GERALD ANGUS.'

As he concluded the reading, Edgell's strong, stern face wore an inscrutable expression. It had been his earnest desire never to set eyes on the writer of the letter again. However generous the excuses he had sought to make for the other's conduct on the night of the attack, the natural shrinking of the brave man from one who had proved himself unworthy would prevail. somehow this appeal altered the situation. depths of abasement it implied spoke of the punishment the writer had already endured; and Edgell, with the contrast of his own well merited V.C. before him, felt impelled to respond. Accordingly he despatched a telegram: 'Thanks for invitation. Will be with you on Thursday morning,' and set about his preparations. following night saw him speeding northward in the Scots express, and the next day he alighted at the little Highland station of Hun.

A chauffeur in sober livery, who besides the porter was the solitary occupant of the station, stepped forward with a respectful salute at sight of him. 'Captain Edgell, sir; the car is waiting.'

A few moments later Edgell, seated in front of the powerful Daimler, was speeding up and down one of the most mountainous roads he had ever traversed. The ease with which the car took the hills drew an admiring ejaculation from his lips.

A faint smile crossed the impassive face of the driver. 'There is a good deal in knowing your engine, sir,' he remarked quietly, though with an unmistakable American accent.

'You are a first-class mechanic then?' interrogated Edgell.

The man nodded. 'I was on the Canadian and Pacific when I met the master, Mr Rafe,' he averred.

'That is Captain Angus's brother?' said Edgell. 'Yes, his younger brother, my master,' repeated the chauffeur.

And how is the Captain?' Edgell queried.

The man shot a quick side-glance at him. 'You will see a great change in him, sir, if you knew him before—before the '--- he broke off.

'Before what?' queried Edgell.

'Before the campaign. It was a great blow to Sir Gerald, the laird, when he sent in his

papers.'
'After all, he would have had to give up soldiering on his father's death,' said Edgell

carelessly.

'The doctors say Sir Gerald may last another twenty years, paralysed as he is,' remarked the man in his subdued tones; 'and there was always Mr Rafe, my master, to look after the property.

The repeated emphasis on his allegiance to the younger brother struck Edgell with sinister significance. He felt a growing distrust of the man at his side.

Every mile as they advanced the salt-tang in the air was strengthening—a moment later, at the summit of a steep rise, an expanse of sunlit ocean burst on their view. On a rocky headland overlooking the bay stood the old Castle of Hun. Edgell was conscious of a curious thrill at sight of the gray pile. The memory of the tragic fate that hung over the first-born of its race rushed across him with sudden illuminating force. It was easy enough to discountenance such superstitious imaginings beneath the Indian stars; but within hail of the fateful environment he seemed to realise suddenly the power that such hereditary influence might exercise over a man's spirit.

A moment later the motor drew up at the porch, and a figure appeared at the door, and stood there, almost deprecatingly.

Edgell had to look twice before he recognised in the wreck of manhood before him his friend Gerald Angus. Then all the lingering resentment he had felt at his mission vanished, swept away in a wave of pity. 'Old man, I'm glad to see you again!' he said seizing Gerald's hand in a warm clasp.

An abashed look crossed the other's face; he crimsoned, muttering some low words of welcome. Glancing round, Edgell caught the chauffeur's impassive gaze appraising the greeting between them; but, seeing himself observed, the man quickly averted his head.

Two ladies were seated before the great open fireplace in the hall of the castle as Edgell followed his host within. There was a curious constraint in the greeting Lady Angus accorded to her son's friend; her manner sug-

gested either that guests were unusual at the castle, or that for some reason or other she resented his coming. A girl who had risen up from the settle beside the fire at his entrance held out her hand, looking with an almost challenging directness into his eyes. It did not require the mention of her name for Edgell to realise that she was Ursula Vassal, Gerald's fiancée. While Lady Angus questioned him spasmodically about his journey, drawing her fleecy shawl more closely about her shoulders as if a waft of the chill mountain air had entered with him, Edgell was subconsciously noting the strained attitude between the lovers; there was a wistful timidity in Gerald's advances which the girl's monosyllabic answers did nothing to encourage. A moment later the party was completed by Rafe. Edgell was struck by some extraordinary attraction in his personality, to which his mother seemed to respond; her manner became at once more natural, she brightened visibly in his presence, while the constraint between the other two was rather intensified.

'Now we shall hear something about the campaign,' Rafe said, making himself the centre of the group as he leant with one shoulder against the massive stone mantel in the glow of the firelight. 'Old Gerald has been so uncommuni-

cative!'

Glancing quickly round, Edgell was just in time to note the pained flicker that crossed the elder brother's eyes at his words. Had they been spoken intentionally to wound? The query darted unbidden into his mind.

'Yes, indeed,' chimed in Lady Angus. 'We expected Gerald to bring home a V.C., Captain Edgell; but we have heard nothing—nothing.'

She finished with a little nervous laugh.

'I fear you will find me as reticent,' said Edgell quietly. 'We soldiers do not care to talk about our experiences.' Then, with a deliberate change of subject, he turned to Rafe. 'What a splendid driver your man is; he seems one with his car.'

'Kanz! Yes, he is a famous mechanician,' said Rafe. 'I picked him up when I was "making good," in Canada.'

'And his music—his music,' chimed in Lady

Angus.

'I think it was that that first attracted me to him,' said Rafe, smiling reflectively. 'There isn't a piper in the strath to touch him, Yankee though he is.'

Lady Angus had leant suddenly forward to Edgell. 'My son is very musical,' she said impressively.

'What, Gerald?' said the soldier, turning with

a laugh to his friend.

'No, Rafe,' she corrected him, as if annoyed at the supposition. It was easy to see which of the two was her favourite.

'Play something now for Captain Edgell,' she went on, addressing the younger.

'If Ursula will accompany me,' he agreed, turning his brilliant gaze on the girl.

She answered his look, then rose silently—automatically it seemed to Edgell—and crossed to the pione

Rafe produced his violin—the next moment the hall was filled with a low, whimpering plaint that seemed to creep up among the dark rafters and through the shadowy corners of the hall like a spirit in distress. The next instant the tune had changed to a light mocking measure; faster, wilder it grew. The musician's eyes never left the girl seated at the piano. To Edgell it seemed as if he were playing for her ears alone; then suddenly, with a discordant twang, the music ceased—a string had broken. Uttering an impatient exclamation, Rafe laid aside his violin and left the hall.

It was not until late the same evening that Edgell had an opportunity of private conversation with his friend. Rafe monopolised the conversation in the smoking-room after dinner, talking in his brilliant, magnetic way of his experiences in the Far West, until Edgell almost forgot the presence of the elder brother.

It was Gerald who at last forced an interruption. Rising abruptly, he said to his guest, 'Let

us go out and have a look at the sea.'
At once Edgell complied, half-guilty for his

temporary subjection.

'İn that case I shall go to bed,' said Rafe, yawning lazily. 'Don't get moonstruck,' he added with an odd little laugh as he was bidding the guest good-night.

A silvery moon was shining on the waters of the bay as the two made their way down the steep little path that led to a terrace on the cliff. A rough stone bench had been hewn out of the rock face, and on this they seated themselves.

'We can talk here,' said Gerald. 'I always feel as if there were listeners up at the house.'

The conversation that followed was painful enough for both. Gerald's confession was even more tragic than Edgell had anticipated. 'I absolutely funked that night, as you saw,' he admitted hopelessly. 'I, Angus of Hun, a coward! Far better if I had been shot down. What has my life been to me since? And yet I can't bring myself to tell them. But they guess it—the Mater, Rafe, Ursula even. I see the suspicion growing in her eyes every day, though she tries to be loyal, and not to believe. If I told her the truth it would be the end, of course; she reverences courage above all things, and despises—the other thing,' he broke off.

Edgell was silent. What could he say in the face of incontrovertible facts?

'That is why I asked you to come,' Gerald continued. 'I have thought about the thing so much that my sense of proportion has gone. I want you to decide for me. If you consider it my duty to tell, I will; in some ways it would

be a relief. I would go away and give up everything. Ursula could marry Rafe,' he finished with a cheerless little laugh.

Edgell started. Here was the very suspicion that had suggested itself to his mind that afternoon put into words, though whether seriously intended by the speaker or not he could not tell. Rafe Angus was in love with his brother's fiancée, and was plotting to undermine Gerald's place in the girl's affections. The idea gave an impetus to the decision that was hovering in his mind. In any case, confession seemed a futile act; trebly so if it were to furthor the ulterior designs of a third party. The problem had simplified suddenly—he felt all at once clear and convinced.

'I don't see that anything would be gained by raking up the story,' he began in low, decided accents. 'Nobody knows of it but myself, and I have never heard a whisper against your reputation. There were many extenuating circumstances that night: the sun, hereditary influences. The mistake you made was in sending in your papers. I understand your motive. You felt yourself unworthy to wear the King's uniform, and since then you have let

your nerves get the better of you to the extent of arousing suspicion. You must win back your own self-respect and live the thing down.'

Unconsciously his voice had risen as he spoke, and sounded loud and distinct through the silent night. 'It will take an heroic effort; but I will help you all I can, and who knows what further opportunities you may have of proving your mettle.' He stood up abruptly as he finished speaking.

Gerald remained seated for a moment with bent head, then he too rose. 'God bless you, Edgell!' he murmured huskily. 'I'll have a

A moment later the two made their way silently up the little path to the castle again. As their figures disappeared, a man who had been crouching among the clumps of whin that fringed the overhanging edge of the cliff sprang up, straightening himself, his face, pale and malignant in the moonlight, was turned in the direction they had followed.

It was Kanz. 'So Mr White Feather,' he muttered in a low, drawling voice, 'my master was right. I guess he'll win yet—everything.'

(Continued on page 601.)

ENGINEERS' TALES.

By FREDERICK A. TALBOT, Author of The Railway Conquest of the World, The Making of a Great Canadian Railway, Railway Wonders of the World, &c.

RAILWAY building is not generally supposed to be very intimately associated with anecdotes; the task is too grim and serious to admit of farce and comedy, although unfortunately the dramatic and tragic are somewhat prevalent. The railway builder—that is, the man toiling strenuously in fashioning the permanent way for the bond of steel—is a unique character, rough and ready, somewhat thriftless, and decidedly happy-go-lucky. The majority of the men are content to struggle along on a daily or weekly wage; but others, who are more ambitious, prefer pieceworksub-contracting a station, as it is technically called, which represents a hundred lineal feet The sub-contractors are their own masters, and their earnings depend upon the celerity with which they complete their task according to specification. The station may represent a length of embankment or a cutting, and the remuneration is graduated according to the material handled. Obviously, the man working on rock, which requires wearying drilling and the use of explosives, commands a higher rate of payment than one wrestling with loose earth. Moreover, rock cutting is dangerous, and the chance of coming out on the losing side is enhanced if the man is not thoroughly skilled in his work.

While traversing the wild North-West I came

in contact with an Irishman who was a famous character for a hundred and fifty miles around. He was known to every one in the neighbourhood, and those who knew him only by name spared no effort to make his acquaintance. One and all were welcome to his humble domicile—a shack set back a trifle from the river—and every one was welcome to what he had, which was not much, since, excepting the tools of his trade, his belongings were packed in a dunnage bag. Flynn was the breeziest 'rock-hog,' as he called himself from his prowess in excavating rock, that one could hope to meet. Adversity never affected his exuberant spirits. In fact, the more things went against him the heartier his laugh and the sharper his quips and witticisms.

'If a rock-hog ain't got no sense o' humour, then rock-hoggin' ain't his game. If you can see the funny side o' things just when everything's up against you, why, just look at the load it takes off your mind. You don't feel as though you are losin' money at all—at all.'

This bit of quaint philosophy was fired off for the benefit of all and sundry; there were guffaws from those within earshot on the 'alligator' which was beating her way down the swirling river through the driving rainstorm. It had rained incessantly for nearly a fortnight, and the little homily came as a ray of sunshine to the soddened and motley crowd of travellers.

'Why, boys,' continued Flynn, amid vicious expectorations, savage lunges at his luscious quid, and intermittent revelations of his broad set of nicotine-tanned ivories, 'just look at this I've not done a stroke for the last ten Drill-holes full o' water, fuses damp, days. dinky locomotive in the river because the ground slipped away from under it during the night; and then, to cap it all, along comes the resident engineer and cuts down my work by over a thousand cubic yards. "Can't allow it, Flynn," "You're a little bit too free with your savs he. extras." "Oh, am I?" says I. "Yes," says he, and he cuts down the figures. Now, I felt just like knocking his head off, trying to teach me my business; but I just asked him to have a smoke, said I would see the "chief" about it, and politely told the "resident" that if his ugly face were around my shack when I came back that I'd throw it in the river. But, begorra! where's the purser o' this tub !-Hi! come and take your blessed money, or by gum if I find the saloon before I do you, you won't get it at all-at all!'

I kept company with the genial Flynn until we reached Vancouver. He saw the chief engineer, got his account squared and settled; and, disgusted with his task, sold the whole of his plant, determined to leave the district 'frivver,' as he said.

We were having a parting toast, and exchanging farewell expressions for future prosperity. Flynn, with his usual bon camaraderie, insisted upon first throw.

But ere the famous wine of his country had wetted his lips a raucous voice rang out, 'Why, Jack! where the blazes are ye off to now?'

'Hallo, Sam! where've you sprung from?'

'Panamá.'

'Is that so? I hear money's free down there, and I'm just off to pick a bit o'it up.'

'Don't go, Jack. For the love of Mike, go somewhere else!'

'Why, what's the matter?'

'Can't make coffins quick enough, me boy!' was the laconic, ambition-crushing retort.

Two hours later Flynn was making tracks once more to the place where I had first met him. 'Begorra! if I get back quick I'll be able to get me outfit back from the guy I sold it to.' Saying which Flynn jumped on to the tram, waving his bag of belongings frantically in farewell.

An engineers' camp among the western wilds of Canada does not offer its small coterie of toilers much variety in the form of diversion; but one ingenious surveyor, a bright young Scotsman, started a sensation which threatened to startle the scientific world. One of his greatest treasures was the photograph of a wild, weird animal. It had been snapped in the brush, and was as unlike any known member of the animal kingdom as a duck is dissimilar to the prehistoric dinosaur.

One day a party, such as roves the hinterland

in the interests of science, visited the camp. It was a small expedition under a young scientist fresh from college, who had come out into the wilds to gain experience and to win his spurs. While seated round the camp-fire in the evening the photograph was trotted out.

Instantly the young scientist was all agog with excitement. He examined the photo closely; and, feeling that he was on the brink of a great discovery, which would equal the finding of the okapi, he pestered the Scot with questions. He was determined to find that animal at all costs.

The Scot gave every information. No, the animal certainly did not belong to the carnivora, because they had photographed it among the rich grasses and berries; it apparently did not come below the four thousand feet mark; they had seen only one specimen, which they photographed; had not followed it for lack of time, but he would direct the scientist to the spot with pleasure. He thereupon launched out, giving minute details to enable the party to pick up the spoor, and also suggested that the Indians in the vicinity would prove useful guides, as doubtless they were familiar with the animal. Certainly, the visitor could have the photograph with pleasure.

The young scientist thanked the engineer profusely, and set off excitedly early the following morning, resolved to run the 'shrieking lgoun,' as it had been dubbed, to earth. His name was destined to be carved upon the scroll of fame without a doubt. Leastways, such were his

innermost thoughts.

A week later the Scot's camp broke up to move to a point some sixty miles ahead, so he never saw the expedition again; but another camp did. The boys of the latter were out one Sunday morning hunting for bear when they happened upon the young scientist, accompanied by two or three Indians, toiling among the mountain crags. They were hailed by the engineers. Presently the two parties met. The scientist was somewhat despondent. He had searched zealously for a new animal which was said to haunt these parts, but in vain. Had the engineers seen it? Did they know anything about it? Saying which he produced the treasured photograph.

The boys inspected the picture and then burst into roars of uncontrollable laughter, to the discomfiture of the scientist. To him the reason

for their mirth was inscrutable.

'Say, did you get this photo of the "shrieking lgoun" from Little Mac, way back yonder?'

The scientist nodded assent.

'Well, do you understand Russian?'

A negative shake of the head betrayed

ignorance of that language.

'Well, Mac spent some time as resident among some Russian workmen down east, and he only learned one word. That was lgoun, which in plain English means "liar." Nobody in these parts ever has seen this brute except Mac and

his chums, because they made it up one Sunday morning when they had nothing else to do. I reckon if you search round his abandoned camp you'll find it all right—if it's still standing—an old grizzly skin, a cow's head, a moose antler, and one or two other things rigged up on a dead mule.'

When the railway builders invaded China they encountered hostility of a varied and extraordinary description. Even to-day native prejudices have not been subjugated entirely, as one engineer found to his cost. He had to supervise the erection of an aerial railway across some rugged mountains to penetrate a coalfield.

'The mountains were absolutely honeycombed with caves used as graves,' related the engineer. 'In some instances they were from four thousand to five thousand years old, and in a deplorably ruinous condition, the entrances being completely concealed by rank scrub. The result was that although we spared no effort to dodge the tombs, so as not to wound native susceptibilities, I was always falling foul of these sacred places. At last I ran a route which I thought would meet all requirements and save me from hostility.

'The worst stumbling-block was the Kiao Mountain, which I had to get over somehow. This was a kenchin, or holy hill, said to contain the graves of members of the imperial family. My first appearance upon the hill with my instruments caused a panic which almost culminated in a riot. The natives turned out to a man, armed with all kinds of weapons, and they told me as plainly as they could that if I went any

farther I should do so at my peril.

'I took no notice of their diatribes; but before you could snap your fingers there was a wild mêlée. Stones and sticks were rained upon our party with the fury of a tornado. My men were hard pressed to defend themselves. Not wishing to be the cause of an uprising or "holy war," I backed out of my position, and at the same time sought the protection of the imperial forces. Chinese police were hurried to the spot, and the sight of these emissaries of law and order quelled the fanatics.

'But the trouble broke out again in greater force when my erectors came along and started to plant their steelwork forming the towers. The natives could not resist the opportunity to attack us. They did so with mad fury, and there were lively times between the police and the inhabitants. The former, in their peculiar way, got the upper hand, and held it, so by force we got a number of supports set up.

'One morning my assistant came running to the camp and yelled excitedly, "Two of the posts

have gone!"

""Gone! What do you mean? Where?" Seeing that they were pretty weighty and bulky pieces of riveted steel, and had been set up firmly, I could not understand how they could have disappeared entirely.

'I jumped into my clothes and hurried to the spot, my assistant pumping out between his gasps, "The natives know nothing about it. The holes are there. The coolies say that Shansi has been busy, and that he has stolen them as vengeance upon the white devils for desecrating his grave."

'Sure enough, the posts were gone, and, examining the holes, I found that the supports had not been torn out by the fanatics. I scratched my head, somewhat puzzled, because the holes were in good condition. I began to think that Shansi certainly was a force too subtle and mysterious for me. I went down on my knees and peered into a hole. At last I caught the glint of metal some thirty feet down.

'Shansi had been busy during the night. He had collared the supports, lock, stock, and barrel. How? Oh, I found that the posts had been set upon the roof of a tomb which I had failed to notice, and the crown of the cave, unable to bear the weight, had let them clean through!

'I tried desperately to recover the supports. I opened out the holes, but the soil was so friable that it caved in as rapidly as it was excavated. So I gave up the job, rigged up temporary timber towers, and cabled to Europe for replacements. But I must confess that on this occasion Shansi certainly scored!'

A colleague of this engineer, who was entrusted with the construction of the Toli aerial railway among the Fangshan Mountains, had a more exciting adventure, the end of which, while humorous, promised to be tragic. He had the usual troubles with the natives; and, although under strong police protection, found it no easy task to make progress with his work; but finally he won the population to his side. He was a very enthusiastic sportsman, and on every opportunity he shouldered his gun and went out shooting. Unfortunately there was not much game about, but the countryside was suffering from a plague of foxes that had been driven in by the severe winter, and were devastating the stocks of the natives. He shot the animals down by the score; the natives followed this wholesale destruction with infinite delight, and whenever a fox was seen the assistance of the engineer was sought.

In a short time the engineer became the idol of the district, and many local farmers made trips to his camp to invite him to their properties to have a fox-shoot. Requests of this kind became so frequent that whenever a native came hurrying toward him he divined the mission, and accordingly yelled out before the man had uttered a word, 'All right. I'll come along directly and

shoot them.'

Unhappily his knowledge of Chinese was severely limited. One morning, when engaged upon a particularly trying piece of work, he failed to observe the approach of a native woman, who was weeping piteously. She came up to

him, and, dropping on her knees, poured out her sorrows and lamentations.

'More foxes,' thought the engineer, when his attention was attracted to the woman. Then, waving his arm, he yelled to her, 'I'll see to But the woman did not desist; and the engineer, somewhat preoccupied, simply ejaculated rather testily from time to time, 'That's all right, my good woman! Now, don't worry! Let me finish this first,' and so on.

Still the woman clung to him, howling more woefully than ever. At last he yelled in sheer desperation through his interpreter, 'I've told you fifty times not to worry. They shall all

be shot!

Like magic the pleadings of the woman gave way to shrieks of terror and bloodcurdling howls. Turning to the crowd, she yelled what seemed an unintelligible jargon, which made the engineer pause in his work. The onlookers, who had been following the proceedings with utter indifference, instantly changed their attitude, scowled fiercely, grabbed missiles hurriedly, and advanced threateningly toward the engineer.

Now, what in thunder is the matter? What have I done?' he inquired in astonishment.

'Sir,' remarked his interpreter, 'you have made a slight mistake. You thought this woman was asking you to shoot foxes destroying her property. But she is a beggar-woman, and she is asking you for money because her daughter has

just given birth to triplets!'

The European labourers who migrate to America to improve their fortunes never fail to be impressed with the many devices and systems practised to lighten toil and labour in the commercial offices. One of these new arrivals was a burly son of Scandinavia. Used to tearing down rock by the aid of dynamite in his native land, he naturally drifted out to the railway-building There he sweltered like the average toiler; but, with an eye on the future, he resolved to become a sub-contractor at the first opportunity. Fortune favoured him, and he secured a difficult and heavy station upon a mountain section. was expert at his work, and he made money rapidly; but he suffered from the disability that his handwriting was so utterly unintelligible that his accounts drove the clerks of the contractor almost to despair. The result was that disputes concerning amounts due were of frequent occurrence.

'Look here,' growled the cashier, after one of the periodical quarrels, 'why don't you get one of those things? pointing to a typewriter. 'They save a lot of time, and your figures would be a thundering sight easier to read and understand.'

The Swede said he would, and forthwith he went out and purchased a machine, which he tumbled into a dunnage bag, and returned to A few nights later the resident his shack. engineer was making his way to his camp, when, hearing a strange though familiar clicking proceeding from the Swede's shack, he peeped in upon an unusual sight. The son of toil was seated on the ground, Oriental fashion, with his pretty typewriter before him, punching the keys with the force of a sledge-hammer, his big, clumsy digits, with uncanny persistence, depressing two or three keys at once, which consequently jammed. The Scandinavian, however, was the personification of perseverance, and he kept to his task, although the operation was obviously trying, demanding free punctuation with explosions of invective and the condemnation to everlasting oblivion of the man who invented the typewriter. Six solid hours the man wrestled with that typewriter, and then he looked with justifiable pride on the result of his handiwork.

But when the clerical department received the first typewritten statement from the Swede it went frantic. The man had typed his figures, as suggested; but whether the columns were to be read horizontally, vertically, or diagonally they could not fathom. It was more baffling to unravel than the 'pigs in clover.' After a struggle of several hours the account was given up in despair. Two days later the toiler called for his settlement, and the cashier wearily remarked, 'I see you've got the typewriter O.K.'
'Sure! The work looks pretty, don't it! I

reckon you got on all right this time, eh?' he

replied with pride.

The clerk leaned over the desk. 'Look here. Take my advice. When you get back to your camp chuck that typewriter into the river.

'Why? What's the matter now?

'Oh, nothing—nothing! I've studied Egyptian hieroglyphics, am a master of Japanese, Assyrian, Chinese, Russian, and even can interpret the marks left by a fly which has fallen into the ink-pot and crawled across the paper,' was the sarcastic retort; 'but I'm hanged if I can make head or tail of your typewriting. I'd rather have your handwriting any day, although it does give me an attack of neurasthenia!'

THE VIEW FROM BEN VORLICH.

How great is a glance of the eye! It sweeps from Ben Lawers to Loch Lorn, Takes in the whole arch of the sky, And all the display of the morn— Hills bristling with heather and horn, Moors with the whaups and their cry, And corries with waterfalls torn, Streams and the straths they adorn, Lochs and the marshes thereby (Where Mairi is calling the kye), Crofts and their patches of corn In stubble or stook or unshorn! N'importe where the title deeds lie; His claim to exclusion I scorn, His palings and parchments outworn, Whoe'er to debar me would try From the right of the range of the eye To which, and the light, I was born. J. LOGIE ROBERTSON.

O'HIGGINS OF CHILL THE

By PERCY CROSS STANDING.

AFTER the names of Washington and Bolivar, there are few more illustrious in the development of independent America than Ambrosio and Bernardo or Bernard O'Higgins, father and son. It is with the latter that we are here concerned, the dictator of the new-born Republic of Chili.

Ambrosio O'Higgins, the Irish peasant boy who rose to be Viceroy of Peru, died in 1801 at the age of eighty, leaving a natural son, Bernardo, whose mother is described as one 'Isabel Riquelme of Chillán.' Bernard was born on 20th August 1780. His father left him a handsome fortune and estate, on which (after spending some time in England for the purposes of his education, &c.) he was preparing to settle down when the South American War of Independence broke out. On 18th September 1810 Chili formally declared herself free from Spanish usurpation, and O'Higgins, offering his sword to the patriot cause, found himself at first only assigned to a border regiment. Nevertheless he started well, his first fine feat of arms in the war being the capture of a strong Royalist patrol, though he led only thirty-six

But the campaign of 1813 was destined to open with a discreditable reverse. In what is known as the battle of San Martin, a force of ten thousand Chilians, led by the incompetent Carrera, allowed themselves to be worsted by a much smaller Spanish contingent, in spite of the personal example of O'Higgins. Soon after this the egregious Carrera failed again in a night attack upon Chillan (the birthplace of O'Higgins's mother), and the patriot forces fell back to the river Itata. Here, in an exposed position, they were attacked by night, and must have been destroyed but for Bernardo's gallantry 'Live with honour or die with and initiative. glory! Let the brave follow me!' he exclaimed, and, rushing to the onslaught, beat off the Spanish attempt with a loss to the assailants of a hundred killed and prisoners.

men.

It was by this time obvious to all well-wishers of Chili that O'Higgins must supersede Carrera in the command, and this was effected at the beginning of 1814. The patriot forces were much scattered, and another brave Briton,

a loss of four hundred, only to be shot in a duel by Carrera's brother.

O'Higgins was now concerned for the safety of Santiago, the capital. His audacious genius actually induced the Spanish General Gainza to agree to a treaty whereby Chili retained her independence, while admitting the suzerainty of the King of Spain. This so infuriated the latter and the Viceroy of Peru that Gainza was at once superseded by General Osorio, who, advancing rapidly five thousand strong, entered Santiago

in triumph. It was a daring stroke of strategy.

This was a heavy blow, but worse was to follow. Owing to the pusillanimous and treacherous Carrera utterly failing to co-operate, O'Higgins was overwhelmed by Osorio at Rancagua, he and four hundred followers being the remnant left of one thousand seven hundred troops. For the time being the cause of Chilian freedom seemed paralysed. Osorio ruled in Santiago with a rod of iron, and even the Inquisition was re-established.

O'Higgins escaped to Buenos Aires, there to join hands with the celebrated San Martin. Within a month of its starting across the Andes, their well-equipped little army met and routed the Spaniards in the battle of Chacabuco, and triumphantly re-entered the Chilian capital. First honours rested, as usual, with O'Higgins, who at the head of a division two thousand strong bore the brunt of the battle. victory was none too closely followed up, and the Spaniards determined on a bold coup for the retention of the province. They despatched six thousand men from Callao, organised by the Viceroy of Peru and commanded by Osorio. This officer, though he had beaten O'Higgins by a fluke, was a poor creature, albeit San Martin had a foil to him in the cowardly old Marshal Brayer. But Osorio's troops were of the best calibre, and, moreover, their advance found the patriot army somewhat scattered after When reunited, however, its recent successes. San Martin's strength amounted to eight thousand five hundred infantry and cavalry, with thirty-three guns, and Osorio promptly fell back to his base of operations.

Osorio was now superseded by General Ordonez, who quickly advanced, and caught the Colonel Mackenna, defeated the Royalists with | Chilian army in the act of 'changing front.' AUGUST 22, 1914.

No. 195.—Vol. IV. [All Rights Reserved.]

In the mêlée that ensued O'Higgins's men fired at each other instead of at the enemy, and he was unhorsed and sustained a broken arm. This injury incapacitated him from participation in the glorious victory of Maipo, as he was left in charge of the garrison of Santiago. While San Martin lost a thousand killed and wounded. he took two thousand three hundred and sixty men and officers prisoners at Maipo, together with twelve guns, battle-flags, and all the material of war. The effect of Maipo was worldwide, where since the downfall of Napoleon there had been none of the excitement of fighting save Lord Exmouth's destruction of the Algerine power on the Mediterranean in 1816. Not merely decisive of the liberation of Chili, the battle of Maipo conferred an enormously enhanced prestige upon the Republican arms. O'Higgins was destined to become the first dictator of the new Republic, and to this day the Chilian navy contains an O'Higgins and a Dundonald ironclad.

After San Martin and O'Higgins, the principal honours of the Army of the Andes rested with General Las Heras, the second in command in the battle of 5th April 1818. Not less to the conspicuous humanity than to the admirable strategy of this chivalrous soldier was due the completeness of the Chilian triumph on that glorious April day. Maipo paved the way for the freedom of New Granada, which was brought about by the decisive victory of Boyaca on 17th August of the succeeding year.

Apart from the circumstance that it was not a very happy Chili that he had to rule over, O'Higgins had some more fighting to do. Near the close of the year 1818 he smashed the enemy at the battle of Talcahuáno. Meanwhile the dashing Cochrane had arrived to give his sword to the cause, and he and O'Higgins between them provided Chili with her first fleet. 'The King of Spain won South America with five small ships. We shall drive them out with the same number!' said O'Higgins. These five vessels were the Lautaro, Cumberland, San Martin, Araucano, and Chacabuco, and a sixth was presently added, the O'Higgins. A devoted and lifelong friendship sprang up between these two colleagues in the struggle.

In 1819 General Osorio reappeared at the head of a great army, and we find San Martin writing to O'Higgins: 'United we are invincible; divided we are weak. Osorio can attack us anywhere with our four hundred leagues of coast.' He advised a general despoilation of the country, so that the Spaniards might obtain no sustenance anywhere. This actually was done, O'Higgins taking about with his army some fifty thousand non-combatants. In 1820 a ruffianly guerilla renegade, one Benevades, with two thousand four hundred Spanish and 'mixed' troops, lured six hundred patriot soldiers under General Alcazar into an ambush. On promise of good treatment they were induced to capitulate, when the miscreant Benevades had every man of the six hundred shot in cold blood! O'Higgins afterwards captured and hanged Benevades; but the incident makes one of the most appalling pages in the story of South America's fight for independence.

Gradually the Spaniards were driven out of Chili; but the dictator found himself hedged around by enemies secret and avowed. gallant Cochrane indignantly declined to participate in a plot for his removal; but a crisis was reached when, in January 1823, the disillusioned O'Higgins thus addressed the Junta at Santiago: 'If it has not been given to me to consolidate the new institutions of the Republic, I have at least the satisfaction of leaving it free and independent, respected abroad and glorious in its conquests. I thank God for the favour which He has given to my government, and I pray that He may protect those who have to succeed me. During my government I may have committed mistakes, but they were due to the difficult circumstances. If these faults have caused evils which can only be purged by my blood, here is my breast!' Efforts were made to induce him to retain power; but he declined, and retired to a Peruvian estate conferred on him by San Martin, where he lived until his death, at the age of sixty-three, on 24th October 1842. Of the sincerity of his patriotism there was never the slightest doubt, and the name of Bernardo O'Higgins stands second to none on the scroll of South American glory.

THE HOUSE OF LADDO.

CHAPTER III.

TAKE it that most of us looked for some signal demonstration of anger on the part of my uncle some time in the ensuing days; for it seemed impossible that a man could be possessed of a rage so murderous and continue to nurse it in silence within himself. Yet this is what

took place; he shut himself in his room with his papers, and we never saw him nor even heard his voice. I think we all felt this state of affairs to be more terrible than the most passionate outbursts. Hours and days went on, and nothing happened; yet all the time there

was this terrible old man scheming and designing, working who knew what mischief for us all? Cockburn came almost daily, appearing more and more sinister with every visit, till at the end I could almost have screamed at the sight of him. Steenie was away on some lasting errand, and every second day Rintoul rode out on some affair. It was plain that things were in train all around us, but to what end we could no more tell than fly.

As was only natural in the light of recent events, I was much drawn to the society of Alice Lechmere; but at first she avoided me, which vexed me a great deal, and seemed even uncomfortable in my presence, which tried me even more cruelly. She, who had ever treated me so kindly, and who had of late risen by so vast a leap in my esteem, was the last person from whom I could bear any sort of coldness. But at last, one morning, as I sat, rather miserable, in a kind of dilapidated arbour we had in the grounds, I heard her little stick come tapping down the path towards me, and presently she came and sat by my side.

'You are there, Davy?' she said; and then, at my assent, 'I have been unkind to you, who have done me the greatest of services, and I am

sorry for it, Will you forgive me?

The tears sprang to my eyes, greatly to my then mortification, though I think now they did me gredit.

'How have I offended you?' I cried, 'It was

the last thing I would have wished.'

'In no way that you could help, you poor boy,' said she. 'It was simply that you were so strong where I was so weak. Women are strange creatures, you know, Davy. You see, I—I am blind, and I had to be helped. I do not care to think of it.'

At this my feelings fairly carried me away, and I would have told her in a rush how brave I thought her, and how splendid—had indeed made some beginning of my speech—but she laid a hand upon my shoulder.

'Now, Davy,' said she, 'do not be a foolish boy; you can help me better than that, I have not dared to go out these last days. Tell me, have you seen anything or any one strange?'

'Oh, but I have,' said I, and plunged straightway into a description of the man on the hill. I was almost half-way through with this when she suddenly gripped my arm like a vice.

'Tell me,' said she, 'did he carry an emerald

ring on his left hand?

'I do recall such a ring,' said I.

'Merciful Heaven!' said she, 'it must have been my brother Robert;' and then, with a start, 'Oh, I ought not to have said that!'

'You do ill to suspect me, Miss Alice,' said I

bitterly.

'Indeed, I do,' said she very kindly, patting my shoulder the while, 'and I am sorry for that too. But I have lived so long in secrecy that I

grow uncharitable. I had no thought he was so near.'

'And are you not rejoiced at it?' said I.

'I know not whether to be serry or glad,' said she, in much agitation. 'Oh Davy, you must see him soon, and tell him he must go—go at once. He is in such danger. Promise me you will; promise me now.'

'I will undertake to tell him,' said I; 'but I

much misdoubt if he will go.

'You are right,' said she sadly. 'He will not. I should not love him so if he would. But my father will get them all; I know he will,'

'One man to catch so many?' said I, with

some heat, 'Surely not!'

'But such a man,' said she with a slight shiver. 'You do not know my father. He has given his life to this, and he will not fail, He has a net drawn round every Jacobite laird in Fife. Oh Heaven!' she cried, clasping her hands, 'he has them even now. They have but to move and they are in it. I did my best for a while, she presently in a calmer voice, 'but now I dare not move. Some day you may meet Mr Andrew Farquhar of Dinnie, and then you will meet a noble soldier whose life has been placed in jeopardy a score of times by this sad weakness We worked together for a time, he of mine, and I, and we did so much; but now it is no use.

'Never say so!' I cried. 'I promise you that within the next few days I will see your brother, and I'll warrant we shall set something afoot.'

The next day I set out upon my search for Mr Robert. I should say here that since our first meeting I had seen him on two separate occasions. Once he had no orders for me, but the second time he had seen Rintoul riding out, and desired to know his destination—which information I was, by a lucky chance, able to supply, thereby taking a definite side, and pleasing myself in a greater degree than him. The luck still served me, for now, on the first cast, I caught sight of him sitting by the pillar, looking very big and determined in the morning mist. I laughed to myself as I thought of the surprise he would presently have.

'Give you good-morning!' enied he. 'What

news?

'Great news,' said I, coming to a stand before him. 'Your name is Robert Lechmere.'

At the words he started nearly out of his skin, and then, with a shrug of his big shoulders, burst out laughing.

'You see, I am but a prentice hand in conspiracy,' said he. 'Your master villain does not

jump like that.'

'And in any case,' said I, 'you need have no fear of me, for I am David Lechmere, your own eousin, and what Rintoul calls a "dawmnable Jawcebite" like yourself.'

He leapt from the wall and wrung my hand with a most gratifying warmth.

'Well met, "dawmnable Jawcobite"!' cried he, laughing. And then, with a more serious face,

'What news from Laddo?'

'I have a message for you,' I said, 'from—your sister.' I thought I noticed a slight twinge of disappointment cross his face; so, before he could reply, 'I am sorry,' said I, 'that it was not from Miss Chalmers.'

At that he flushed very red, and something of

his father came into his face.

'My lad,' said he, 'you seem to have made good use of your ears. We shall get on better if you make less free with your tongue.' And then, seeing me confused and ashamed of my presumption, he said, 'Anyway, what said my sister?'

I told him briefly, and his face grew very

grave.

'If she says it is so, it must be so,' said he at last, 'for she knows everything. We must make a move. The game is up—here, at any rate. Oh, ten thousand curses on the black day that turned Prince Charlie back from Derby! When I think of the king's plate all stowed on the royal barge, and the London militia all ready on Finchley Common—— Well, well,' said he more calmly, 'we sha'n't mend matters by ranting here like play-actors. Do you be here every morning at nine, and I will soon give you adventures and to spare.'

We were parting at that, when he suddenly

called me back.

'Tell me,' he said, in the most confused and shamefaced manner, 'how is—Rose?'

'Very well,' said I; 'and on that topic I pray you forgive me my impertinence.'

'Indeed,' said he, 'I am very glad you said it,

since but for that I could not have spoken of it, which,' said he simply, 'I very much wanted to do.'

'You may command me,' said L

'Thank you,' said he. 'Remember she must not know I am here.'

It was on the tip of my tongue to say something of Cockburn, but I held it back, and at that we parted.

But, strangely enough, the first person I met on my return was Rose herself. I found her pacing one of the garden-walks, and her white and drawn face stopped me short.

'Miss Chalmers,' said I, 'what ails you?'

'Davy,' said she, 'do people die of fright? Because I think I shall.'

'My uncle?' said I.

'Who else?' said she. 'I have feared him all my days, and now he thinks it is I who have spied upon him; and, 'fore God, I have done no such thing.'

'What could he do to you?' said I, to soothe

her

'He can come and look at me,' said she with a great shudder. 'That would be enough. He will kill me; I know he will. Cockburn shall marry me; I shall make him somehow.'

'Such a marriage would be no escape from anything,' I said; 'even I am old enough to

know that.'

She looked at me in despair. 'Well, what am I to do?' she said. 'I care for no one.'

'Put Cockburn from your mind,' said I.

'No,' said she resolutely, 'I will not. He would at least take me away from here, and that is all I care for now.'

'You will but regret it,' said I.

'My life is a regret,' said she.

(Continued on page 613.)

THE TAKING OF MATEHUALA.

A PERSONAL EXPERIENCE DURING THE MEXICAN CIVIL WAR.

By W. E. LLOYD.

SOME months ago, shortly after the present revolution commenced, I happened to be in Matchuala when it was attacked by the rebels. Matchuala is a city of some ten thousand souls, in the state of San Luis Potosi, northern Mexico, and the terminus of a branch of the National Railroad. In the adjoining hills are many rich mines, some of which have been worked continuously since the days of the Spanish occupation, and on the edge of the town is one of the plants of the American Smelting and Refining Company.

Reading in my room one Sunday afternoon at five o'clock, I heard in the near distance—without any preliminary warning—a quick succession of rifle-shots. Presently came the sound of

many horses galloping madly through the streets. And above all other noises rose the shouting of men and the screaming of women! I realised at once what it all meant; we had been attacked by the Carranzistas. Since the day previous they had been expected, for many people from the neighbouring ranches, flocking into town for safety, had warned the authorities that Santos Coy, already notorious as one of the most active cabecillos, was in the vicinity, at the head of several hundred well-armed mounted men.

When the warnings came many of the City Fathers (who were probably in touch with the rebels, or at any rate secret sympathisers with their cause) pleaded with the prefect, Major Zuñiga, to surrender without fighting. They pointed out how inadequate was his small force of eighty infantry, unaided by even one machinegun, to cope with so large a body of horsemen. Threatening to imprison as a traitor the next man who attempted to turn him from his duty, the prefect made such defensive preparations as were within his power and capacity, and calmly awaited the onslaught.

Being somewhat remote from the main thoroughfare, it turned out, fortunately, that my hotel was not in the direct line of fire; so, by closing the thick hardwood shutters and keeping away from the window, I was comparatively safe within doors. In this way I saw very little of the battle; but I heard the din, the deafening roar of it, and the tumult sounded to my ears what one would imagine a mutiny in Hades to be like! The principal scenes of action were the Plaza de Armas, the city hall, and the barracks, all situated about a block from my hotel. There was also a lot of handto-hand fighting in the streets (which were very irregular and narrow), and some firing from the house-tops. At all points the struggle continued without intermission until it was too dark for the combatants to see each other.

We in the hotel could not know who were the victors, or if the result obtained so far was decisive. Waiting for news, we sat behind closed doors at the back of the house (which was built against a high stone wall, without a back entrance). When darkness fell upon us we had to ransack the kitchen for candles, and were fortunate enough to find there half-a-dozen paraffin-dips. All electric wires had, of course, been cut when the enemy gained entrance to the city. And thus we sat talking in subdued tones, not realising in our excitement that there was no need for such precaution, and smoking incessantly in an effort to control our nerves.

After dark all noise ceased, save for an occasional pistol-shot, caused probably by one of the guards potting at an imagined straggler. About ten o'clock I felt jaded and sleepy, and went to bed. But just before turning in I took a look up and down the street. Through the gloom I made out the forms of two or three dead men, and here and there the carcass of a horse. But nothing alive was in sight, and the silence was that of the grave.

With the dawn came a renewal of hostilities; but not for long, for it was soon known that but few of the Federal garrison remained. Not many of the townsmen had elected to fight on the 'Huertista' side, and those who were left quickly vanished when the morning light revealed to them how things had gone. The principal defenders were the soldiers of the regular army, and of these some thirty odd lost their lives. The balance of the eighty originally mustered escaped or were wounded. The latter, along with those of their opponents in the same

condition, were carried to the American Smelting and Refining Company's hospital at the smelter, where both parties, without the slightest discrimination, were attended to by the company's American surgeon and native pharmacist, and lay side by side in the wards.

The city was taken by the Carranzistas at a cost to their ranks of seven dead and about a dozen wounded. Of the non-combatants several were killed outright, and quite a number were hit and died later—how many will never be known, for the Mexican peon is very secretive, and matters of this sort are seldom allowed to be spoken of outside the family circle. Of the better class, two aged ladies died of fright, and three children were wounded by stray bullets, one so badly that she died next day. In an abandoned house a man was found behind a bedroom door dead, shot through the lungs. week after the battle two decomposed corpses were discovered when the débris was being removed from ruined dwellings.

The first move of the victors was to loot the municipal treasury and destroy some of the public buildings. Among the latter that were spared—not even entered!—were the post and telegraph offices. Why these exceptions were made I could not learn, despite the inquiries prompted by my curiosity, for other rebels I had run across were always careful to strip these institutions of their last peso in both stamps and coin! This incident was one of several that demonstrated to me the superiority of Santos Coy's band above the general run of revoltosos; it was obvious that they made an effort to play the revolutionary game as consistently as circumstances permitted. After they had levied forced 'loans' on the well-to-do of the business men, by which process they secured some forty-five thousand dollars, an order was issued demanding the immediate delivery of all the funds held by the local branch of the Banco Nacional. To obtain this money dynamite had ultimately to be resorted to, for the managerwho was also the cashier, and alone possessed the combination of the safe—could not be found. His absence did not, however, suffice to save the funds, at least the metallic portion of them and the notes of small denomination; the fact of there being no notes of high value was taken to indicate that they were with the manager in After an ineffectual trial his hiding-place. with hammer and chisel, a charge of explosive was inserted and the door of the safe soon wrenched off its hinges. The job was rather a tough one, but it proved worth while, for it yielded twenty-six thousand dollars. For this money, and for the sums obtained from the merchants, provisional receipts were given promising repayment when the success of the Constitutionalists was an accomplished fact—a matter of but a short time, they said.

Then was allowed to take place a most gratui-

tous wrong, something entirely without benefit, pecuniary or otherwise, to Matehuala's captors, and an act that effectually withheld any excuse that the foreigners present might have been inclined to make for what the revolutionists had hitherto done. Santos Coy acceded to the request of the mob for permission to sack, burn, and pillage! He restricted them, however, to certain quarters of the business section, and imposed a time-limit of two days. Another redeeming feature was that looting from private houses was sternly prohibited, and the troopers were absolutely forbidden to share in the plunder. Immediately began an exhibition of lawlessness and savagery impossible for me fully to describe. Stores were broken into and quickly denuded of their stocks. Merchandise estimated to be worth three hundred thousand dollars, and consisting principally of dry goods, groceries, provisions, wines and liquors, shoes, hats, furnishing of all kinds, was grabbed and fought for by a struggling mass of men, women, and children, every one of them excited to the point of delirium! Sacks of sugar were emptied, their contents being trampled in the mud as unworthy of notice; and then, in common with begs of other kinds, were stuffed with rolls of cotton prints, bolts of linen, suit-lengths of French and English woollens, fine cheviots and cashmeres, silk dress-pieces, zarapes, rebosas, and other articles of wearing apparel of native manufacture. The sacks, now become bales, were strapped to the backs of horses, mules, donkeys, and men, and conveyed to remote villages and secret caves in the adjoining sierras, to be brought out for sale or barter when it would be safe to offer them. Some of the loads were hidden in huts and hovels well within the city limits, for I heard a burro-driver boast that during the first day's looting he had made twenty-one trips! Holes were cut in the walls of stores, and goods passed out to women and children, who made off with them.

Many of the women joined the men in broaching the wines and liquors, and champagne was drunk out of ollas and similar earthen vessels, the necks of the bottles being knocked off against the walls. Drunken men staggered along the streets waving aloft bottles of the best French brandy, some brawling and swearing in obscene language, others singing ribald mañanitas or doggerel, and many cheering and shouting, 'Viva Carranza!' 'Viva la Democrácia!' 'Viva Mexico/' this last when any foreigner happened to be near. One burly fellow, with a sense of humour and a keen appreciation of the existing situation, called out, 'Que vivan nosotros / ('Hurrah for ourselves!'), a sally that was endorsed unanimously, judging by the roar of approval it evoked. Early in the day several of the stores-notably those where efforts had been made by the proprietors to resist the crowdwere set on fire, and soon entire blocks were ablaze and the air filled with smoke and sparks.

Word came to us that all the hotels were to be delivered to the pillagers, and we at mine inn sent out a scout to ascertain the truth of the report. He returned within a quarter of an hour to say that the largest hotel in town, the Hidalgo—where I had been advised to stop, but fortunately, as it turned out, was dissuaded from doing so by the eloquence and activity of the opposition 'runner,' who beat the others in getting hold of my baggage at the railway station—was already in flames.

Then came a woman hurrying past our door carrying a load of plundered furniture. Seeing us crowded about the entrance, she shouted, not stopping for a moment as she struggled along under her burden (a huge bundle of bedding on her head, chairs tied with string hanging in front and over her shoulders, and in her hands framed pictures and pottery), that we had better be moving and not stand staring at her; that as mine host was a Spaniard his house would probably be the next to receive attention. Five minutes after the woman had uttered her resentful warning I was absolutely alone in the building. In all revolutionary riots and disturbances in Mexican towns Spaniards are the special marks of the mob's fury; and as most of my fellow-guests were of Spanish nationality, they 'stood not upon the order of their going, but hurried off to the hills, there to await the passing of the storm. The landlord became too much absorbed in the task-not an easy oneof removing his wife and young family to a place of safety to give a thought to business; and the servants, having thus nobody to direct and restrain them, scuttled off to their homes. Mexican servants invariably live out.

Undecided as to the course proper under the circumstances, I remained in the house for a little while. Fearing, however, that if the mob found me there alone they might be tempted to make a sort of scapegoat of me, I finally concluded that I had better get away while there was yet time. So I started out, intending to make for the residence of the local dentist, an American, with whom I had become acquainted, and whom I wished to consult professionally, as it happened. For a distance of about two blocks I passed unmolested through the crowd, but when turning the corner opposite to the blazing hotel Hidalgo—the patio of which, all aglow, struck me as bearing a remarkable resemblance to the interior of a gigantic oven—I was peremptorily commanded to halt. I obeyed (instantly, you may be sure), and found myself looking down the barrel of a rifle pointed by a rebel cavalryman. I could see that the man had been drinking, so I was very careful not to give him the slightest excuse to pot at me by appearing to be angry or excited. Although my nerves were tingling and my heart

thumping against my ribs, I maintained an absolutely imperturbable front when replying to the sharp, gruff questions as to my identity, and the reasons for my being in the street at that time.

The answers I gave did not seem to satisfy my interrogator; he cut me off abruptly, and, shouting at the top of his voice, announced, with a volley of oaths, that he had captured an American spy! Calling to those of his comrades who were in the immediate vicinity to close up behind, and prodding me in the back vigorously with his rifle—which I expected every moment to hear go off, so careless was he in the handling of it—my captor ordered me to march ahead of the group, to be shot, as he informed me with an air of fiendish satisfaction, as soon as we arrived at headquarters!

Although at the moment there was nothing to indicate that the threat was not uttered in all seriousness, I don't believe now, nor did I really feel then, that there was any intention of carrying it into effect. Rather, the man's idea was to make a 'grand stand' display in front of the assembled populace, and good the gringo, for his own sport and the amusement of the crowd. He expected me to kneel and beg for my life; and that I did not do so, but, on the contrary, remained silent and apparently cool—the latter to an extent that, having regard to the manifest possibilities, was almost as great a surprise to myself as it appeared to be to the trooper—seemed to upset his calculations. After driving me before him to the end of the street, and failing to elicit a word from me either of protest or entreaty, the leader held up his hand and brought the procession to a sudden stop. Warning me of the summary punishment that would follow if I answered him untruthfully, he then submitted me to what was doubtless thought to be a severe cross-examination, and finished by asking me if I could prove that I was not a spy. I promptly demonstrated to the fellow by producing my British passport that he had made a mistake in not giving me an opportunity of answering that question at the beginning, and in taking the matter for granted. Staring at the document, and pretending to read it—which, of course, he couldn't do, because of its not being in Spanish -my custodian, quite crestfallen and anxious quickly to put a stop to the jeers which his companions already were greeting him with, mumbled an unwilling and surly excuse, and intimated that I was at liberty.

A couple of days later the officers in command of the rebels—most of whom I had become quite well acquainted with in the meanwhile—apologised profusely to me for the rough treatment to which I had been subjected by their troopers; they had only then heard about it. They assured me that if I would identify the principal offender they would have him executed. It is short shrift when it comes to a matter of punishing

their men. If, in the interests of discipline or for other just cause, it is deemed necessary to put them to death, the delinquents are shuffled off without ceremony; few preliminaries are observed, and no compunction is shown. Of course, in cold blood I could not seek to revenge myself, so the incident was allowed to pass. I cannot deny, however, that when the occurrence was actually taking place I could willingly have killed the man with my own hand, so mortified and angry was I.

As soon as I was set free I continued my quest for the dentist, and arrived at his house without further mishap. But, as was to be expected by this time, all the inmates had fled, a big bar and padlock on the front-door bearing witness to the fact. I then made the best of my way to the smelter, where, I learned from a friendly native, all the American and British residents had taken refuge. Accommodation for the women and children had been prepared by the superintendent and his wife, Mr and Mrs Grabill, who did all that lay in their power for the refugees; they were most kind and solicitous for the comfort of the distressed foreigners, without regard to nationality; and the other members of the staff took care of the The upper story of the office-building was reserved for the families, and the rooms on the ground-floor turned into dormitories for the bachelors.

All the men of the party were assigned to defence-duty, and they stood guard at the various points of vantage in anticipation of the possibility of attack by the rabble. By the time I arrived on the scene all the positions about the plant had been allotted; but work was soon found for me, and I was told off to look after the superintendent's town house. Eleven Spanish women had sought security there under the American flag; the men of their families had been secreted elsewhere, which was a very good arrangement having regard to the ugly temper of the mob where Spaniards were concerned. To get to the house I had to return to the centre of the city, and to attempt to do so on foot would have entailed considerable risk just then; so it was arranged that I should go in the automobile belonging to an English resident, Mr Dingwall, who had at that moment arrived with his wife and young children. Mr Dingwall lived in the largest house in town, but it was situated almost in the heart of the most disturbed district. Acting, therefore, on the principle of there being 'safety in numbers,' he had followed the example of the majority, and brought his family to the smelter.

Taking a circuitous route, and avoiding the multitude, I duly arrived at my post, and remained there on 'sentry-go' for three days. By the end of that period the popular fury had abated sufficiently to make it safe for my charges to return to their homes.

Occasionally it was imperative that I should go out foraging, and at such times Hop Kee, the Chinese cook, mounted guard, assisted by the mozo (native man-servant). The former posted himself behind the wooden shutters of a projecting window, and through a peep-hole had a view which commanded up and down the length of the street. The mozo was stationed at the frontdoor, a great, strong oaken affair studded with iron knobs, which was opened to nobody who could not, in answer to his stentorian 'Quien vive?' satisfy him as to their bona fides.

The first time I ventured out I went to ascertain if the looters had carried out their threats to burn my hotel, and I was very agreeably surprised to find that the alarm was a false one; beyond a few windows broken, no damage had been done. Some of the servants and a few of the more daring of the guests had returned; but the doors were kept closed, and there was hardly a sign of life about

the place.

Except in the centre of the town, where the business houses were situated, and where the common people were searching among the ruins of the burned stores and warehouses, there was scarcely a living soul in sight when I left the house after the second day. Dead horses, with here and there the swollen, ghastly corpse of a man (presumably without kin to give him burial, and awaiting the coming of the scavengers for removal to the 'potter's field'); smouldering beams hanging awry from the roof and obtruding across the sidewalk; the iron railings in front of windows twisted out of shape by the heat; pieces of wrecked furniture strewn about; heaps of ashes, charred fragments of books, little piles of broken crockery, and various other sorts of débris lying before the residences, presented a scene of desolation sad in the extreme.

During my excursions from the house I was very careful to avoid the revolutionists' headquarters, which were established in a large building near the main plaza. My object in this was to prevent any of the rebels following me home and finding the women. Because of keeping away from the rebel barracks I did not personally see what I am about to relate, but several of the smelter officials were present and told me of it. I refer to the execution of the prefect (or jefe politico, as he is more generally called in Mexico). This was an act of barbarism, and a crime, judged by the standards of civilisation, notwithstanding the claim that the usages of civil war treat as traitors who have incurred capital punishment those in authority on the side opposed to the victors, both sides asserting sovereign rights as the Government.

The officer in question was tried by courtmartial and condemned to be shot. He was much respected, both as commandant and socially, and strenuous efforts were made by the foreigners

-the natives dared not interfere—to have him pardoned; but, alas! without success. rebels insisted that the responsibility for the death of those of their troopers who had fallen lay with him, and that it was just that he should share their fate.

The jefe's defence was that, as an officer of the regular army and a servant of the republic, he had simply done his duty and kept his oath of office. Addressing the court, he said: 'For being faithful to my trust I knew well what fate awaited me if you won and captured the city, and I do not ask for your mercy. I go to my death without regret, calm in the consciousness that I leave to my children an untarnished name. Had I surrendered the town before my last cartridge was expended I should have been a coward and brought shame upon those dear to me; they, not I, would have had to suffer, and would have ceased to have any affection for me, and I would rather be dead than live without my children's esteem.

The pathos of his last words availed the brave commandant but little; the only indulgence allowed him was permission to write to his wife, who, with all the other members of his family, lived in San Luis Potosi, the capital of the state, a couple of hundred kilometres distant.

Handing the letter to Mr Grabill, the doomed officer coupled with the request of its delivery the promise from the superintendent that the latter would take charge of his remains until they could be transferred to his family for burial. The promise was given, and-although with much difficulty—faithfully kept. Shaking hands with the Americans present and with his fellowprisoners, the jefe walked slowly but very firmly out into the patio, and, taking his stand against the adobe wall, faced the firing-squad without a tremor. They sought to bind his eyes; but when one of the officers advanced with a black silk handkerchief ready for the purpose the jefe waved him aside, and, with feet placed firmly apart, heels together, and arms straight at his sides, correctly at attention, called out in a clear voice that he was quite ready. There was a moment of absolute stillness; then came the order, Fire!' 'Ready! Present! and the body seemed just to crumble into a heap of clothing as the bullets from the volley struck it.

When the story of this bloody revolution takes the form of history it is not likely that so humble a victim as Major Mariano Zuñiga will receive even passing notice, the engagement which brought about his death being but a 'small affair.' But it can never be denied by the residents of Matchuala that he gave his life in their defence, and if they have a spark of gratitude they will see to it that a monument to the brave jefe politico has a place under the shade of the giant pecan trees which adorn their pretty Plaza de Armas.

THE WHITE FEATHER.

CHAPTER II.

DURING the days that followed there was a marked improvement in Gerald Angus's spirits. He seemed to some extent to have recovered his lost manhood; his whole bearing was brighter, more confident. Rafe remarked the change one day at luncheon.

'You've made a new man of Gerald, Captain,' he said to Edgell with one of his light, halfmocking laughs. 'He has seemed to be under a

cloud since he came home.'

Edgell almost felt the wince with which the elder brother received the remark; the old pained flicker crossed his eyes that he had not seen since the day of his arrival at the castle.

Ursula was gazing before her with the wilfully misunderstanding expression she always assumed on such occasions. But Edgell had gauged something of the girl's real attitude during the past Chance allusions had betrayed to him how bitter had been her chagrin and disappointment when her lover had thrown up his military career, and that without a word of warning or consultation. It was his reticence on the subject and the mystery with which he had allowed it to be surrounded that was at the root of her displeasure, and her resentment had proved a fruitful soil for the artful insinuations of the younger brother. Yet, however subtle the influence Rafe had acquired over her mind, she was still unconscious of the real trend of his ambitions, and for this Edgell was thankful. The suspicion of conspiracy that had beset him on that first day had strengthened into conviction as the time passed. His own arrival had created a temporary check to the system of persecution whereby Rafe had planned the overthrow of his brother; but how long he would suffer his cherished project to be thus defeated was a matter of doubt. Already the soldier could feel the young man's growing resentment at his own prolonged stay; it was in the air, rather than expressed—a subtle emanation that sooner or later would take active shape. But Edgell set his teeth and swallowed the He had resolved on the rehabilitahumiliation. tion of his friend's shattered manhood, and if he was to depart now the old baneful influences would soon undo all the progress that had been The excellent covert-shooting at Hun provided excuse for the extension of his visit, and Gerald was ever ready with fresh pleas to detain him. So matters progressed until one evening something happened that gave warrant to his expectations.

Dinner was almost over at the castle. Gerald had been unusually gay and talkative that night, enacting the rôle of host with a naturalness and ease that were in striking contrast to his former

timid, deprecating air. Rafe, on the other hand, seemed preoccupied and distrait, his gaze turning again and again to a spray of scarlet rowan, the Angus badge, that he had presented to Ursula as they entered the dining-room, and which the girl had thrust carelessly into the front of her white dress.

'How the sea moans to-night!' Lady Angus had started forward suddenly in her chair with one of her restless, unaccountable movements.

Instinctively they all listened. Another sound had mingled with the low crying of the waters—hardly distinguishable at first, but gradually assuming distinctive proportions—the wail of the pipes. Ursula's face blanched.

It was the 'Lament of Clan Angus' that was being played: 'The rowan is weeping, its berries are withered.' Every note of the dirge seemed to bring the mournful words to their ears.

'It's only Kanz practising,' said Rafe, glancing quietly up at his brother, as Gerald started angrily to his feet.

'What right has he to play the thing at all a miserable Yankee?' cried Gerald; and, with a muttered apology, he pushed back his chair and strode from the room.

Mystified by his agitation, Edgell glanced at the head of the table, and was still further surprised to see the effect of the music on his hostess. Her face was pale, her eyes strained and fearful; her thin, clawlike fingers trembled as if palsied.

In vain Rafe and Ursula sought to reassure her; at last they led her from the room, still

trembling and distraught.

When Rafe returned, closing the door behind him, his face wore an enigmatic expression. 'You must be surprised at all this agitation over a mere tune on the pipes,' he explained apologetically to Edgell, who was still standing by his place at the deserted table. 'But the fact is, the Lament is always supposed to be heard prior to the death of the heir. You know the miserable curse that hangs over our House'—— He broke off.

Edgell was silent. Again in his ears there echoed the words last heard in a little tent on the Indian frontier, the very tones of the speaker's voice reproduced fateful and prophetic:

Oh wae's me for the Heir o' Hun,
And wae's me for the weird o' him;
Short is his course in the licht o' the sun,
And that s'all be the curse on him.

'It was so in the case of the last heir,' Rafe's voice continued. 'My father heard the Lament on the day before his elder brother was overtaken by the tide in riding round the Headland of Hun, and drowned. He has never rightly

recovered from the shock of it. Of course this is different,' he added in a lighter tone. 'There is nothing supernatural about it. Kanz was practising, and thoughtlessly stumbled on that tune.'

He had picked up a silver cigar-case from the table as he was speaking, and handed it across the table to his guest.

'A mere coincidence, in fact,' said Edgell

dryly.

The eyes of the two men met.

At that instant the door opened and Gerald re-entered the room. He was out of breath, as if he had been running, his hair disordered, a reckless, defiant expression on his face.

'Awfully sorry, Edgell,' he burst forth apologetically. 'It was a mistake of Kanz's.' He laughed in an odd, excited way. 'One doesn't want funeral laments at dinner;' and again he laughed.

'I'm sure he was sorry himself,' put in

Rafe.

Gerald just cast a glance over his shoulder at his brother, then as quickly averted his head. 'Infernal Yankee!' he muttered under his breath.

Edgell was returning from the moors in a thoroughly dissatisfied state of mind. He had parted from Gerald a few minutes before, the latter having gone farther up the glen to visit a sick crofter, and was continuing his way home alone. Shooting had been difficult, thanks to the stormy wind that blew from seaward across those exposed mountain-tracks, and that was rapidly rising to a gale. But it was not this fact that was responsible for his disturbed mental condition. It was his last day at Hun; the morrow would see him speeding southward again, leaving his self-imposed task unfinished. The step had been literally forced upon him. Ever since the evening of Kanz's contretemps he had lived in dread of some such development. There was no doubt that the incident had preyed upon the mind of his friend, deride it as he might; while in the case of Lady Angus its effects had been still more disastrous. She had not been seen downstairs since, and that morning Gerald had come to him in the smoking-room, and with a strangely awkward and reluctant air given him to understand that the presence of a stranger in the castle was having an injurious effect on his mother's nervous condition.

What could Edgell do but make his arrangements to leave the following morning? He dared not put into words his belief that the whole thing was a plot engineered by Rafe to get rid of him—Rafe, whose influence over his mother amounted to hypnotic possession—and when he was gone what hope was there for his friend?

The great hall of the castle was dark and shadowy as he entered; not a soul was in sight;

and, flinging himself down in a distant recess, Edgell relinquished himself to gloomy speculation. The struggle with the wind outside had exhausted him; he could hear it rising every minute, shrieking round the old gray fortalice, and the angry lashing of the waves below. By degrees the combined sounds lulled him to unconsciousness, from which he awoke some time later to the low murmur of conversation. In a semi-waking trance he listened.

'Rafe, what do you mean?'

The voice was Ursula's, and the sharp, pained sound of the interrogation drove away the last semblance of sleep from Edgell's mind.

'God knows, I never meant to tell you.' The answering voice sounded dangerously low and seductive. 'It's only for Gerald's sake I am speaking now; unless something is done, the trouble, the shame of the thing, will drive him out of his mind.'

'Shame?' There was an instinctive recoil in the speaker's utterance as she echoed the word.

'Yes, shame,' he said. 'I have had my suspicions ever since he sent in his papers; you have had yours, though neither of us dared put them into words.'

Edgell could almost feel the shrinking assent in the girl's attitude as she listened, and ground his teeth. No thought of revealing his presence suggested itself to him; for his friend's sake he must make himself acquainted with the full extent of the treachery.

'It was only the other day that my suspicions were confirmed,' Rafe went on. 'By accident Kanz overheard a conversation between Gerald and Captain Edgell, in which Gerald spoke openly of his own cowardice in the Orakzais affair.'

A stunned silence followed the revelation.

Edgell had a wild impulse to stand forth and refute the accusation, which he hopelessly discarded the next moment. How could he deny the truth? But at any rate what he had heard had confirmed his suspicions of treachery. Remembering the inaccessible spot on which his conversation with Gerald had taken place that first night, he realised how deliberate must have been the intention of the eavesdropper.

'I shall ask Captain Edgell myself.' Ursula was speaking again, a new note of passion in her voice. 'It—it—can't be true,' she broke off.

Before her companion could reply a distant reverberation smote on their ears, carried on the wings of the gale. Rafe had started up at the sound.

'Minute guns!' he cried. Again came the dull boom.

'There must be a ship in distress.'

He had turned and was half-way across the hall as he spoke. Ursula too had risen. For an instant she hesitated; then Edgell heard her swift, light footstep. He was about to call after

her, but the remembrance of his friend checked him. He must see Gerald first and put him on his guard.

Groping for his discarded cap and shootingcloak, he emerged from his dark corner.

The two deserted chairs in the proximity of the fire had a tragic significance in the light of the fateful confidences they had witnessed. But outside in the wild night was a more clamant consideration: the lives of shipwrecked fellow-creatures hovering in the balance. Ashamed of his momentary hesitation, Edgell made for the door, and the next instant was battling down the steep little path to the shore. The roar of wind and water deafened him at first; he could see the foam-topped breakers, careering streak-like through the darkness, hurling themselves against the cliffs beneath. The air was bitter

with their flying scud.

Little knots of people had gathered on the shore, their eyes strained toward the rocky headland beyond which the doomed vessel lay.

'The rocket apparatus is at Mallish, five miles up the coast. They've sent some one, but it'll be too late—she's breaking up fast,' said one of the watchers in answer to Edgell's hasty interrogation.

A little farther he came on a group of three, Rafe and Ursula, with Kanz enveloped in oilskins beside them.

'Where's Gerald?' called Rafe at sight of Edgell, making a trumpet of his hands.

Even in that moment of crisis the soldier realised that his intention was to point the significance of the elder's absence.

A laugh from Ursula echoed the words. 'There's danger here.'

The girl's low-uttered words were carried straight to Edgell's ears by the storm-fiend itself. But before he could reply a distant cheer from farther up the shore reached them. Instinctively they all started in the direction of the sound; other figures were battling through the darkness toward the spot where an excited concourse of people had gathered. What could have happened?

'Some one's swimming out with a life-line; he'll never reach it,' shouted a man on the out-skirts of the crowd at their approach.

Edgell, who was next to Ursula, caught the answering gleam in her eyes.

'What a splendid fool!' she cried. 'What a hero!'

The bitterness in her tone went straight to his heart. 'Just the sort of thing you'd expect Gerald to do,' he called above the storm in answer. He never could tell afterwards what had inspired him to say the words; but their only response was another wild laugh from the girl.

At the sound of it a woman standing by turned and caught her arm. 'Div ye no' ken who it is oot there?' she cried, pointing wildly

to the blur of waters before them. 'It's the young laird—and the curse on him—and no' another soul offered.' Her voice dwindled away into a low, whimpering plaint. Plainly she had not recognised the identity of her companion.

'Gerald!'

Edgell, standing by, heard the awe-struck repetition of the name in Ursula's voice. Her hands were clasped.

The memory of another night had rushed back into his own mind—to which this seemed a fitting sequel—a night of dark and terrible happenings on the Indian frontier, of cruel mischance and tragedy for the one who was now so recklessly—hopelessly, as it seemed—endeavouring to make restitution for his forfeited honour.

Boom / Again the signal-gun sent out its tragic appeal through the darkness.

A louder shriek of wind answered it.

With a spasmodic gesture, Ursula suddenly thrust her hands over her face.

'Oh Gerald, Gerald!' she moaned.

Edgell was pacing up and down the hall at Hun in the gray light of the early morning. It was six hours since he had helped to carry the unconscious form of his friend up the steep approach to the castle from the sea that had so nearly proved his sepulchre, and during that time he had hardly sat down, waiting in an agony of suspense for news from the silent room upstairs. The hard, phlegmatic soldier had been battling with new and hitherto unexperienced sensations, his contempt of supernatural influences warring with a reluctant, half-conscious faith in their sinister power. Would the fateful tradition prevail? Had his friend redeemed his honour only to fall victim to the curse that hung over his House? Well, certainly he could not have met death in more gallant fashion. The rescue of a whole ship's crew was an achievement to place him among the roll of heroes.

A swift step in the hall made him turn, and glancing round, he came face to face with Ursula Vassall. Pale as was her face, a suppressed radiance in her look told him that the news she brought was good.

'Gerald has recovered consciousness,' she said.
'We have been talking.'

'Thank God!' burst from the soldier's lips.

'I don't know what you must have thought of me last night,' she went on in a lower voice, a note of shame in its sound. 'But I had just heard something—something dreadful—about him. I'—— She broke off.

'Something you should never have been told,' Edgell supplemented sternly.

She glanced up at him, startled.

In answer to her look he went on, and in a few words explained how he had been a listener to Rafe's treachery the preceding afternoon, concluding with his own version of Gerald's failure on the evening of the attack.

'His heroism last night proves the real stuff of which he is made,' he added. 'It was the sun—the presentiment.'

She glanced round apprehensively. 'That

dreadful prophecy!'

As she spoke a bell rang sharply in a distant portion of the house. It was followed by the

sound of hurrying footsteps.

The next moment Rafe, with a face deathly pale, came across the hall toward them. 'My father,' he said, halting at sight of the pair, and speaking in a low, uncomprehending fashion—'he is dead. They found him a few moments ago. It must have been another stroke.'

A silence followed the announcement.

'Then Gerald is no longer the Heir of Hun.' It was Edgell's voice that had spoken. He was

half-ashamed of the words the next moment; they had been forced from him almost unconsciously by his sense of relief at the solution of an inextricable problem. After all, what had life meant to the paralysed invalid upstairs?

Oh wae's me for the Heir o' Hun, And wae's me for the weird o' him; Short is his course in the licht o' the sun, And that s'all be the curse on him.

Rafe repeated the lines half-mechanically, his eyes staring before him. Then he gave a sudden, odd little laugh. 'I didn't think of it till just now,' he said. 'I am the Heir of Hun.'

Edgell glanced quickly at Ursula. The girl's face had flushed. 'I believe,' she said very low, 'that the curse is broken; that last night wiped away the reproach from this House.'

Edgell's deep tones echoed the sentiment.

THE END.

CORSTOPITUM, THE BURIED ROMAN TOWN IN NORTHUMBERLAND.

By A. Brown.

IT will no doubt be of interest to archæologists and others who have an opportunity of seeing or hearing of the excavations and the interesting things unearthed at Corstopitum to have some outline of them given here. With that object the writer presents these notes, and will be glad if he can convey some of the pleasure which was experienced from his visit.

Through Allendale, where the lordship stretches for miles, the river Tyne flows in great sweeps and stretches of still water, and again great ripplings that ebb and flow in ever-changing volume. An elevated plateau less than a mile west from the modern village of Corbridge is the scene of the work on which the Newcastle Antiquarian Society has been spending its energies for some years past.

The whole site was cultivated land, yielding its routine of crops like the neighbouring country-side, without a murmur of the dead things of history that lie so close to its surface, though in the crypt of Hexham Abbey is the inscribed stone of the Roman Emperor Lucius Septimus Severus and his two sons, Caracalla and Geta, which probably came from Corstopitum.

Overnight it had rained heavily, and through the open window was heard the increasing rush of the rising river; by morning light it had risen from four to five feet, and was flowing through all the seven arches of the modern bridge, the successor of the old Roman bridge which carried the Watling Street of the Romans across the river at the same point. Bright sunshine, however, burst through the mist and kindled a longing to be out by the riverside and the 'things of old.' Salmon were racing

up with the spate, plum and apple trees hung red, and the old pear-trees in the village gardens were laden with yellow and brown speckled fruit.

The Wall of the Emperor Hadrian (built about 120 A.D.), which stretches from the Solway to the Tyne at Newcastle, ran but two to three miles north of this.

As the open country is reached the view is truly magnificent, right up the Tyne valleys and beyond Hexham to the north, with rolling woodlands and hills. What an eye for country the Romans had! A spot which commanded the whole country round is the site of the Roman station which is being excavated.

The work has the advantage of keen and thorough oversight. Oxford thought has been attracted by the material for studying archæology at home, and the field is but yet opened. It is now considered that the ground to be explored cannot be less than thirty acres, and only a few

of these have yet been overtaken.

The leading principle to get at is: what is the relation of this Roman station of Corstopitum to the military Wall of Hadrian? The excavations have to a great extent elucidated that. Passing round the mounds of excavated earth are found two oblong foundations nearly equal in size, and apparently utilised for similar purposes. Their basements, or, rather, ground-floors, as they would be, are paved and ventilated below and from the sides by stone conduits as airpassages, their purpose evidently being that of grain-stores. No remains of implements for winnowing have been found, as that would be done before the grain was collected; but hand-

grinding millstones are numerous. A convenient collecting centre, this station of Corstopitum had had its guard of the Twentieth Legion, and had sent north under escort supplies to the garrisons on Hadrian's Wall. These granaries measure nearly a hundred feet in length; their masonry is well preserved, except where depleted of its outer courses, for the site has been quarried for building material in later times. What remains is of admirable finish and uniformity. Stone mullions appearing in one of the windows are said to be unique as a feature of Roman architecture, and one of these still in its place is probably the oldest extant.

The Romans were nothing if not practical; they did not allow their soldiers to die of ennui. Close beside these granaries is a large fountain, the trough almost intact and complete except where the footsteps of thirsty animals have worn the stonework through years of use. The scroll indicates that it was built by the soldiers of the Twentieth Legion.

Farther east is the most extensive and massive Roman building that has yet been found in the north, or indeed in Britain; the Roman baths at Bath, of all the Roman remains, can alone compare with it. Its plan and purpose have yet to be cleared up, though it is suggested that it appears in the nature of a forum, the square court-house foundation (like the prætorium of a Roman camp) standing alone in the open centre of the enclosure. The masonry of this forum is of solid oblong blocks of stone which pass right through its walls, one end being the outside wall surface and the other end the inside wall surface. The stones are dressed in rustic fashion, with a moulding outside, and no lime or cement was used, as the blocks themselves gave the walls sufficient solidity. The whole enclosure is about fifty yards square, and shops or offices around indicate the whole as a place of exchange or meeting. Here and there traces of fire appear Whether these are the result on the stones. of fires of squatters in later times seeking the kindly shelter of the then ruined walls, or whether the station in Roman times had been burned down, it is not possible to say. The Roman occupation, however, continued till the close of the fourth or beginning of the fifth century, when it seems more than likely that Corstopitum was attacked and burned down.

While the large buildings above referred to form the groundwork for archeological discussion, the lesser things found bring us nearer to the living realities and surroundings of the Romans who lived there. Frequent is the finding of pottery ware, both of local clay and make and of what appears to have been brought from the Continent. Samian and Castor ware abound, in fragments more frequently, though in many cases restorable by piecing together. Embossed

work round the potsherds shows hunting scenes, and in one case a rustic piping under shading trees to a youth who is dancing in front. One very effective and unique fragment of embossed work is the figure of a man in a state of rude nature, in strong relief from the groundwork, holding in his hands a stone hammer. Probably, even in Roman times, this was an ornament characteristic of the early conditions of the inhabitants when Julius Cæsar first came to Britain before the beginning of the Christian era.

There are spear-heads, knives, and other iron implements of war and the home, swollen and blistered with rust; and one curiosity is what looks like a primitive razor, its joint pointing to its having been used as such. Ballista stones (ball ammunition for the catapults) are in abundance, varying in size from three to five inches in diameter; no doubt they were hewn at Corstopitum from its local quarries close by for the legionaries on the Wall. Of sculptured architectural fragments the most noteworthy is the head of the sun-god in low relief, on local stone, about two feet square, with an unusual nimbus, but bold in its tracery and effects. It has been suggested as belonging to the fourth century, and the most interesting of that period found in Great Britain.

Some hundreds of copper coins have been found, varying in date from Vespasian onward. A great hoard was brought to light one morning. At the breakfast-hour one of the workmen drew out from the mould not two feet below the surface a twisted roll of lead; his pick went through it, and he was about to throw it back, when, in pulling it off the pick, he saw the glint of gold The excitement over the workings was intense till the unrolling of the lead revealed forty-eight gold coins, which, with those found later in a copper jar, form the largest treasure of Roman gold coins ever found in Britain. They are a little less in size than our sovereign, in beautiful preservation, and one could fancy they had been minted but yesterday; their metal is rich in colour, and about twenty-two carats, or nearly pure gold. Amongst them are the coins of many Roman emperors, including those of Valentinian I. and his brother Valens, who reigned over the then divided Empire from 364 to 378 Their obverse, with the Emperor's head, is a beautiful piece of design, clearly cut and well defined in feature and sharpness; the reverse has 'Restitutor Reipublicæ' or 'Victoria Augg,' and inside the frame beading a full-length javelinthrower; and the mint marks R.T., T.R.O.B.C., &c., indicating their minting at Rome or Treves. Some twenty-four of them are of Emperor Gratian and Valentinian II., sons of Valentinian I., who succeeded, and reigned till about 382 A.D. On the reverse of one of the Gratian coins the words are 'Princeps Juventutis.' Perhaps the most interesting are two of Emperor Magnus

Maximus (383-388 A.D.), the ambitious General of the Roman camp and troops in Britain, who conquered and killed the Emperor Gratian; then the Emperor Theodosius—represented by five coins in the hoard-who ruled the Eastern Empire from Constantinople, for his own protection, and, as we can well understand, in revenge for his slaughtered colleague, gave him battle and killed him. Theodosius thereupon ruled the whole Roman Empire East and West, and was the last that ever held such a position. It is curious to note that the mintmark on two of the coins, 'Cons.,' points to the possibility of their having been minted in Constantinople, though the better opinion is that 'Cons.' stands for Constans, in the south of Gaul. For fifteen hundred years these coins have lain hidden, and no doubt the person who placed them there intended to call for them again, but something happened.

The organic remains are numerous. Some found are identified as tusks of the wild boar, antlers, bones of the badger, &c., and, most interesting, those of the beaver. With the gold coins was enclosed a gold signet ring (the stone gone), pointing to their having been placed there for their intrinsic value in some emergency. Several stones fallen from their settings were found, their wax impressions yielding the curious combination insect, probably after the scarab of the ancient Egyptians, indicative of a combination

of virtues or charms to ward their wearer from the imaginings of these superstitious times.

The mysterious unknown is always of interest, and to pick up facts like those narrated of days fifteen hundred years ago quickens the historic sense and livens the archmological faculties. They give to us the outlines and the draperies of that mighty Empire; they give us hints of the interests and duties the legionaries had at the outposts of that Empire, and of that firm discipline and order which are our inheritance from them in manners and customs and laws, the Theodosian Code of the Roman Civil Law.

Beyond the sciences, archeological and historic, that free-lance, thought, and its subtle quiver of imagination point and lead the mind to draw aside the veil of the dead past; we feel the pulse and see the passions of these old-world men stirred to ward and fend what was their life's work; and through the openings in the Caledonian forests we see too the native, while shrinking from the Roman sword and spear and advancing phalanx, still hovering near and waiting his opportunity, which was soon to come, for by the beginning of the fifth century Corstopitum had been evacuated by the Romans, recalled to defend their Empire at its core.

What was left to the native and what was left to us of Roman culture have not yet been fully learned in these fifteen hundred years.

A PASSIVE RESISTER.

By Douglas Blackburn.

JEBSON, Deputy Native Magistrate at Ubizo, lounged on the veranda, reading in the local paper the report of a violent speech made in the Legislative Council by Arborrow, the ardent and vitriolic champion of the aborigines. The Humanitarian had been exhibiting his humanity to white men by proving that all white officials were savages, and the fons et origo of the native unrest. His text was a recent 'incident' upcountry, wherein Bulpin, the Deputy R.M., had knocked down an insolent chief, and precipitated a 'rising' that had resulted in several natives and policemen getting hurt. Arborrow demanded the suspension of Bulpin and an apology to the chief, and threatened an appeal to the Colonial Office.

By one of those coincidences only permitted in the stories of lady novelists, Jebson was in the act of expressing his opinion of Arborrow when Fate brought him within the aura of the Humanitarian. Bulalie, the native head-constable, rode up to the veranda and reported.

'You have been a long time, Bulalie. What detained you?'

The 'boy' explained, with native wealth of

superfluous detail, how he had met a gang of natives, under a white baas, conveying a mahogany log, and had yielded to a request to show the road.

Jebson knew that the 'boy' was lying, and that the object of his lingering was the liquor that these labour gangs always carried, in spite of restrictions and penalties; but it was too hot to waste breath in saying so. The explanation, however, interested him, because of the suggestion that a log of mahogany should be met on that particular route, going away from the coast instead of towards it. He asked a few more questions, as the result of which he issued orders to Bulalie to saddle fresh horses and prepare to show the way to the gang.

Three years of sweltering at the hottest station in the Protectorate had not sucked all the energy out of Jebson, or, more marvellous still, his official zeal. He got into his riding-kit promptly, and armed himself with strange weapons—a handsaw, inch auger, and chisel, which Bulalie wrapped in his blanket and carried at the crupper.

Two hours later the pair rode into a native kraal of a dozen huts, and saw a mahogany log. twelve feet by three, which, by means of ropealings, had been carried by a gang of twenty strange up-country natives, now busy over their evening meal.

'Where is the white baas?' Jebson demanded

of the head 'boy' of the gang.

'Gone on three hours ago, baas.'

'To Sekuni's kraal?'

The head 'boy' hesitated, and Jebson did not press him. It was safe to guess that the white man was at that time discussing with the old rebel plans for the safe reception of the log. Jebson dismounted and examined the object of his quest, while the natives crowded around, looking on in silence.

'Bring the tools, Bulalie.'

The auger had penetrated about three inches when it stopped with a grinding sound. Jebson smiled triumphantly, and went to the butt-end, prodding with his pocket-knife at several blobs of sun-dried clay. The heads of screws came in sight. With the chisel he enlarged the screwholes, and after ten minutes of moist labour prised off the end of the log, a three-inch slab that had been neatly fitted on to disguise the fact that the log was hollow. When the grass stuffing had been pulled out, the butts and muzzles of closely packed rifles gladdened his sight.

After two years of anxious watching and scheming, and many narrow escapes of mares' nests, Jebson had captured a parcel of illicit arms en route to the wily old chief Sekuni, and won

the long-hoped-for promotion.

Jebson ascended into heaven for the space of five delicious minutes. He was brought back to earth by the excited jabbering of the natives and the realisation that he had been too precipitate. He had no legal proof that the rifles were consigned to Sekuni; neither had he caught the white man in charge, who he had every reason to believe was the notorious gun-runner Booker, much suspected, but never caught in the The offence—high treason—was so serious that the Government would not prosecute unless More than one overzealous certain of its case. official had covered themselves with ridicule and earned official reprobation for shouting too soon. Gun-running was so risky and profitable that the runners took no chances. They made their plans with the elaboration that ample capital permitted. There was not a 'boy' in that gang who would not be prepared to swear that he had never seen the baas when called upon to identify him, and fifty witnesses would be produced to prove that he was a hundred miles away at the time he was supposed to be superintending the transport of the arms.

Jebson pondered all these things as he wrote a note to the white police trooper of his station, who unfortunately was away at the time of Jebson's departure.

When Bulalie had ridden off with the message, Jebson replaced the end of the log, warned

the natives not to go near it, went to one of the huts in search of food and rest, and sat down to think out plans for consummating his partial success.

Before his pipe was well under way shouts and laughter from the neighbourhood of the log made him look out. The rifles were being dragged out, and a dozen were in the hands of as many Kafirs. He rushed out with a yell that sent the crowd scattering, most of them into the bush a hundred yards distant.

Jebson picked up a rifle and a bag of cartridges dropped by one of the runaways, and proceeded ostentatiously to load. Then he called in the direction of the bush, ordering the thieves to bring back the guns. There was no response. Three women carrying rifles broke from the rear of a hut and ran like buck toward their hidden menfolk.

Jebson quietly selected half-a-dozen weapons and loaded them deliberately, taking care that the operation could be seen by the refugees. He noted that the rifles were of the usual 'gas-pipe' pattern turned out at Birmingham for the gunrunning business at five shillings and elevenpence, and sold to the natives at anything from three to five pounds apiece.

He arranged the loaded rifles near his hand, and, sitting on the log with one on his knee, called out, 'If the guns are not brought back at once I shall shoot every man I see, fire the kraal, and drive off the cattle!'

A derisive yell was the answer. The thieves could afford to laugh at the threat, because the huts and cattle were not theirs, and the bush made excellent cover. An old crone lying in one of the huts did the crying and lamentation on behalf of the prospective sufferers.

An ominous silence prevailed for many minutes. Jebson issued another ultimatum. 'You all know I am a great shooter; that I never miss. Bring back the rifles, and I will not shoot; if not, I

will do what I have threatened.'

He was loading his pipe, when something rattled on the stony ground in front! He looked up in time to catch the glint of an assagai dropping twenty yards away. The Kafirs were trying to get him from the cover of the bush. He smiled. A hundred yards are twenty too many for any but a Zulu, and these natives were poor performers with the throwing-assagai. So long as they did not rush him, Jebson could go on smoking in full sight of the enemy. But it was getting toward dark, when they might approach to within range. If the assistance he had requisitioned did not arrive within an hour matters might be serious. There was just a chance that Bulalie might find the trooper at a junction of the roads a few miles back; but if he had to go on to the magistracy it would be at least five hours before relief could be expected.

Jebson was quicker in thought than action. He had made up his mind to saddle his horse and make a bolt for it as soon as it was dark enough to cover his movements; but his physical inertia, and a vague hope that help would arrive, kept him smoking on the log with rifle on knee for half-an-hour after he could distinguish the spot where the enemy lay.

A sharp snort and the sound of his horse plunging stirred him to action. He ran to the tethered animal, and found an assagai sticking in the shoulder. The agony of withdrawing it increased the rearing and plunging. The bridle gave way, and the horse dashed off in the direction of the bush.

Then it was that Jebson admitted to himself that he was in a hole. He returned to the log and crouched behind it. For a moment he had thought of taking cover inside one of the huts; but second thoughts reminded him that, while the owner would hesitate to burn him out, no such delicacy would characterise the others, who had no proprietary interest in the structure. He rattled the rifles to let the enemy know he was awake. A sharp, hot sting on the left arm proved to him that some one else was also awake. He pulled out the assagai, and was thankful that it had just missed the muscle.

For hours Jebson waited in the dark for the next assagai. The pain of the wound was of the throbbing kind that will not be ignored; but it was a trifle to the pain of waiting for the other assagai that did not come. Men have gone mad under such an ordeal, and thousands who have endured its agonies have been ashamed to describe or confess them.

When the corporal and half-a-dozen native police arrived, five hours later, Jebson received them with a volley of abuse that could not have astonished the corporal more had it come from the mouth of a bishop. Had he not relieved his nerves that way he must have cried, laughed, and hugged like a pleased Dago official. Being typically British, and ashamed of exhibiting weakness, he bullied the corporal for not having made better time. When he had had something to eat, and a smoke, he apologised inferentially, and admitted, without being asked, that, considering the fact that it was dark, the party had travelled as fast as was reasonable.

At daybreak they rounded up the thieves, getting all the rifles back; then inspanned the gang, and made them carry the arms, log and all, to the magistracy.

The corporal's version of the incident did not do Jebson any harm. It told how the levelheaded young Deputy R.M. had sat tight on a parcel of rifles right out in the open, never firing a shot, while the heathen raged and threw assagais that stuck like porcupine-quills.

Officialdom applauded and wondered. worst of it was that Arborrow—Jebson's special aversion-led the applause, and nearly crabbed the hero's chance of promotion by demanding that the Government should grant it. Worse still, he held up Jebson as an example of that Humanitarianism that was, or ought to be, a greater essential in a controller of natives than the animal courage that shot on sight and 'upper cut' an argumentative chief.

Jebson took the embarrassing glorification lying down until his promotion was gazetted, and the youngsters began to make jokes about the advantages of officials not being able to shoot.

It was at the club one evening, when the Governor was present, and Walters, the 'funny man of the Government House set, had rather spitefully chaffed Jebson on being 'gun shy.'

'I dare say, if I took the trouble, I could shoot as well as many of you,' he retorted amiably. 'Certainly I should have potted half those beggars that night but for one thing.'

There were shouts of 'Arborrow.'

'No; I was waiting for them to fire first.'

'To justify your shooting them?

'No; to save me the trouble. Those "gaspipes" always burst at the second or third round, and I had no revolver.'

AT THE OFFICE WINDOW.

OH the purple of the heather on the hill-top by the sea!

Where I used to lie a-dreaming when the summer days were long; When the scented bells were rifled by the honey-

seeking bee, And the salt breeze from the ocean was a tonic

pure and strong!

From my office in the City I can view a patch of sky,

And my neighbour has a rose-bush that is thick with crimson bloom;

But we had a lovelier birthplace—his little tree and I-

And it often, often sends me a sweet message of perfume.

Then amidst the roar of traffic I can hear the hum of bees,

As they flit in search of nectar o'er the green hill's sunny crest;

While the wind makes eerie music in the bent and twisted trees, Or the lark pours out his passion far above a

lowly nest.

I can see the quaint gray homestead and the granite window-sill,

With the pot of red geranium and the yellow-

flowering musk; And I wonder if my mother keeps her patient vigil still,

Though no sound of eager footsteps breaks the quiet of the dusk.

Oh the purple of the heather! oh the sapphire of the sea!

Oh the anxious face that smiles at me across the waning light! But I cannot see the roses on my neighbour's

little tree;
You may close the office window—there must
be a fog to-night.

F MATHESON. E. MATHESON.

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, Yesterday.

THIS celebration of the Centenary of Peace, as it is named, between the United States and Great Britain, which, having been already begun, is to be continued until next year, with a variety of rejoicings in different parts of the world, is an interesting business, one to cause deep reflection when properly considered. official keynote to these celebrations and all announcements concerning them is a statement of the brotherly feeling existing between the two nations, of their recognition of the old and honoured sentiment that blood is thicker than water, and that the Americans are, after all, but Britons gone across the water. The people of the two countries, it is urged, speak the same language; they read the same literature; they have many thoughts and ideals in common. It is therefore a glorious thing that for a hundred years two such powerful nations should have been at peace with each other when nearly all other Powers of the world have been continually intermixed in destructive warfare. In that fact there is certainly much satisfaction, though it should not be entirely overlooked that more than once these sister-nations have come dangerously near to fighting, and that in argument and diplomacy there has not always been displayed toward each other that gentle tolerance, the realisation of well-meaning, that we might expect from those who place the claims and sentiments of kindred above other considerations. Perhaps because neither of them is a military nation in the sense that the Powers of Europe are, and they have other great work to do, an empire to maintain on the one hand, and a continent to develop on the other, and because the crime against humanity that is committed by bloodshed in battle strikes against their conscience more than it does against the consciences of other races, may be the reasons why America and Britain have not fought since the Treaty of Ghent was signed in 1814. Possibly these considerations have had more to do with this happy achievement than any thought of language and blood that may ever have been entertained. The achievement is magnificent, and wholesome to the world; and if we question the causes of it, that does not signify that it is appreciated any the less, or that now we should not rejoice with thankful

hearts and each to the other express our sincere obligations. But between two people of supremely good sense there should always be candour and sincerity, and to no Briton who has travelled with open eyes and an inquiring tongue through the United States does it appear that the language being employed in respect to the preliminaries of these celebrations represents the real feeling of the two great communities. This, perhaps, should not have been expected of it. Official language is rarely sincere. It is designed to serve a purpose. It is smooth, suave, pleasant, and most highly complimentary. It means little or nothing; sometimes it is intended very craftily to mean the opposite to what it represents. It rarely does any good; but it is prepared with the object of doing no harm. Occasionally those with deepest knowledge of the undercurrents of affairs can detect a subtle innuendo beneath the simplest statement, and the chancelleries may exercise themselves greatly upon it. innuendo may have been intended. Official language, in the form of declarations and speeches, particularly when it is pleasant, has effect, therefore, only upon the ignorant. Those without knowledge and understanding are being informed at the present time about the joyous feelings which animate the two countries as they go forward to the celebration of the Centenary of Peace. As a matter of cold truth, this does not by any means suggest the spirit in which the excellent Americans are approaching the festival. To them it is the Centenary of the termination of 'the second War of Independence,' as it has been called; their final riddance of the rule and tyranny and oppression of Britain, the mother country; and in all the circumstances of the case I do not blame them for their view.

* * *

It is a matter which interests me exceedingly; for in two successive years I travelled far through the United States, and to persons of all qualities and kinds I continually directed inquiries and made conversations with them, with the object of discovering the exact nature of the sentiment that Americans in general entertain toward this country and its people. Perhaps we should not write of 'Americans in

No. 196.-Vol. IV.

[All Rights Reserved.]

AUGUST 29, 1914.

general,' for any averaging or generalising of character and opinion is nearly impossible in this great country, and between the East and the West there are such divergences as can hardly be comprehended by Europeans who have not considered them on the soil. I read now that official plans for national thanksgivings in both countries are extensive and elaborate. America more than eighty towns have appointed committees to arrange for local rejoicings, and something of the kind is to be done in this There are to be thanksgiving services in the churches of each country, and the denominations are to exchange fraternal greetings and gifts with each other. The municipality of Ghent has invited delegations from the United States and Great Britain to take part in two or three days' rejoicing in the city where in 1814 the treaty was signed which put an end to the war between the two countries. It is anticipated that the American delegates will afterwards come to London, and it is proposed to hold the official British celebrations next June. Then there is a scheme for the visit of two delegations from America to this country, and for two British delegations to pay a return visit to the United States. In this way all the needs and courtesies of the occasion will be most fully satisfied. Nothing that can be done officially to suggest the happiness of the peoples in their mutual friendship will be left undone. And yet I fear that there are candid and cynical men and women in Chicago and San Francisco who will be little influenced, and who on the very days of these rejoicings will bless themselves, as they do continually, that they are not like the British, and hope to be more and more unlike them as the years pass on. And at this moment I read that Congress has refused to supply money for the celebrations of the centenary of the Treaty of Ghent. The treaty stood for the mere peace; the great independence and all the marvellous development and a soaring freedom of spirit were developed afterwards. Congress, of course, does not explain that.

* * *

Those who have not visited America can form no proper idea either of the nature and quality of the country as it has been developed, and its institutions, or of the ways and the manner of thinking of the people, their attitude to life and to the rest of the world. Our Eastern imagination fails at creating a fair picture of the United States and its people, notwithstanding our constant and extensive association with American visitors to this country, the American newspapers that are printed in English, and the illustrations of the cities and the country that are presented to us. It is easier to imagine Egypt and Italy with a fair degree of accuracy before going there than it is to imagine the United States. In the same way I suspect that Americans who have

never visited Britain have but the crudest notion of the strength and the splendour of the country, and the quality and vigour of the people. In the elementary schools of America the children are taught a kind of history which is most misleading in the facts stated and in the impression that it conveys. A seed of something approaching contempt is apt to be sown in the young American mind, and it grows afterwards in a soil that is well cultivated for it. A fair part of America believes that all the male British who would not be seriously inconvenienced wear eyeglasses and walk about always with goldheaded canes, bowing most obsequiously to all persons of title if they do not happen themselves to be of noble blood. One of the things in America that every travelling Briton must sorrow for most is the quite pitiable character of American ignorance in matters of this kind. The general attitude to Britain varies somewhat according to the class. The lower classes -the comparison being in the matter of wealth and culture—are merely ignorant and indifferent. Britain is nothing; it is as if she did not exist. These people are without knowledge, without thought, and without sentiment. They were either born in America or they have come to America because the rest of the world has failed them; and here, rubbing shoulders with the people of every other country, they live a life of careless, thoughtless freedom. The middle classes, here as elsewhere most powerful in some respects, are generally cold and often contemptuous in their attitude toward us in the abstract and individually until they come by knowledge that convinces them of their mistake; and then, to be fair to them, they are not slow to make amends. But it is that abstract view that is the pity and the danger. I have conversed with literally hundreds of these Americans who think and say—and say it with a smile—that the end of the British Empire is at hand, and that when the German guns begin to shoot it will be time for people to hurry out of London and take all their belongings with them. I have heard welleducated university men talk such rubbish, and mean it, and they seem to gloat upon the prospect most unsympathetically. If ignorance is responsible for much of this extraordinary belief, I think jealousy has something to do with it also. When America gained independence—and it was proper and perhaps inevitable that she should have it, and in such a case the circumstances in which she obtained her freedom matter littleshe did not gain it by conquest, simple conquest. Britain flourished afterwards and grew greater; and, with all the wonders she has achieved, America in her heart cannot, of course, satisfy herself that she is really the greatest country in the world, though she says she is. In the monuments and mementos of the achievement of the independence there is continually suggested a certain vein of bitterness and

antagonism which a hundred and thirty years has done little to mitigate. This is very pronounced, for example, in the Capitol at Washington. The achievement of its independence has been everything to America; it was the birth of the nation; but in the memorials there seems continually to be something done to exaggerate the blameworthiness of Britain and her humiliation. Here, indeed, we hear and see nothing of blood being thicker than water. It is all America, great America, and America alone and mightily independent. Yet there have been indications in recent times that the high authorities of the country are feeling that there may be a danger in too much of this independence. Great and free as she is, America is still a part of the world, and the rest of it has been causing her some anxiety. Mexico has made her uneasy, and there is Japan threatening all the time. She begins to think that there may be an advantage in the possession of friends, and, for the first time in her history, realises that the European system of alliances, with all its faults, still has certain merits of safety. In the upper classes of American society there is for the most part what might be called a tolerance of Britain combined with the usual American affectation of superiority. Yet it is fairly good-natured, and the American gentleman is an extremely fine man, broad-minded, really gentle and sympathetic, and in some of the arts of life, notably in his style and manner of being host to the visiting foreigner, he is the kindest human creature in the world.

* * *

Those who visit only the eastern seaboard of America, the part which is nearest to us, can form no proper estimate of the nature of American feeling toward this country, although they may gather a strong suspicion of it. New York is a fast, gay, boastful sort of place, and it indulges in great exaggerations. Boston is called the 'hub of the universe,' but New York certainly thinks the title should be given to itself. And, to tell the truth, New York is indeed an exceedingly fine city, and those who have not seen such sights as its marvellous, glittering Fifth Avenue, its magnificent Public Library and other municipal institutions, and its splendid harbour can form no conception of what the Americans have, and of what they are capable. Because of an excessive sense of its own value and smartness, New York is inclined to look upon Britain and the British as decadent. Boston, on the other hand, is in New England, and this sentiment of being New England, having association with, or having arisen from, the old one, is very real here and in other parts of Massachusetts. You may hear the expression 'the Old Country' used in Boston now, and used with some kindly feeling, as is rarely the case in other parts of the United States. Boston is American enough; it is as proud as any city of its independence and of the greatness of its country; but it is not cold and callous. It is thoughtful and appreciative, and the wandering Briton here comes upon as good a sense of ease as he may find anywhere between the Atlantic and the Pacific. Yet, despite what I have said about New York, I would add that there and all along the Atlantic seaboard there is no pronounced feeling against this country; such as there is rests only on the surface and is of little account. Notwithstanding the Atlantic, Britain does not seem so far away. There is only water in between, and the financial people of New York and the traders do business with her constantly on the most intimate terms. The cables are busy always with communications between the two. Commercially, at all events, London and New York cannot afford to do anything but respect each other. And when you have done more than cross the ocean, it is curious to discover how little the ocean seems. I remember that once, after travelling for some weeks right into the heart of the country, so far into it that London and England were hardly ever mentioned by anybody, not being places with which they had any concern, I made my way back on the railroad day and night, and at last, on reaching Boston, took the train at once from there to Newport, on Rhode Island, America's most fashionable watering-place, for a few days' comparative rest after a worrying, hustling time. When I reached Newport I went down to the seashore, and for the first time for weeks saw again the great Atlantic. Such a friendly Atlantic it did appear then! I seemed already to be in England again. Did not this Atlantic, here lapping America, touch England also? There should be nothing to do but climb aboard our Lusitania, and sit awhile, read awhile, and sleep awhile, and in England we should be. That was a curious impression to be formed of being practically at home though some thousands of miles of sea still intervened; but I mention it because, as I have discovered, it is common to nearly all travellers who have gone a long way inland, and then, homeward bound, have come back to the coast. Just as I did myself, out of the feeling of friendliness to the good Atlantic, they go down to the edge of the water and touch it with their fingers. So it is with the Americans of the east in a very much more limited way. They feel themselves, despite their independence and their smartness and their greatness, to be very closely in touch with Britain after all, and that feeling has its effect.

* * *

But go far into the middle of the country, and it is so very different. What do they care for Britain in Chicago? There, in that most remarkable city of the central states, the American idea blossoms to the full. In many matters there is a considerable jealousy between Chicago and the cities of the east, and these, including New York, are on the extreme limit of their eastern horizon. There is nothing beyond. London might be There are no ships coming from it anywhere. to Chicago, and there is more than a thousand miles to be travelled on land before any ship, save a lake or river steamer, can be seen. The people in Chicago who have been to Britain are naturally far fewer in proportion than those in New York and Boston. And in Chicago they do not wish to go either. They have no curiosity; Britain does not concern them. In the Chicago newspapers you will find only the meagrest paragraphs about British affairs. They do not dislike Britain so much as they are indifferent, with just a shade of contempt that has arisen through the strange tales they have heard of that old country where ancient customs are still honoured, and where there is still a House of Lords. Chicago is a very wonderful city; for my own part, I regard it as the eighth wonder of the world; and if there is any community of persons in the two hemispheres who, collectively, have the right to be proud of themselves and their achievement, it is the community of Chicago. who have made this great city in such a short space of time. But it is very self-centred, and, being so, is of far smaller mind and comprehension than it thinks it is. Were I lord of the world, and working for its general improvement, I would insist on British history being taught in some of those splendid Chicago schools, and after that the pupils should cram at statistics of British trade and commerce and the wealth and possessions of the country. But Chicago is not to be blamed for its forgetfulness of the existence of all except the millions and millions of acres of wheat-fields of its golden west and the financial centre of New York. Do we not know that even emigrating British who go first to New York feel, as they always do, the homeland straining at their hearts, yet find this pain depart and a perhaps happy forgetfulness come upon them when they go west? It is usually that way, and only a small proportion of emigrants of any class settle in New York after arriving there. The population is more floating than that of any other big city. The emigrant tries to settle in New York; but sooner or later he is drawn into the great American vortex, and then westward it is that he most commonly wends his way.

If I have seemed to suggest that the Americans are blameworthy for not entertaining warmer feelings toward Britain than they seem to have, I would mitigate that impression. Do we not expect too much of them in the way of warm and generous sentiment? And what right have we to

expect anything at all like that? The arrogance of their independence may be a little exaggerated, a little false, but so is the implication in that worn-out sentiment that blood is thicker than water. The Americans are white people, and they speak our language, but little enough of Britain is there in these people now. All the peoples of the world have flocked to that new country, and the white races have mixed and formed such a remarkable amalgam that it is a new race, with new characteristics. Every visitor to New York is impressed with the strong influence of the Dutch element in it. It is quite conceivable that Dutch might have been the prevailing language in that state; and if it had been, where then would have been the blood-and-water sentiment? This new race has made a new life in a new country. It began its world afresh with far more thoroughness and completeness and change in detail than was done in the French Revolution when the old calendar was abandoned and time was begun again with the Year One. Their ways of life are now far, far different from our own, and that circumstance has almost necessarily produced a great change in thoughts, and to some extent in ideals also. Their habits are not the same, and their climate, foods, and drinks are vastly different; and I have a notion that difference in climate, foods, and drinks counts for more in the separation of peoples than even difference in language. America has broken away entirely from the European system and the European habit. Nothing is the same. You may dine from precisely the same dishes in a hundred restaurants in London, Paris, Berlin, Rome, Madrid, and St Petersburg; but you cannot do that in New York and Chicago. We have no right to expect this new and very fine race of people, with such a magnificent virility, living their new kind of life in their new country, to display toward us the least scintilla of sentimental allegiance, and it is because we do expect it and are disappointed that a misapprehension arises. The Americans are not easy to understand thoroughly. Their own national character is not yet completely formed, and will not be until more serious troubles have been encountered and hundreds of years have passed. In this world every man is an actor, and from his birth onward he is playing a part. He plays it consciously at first, and then the part absorbs him, and he is lost in it. That is his achievement of character. But the Americans are still conscious of the parts they are playing; they are all actors, very obviously, and they are not always clever actors. Their celebrated hustling is merely acting; and, for the last word, I think that much of this pride of independence of theirs and this seeming antagonism to Great Britain is acting too.

THE HOUSE OF LADDO.

CHAPTER IV.

COME now to the recounting of a black and terrible night that has lived in my memory when much of more real import has faded. It might have been three days after the meeting with Rose Chalmers of which I have told. In this time I had seen Mr Robert but once, and on that occasion all he could tell me was that his plans were not yet ready. He had seemed weary and ill of spirit; as well he might, for the news of the cause grew worse daily, and I dare say he was beginning to find my uncle's meshes more thickly woven than he had bargained for. Alice inquired constantly for him, sending a thousand kind messages, and expecting as many in return -the which, God forgive me, I had to invent to the best of my ability; for if he had time to think of any one at Laddo, it was always of Rose, and for Alice he scarcely seemed to care. I know not if it be always so between brother, sister, and beloved; but if it be, I cannot help thinking it a very tragic affair.

Well, about midnight on this terrible night I was roused by such screams as the lost spirits must emit in their torments. The first of them set me up in bed with my teeth clenched and a cold sweat pouring down me, the second brought me to the door of my room, and the third into the hall, where I found Rintoul hanging on to the stairfoot with a face like a ghoul and a lantern

jumping about in his hands.

'În God's name,' I cried, 'what is going forward up yonder?'

'Nivver heed it,' said he through his chatter-

ing teeth. 'We maunna heed it.'

'You half-witted fool!' I shouted at him, 'that comes from Miss Chalmers's room. We must heed it, or there may be murder done! Follow

with that lamp.

I sprang to the stairs, but he followed never an inch, and the well of murderous darkness above nearly sent me back to his side. It cost me an effort to lean over the rail, snatch the lamp from his hand, and hold on my way up the stair. I can still see his dead-white face gaping after me with an expression almost imbecile from terror. By this time the screaming had died away, and as I reached the door of Rose's room it flew crashing open against the wall, and out came my uncle with a great hunting-crop in his By the light inside the room I could see Rose lying across her bed; she was half-dressed, and her body tossed and flung from side to side as if in an agony of convulsion. Something in the sight pulled me to my senses, and I confronted my uncle boldly enough.

'Uncle David,' said I (I hope steadily), 'what

have you done?'

He turned upon me a face perfectly vacant, as

at our first meeting, and pushed past me without a word. But my blood was up, and I was minded to go through with this; so I caught him by the coat and repeated my question. He turned at that and looked at me—a cruel, chilling look, like a snake's.

'Go to your bed,' said he.

'Not yet,' said I; 'not till'-

Like a flash his face changed to a fury of hell; he threw down the crop with a crash, and tearing open his coat, dragged from his belt a most hideous curved knife. He raised this frightful weapon to strike me, his eyes glaring in the lantern-light like a beast's, and at that —God forgive me—I turned and ran with a yell of terror. He pursued me but a few yards, when he stopped with a kind of grunt, and retracing his steps down the corridor, locked himself in his private apartment at the far end.

I went back presently to Rose's room, whither I found Alice had already groped her way. I was prepared for I know not what catastrophe, but there was less damage done than we had feared. He had laid no hand on the girl; but he had terrified her within an inch of her life and something less than that of her reason. Her nerves had been too long on the rack, and at the first sound of his voice raised in anger her wits had fairly left her and she had screamed herself into a frenzy.

But I now felt—and I think with some justice—that this matter had reached a climax, and the next day when I saw Mr Robert I laid the whole tale before him. He was extraordinarily moved; his face grew whiter and whiter as I went on, and more and more terribly set, till at last he sprang to his feet

with a tremendous oath.

'Davy,' said he, 'I must see her, and at once. Bring her here this afternoon, or I will have

your life.'

I consented readily enough, thinking it an easy task; but when I gave her the news she only went very pale, and cried out against Heaven for dealing her the most cruel blow of all. It took all my persuasion to make her consent to see him, and when finally we had slipped out of the house and were well on our way and caught a first glimpse of him sitting on the broken dike, she gave a great gasp, and I thought she would have turned back even then. I had thought to see them rush into each other's arms; but instead they stood gazing as white as ghosts—he half-risen from his seat, and she hanging back as though she would fain make a bolt away even yet.

'Davy,' said he at last, 'run away.'

'No,' she said quickly. 'If Davy goes, I go too. He has been kinder to me than you have.'

He winced at that very painfully. 'You are

very hard, Rose,' said he.
'I think you have heard this morning,' said she, 'what has hardened me. That is what you left me to endure.'

'It need not have been so,' replied he slowly, but for yourself. And, in any case, by Heaven, it shall be so no longer, Rose!' he cried, springing up and throwing out his hands towards her. 'Wait but a few weeks till my duty is through, and then you shall come with me wherever on earth you will.

'You are a shade too late, Bob,' said she; 'I

am betrothed to some one else.'

At that I thought he would have fallen, for his face went quite dead, and he swallowed in

'In God's name,' he got out at last, 'who?'

'It concerns you little,' she said; 'but, if you will have it, to Patrick Cockburn.

The name seemed to pull him together again. Rose dear, said he, 'this is some nonsense. You cannot care for Cockburn.

'You are importinent,' said she. 'If the truth he told, I do not; but he can take me away from here, and that is all I care for.'

'Cockburn!' cried he. 'Oh, Rose, Rose, what

has Cockburn that I have not?

She took a very careful stock of him as he said this, and I well believe that it was an effort for her not to throw her arms round him and be done with it. He was not actually handsome, to be sure, but there was that in his face then which made it worth a second look and a third

'He has not your looks, Bob,' said she, still watching him, 'nor your youth. But he has one thing you have not, nor are like to have—a home for his wife. And he can take me away from here.'

'So can and will I!' cried Lechmere. 'Give

me but two weeks more.

'I cannot,' she said; 'indeed I cannot. I am too frightened. You do not understand; Davy did not understand; no man could understand. Men are not frightened like women; they can fight it down. But a woman's fear can be too big to fight. It eats one up; it becomes one's whole life; and in the end one must run away. No, Bob, I cannot and will not stay.'

He sat down again on the wall. 'Am I to have no chance?' he asked.

'You had your chance long ago,' said she very cruelly, 'and you chose to throw it back in my face. Can you complain?'

'Is that your last word?' he asked in a level

'Yes,' said she; 'I am going away with Cockburn the next time he comes—and I pray God it may be to-night.'

'I wish you happiness,' said he. 'Good-bye.'

Rose and I had gone some little distance, when, on a foolish impulse of consolation, I turned and ran back to where he still sat on the ruined

'Mr Robert,' I began, 'can I say'----

He looked at me with some of his father's passion in his eyes.

'She said you were kinder to her than I,' he said in a voice I scarcely knew. 'Get out of my sight ere I kill you!'

But I had gone but a few steps when he called after me. 'Come to-morrow morning,' he cried, 'and we shall get to more serious work than this.

By way of epilogue to this incident, let me add that Cockburn came to Laddo that evening, and that ere he went he asked Rose to be his wife—which he had not done before. I know not to this day how she got it out of him, but she contrived it somehow. But for some feminine reason, which it would ill-beseem me to guess, she did not then go away with him, but remained where she was, terror and all.

I was upon the knoll betimes the next morn-

ing, but for once there was no sign of Mr Robert. I waited in the usual place, while the sun climbed slowly up the heavens, touching out ever more brightly the flat lands on the promontory of Laddo and the dull rounded expanse of sea beyond, and was just falling into some perplexity whether to give way to annoyance or misgiving when my attention was diverted by a somewhat unusual circumstance.

Some little distance out to sea a strange ship had come up in the night—less strange in her appearance, which proclaimed her to be some sort of foreign brig, than in her actions. For some time after I first caught sight of her she lay to, fairly close-hauled and nearer in to the Ness than we were accustomed to see such craft; then on a sudden she hoisted sail, and beat up against the wind as though she would make for the May Island. Presently, however, she tacked off northwards, then stood out to sea, and finally, after a sweeping detour, got back to her original position. After about an hour this manœuvre was repeated; and then, it being full noon and very bright sunlight, my quick eyes caught sight of something else. There was a belt of stringy firwood between Laddo and the sea, and beyond this I saw my uncle heading away down to the Ness with his glass under his arm.

At this spectacle all my former curiosity as to his doings came back in a wave. I hesitated an instant with a curiously agreeable tremor of apprehension at my heart, and then, making up my mind to it, I ran at my best speed down the side of the hill, and so got into another of these haphazard straggles of timber. This carried me in a course very nearly parallel to that my uncle was taking, slightly converging upon it, and running to within a hundred yards of the cliffedge, the intervening space being taken up by

a rough incline covered with whin and scrub. I had run, as I say, at my best speed, but by the time I reached this open space my uncle had made the water's edge and was out of my

There was nothing for it but to creep along among the whins in the hope that I might come upon him, and so I presently did. Almost at the nearest point to the House of Laddo there ran into the land a small rectangular bay or creek, flanked by natural piers of flat rock, and culminating in a tiny beach of shingle. It was on one of these piers of rock that I now saw my uncle standing. He had been joined in the interval by another man, whom I made out to be Rintoul, and with whom he appeared to be in deep consultation. The creek was very deep, but at present the tide was low, and a long white frieze of barnacles showed along the rocks. Presently my uncle consulted his watch, and gesticulated towards the ship, which had by this time recommenced her evolutions; then, very shortly after, he went off, taking Rintoul with him.

I was determined to see this matter out, and at first minded to stay where I was; but, thinking it conceivable I might be missed, I returned by a detour to the house. The place was perfectly quiet for the remainder of the day, Rintoul going about his work, and my uncle closeted with his papers. Cockburn came for a time, which he spent wholly in seclusion with Rose, so that I concluded that in this part of my uncle's transactions he had no share. We were all got to bed early, and for two good hours nothing stirred. Then at last—it might be about eleven o'clock -I caught a slight bustle from the coach-house, and saw Rintoul's bent and goblin-like figure creeping to and fro with a lamp. After an interval I heard my uncle speaking in a low voice; and at last the lantern went bobbing and circling away like a will-o'-the-wisp in the direction of the sea.

I slipped out by my window, and found that the fog with which we had all day been threatened had blown up thick from the east and plunged us in a watery and impenetrable darkness. It was cruelly cold, and I was glad to run as fast as the mirk would allow me, with the result that in spite of my detour I had crept into the bushes right above the creek some five minutes before my uncle and Rintoul came

stumbling down the path.

Rintoul set down the lantern on a rock, and for some slight interval nothing further occurred; then, very suddenly, there came a hoarse voice, bawling something out of the fog. Rintoul made a trumpet of his hands, and shouted back something, alike unintelligible; and after some further like interchanges, a long, lean boat, manned by four men, shot out of the wall of mist and drew into the creek. My heart began to thump wildly; I know not what I expected to see, but I think there was no earthly horror for which I was not prepared. But in a moment they were all as busy as bees, pulling boxes from the boat, and setting them down with considerable clatter on the rocks; and at that the truth dawned on me, with a chill of disappointment-my uncle was no better and no worse than a common smuggler, his riches made by no more harrowing means. I know not whether it were mirth at the thought of this right hand of government and order being so employed, and of Rintoul's dreadful deeds, which cost him so many rackings and groanings, turning out to be merely the carrying of a few kegs of brandy, or whether it were exultation at the thought of the weapon I could now place in Mr Robert's hands, or whether it were merely the cold; at any rate, I gave a great start, and shook a large stone out of the rubble beside me. Down went this cursed boulder, leaping from rock to rock with the most fiendish din, and finally plunging, like a cannon-shot, into the deep water within ten yards of where they stood.

Their heads went up as one man, and as one man they pulled out some sort of weapon. But for the cold fear that kept me flat on my face I would have jumped up and run for it, and so without doubt should have lost my life. As it was, I lay in a kind of paralysis, while they stood in a little knot with their heads on one side listening—all save that very chicken-hearted pirate Rintoul, who was already at his prayers. Presently my uncle picked up the lantern, and, followed by a great black-haired giant from the boat, came deliberately to the end of the creek, and flashed the light on the bushes where I lay.

'A stray sheep,' said he at last.

'I'm none so sure o' that,' said the other.

'Put a shot through these bushes, then,' said my uncle.

'On the word, before I had time to move or think, the fellow cocked his great horse-pistol and let drive. The ball roared within three and let drive. inches of my head, and drove a splinter of whin into my left cheek; and at that a sort of sickness came over me, and everything went black.

I came back to my senses to find myself alone, with the dawn breaking coldly and dismally through the fog, the white lines of barnacles again showing in the creek, and the tide lapping slowly back. The wound in my cheek had bled considerably, and gave me much pain, and I was stiff with cold and wet, but I got somehow to my feet and began to make my way back to Laddo. At first the fear still had hold of me, and I felt sick and faint; but presently, as the blessed daylight grew stronger, my spirits revived. I had got through the night's work, and through it well; I seemed to hold my uncle in the hollow of my hand. I began to see myself again as the protagonist in the drama, and the saviour of all concerned.

(Continued on page 633,)

WITH NAPOLEON TO ST HELENA.

By A. FRANCIS STEUART.

AMONG a bundle of old papers entrusted to me a few days ago I came upon a small red book-of the kind which we now make 'weekly books' of, but which apparently cost three-andsix when bought in 1815, showing the high price and rarity of paper in former days-which is a record of a lieutenant in the Royal Navy, who had, as he would no doubt have expressed it, the good fortune of assisting to convey the Corsican Tyrant Boney' on his last voyage on H.M.S. Northumberland. The writer was Lieutenant Nelson Mills, R.N., and there is a romantic reason why this private journal was kept. A dearly loved cousin of the youthful lieutenant was Henrietta Moore, née Janssen,* a passionate hero-worshipper, with Napoleon as the object of her worship, and it was for her that the young naval officer kept the record, knowing that information about her hero's doings on his entrance to his last exile would give her pleasure and interest her greatly, but perhaps not knowing that the record supplies some facts wanting in the accounts of the lieutenant's superior officers, and that every little detail about the great man would be of future value.

The journal begins: 'August 7th, 1815.—Came on board General Napoleon Buonaparte (from H.M. ship Bellerophon). He was saluted on the quarterdeck by the marines of the ship under arms in the same manner as an English General.' He mentions his followers, the faithful General Bertrand and the Comte de Montholon, with their wives and children, and the rest of his suite by name, and adds that the ex-Emperor had 'twelve male and two female servants.'

Napoleon 'returned the salute by taking off his hat and bowing to all the officers who were He entered into conversation with Captain Beattie of the Marines respecting the length of time he had served, what actions he had been in, and whether he had ever been wounded. He replied that he had served many years, had been wounded, and was at the siege of Acre. Napoleon took hold of his left ear, and, gently pulling it, said, "Ah, ah / vous êtes un brave homme, brave homme /" He was very much pleased when introduced to the Admiral and shown all through his cabin, and then was, at his own request, introduced to the officers, and expressed himself 'much pleased with the discipline and regularity of the ship.' His dress is noted: 'a green uniform coat, with red facings, plain gold epaulets, white knee-breeches, shoe-buckles,

a high cocked hat with the tricoloured cockade; on his left breast was a large silver star, and below were the three different insignias suspended by three coloured ribbons.' The diarist gives the Emperor's conversation with Lord Lowther and Mr Littleton, who had accompanied the Admiral from Portsmouth; and, finding that Mr Littleton was a member of Parliament, the fallen potentate tried to 'pump' him about politics and the suicide of Mr Whitbread. At dinner 'he ate very hearty, but rose up soon, and came out to walk the quarterdeck. He again entered into conversation with Mr Littleton, by whom he sent a private message to the Prince Regent. He requested the band might play "Rule Britannia" and "God save the King," which was instantly complied with.' In fact, the Emperor was determined to make the best of things that day.

Next day sea-sickness kept Napoleon in his cabin most of the day, and his suite suffered severely, 'especially the ladies,' says our author, 'Madames Bertrand and Montholon;' and adds the scathing criticism: 'The former [née Dillon] is a very amiable and good woman, but the latter is quite the contrary.' This is only because the latter had two divorced husbands living!

On 9th August Napoleon was up and about. 'About eleven o'clock Buonaparte came out of his cabin and took a walk on the quarterdeck for about half-an-hour, conversing alternately with Admiral Cockburn and Sir George Byngham (Bingham) upon the loss of the battle of Waterloo, and attributed his loss in part to the new (and untried) Guard being dressed in the uniform of the Old Guard, and the fear in the army inspired by the sight of (as they thought) the Old Guard in full flight. It is strange that Sir George Cockburn in his diary does not mention this conversational theme. 'He retired to the Admiral's after-cabin to play at cards, of which he is very fond, although he always loses.' Later, the diarist mentions that Napoleon played only piquet and vingt-et-un.

On 10th August the Emperor spoke of his order to poison his men at Jaffa out of 'motives of humanity.' Next day (a mistake for 12th August), according to our writer, 'Buonaparte walked the deck in the forenoon, it being a fine day, attended by his two confidants Bertrand and Las Cas [Las Cases]. He takes very little notice of the others. . . . The midshipmen who were walking on the lee side of the deck attracted his notice, and he immediately crossed the deck to them, asking them if they could speak French, and if they had been in France. There was one amongst them who had been in prison at Verdun' (it is impossible to trace him, I fear), 'and had

^{*} Daughter of Sir Stephen Janssen, Bart., Lord Mayor of London, and wife of Colonel Lorenzo Moore of the Battle-axe Guard. It is by the kindness of her greatgrandson, Mr S. T. J. E. Budgen, of Ballindoney, that I am enabled to print these extracts.

seen him [Napoleon] when passing through that place at the head of his army on his way to Russia. He immediately said, "Cest un beau pays," and walked away, taking hold of one or two of us by the ear,' his favourite but uncom-

fortable enough sign of familiarity.

'August 12th [sic; really 13th].—Buonaparte did not appear on deck to-day, being unwell, but came to table for a short time. He does not eat his breakfast at the same time as the Admiral does, but has it by himself in his cabin; it generally consists of fowls, meat, and porter; he never touches tea in the morning. . . . This being Sunday, divine service was performed by the chaplain [the Rev. George Rennell]; but neither Napoleon nor any of his officers were present.' He walked with his confidents, however, 'who are always uncovered when in his presence; he seems to exact the same respect and obedience from them now as when an Emperor.' The writer then gives an intimate, if unpleasing, trait: 'He takes an amazing quantity of snuff of a very coarse sort; he keeps it in a large box in the shape of a chest, and spills twothirds of what he takes in one pinch.' But the diarist noted the ceaseless questions about navigation with which he plied Admiral Cockburn.

On the 14th Napoleon did not appear until after dinner, and then talked to Sir George Bingham about his 'firm intention' to have invaded England. He hoped to cause a revolution then in his favour, though 'he knew he had a great deal to encounter before he could accomplish his design.' We now learn one detail of the ship's life not given in the other accounts of the voyage. 'At six o'clock the ship's company's hammocks are piped down, and Napoleon is always standing with his back against the foremost gun on the quarterdeck, and four or five midshipmen always round him to keep the men from running against him.'

The next day was a special occasion. day was the anniversary of the once great Napoleon's birthday. He seems, if anything, a little more enlivened and gay than usual. His officers were all dressed, and paid him particular attention. At dinner the Admiral paid him a great many compliments.' The Admiral, in his account, says it was on this day that he was told about the projected invasion of England, on which subject Napoleon seems to have been by no means reticent. 'He walked more than ever, his officers attending him the whole time;' and playing cards at night, he won, for the first time during the voyage; 'the Admiral and those with whom he was playing were obliged to send out The Emperor frequently for more money.' naturally sat up rather later than usual.

On the 16th the Emperor rose late. After dinner he walked for an hour, and conversed with Sir George Bingham for a few minutes, 'taking a pinch or two of snuff,' and then 'pulled him by his whiskers and walked away to converse

with his two confidants. He took his old station against the gun, which seems to be his favourite place when on deck. Two of his servants got intoxicated and became very riotous. He requested they might be punished, and they were immediately put in irons.' They were told later that if they offended again they would receive the customary punishment.

On the 17th 'Buonaparte walked the deck after dinner, as usual taking quantities of snuff, and very often looking at the other vessels of the squadron through his opera-glass, which is a very handsome one (made in England), and which he always carries in his pocket. He is often very near falling (when the ship rolls heavily), being seemingly very weak in his legs, and was only narrowly prevented to-day by Maréchal Bertrand catching him in his arms, having been conversing together.'

The next day or the next again Napoleon's theme was the burning of Moscow—the commencement of his bad fortune—and the awfulness of the Russian campaign. He stoutly asseverated that all the Russian town-fires were caused by the Russians themselves, and this we now know to be true.

On the 19th Napoleon recurred to the story of his retreat from Russia, and on the 20th a fresh breeze again made him 'not very well.' The Moscow campaign was still the chief subject of his talk with the Admiral, and it is obvious it was the prevailing topic on his mind, and he talked of it to all his familiars in all its details. From this date the duties of the writer evidently became more acute, for he is forced to write: 'Not being able to get note of his different conversations [which passed between the Admiral and Napoleon] daily, I shall give you circumstance after circumstance as I can catch them, which he does con amore. But Napoleon's conversations with the Admiral can be better read in the latter's diary, printed as Napoleon's Last Voyage, in 1888.

Lieutenant Mills's diary only begins again on the 23rd September, when the ship 'crossed the Line,' and this is his account of that day: 'In the morning we prepared for the usual custom of shaving those who had not crossed the Line before. After those officers who belonged to the ship had undergone the operation (which is performed with a rusty, notched iron hoop), it came to the turn of Napoleon and suite. Buonaparte himself did not appear on deck, but begged permission of the Admiral to give Neptune and his gang (the people who perform the operation) one hundred napoleons in gold, which amounts to ninety pounds sterling; but this the Admiral objected to, it being in his opinion too much, but permitted him to give twenty napoleons as a compensation for not being shaved. Next came General Bertrand, with his children, to the place where the ceremony was being performed. also presented the men with several napoleons

for themselves, their wives, and children. The other French officers came in their turns, and also gave the seamen some money.'

Then comes the last entry, for the great voyage was over: 'On the evening of the 15th [really 16th] October 1815 we landed General Buonaparte on the island of St Helena. We put him on shore at seven in the evening, and disguised to prevent the populace from recognising him, as he detests nothing so much as being stared at. Coming in to the anchorage, he was walking the deck, and several times remarked how difficult a place it would be to take if well

fortified, shrugging his shoulders at the same

time, apparently at the little hope he could have of escaping from such a rock. The morning after he landed he rode up into the country with Sir George Byngham to a place called the Bryars, situated at the head of the valley in which the town stands, and about a mile and a half from James Town. He took such a liking to this place that he obtained permission to pitch a tent next to the door of the house which belongs to a Mr Balcombe, a merchant of St Helens, who resides there with his wife and two-daughters.'*

And so this 'Private Diary' ends just as 'the

Last Phase' had begun.

THE BARD'S REVENGE.

A TALE OF LOCHABER (A.D. 1663).

By an OLD ROYAL ENGINEER, Author of The Curse of Cluny.

There never was such a murder in Scotland, Though they were once very savage. . . . Such a wisfortune never befell Any chief under the sun.

IAIN LOM, Bard of Keppoch (A.D. 1669). (Translated from the Gaelic.)

TOURISTS, in making that delightful voyage in the comfortable saloon steamers through the romantic and beautiful scenery traversed by the Caledonian Canal and the chain of lakes that connect it from Fort William to Inverness, may have had their attention drawn to a monument which stands on the west bank of Loch Oich, about a mile south of the grand old ruins of Glengarry Castle. This monument stands over a well which is known throughout Lochaber as Tobar nan Ceana, meaning Well of the Heads. The apex of the memorial is surmounted by a sculptured device representing a hand grasping seven men's heads by the hair, with a Highland dirk slipped in between. On each of the four sides of the monument a short account of the reason for its erection is given in Latin, French, Gaelic, and English. The English version is as follows:

As a memorial of the ample and summary vengeance which, in the swift course of feudal justice inflicted by the orders of the Lord Macdonell and Aross, overtook the perpetrators of the foul murder of the Keppoch family, a branch of the powerful and illustrious clan of which his lordship was the chief, this monument is erected by Colonel Macdonell of Glengarry, XVII. Mac-Mhic Alaister, his successor and representative, in the year of our Lord 1812. The heads of the seven murderers were presented at the feet of the noble chief in Glengarry Castle, after having been washed in this spring, and ever since that event, which took place early in the sixteenth century, it has been known by the name of Tobar nan Ceann, or Well of the Heads.

As will be seen in the following, the record on the monument is not historically true, for it was the Bard of Keppoch, aided by Sir Alexander Macdonald, chief of the Macdonalds of Sleat, and not the chief of Glengarry, who caused the seven murderers to be brought to justice; and, instead of taking place early in the sixteenth century, it actually happened in the seventeenth—namely, September 1663.

The scene of the terrible internecine tragedy is in Glen Roy, situated in the wildest part of Lochaber, at the Castle of Keppoch, the residence of the chief of the Clan Macdonald of Keppoch, and is known in Highland history as the *Murt na Ceapaich*, or Murder of Keppoch.

John Macdonald, better known as Iain Lom, or Bare John, was the bard of the Clann Ronaill na Ceapaich, a sept of the great Clan Donald or Dughaill. He was the greatest of all the clan bards, and was considered a remarkable man in his day. Very little is known of his history beyond such oral account of his fame as is handed down throughout the Highland clans and the information recorded in his poems. From all that can be gathered, it tends to show that he was a wild, poetic enthusiast, who exercised great influence over the chiefs and clans in all the causes he wished to support, his poetic powers being of great service to aid and further the ends of his own party. Iain was known to be a man of education, as he was intended for a priest, and, like many of the Highland and Irish priests of his time, was educated in Spain, at the College of Valladolid, but was rusticated from that seminary for some grave act of indiscretion, and returned to the Highlands to rejoin his clan, where he became an important influence among the people of Lochaber and the western Highlands, more especially with the various clans and septs of the Dughaill (Macdonalds), by reason of his superior talents as a poet and a scholar.

^{*} This MS. was used by Miss Price in the Century Illustrated Magazine, September 1889, but without correction or comment.

Although a most zealous royalist, he managed to keep up an outward appearance of friendship with his enemies, and no man of his day was better acquainted with all the remote and wildest parts of the western Highlands. For his services to Montrose, rendered in the king's cause, he was made by him Gaelic Poet-Laureate to the king, and Montrose was often beholden to the bard for secret information. The murder of Keppoch, his chief, and the active part taken by the clan bard in avenging the deed, first brought his name into prominence beyond the borders of his own country, Lochaber.

Glen Roy in Lochaber was part of the territory presided over by the chief of Keppoch. In this glen in the autumn of 1870 we met an intelligent old Highlander of the Clan Macdonald of Keppoch who was a lineal descendant of a clansman who lived at the time of the tragedy (September 1663). This old 'indweller' conducted us over the whole of the district of Lochaber referred to by the bard in his Murt na Ceapaich ('Murder of Keppoch'). The incidents of this terrible family crime, as related to us, which certainly seem to be verified by the little information otherwise known or recorded, and are supported by the bard's poem written at the time, are as follows.

It was about the year 1650 that the chief of Keppoch died, leaving two sons. These boys were sent to France to be educated, and on their departure their widowed mother (who was a Lowland lady *) returned south to join her own kindred. It was necessary, owing to the chief's death and the minority of the youthful heir, to appoint a guardian, and some member of his family to act as chief. The gentlemen of the clan directed that his uncle should take over these responsibilities until such time as his nephew was of sufficient age to assume in his own right the command of his clan. This uncle had six sons, all arrived at maturity and warriors of the clan, who in consequence of their father's new position found their own social rank and condition greatly enhanced. At length, in due course of time, the day came when the young chief of Keppoch returned home to his Lochaber castle. His prolonged absence in France had so habituated his relatives to the pleasures of power that they were very reluctant to resign their position and its emoluments to their rightful chief and kinsman, and revert from being masters of the estate and clan to the simple occupancy of a farm and the ordinary rank of daoineuasail, or gentleman.

Where the rapid waters of the river Roy divide the hamlets of Bohuntin and Bohenie there springs up from the west bank of the river a small rocky knoll. In 1663 this must have been a wild and solitary spot, and there the uncle and his six sons agreed to meet in

order that they might secretly discuss the matter. Being all discontented with their sudden loss of power, they finally decided that they should take the oath on the skein dubh, or black dirk, that they would murder the young chief and his brother, and the seven be as one in the matter of the deed; that they would individually and collectively support each other to the end. To this day the knoll is known by the name of Torran na Mionn (the Hillock of the Oath).

It is said that the time fixed for carrying out the murders was hastened by the actions of the young chief himself, whose education had taught him views considered by his clan to be detrimental to their interests. He, for instance, censured cattle-lifting (and his whole clan lived by raiding), and condemned many other wild ways practised by them. However, be this as it may, the uncle and his sons, being invited to sup at Keppoch Castle, fell on their chief and his brother and murdered them. The uncle then assumed the rank of chief of the clan: and, although the fact of the murders was well known to the clansmen, the usurper being popular, and having during the years of temporary possession of power made the best use of his time to ingratiate himself with all the responsible members of the clan-who were chiefly ruthless warriors like himself, having no scruples where their own or their clan's interests were concerned, added to the fact that this sort of chief was in exact accordance with their clanusage and sympathy—they would on no account give the murderers up to justice. Under these conditions the matter might doubtless have been hushed up, so far as the clan and their neighbours were interested, had it not been for the untiring exertions of Isin Lom, the clan bard, demanding vengeance.

This old minstrel had foreseen what eventually happened, and had pleaded with the chief of Glengarry to prevent it; but the Lord Macdonell and Aross, the then chief of Glengarry, cared nothing for his murdered kinsmen, whose straightforward views were quite the reverse of his own. So, when the bard made known to Glengarry that the minds of the Keppoch clansmen were alienated from their lawful chief, and said he feared that serious trouble to his young chieftain would happen, Glengarry took no action; and from his subsequent apathy it is just probable that he may have been privy to the crime. After the murders Iain endeavoured to awaken his kindred Keppoch clansmen to a sense of their duty. Failing in this, he twice appealed to Glengarry, who declined to take vengeance. He then went up and down the country of the Macdonald clans singing the Murt na Ceapaich, but without avail; for if Glengarry, who was Keppoch's nearest neighbour and most powerful kinsman, had twice refused his aid when solicited, it was surely not wise for others to-

^{*} This lady was a daughter of Forrester of Kilboggie in Clackmannan.

intermeddle in the affairs of this celebrated branch of the great Clann Dùghaill.

The stern old bard, relying amid his difficulties on the justice of Heaven and the unshaken constancy of his own mind, determined at all hazards to have the murderers punished. In this sore strait he invoked the muse to his aid in order to provoke Glengarry for refusing his assistance. This song extolled the might, valour, and generosity of the chief of the Clan Macdonald of Sleat, and no bard knew better how to plead his cause with a high-spirited and chivalrous chieftain, as he says in his song, 'Sleat of the red hand, that never blenched in combat.'

Sir James Macdonald, sixteenth Baron of Sleat (1663), determined to take the matter in hand, and sent the bard to Edinburgh with a petition to the Lords of the Privy Council of Scotland, who issued 'a most ample commission of fire and sword to Sir James Macdonald, signed by the Duke of Hamilton, Marquise of Montrose, Earl of Eglinton, and other six of the Privy Council, with orders and full powers to pursue, apprehend, and bring in dead or alive all those lawless robbers and their abetters.'

The faithful old bard now concerted measures with the chief of Sleat for carrying out the edict of the Crown, 'his sagacious and welljudged suggestions meeting with Sleat's full A clansman was sent to North Uist, approval. with a message to Archibald Macdonald, an officer of the Clan Sleat, commissioning him to take a company of chosen men to the mainland and act under the bard's instructions. gentleman, 'who was Iain Lom's coadjutor in punishing the murderers of the lawful heirs of Keppoch, was an illegitimate son of Sir Alexander Macdonald, fifteenth Baron of Sleat. He was faithful, prudent, and active, and to him was confided such matters of importance as required sagacity, zeal, and bravery. He was educated at Edinburgh, and was a poet as well as a

When Lord Macdonell of Glengarry heard that the chief of Sleat was authorised by the Crown to take action, he determined (from no goodwill, but for fear that his prestige among the clans might suffer) to assist the bard with a party of his own men. The combined clansmen of Sleat and Glengarry were quartered in Glengarry Castle, and kept well under cover, so that no suspicion should arise to any observer on the opposite hills. When any clansman had occasion to quit the castle to draw water from the loch, he had to put on an old bonnet and plaid kept for that purpose. The reason for this is explained by the fact that ever since the murders the castle had been watched. Leiter Fearna, the hill on the opposite side of Loch Oich and facing Glengarry Castle, rises abruptly from the verge of its waters to a height of two thousand feet, and forms part of the continuous chain of

mountains enclosing the Great Glen of Scotland, Glen Albin. From the summit of this hill a fine commanding view of Glengarry Castle and its surrounding country is obtained; hence to the keen sight of the Highlander it formed a unique watch-tower. Here every day, it is said, for two long years, a sentinel was placed to keep watch on the castle from daylight to dusk by order of the chief of Keppoch. These sentinels one after another reported to their chief that 'there were no men at Glengarry Castle save one old man dressed in a plaid and bonnet, and that they were sure his lordship and his clan were away on some distant foray.

This Castle of Glengarry, where the bard and his clansmen were quartered, was a fortified residence, and was burnt down by the royal troops after the defeat of the clans at Culloden. It is now a magnificent ruin, 'that castellated palace which, beautiful and majestic in its decay, mirrors itself in Loch Oich.' Iain Lom had a confederate kinsman of the Keppoch clan, who informed him that the chief of Keppoch and his sons, believing that their crime had at last dropped out of memory and notice, were about to hold a great feast over the hour of their liberation from danger. On that night, when darkness set in, the bard, with his men, under command of Macdonald of Uist, embarked in a galley and rowed across Loch Oich. Ascending to the summit of the mountain, they crossed over the ridge of the watershed and came out at the head of Glen Roy. Silently and swiftly, with the bard as their guide, they pursued their course down the glen, and avoiding the hamlets and availing themselves where possible of the long level stretches of the celebrated parallel roads of Glen Roy, they at length arrived at the Castle of Keppoch. This ancient castle-of which no vestige now remains-stood immediately facing the junction of the rivers Roy and Spean on the west side. It was constructed on a special design, with a view to its owner's safety, and was honeycombed with secret passages, doors, and apertures for hasty exit in the hour of danger. Each point d'appui could tell its own tale of tactics and strategy, of a great outflanking of some enemy. When the whispered Gaelic equivalent for 'Let us go!' or 'Come on!' ('Rach troimh /' meaning 'Go through!') was passed it was enough, and the law officer or other foe found 'the proud bird of the mountain' was flown! The bard, being well acquainted with the castle, knew of these secret outlets, and directed Macdonald of Uist so to place his men as to cut off all possible means of escape. The attack was then made; the chief of Keppoch and his six sons, aided by some of their clansmen, stoutly resisted, killing and wounding several of the attacking party, and, refusing to be taken alive, were at last overpowered and slain. It is said that sixty lives were lost in this engagement.

The bard, having cut off the heads of the seven

murderers, carried them to Glengarry, and in passing the spring washed them in it before proceeding to Glengarry Castle to present them to Lord Macdonell, the chief of Glengarry. Hence the name of the well, *Tobar nan Ceann* (or the Well of the Heads), which the monument commemorates. The heads were then taken to Inverness and exhibited on the castle walls, as directed by the warrant of fire and sword.

The special services rendered to the Government by Sir James Macdonald of Sleat were acknowledged by the Lords of the Privy Council: 'Immediately thereafter, by order of the Privy Council, he got a letter of thanks from the Earl of Rothes, then Lord High Treasurer and Keeper of the Great Seal of Scotland, full of acknowledgment of the singular services he had done the country, and assuring him that it should not pass unrewarded, with many other clauses much to Sir James's honour. This letter is dated the 15th day of December 1665. Sir James died in 1678.'

Iain Lom, the Bard of Keppoch, lived through

the greater part of the reign of Charles the First, and died at a great age in the year 1709, in the reign of Queen Anne. He is buried on the Braes of Lochaber. A monument ten feet in height, in imitation of the ancient stones of Scotland, marks his last resting-place. In the early days of the nineteenth century, Captain Macdonald of Inverlair, a clansman of Keppoch and an officer in the 82nd Regiment, owing to some doubts having been expressed as to the truth of the poem written by the bard, caused the graves to be opened up, when it was found that the seven skeletons were minus their heads, thus confirming the account so impressively related in the Murt na Ceapaich by the poet.

To the thousands of tourists who must have passed this way and viewed the lovely scenery surrounding the monument and the stately ruins of Glengarry Castle—both standing on the silent banks of Loch Oich—we trust this true historical Highland story may serve to call up happy holiday memories blended with romantic thoughts of the wild and ruthless 'days of long ago.'

THE MONTH: SCIENCE AND ARTS.

A NOVEL MILK AND BUTTER COOLER.

THE frugal housewife is only too painfully aware of the difficulties of preserving butter and milk during hot summer weather, and even in a sweltering kitchen. These two articles are particularly susceptible to deterioration and decomposition under such conditions, the butter attaining the consistency of oil, and in this state being wasteful to use; while the milk sours very quickly, especially if thundery weather prevails. An ice-box is the obvious solution of the problem, but the difficulty in procuring the necessary ice is the one drawback to this system. Recently there has appeared upon the market a simple apparatus which should make a strong appeal to the housewife. It is a cooler, either for milk or butter, and works upon the simplest cooling principles. There is an outer vessel of convenient shape, made of terra-cotta. This is Within is a second vessel made of glazed white earthenware, while the lid is of the same material. The inner vessel is considerably smaller than its container. All that is necessary is to place the milk or butter in the inner vessel, and sufficient cold water in the outer vessel nearly to fill the latter when the inner vessel is placed in position. The lid seals the vessel. Owing to the outer pot being porous, the water within gradually, though imperceptibly, oozes through to the outer surface. As the surrounding atmosphere plays upon the outer surface of the container the water is evaporated as rapidly as it exudes, and in this way the interior is insulated, because the heat cannot radiate to the

inner vessel. In fact, the temperature of the inner pot is lowered from ten to twenty degrees. The writer subjected the cooler to severe trials, leaving it exposed to a solar temperature of over ninety degrees for several hours. When examined, the butter within was found to be hard and solid, while the milk was several degrees lower in temperature than when placed in the vessel, and was perfectly sweet. Subsequent trials in a hot kitchen were equally striking. Owing to the fact that the apparatus comprises only three parts there is nothing to get out of order; while, as it is made of terra-cotta and earthenware, absolute cleanliness is assured. If one is able to obtain ice to fill the outer vessel therewith, the temperature of the contents may be lowered to an extreme degree, but cold water from the tap is quite as effective for everyday purposes. It is an ideal domestic cooler for tropical climes, and being made in various sizes it may be utilised for the preservation of many small articles of an extremely perishable nature.

A WIRELESS DIRECTION-FINDER.

Wireless telegraphy has accomplished remarkable achievements in matters pertaining to the saving of life at sea, but at times there is one handicap. A ship receives an urgent call for assistance from a distressed craft; but often the latter is unable to indicate its latitude and longitude, while similarly the vessel receiving the call has to verify its position before proceeding to the incapacitated craft. For some years past efforts have been made toward the perfection of a device which would automatically indicate the direction

from which the wireless signals were issuing, and which would enable the craft receiving the call to proceed to her distressed colleague immediately, and without the navigating officer being forced to work out the respective positions of the two ships. This end has now been achieved by means of the Marconi-Bellini-Tosi apparatus, which has been fitted to the Canadian Northern royal mail steamer Royal George, and which under the trying conditions experienced upon the Atlantic has proved wonderfully effective. By this means a liner, even in the thickest weather, is able to find her position without the aid of compass or sextant when she is within a radius of about fifty miles of a fixed wireless station or of another vessel, the position of which is known. In the foregoing tests the instrument was found to be accurate to a degree in determining the compass direction both of shore stations and stations upon other vessels. They were able to ascertain the compass position of Cape Race and other land points, and also to verify wireless signal directions from passing vessels which were from eighteen to sixty-eight miles away. Although Cape Race was enveloped in fog, that made no difference in the results. The Marconi apparatus has in and by itself worked wonders; but this latest device renders travel at sea still safer, and in the event of disaster would enable a rescuing ship to reach the scene of the accident in less time than would be the case were the ordinary wireless apparatus only in operation.

THE 'PERMUTIT' WATER-SOFTENING PROCESS.

Some months ago we drew attention in the 'Month' to the permutit process of water-soften-The West Cheshire Water Company has introduced the system at its Hooten waterworks, being the first water authority in this country to embrace the idea. Under an Act of Parliament the company is not permitted to supply water for public use with a hardness exceeding ten degrees according to the Clarke test; but the water derived from the boreholes showed a hardness of nineteen degrees. Consequently it was imperative to reduce the degree to statute limits. After a complete investigation of the various water-softening systems in vogue, the company decided to adopt the permutit method, and its enterprise has been attended with complete success. The base in this system is sodium, and the process comprises the exchange of the calcium and magnesium salts which are responsible for the hardness of the water by the permutit base. This is insoluble in water, and can be revived over and over again merely by the application of a solution of common salt, which reinstates the sodium and at the same time expels the lime and magnesia which have been picked up from the water. The Hooten plant is designed to handle a round million gallons of water daily, which is softened to zero, and then combined with an equal quantity of virgin water drawn from the wells, which has a hardness of nineteen degrees, so that the resultant water has a hardness of nine and a half degrees, which is half a degree below the statutory limitation, and in this condition it is driven into the public mains. The permutit system has found wide favour in Germany, and doubtless will be pressed into service extensively in these islands once its simplicity, economy, and efficiency become realised and appreciated. The Hooten plant requires the attention of only two men.

A NOVEL LOCK-KUT.

Slackening nuts are the bugbear of those who have anything to do with machinery, and many ingenious devices have been introduced to prevent a nut from slipping under vibration. The latest development of this form of ingenuity is both novel and effective, the locking action being effected by means of a pawl actuated by a spring. The pawl itself is pivoted in a slot, and has a sharpcornered heel which engages with the thread summits, thereby exerting an extremely tight grip, which increases as the efforts of the nut to release itself are augmented. Consequently the nut cannot slacken back. But if it is desired to release the nut, the application of the spanner forces the spring in such a way that the heel rises clear of the threads, thereby enabling the nut to be moved. The design of the nut enables it to be screwed on by means of the fingers, but no jar or vibration, no matter how severe or spasmodic, can exercise any effect upon it, because a jamming action is produced. Neither is it possible to put the nut on the wrong way. When the device first appeared it was feared that the nature of the design introduced an element of weakness into the nut; but elaborate tests have shown that invariably the bolt is weaker than the nut.

A STONE PRESERVATIVE.

The stone-destroying action of the atmosphere heavily saturated with smoke in our busy towns and cities is a matter of vital concern to those responsible for the maintenance of public buildings wrought in masonry. Numerous protective specifics have been evolved, some of which are eminently successful. Recently the attention of architects and engineers, who are perturbed by the ravages of weather and sulphurous smoke upon famous buildings, has become centred upon a new preservative which differs radically from its rivals in its composition and action. Cephasite, as it is called, is not a mere waterproofing medium, which only imparts a film of a nonporous character to the surface of the stone, but is an actual stone-hardener. When it is applied to the surface a chemical action immediately commences and continues indefinitely between the silica and the constituents of cephasite. result is that a soft or scaling stone becomes

converted into a hard mass which weather action continues to harden instead of disintegrating; yet the masonry retains its 'breathing' characteristics. The medium is slow in its action, from three to four weeks elapsing before actual action is revealed; but once the action commences, it continues for an indefinite period. The stones which have been treated therewith for a long time are intensely hard. In fact, stone of an original soft nature which was treated two years ago is now practically unbreakable. The resistance to sulphuric acid is perhaps the most remarkable feature of the preparation. Treated and untreated specimens of stone have been immersed in 10 per cent. solutions of this acid for one month—a very severe test. At the end of that time the untreated specimens were found to be 'perished,' while the treated specimens were as hard as they were previous to immersion, if not harder. Unless there be any iron in the stone, cephasite does not discolour the masonry. At the same time it imparts that weathered appearance which a good stone presents after it has been exposed to the weather for some time, and which contributes to the picturesque The preparation appearance of a building. may be applied to damp or dry stone, and in any kind of weather, while pressure is not necessary when dressing. It is a germicide, so that lichen and moss growths cannot establish a hold, being reduced to a fine carbon, which wind and rain easily remove. One gallon of the medium is adequate to treat from eighty to ninety square yards of surface, and as only one coat is required, its application is economical. Where the stone shows signs of pronounced decay three or more coats may be required to secure the requisite protection, according to the depth to which the decaying influences have penetrated. All powdering is hardened thereby; but if the stone is scaling, then the loose stone must be removed before treatment. The application is very simple. An ordinary sash-brush suffices-metal-bound brushes set up discoloration—and it is only necessary to observe that the stone absorbs the liquid and does not throw it off, as dry stone is apt to do. Even delicate carving may be treated therewith, the medium being applied by means of a vulcanite sprinkler.

A LIFE-SAVING CHAIR.

The marine catastrophe in the St Lawrence River has taught more than one valuable lesson, foremost among which may be mentioned the necessity for having upon the decks loose articles which, when sent adrift, are able to float, and thus provide some means of refuge to which immersed passengers may cling. The deck-chair is an obvious article of this type, which is indispensable upon the decks, but it possesses no life-saving characteristics. Had the unhappy liner been provided with chairs which were able to float and support a dozen or more people, the

death-roll might not have been so heavy. passengers were thrown so suddenly into the water that there was no time to don a life-belt, and, deprived of floating articles to which they could cling, they were drowned. Under these circumstances it seems as though buoyant deckchairs should be rendered compulsory. In the 'quidos' chair, for instance, instead of ordinary canvas being used for the seating, a cork and cellular construction is employed. chair drops into the water it floats quite easily, and may be even transformed into a raft. The material may be pulled round the frame of the chair in the manner of a roller towel; and, should exigencies permit, the release of a knot removes the cork section and stretches it out to a length of some twelve feet, forming a substantial raft capable of maintaining the combined weight of several people. It is a chair with life-saving possibilities which have been proved, and it should be used upon steamboats; but it is equally indispensable to houseboats and campingout parties. One cannot reasonably expect steamship companies to provide devices which may never be required; but at the same time a deck-chair which is invaluable in times of emergency seems worthy of adoption. It is more expensive than the ordinary deck-chair, but in matters of life and death the additional cost is unimportant.

THE SEASONING OF TIMBER BY ELECTRICITY.

Accelerating the process of nature in woodseasoning is a somewhat important issue, and in this direction considerable advance has taken place recently. One of the largest billiard-table manufacturers upon the Australian continent has practised electrical seasoning for many years past. An electric current is passed through the wood, the sap of which acts as a conductor. The duration of the treatment varies according to the length and thickness of the wood; but timber twelve feet in length by a foot wide can be seasoned in about eight hours, although it has to be stacked for a further four months or so to permit the remaining moisture to dry up. Against this, however, a period of four to five years is necessary under natural conditions, so that electrical agency has brought about a saving in time of some 90 per cent. One great advantage arising from electrical seasoning is that the losses from warping are considerably less as compared with natural seasoning. In fact, in this instance, warping losses are placed at 25 per cent. as compared with 10 per cent. under electrical seasoning. While application has only been conducted upon a limited scale, those using the process express their conviction that there is nothing against the treatment of large logs thereby, the governing factor being purely and simply one of power. It is stated also that the greener the timber the better the results. The process in this case has been applied essentially to blackwood, but mountain ash has been seasoned likewise with complete success. The French are devoting attention to the electrical seasoning of timber, and one recent method has proved eminently practicable.

AUSTRALIA AND THE FAR EAST.

Australian sentiment regarding the Farther East is not appreciated or even quite understood by the people of Great Britain. In the mothercountry the door of admission is open to every stranger, irrespective of colour or nationalitywhite or black, yellow or copper-coloured; and, in so far as racial purity is concerned, the situation of the British Isles, almost in the midst of the white races of the world, enables this to be done with comparative impunity. There is no danger of an overwhelming influx of coloured aliens, and the stay-at-home Briton is prone to take the view that similar conditions exist everywhere; but it is not so in Australasia. This farthest outpost of the British Empire is within easy steaming distance of the most puissant coloured races in the world, and to allow them the free right of entry would mean that a handful of whites would very soon be submerged by an irresistible tide of yellow undesirables. The Caucasian element would cease to be paramount, and the country would pass into the possession of a coloured race. This sentiment dates back to the earlier gold-digging days, when the Chinese competed so vigorously with the white man that the diggers of Lambing Flat drove them from the field. Then followed legislation excluding every coloured alien from Australia. That stopped the influx, except that a few stowaways still evade the vigilance of the authorities; but as every ship's captain who permits a coloured alien to land in Australia is fined a hundred pounds, the number is negligible. This legislation is meant to preserve the purity of the race, as well as to protect the white man from the unfair competition of a people whose standard of living is at a lower level; it is a policy which has been endorsed by every political party, and it has sunk so deeply into the national conscience that it will never be repealed except by force of arms. That is where the danger lies, for the proud Eastern races, already jealous of the trumpeted wealth of this partly unoccupied land, and thirsting for expansion, deeply resent this provocative drawing of the colour-line by a people who in themselves have not the numbers or the strength sufficient to defend themselves from aggression. Their national vanity has been wounded, and sooner or later their honour will be avenged at the point of the bayonet. Australian publicists and thinkers fully realise that at the present time the supremacy of the British navy is their only safeguard; but if the Empire were involved in war the way might be opened for an invasion from the East. It is to meet this contingency that preparations have

been made to build a small navy and to train the youth of the land to the use of arms. But Australia is not strong enough to build and man a great navy immediately or to provide an army fit to meet the disciplined troops of any Great Power, and in the meantime there is ever the Eastern shadow overhanging the land.

THE DESCENT OF THE RHONE.

A Consular Report on the district of Lyons, issued since the article on 'The Descent of the Rhone' contained in this month's Chambers's Journal (page 554) went to press, confirms the promise of a resumption of the passenger-steamer service from Lyons to Avignon referred to by the writer. Mr Consul E. Vicars states that, after protracted negotiations, the Lyons municipality has at last succeeded in definitely arranging for the financing of a regular summer passenger service on the Rhone. A new steamer, accommodating over a thousand persons, now makes the journey from Lyons to Avignon twice weekly (thrice, if the demand warrants it); the downward passage takes eight and a half hours, the upward about fourteen. The service was opened this summer, and much interest is being taken locally in its renewal.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

THE MAGDALEN: A CITY IDYLL.

PALE shade of vanished beauty, slain by sin!
Worn are her shoes, her garments old and thin.
Misfortune's plaything, pleasure's poorest toy,
Whose smile reflects no mirth, whose laugh no joy,
But the most bitter note the soul can know
Of broken-hearted woe.

Dare she recall, ere life's red stream grows cold,
The leafy lanes where youthful vows were told;
The words of love which passion could not speak
Save in fond kisses on her upturned cheek;
While in the woods the bird of love's sweet pain
Did to the moon complain?

Broke is the bridge for her returning feet, Joy's starlit way with thorns is now replete; Bitter, past all which thought or word could tell, Remembrance—deep as grim unfathomed hell— Lies now between her and Love's cottage door.

She can return no more!

LAUCHLAN MACLEAN WATT.

* TO CONTRIBUTORS.

- 1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'
- 2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3rd. To secure their safe return if ineligible, ALL MANU-SCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
- 4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

THE INTERRUPTED WEDDING.

By Andrew W. Arnold,

Author of The Attack on the Farm, Pepita, The Colonel's Murillo, Père Mumbart, &c.

CHAPTER I.

N the centre of the square a sharp voice rang out, 'Messieurs les savants, et les mulets, en carré s'il vous plait.' * As regards the mules, or the demi-savants, as the men bitterly called them, this was not an easy matter, for, apart from their natural obstinacy, laden as they were with scientific instruments and worn-out by fatigue, they were more troublesome than usual; but messieurs les savants showed remarkable quickness in obeying the order. It was about time they did, too, for on the horizon, with the sea behind, near an entrenched camp we saw masses of Arab cavalry, under that redoubtable leader Mourad Bey, evidently about to attack us. For the most part we were glad they were, for our sufferings since we left Alexandria had been so terrible from the awful heat and the want of water, to say nothing of the flies and the clouds of sand, that, whatever happened, we felt we could not be worse off.

There were only sixty of us Guides in the square, for we had lost many of our horses when they were disembarked, and the English had captured many transports. I, Jacques Kleinberg, considered myself, being a mere conscript, lucky to have a mount at all; nor should I had I not been servant to Captain Tocqueville, who commanded my squadron.

'Now the dance is going to begin, mes enfants,' said Maréchal de Logis Desdier, with a chuckle.

As our square was six deep, and we were inside, though it was my first battle I did not care if it did. On they came, those marvellous Arabs, hidden now and then as they descended some slight hollow. Though coming at full speed, they opened fire on us, and that, too, from such a range, owing to the long barrels of their guns, that we could not reply to it.

'Steady, mes enfants!' shouted General Menou, who commanded our square. 'Wait for them; take your time; fire low.'

For the first time in my life I learnt what the whistle of a bullet was like, and instinctively lowered my head, as did many another conscript, in spite of the chaff of the vieux moustaches.

'First rank, kneel; and second and third, fire!' suddenly cried the General.

What effect this had we could not tell, for the countless hoofs raised such clouds of sand, apart from the smoke of our own muskets. The fourth and fifth ranks had just time to pass their rifles to those in front, and these last to give our foes another volley, when, with loud cries of 'Allah!' they were right upon us. Like fiends incarnate they endeavoured to force their way into the square, some even trying to back their horses on to our bayonets. I had never before seen, or even dreamt of, such courage. No wonder Bonaparte said that with Mameluke cavalry and his own infantry he would conquer the world; for these fanatics had not the slightest fear of death; in fact, they welcomed it, for did not their creed teach them that if they fell in the service of Allah the most lovely houris were awaiting them? And if that did not make them fight, nothing would. But in spite of all they could do we stood firm.

The horses and bodies were heaped up in front, and this in itself formed an impediment; and, so far as our square was concerned, as we continued to fire into them, their efforts gradually slackened. Then the order was given to advance en échelon to bring us opposite to their camp, and then we halted; for again we saw clouds of dust, and once more we were attacked, but not with the same fury as before.

The square on the left flank was commanded by General Bonaparte himself. This had been attacked at the same time as ours. No sooner had the Arabs been driven off a second time than we saw cavalry issuing forth from that square under those two fiery leaders Murat and Junot.

Taking his cue from that, General Menou ordered us to follow their example. Probably I turned a trifle paler; I know some of the other conscripts did, for on our poor half-starved horses, which had been cramped up on board ship for five weeks, I did not see what chance we should have. However, as we galloped over the sand to the aid of Murat's men, who were

SEPTEMBER 5, 1914.

^{*}This is the title of Philippoteau's celebrated picture depicting this incident in the battle of the Pyramids.

already engaged, I resolved I would sell my life as dearly as possible.

Seeing us advance, those who had just been driven off from our square, tired though their horses must have been, were rallied under a sheikh in a green turban (their sacred colour), and came straight for us. Our trompette sounded the charge, and we rushed forward. They fired at us as they came on, and a bullet must have struck my horse, for it stumbled and sent me right over its head, a regular somersault. I fell on my back, and for a few moments I was com-When I got my senses I saw pletely dazed. that my horse had risen and was following the others. In a number of isolated mêlées my comrades were fighting, and as I could do nothing I was about to retreat to an advancing square, when I saw a riderless horse emerge from a hollow. I recognised it at once, for, to my horror, I saw it was the beautiful black charger Roland, belonging to Captain de Tocqueville, who commanded my squadron. Day by day on board ship had I tended it. I ran toward it now, calling it by name, and at once the obedient creature came trotting up to me.

Another moment and I was on its back, and was about to join my comrades, when, and not till then, I actually found that I had lost my sword. True, I found both pistols loaded in the holster; still I hesitated, a sense of shame preventing me from riding back to the square. While I hesitated I heard a shout, a bullet whistled past my ear, and coming straight for me on his splendid Arab I saw the sheikh who had led the second charge against us. I will candidly admit that, being without my sword at that moment, my heart nearly came into my mouth. If I fled, I reckoned he would probably catch me, good as my horse was; so I resolved to wait for him where I was, which luckily was on the crest of a slight hollow. Heaven knows that I thought my last hour had come, and heartily wished myself back in Alsace.

On he came, his arm raised and his curved scimitar shining in the sun. Taking my time, I fired right at his chest, and he fell forward on his horse, which instantly stopped quite dead. In a moment I was off my steed. Only let me get his sword and I would fear no one; and, ma foi, what a sword it was! The hilt, with the exception of one fine sapphire on the top, was covered with uncut jewels. It was no easy matter to get it from his death-grip. On one finger, too, was a splendid diamond ring.

The sight of these gems, for a reason which I will explain afterwards, for a time almost turned my head. I thought of nothing else. Round his neck, hung by a thick gold chain and set as a charm, was a superb emerald, a stone valued more than any other by Mohammedans on account of its colour. I found on him, too, a small leather bag-purse full of gold coins, and another

larger one full of silver. This may take time to describe, but the whole incident took but a few minutes. Whether I should be reprimanded or not, I resolved to get back to the square with the splendid Arab I had captured. I had mounted the black charger, and was about to do this, when I heard a cry for help, and I saw my captain, whom I loved dearly, for he was always so kind, generous, and considerate, staggering toward me, his face streaming with blood.

I galloped up to him. He got his foot into the slipper-like stirrup of the Arab; but so weak was he that without my help he would never have got into the saddle, and when he was there

he quite collapsed.

'Courage, mon capitaine!' I said. ' Nous irons au pas;' and so we did a little way toward an advancing square, when I heard warning shouts in front of me; and, sacré bleu / if a body of Arabs was not racing in our direction on the right flank, rather in the rear! I only took one quick glance; whether there were many or not I could not tell—their shouts were enough for I saw it was a race for life; so, keeping a firm hold of the Arab's rein, I dug the spurs into my own steed, and tore ventre à terre over the baking sand. An Arab saddle is as comfortable as an arm-chair, and the captain, though hanging over the crupper of the horse, could not lose his Therefore I was not without hope, for I knew my pursuers would soon come within range of the square, which had now halted. knew this too, and accordingly they pulled up, for their losses had made them more cautious; and in another moment, amid cries of 'Bravo, Blanc Bec!' I and my charge were safe in the square. Here there were plenty of doctors, and I left the captain to their care. I was still wiping the perspiration from my face when a civilian offered to buy the Arab of me for one thousand francs, for this was before the regulations were made about captured horses, and each trooper was allowed to get what he

'Don't you sell for that,' said an old sergeant; and before the end of the day I received two thousand two hundred francs for it, and gave the sergeant two hundred for his good advice.

This is all I saw of the battle of the Pyramids; but, of all the many battles that I took part in during the campaign, I look back on that with the most pleasure. In fact, at the time, in spite of the overpowering heat and fatigue, I was quite intoxicated with delight, for the possession of the jewels was simply everything to me. My thoughts went far away to our little village of Drelheim, in the Vosges, where Bertha, daughter of Hans Reichardt, landlord of 'L'Échelle d'Or,' was waiting for me; and I reckoned, with the coup I had just made, that the lovely girl was already mine.

My brother Mark and I had been left orphans when I was ten and he was eight years old,

and were brought up after the death of our parents by an uncle and aunt. My mother came from Champagne; all her life she had spoken German like French. Thus from our cradle we learnt both languages, which turned

out a very good thing for us.

It was soon after the death of our parents that the Revolution broke out. Rogues, with the idea of filling their own pockets, tore all over the country urging people to burn the churches and châteaux, all in the name of 'Progress' and the 'Rights of Man.' These firebrands, however, with two exceptions, met with little success in our quiet, law-abiding district; but one of them, alas! was my uncle. He would never have been persuaded but for Hans Reichardt, who was a wheelwright then, and as cunning a rogue as ever lived, and who had great influence over Though married, these two 'sons of the people,' as they called themselves, set off to seek their fortunes. They were both splendid fighters. Reichardt became a sergeant, and my uncle a corporal. They hunted in couples, but Reichardt kept the bag. In two years they came back. My uncle was able thoroughly to stock his little farm, and Reichardt bought a fair amount of The latter became quite a leading man in the village, and was never tired of telling what could be done in the name of 'Progress' and the 'Rights of Man.' When the allies invaded France once more these two set off again. Alas! my uncle never came back. In his last letter he told my aunt that he had got enough money to buy the farm outright. When Reichardt returned, and my aunt claimed her husband's share, he told her that he and her husband had quarrelled a week before the latter's death, and he knew nothing about his money. To her dying day she never believed a word of this, but she could prove nothing, and had to submit. As for Reichardt, he bought land in all directions, and became landlord of 'L'Échelle d'Or,' the largest inn in the village.

But for the fact that my aunt and Reichardt's wife were schoolgirls together, and that she was actually Bertha's godmother, she would never have allowed me to have anything to do with them. From childhood Bertha and I had grown up side by side. My aunt Eliza was as fond of the beautiful girl as I was, and Bertha's mother was always my friend; and when I was eighteen, and had to go to be a soldier, Bertha promised, if her father would agree, that she would marry me; adding, with a kiss, 'If he does not agree, I promise you I won't marry any one else.'

But when I went to her father he took high ground, for he was a rich man now. 'I would as soon she should marry you,' said Reichardt, 'as any other lad in the village, but with the dot I can give her I must have an equivalent. There's plenty of time; she's not seventeen yet. I have taught you what "Progress" and the

"Rights of Man" mean; I have practised them myself. Now you go and do the same, and when you come back with your pockets full of money we will soon set the wedding-bells ringing."

Poor Bertha cried when I told her this. 'Have no fear, dear Jacques,' she sobbed, as I kissed her for the last time; 'whether you come back rich or poor, you may trust me as I trust

vou.'

The next two years were spent in the barracks. Being used to horses, and being fond of them, I elected to go into the cavalry. It takes three years to make a complete trooper. However, I took to my duties instinctively, and I made such progress that when the expedition was being got ready to embark for Egypt I was sent with the regiment to Toulon.

It was there I for the first time saw the famous General Bonaparte, who in the year 4 (1796) had done such wonders in Italy, and of whom all the world was talking. The conscripts, on account of the trying climate, were again undergoing a medical inspection. We were drawn up in line in the manège, and were standing half-stripped, awaiting our turn to be examined.

Suddenly the door opened. 'That's Bonaparte,' whispered a comrade standing near; 'the little one in front. That's Kléber on his right, and Junot and young Kellermann* behind. I know them, for I saw them at Dijon.'

I can see the future Emperor now, with a red sash round his waist, as he came along slapping his yellow boots with his riding-whip; his light-brown hair, worn long under his tricorne hat, with a three-sou cockade on it, falling over on his dark-blue Directoire coat.

'Parbleu, there are good ones among this lot! Where do they come from 'he asked of Colonel de Tocqueville.

'The bulk of them are from Alsace and Burgundy, mon Général,' he replied.

'Ah, Kleber,' the Emperor said, 'your countrymen can always be trusted.—Kellermann, you will be able to do something with these men.'

'Trust me for that,' said Kellermann.

Then the little General walked along the line, pinching our muscles and asking questions. It is impossible to describe the unlimited confidence all those who had served under him had in his power to lead them to victory. All had got the idea into their heads, though I don't know how it arose, that, though we were to land in Egypt, we were going on to India, where we should be able to pick up precious stones by handfuls. We had no knowledge where either of these countries was, but that did not trouble us. In the highest spirits, we embarked in May 1798. These, however, soon disappeared. Never shall

^{*} The future marshal, who was destined to become even more celebrated than his father, the victor of Valmy.

I forget that awful voyage, with four hundred of us crowded into a four-hundred-ton ship, with horses on the deck. What with storms, and being chased out of our course by the British, not to speak of the terrible heat as we approached the African coast, all the precious stones in the universe, we vowed, were not worth it. After many weeks, we arrived at Marabout on 2nd July.

We all thought, after our victory of the Pyramids, that when we reached Cairo we should be allowed to sack the town. But we were mistaken, for the General wished to make a good impression. He called all the sheikhs and rulers together, and quoting the Koran, told them he was going to save them from the Turks. He held grand reviews, and at one of them, when honours were distributed, for saving the life of Captain de Tocqueville, who was our colonel's nephew, I received a sword of honour.

As the captain's servant it fell to me to look after him till he recovered from his wound. He never forgot that he owed his life to me, and from that time, in spite of our different positions, we became almost like brothers. I told him all my hopes and fears; and he, I learnt, was also betrothed. The friendship thus begun has lasted all our lives. Thanks to his influence, my love of the service, my knowledge of French and German—for the words of command had to be given in both languages—and my splendid constitution, I found myself a maréchal de logis at the end of two years.

Fortune had, it will be seen, been good to me already; but even greater luck was in store for me. We happened to be at Cairo when Bonaparte took his sudden departure. Owing to some urgent family affairs, our colonel, not being able to return to France, got leave for Captain—or, rather, Major now—Tocqueville to do so. He was returning after seeing his nephew off, and had nearly reached the barracks, when he found he had not given him some important paper.

'Here, sergeant,' he said, 'follow me. You are the very man I want.'

We returned to his quarters.

'Take this paper, and at any cost get a boat and get on board,' he said, putting a handful of silver into my hand.

I left him. The squadron consisted of twofrigates and two small vessels. All was confusion on board, soldiers, civilians, and fussy old savants all asking questions; but I could not at first find the captain.

All this had taken some time, and to my horror, when I got on deck I found the ship was already under way. I begged and implored the officers to heave to, but without avail. In desperation I hurried down to the captain.

'So much the better,' he said. 'Î will make it all right. I will take care you don't suffer.

In fact, it is all for the best. I may not return, and you will be a trustworthy messenger to take some papers that I fancy the lawyers will desire to be sent to my uncle.'

I did not much like that prospect; but when I had got over my surprise, and thought of seeing Bertha again, I could hardly speak for pleasure. The General-in-Chief landed at Frejus on 12th October 1799; but our little ship had become separated from the others, and we landed the next day at Marseilles. The captain had taken a fancy to the fine diamond ring I had found on the sheikh, as he wished to give it to his fiancée, so we went to a jeweller's, who offered four thousand francs for it; but my captain promised to give me six thousand later on, and then we parted after he had told me to be at Marseilles that day month.

A week later, having reported myself at the depôt, and having—thanks to the captain—got three weeks' furlough, I found myself in the fine old city of Strasbourg, where I hastened to a worthy clockmaker named Klotz, in the Gutenburg Platz. I showed him the jewels from the sword-hilt and the quaint charm in its barbaric pure gold setting.

'This is not the place,' said the honest fellow, 'to sell such gems as these. As regards the uncut stones, they may or may not be of the first quality; you should take them to Amsterdam. The sapphire and emerald you had better take to Paris, there is a market for them there, but here there is none.'

I pressed him to say what he would give me.

'I cannot give you more than three thousand five hundred francs,' he replied; 'but in Paris you would certainly get double, and very likely ten thousand.'

So, after buying a few trinkets for Bertha and her mother and my aunt, I set off for Drelheim. It was a glorious autumn day. Ah, how my heart beat as the country got more and more familiar, and every mètre brought me nearer to Bertha! Soon, too, above the pines and golden beeches, I saw the spire of the little church, and behind it was the abode of my good aunt, whose farm was called the Church Farm. Soon, ascending the hill_close to the village, I saw some cows turning into a field. A tall girl dressed in black -and it was the colour that deceived me-stood shading her eyes and gazing in my direction. hastened on as she still remained standing, and then simultaneously we recognised each other; and she, light-footed as a fawn, came racing toward me.

'Ach, Jacques meiner Geliebter!' she cried, throwing her arms round my neck as I smothered her with kisses. 'Why, you are as brown as a nigger!' she said, standing at arm's-length for a moment; 'and you are a sergeant, too. Ach, I am happy!' and again her lips were pressed to mine.

'Come, Bertha dearest, let us sit in this field;' and, opening the gate, we sat down on the bank, I with my right arm round her waist, and her hand in mine. For a time we were too happy even to speak. I was so much fascinated by her mere presence that I could only gaze with admiration at her little shell-like ears and her perfect neck as white as snow.

'Himmel, what a lovely girl you've grown!' I cried at length. 'But tell me, ma chérie, why are you in black!' I did not recognise you at

first.'

Though a blonde, she had wonderfully lustrous brown eyes, a peculiarity which was unique in our village, and which added greatly to her beauty. Those large, soft eyes had been beaming with happiness till then; but at my words her lips quivered, the tears brimmed into them, and she leant her head on my breast, her whole frame shaking with sobs.

'Mother is dead,' she sobbed; 'she died before the hops were picked, nearly two months

ago.

I was so taken aback that I could not speak at first. I had hoped that her father would agree to our wedding at once, as I considered I had more than enough money; but I doubted it now, and I was certain of it a moment later. With a woman's quickness she seemed to have read my thoughts.

'No, dear Jacques; you must wait. When I rise in the morning I think of mother, and when I go to bed I cry myself to sleep. It is work, and only work, that does me good, because then I don't think. I am glad you've come; now I shall have you to think of; but I won't marry

you for a year.'

'But your mother would like you to be happy.'

'Oh yes; but don't ask me,' she protested.

I did my best to comfort her. 'See, dearest, what I have here. Look at these ear-rings I have got for you; and look at these ribbons—they will make such nice bows for your pig-tails.' Her silky tresses were so long that she could almost sit on them; and, drawing them in front, we tied the bows on them. Gradually she became more cheerful.

'We'll keep them,' she said. 'But now,' she continued, rising, 'you go on and see father. I will stay here a little, for if he sees my eyes are

red he will be angry.' So, kissing her again, I went on.

Smoking his pipe and looking the picture of contentment, Hans Reichardt stood in front of his door. He stared fixedly at me for a moment.

'Why, *Himmel*, Jacques Kleinburg, can it really be you! You've grown a fine fellow; and you're a *maréchal de logis*, too. That's a fine sword you've got. Come in, my friend; come in.'

'Yes,' I replied, 'that was given me by General

Bonaparte himself.'

'Well,' he said dryly, as we sat with a bottle of Niersteiner in front of us, 'did you get the chance of teaching the Egyptians what "Pregress" means?'

'I should think I did, for you said I should not marry Bertha without doing so. I have just seen her, poor girl! and there will be no weddingbells vet.'

'Never mind about that; I want to know to what extent you were able to teach those people

the "Rights of Man."'

I knew his avaricious nature, and I had not the least intention of letting him know how much I had got; but I produced the box with the emerald charm and the jewels from the sword, and I told him all that Klotz had told me, and that he would give me three thousand five hundred francs.

'Three thousand five hundred!' exclaimed Reichardt. 'That's not enough for Bertha.'

'Not enough?' I replied, quite taken aback. 'Not enough? Where will you find in this village a fellow who could find one thousand francs? The finest cow is not worth one hundred francs, and sheep are dear at ten francs. I could buy a farm and stock it well for her. What dot are you going to give her, then, that three thousand five hundred francs is not enough?'

'Her dot is my affair; we will talk business when you show me five thousand. Now do what Klotz says; go off to Paris to-morrow, and

don't take under ten thousand francs.'

'Go off to Paris to-morrow,' I repeated, 'after I've been away all these years?' and I had difficulty in keeping down my rising temper. 'Donnerwetter / I will see you further. I've come to see my aunt and Bertha, and I am going to do so.'

(Continued on page 649.)

ORCHID-HUNTING ON THE AMAZON.

By J. SALIS-SCHAWBE.

THE love of gardens and flowers has increased enormously of late years; and while it is only natural that the more hardy plants which will grow out of doors have received the most attention, yet delicate tropical blooms decorate the greenhouses and conservatories of the rich,

and are displayed in all their beauty in the flower-shops in ever-increasing quantities. At recent flower-shows the tent which has been most thronged has been the one where orchids have been exhibited. People are interested in orchids; there is something fascinating about

them. One hears of great sums being given for single rare plants; one thinks of adventures in far lands, of lonely deaths in distant forests; of plants like certain Cypripediums and Cattleyas reaching Europe in some stray consignment, and then their place of origin being lost again for a quarter of a century.

To some people of more matter-of-fact mind, that panacea or horrible bogy tariff reform is vividly conjured up, while from recent events at Kew it would seem that orchids are sometimes made the victims of political views; but perhaps this is 'merely the rage of the momentary mush-reom against the immortal, entrancing, and ex-

quisitely lovely orchid.'

Most orchids have now become acclimatised in European greenhouses, and are successfully divided and also grown from seed; yet from time to time it is desirable to import vigorous new stock, and there is always the chance of finding some new variety or natural hybrid. In the forests along the banks of the Amazon, and its great tributary the Rio Negro, many orchids are to be found; and Manaos, on the latter stream, just above the junction of these two mighty rivers, makes a good headquarters.

It is easy enough to get to Manaos—three weeks in a comfortable steamer from Liverpool, and one is there; but the difficulties on arrival are not easily coped with, and it was some time ere the canoes were ready. And now sailing, now rowing, a start was made among some islands in the Rio Negro—here, although more than a thousand miles from the mouth of the Amazon, eleven miles across.

One morning the canoes were paddled up a narrow waterway to an island lake, and were forced through the great leaves of the Victoria Regia water-lily until they came to ground on a praia of silver sand. Near by the lush rivergrass fringed the roots of enormous forest-trees; crocodiles gave hourse grunts as they slipped from log or rock into the water, and a sudden swirl and swish, with the glimpse of a shiny black back, marked where a river-cow, or manatee, was feeding. The Amazon forests are very difficult to penetrate, and the absence of game is very marked. Insect life, however, is present in extraordinary quantity, and day and night the creeping, buzzing, and shrilling never cease, and man as well as beast is subject to persistent attacks. Ants of many species, from large black ones (whose bite gives great pain and is followed by fever) to smaller red ones (who live in a curled-up leaf, and are aptly named fire-ants, so acute is their bite, luckily followed by no unpleasant consequences), are everywhere on the ground among the herbage and on the trees; while bees, wasps, and hornets dispute with motucas and other biting flies over the luckless intruder. Scorpions and huge spiders, as well as centipedes, are dislodged from every rotten treestump or heap of dried leaves; while snakes in some valleys are so numerous that one is content to see them scuttle away without further molestation.

Although the height of the river above the sea at this great distance from its mouth is very small, only about a thousand feet, and although its course throughout remains in equatorial regions, the trees and palms along its banks change very much in character every twenty or thirty miles, and there are never forests of one or two kinds of trees only.

Most trees occur at distances of one hundred and fifty yards or so, and in some cases at much greater distances. This makes the task of the orchid-hunter very difficult, for although most orchids do not confine themselves to one species of tree, yet the growth of certain trees favours the establishment of orchids; and after a good haul has been made from one such tree, instead of being able to despoil its neighbour, a laborious way has to be cut through the tangled forest growth until another orchid clump is seen.

Sometimes waterways can be found fringed with trees on which the mauve Cattleya grows, and then the work is much simplified, as one only has to canoe from tree to tree. The river rises sixty feet, so it is necessary to choose carefully the right time in order to avoid more arduous climbing than is inevitable even under the most favourable conditions. These islands, some fifty miles above the junction of the Amazon and Rio Negro, are a very good collecting-ground for orchids, as within a very small radius there are several changes of soil, and both terra firma and gapo, or flooded land, exist. A long stretch of Tabatinga clay soil is cut by a strip of sand, and this in turn gives way to black alluvial soil and A veritable orchid-hunters' paradise! Great trees with buttressed roots rise a hundred and more feet into the air; trees with rough, scaly skin like crocodile-hide alternate with smooth-stemmed palms, and all are entwined by huge creepers hanging in twisted ropes from branch to branch, and often throwing a cloud of purple or yellow blossom over their unwilling hosts. These great creepers cut into the bark, and here and there the gaunt gray arms of a dead forest giant show with what dire results. Smaller palms in endless variety, interspersed with broad-leaved banana-plants, tree-ferns, and dracænas, give a very tropical look to the undergrowth; while cacti with vivid blossoms sprawl from a decayed stump, and the ground itself is bright with caladiums, ferns, and mosses. A curious subdued light filters down through all this greenery; there is an odour of decay and dampness, and often a strange sense of expectancy. Apart from the shrilling of insects, to which the ear soon gets accustomed, a profound silence reigns for hours at a time, suddenly to be broken by the extraordinary call of a species of crane or the deep-throated note of a howling monkey. The sudden storms of wind, accompanied by torrential rain, often occurring in the afternoon, have but little effect in the depths of these forests. Above, the boughs may swing and roar in the wind, the leaves may be ripped off by the driven rain, but below only an added gloom and dampness is felt.

Passing from these dense jungles to a patch of sand a hundred yards across, we find the contrast to be very great. Only stunted trees and thorny bushes grow on the white sand, and the sun easily finds its way down, so that everything is a little sparse and dry. On the heaps of decaying leaves blown against the thorny scrub different Catasetums have established themselves, some with huge pseudo-bulbs, others with quite diminutive ones. One kind throws up a spike of female flowers like yellow bells, and also a delicate spray of male flowers, with jagged edges purple and black-and-white, that when visited by one of the larger insects shoot out a little bit of themselves as though a hidden spring had been released. It is amusing to touch these blossoms lightly with a bit of stick and see the curious mechanism work.

On the edge of these little sandy patches, before the forest has got too dense, Coryanthus orchids can be found. They are the most extraordinary of any of the Brazilian orchids, and are a little difficult to collect, as they grow at a height of some thirty feet from the ground on slender trees which often are exceedingly thorny and difficult and dangerous to climb, and they always have an ants' nest in their roots. These ants are peculiarly active, and inflict very painful bites. The limbs of these trees are often brittle, and will not bear the weight of a climber, while wasps choose them for hanging their papery nests. If one attempts to cut the tree down—a difficult job in the heavy heat—great leaves bind it to its neighbour, and one is no nearer one's goal. When once the orchid is got down the ants swarm out of its entwined roots over the pseudo-bulbs and leaves, and it is very difficult to handle. The best way is to tie a creeper to it and immerse it for an hour in a stream, by which method most of the ants can be got rid of. In its flowering-time five or six flowering spikes hang pendulous from the plant, some nine or ten inches long, and each has from three to six buds of a spotted, purplish hue. These swell and lighten in colour, and eventually burst open, disclosing one of Nature's most wonderful works. The upper part curls into two wings spotted with yellow, surmounting a helmet-shaped cap with two anthers, from the tips of which trickle slowly and continually the clear drops of a yellowish fluid into a cup below; a faint, agreeable odour is emitted, and the flower is visited by many insects, some of which sip the cup of nectar, drink deeper, fall in, and are drowned. But among its visitors, after it has been open for a few hours, metallic-blue bees appear in everincreasing numbers; and as long as the flowers

remain unfaded—some three or four days—these bees are constant visitors, taking care, however, to avoid the slowly dropping liquid. They are never seen hovering round other orchids or flowers, and disappear as soon as the Coryanthus has faded. They come from great distances to visit the flowers, follow canoes containing specimens right down the river, and even in little gardens shut in between the high tiled houses of Manaos the steely-blue bees appear as soon as the blossoms expand.

On the Amazon this orchid flowers three times a year, and does very well if put in a suitable place after it is brought from the forest; but it is said to be difficult to grow under glass, and to flower rarely in Europe. Penetrating farther into the forest, we see that the smoother-barked trees are free from orchids and parasites, but the remainder are covered with a dense growth . of all kinds of plants wherever a limb makes a convenient angle for a lodging-place. Great numbers of arboreal ferns creep along the branches, and a plant very like a pine-apple plant, with vivid scarlet leaves, and holding a pint or more of water, grows nearer the main trunks. Cacti, with long pale-green flowers and brilliant magenta fruit, hang down, mixed with creepers and parasites of similar nature to mistletoe, and quantities of orchids of all kinds. Moss and lichen, that link between marine and terrestrial plants, grow on the damper under-surface; and amidst all this riot of parasitic and arboreal growth, it needs a strong pair of field-glasses and a somewhat comprehensive knowledge of the local orchids to have a profitable day. In the denser forest the orchids grow at a great height, and the majority are of merely botanical interest, their flowers being insignificant, and it is no easy task to pick out the Cattleyas or Schomburgkias from the commoner kinds. Cattleyas are very local. Cattleya superba, with its fine mauve petals, grows usually at a height of some forty feet from the ground, and always near the waterways. It will occur frequently for some miles, and then be entirely absent—its place perhaps taken by Schomburgkia, which is tiresome to collect owing to its insect guardians. In one variety, which has long sprays of brown-and-white flowers, there is a small hole at the bottom of each pseudo-bulb, and in this a ferocious black ant has its abode, which rushes out and inflicts a painful bite on the despoiler; and as all the Schomburgkias establish themselves very firmly on their trees, and grow into very big clumps, their collection is no easy matter. Cattleyu Eldorado is rarer than Cattleya superba, and its pseudo-bulb has only one leaf; its flowers are very beautiful-pale mauve above or rosy pink, and its lip washed and splashed with yellow. One or two other rarer Cattleyas are to be found, and sometimes white ones, or white ones with a yellow lip; these are very rare and greatly prized. At the time when the river is still high

and the rainy season has not begun, most of these orchids are not in flower or bud; and so, owing to the height at which they grow, and the inextricable confusion of all sorts of parasitic growth with which they are entangled, a good knowledge of the plants themselves is essential. The white Cattleya plants, however, are indistinguishable from the more usual ones; consequently, unless one is lucky enough to find a specimen actually in flower, there are no means of picking out these rarities.

Oncidiums are fairly common; one variety has beautiful sprays of yellow blossoms thickly spotted with chocolate, and is easy to get, as it does not grow very high from the ground. Another Oncidium, Lanceolata, called *Orelho de burro*, or donkey's ear, from the shape of its handsome spotted leaves, has very minute pseudobulbs, and is in consequence difficult to transport to Europe. It has pretty spikes of deep-mauve flowers, shaped rather like butterflies.

One orchid, a brassicola, always grows in the hairy fibre surrounding the crown of a certain species of palm. Its long, thin stems, and grassy foliage with pink pendent bella, look incongruous below the feathery palm fronds, and maybe bunches of half-ripened nuts. With this exception, and one Catasetum, palms on the Amazon are never the hosts of orchids. Scuticaria—so called from its foliage hanging down several feet like long whips—has three or four broad flowers near the tree-trunk, but its long, grayishgreen, whip-like leaves give it a very distinctive

appearance.

Landing one day on a shelving, grass-grown slope of the Rio Negro, quite close to a waterway connecting it with the Amazon, the canoe pushed through a dense growth of floating bladderwort with blue and yellow flowers, to make fast to a dead stump near the water's edge. White cranes flapped lazily away, and in a Tucuman palm-tree a couple of brilliant red-and-yellow macaws were busily feeding before flying off, screeching at our approach. At a little distance from the bank a lake was left by the receding waters, and here turtles abounded, and crocodiles had remained to feed on the lush weeds and the many imprisoned fish. The sand showed the marks of crocodile-hide and turtle-shell, as well as the usual footprints, and here and there a trail could be seen where an enormous boaconstrictor had wound its sinuous way. Golden orioles flew from tree to tree, and in the more open parts lovely metallic butterflies flitted, now settling in little companies to drink at the wet sand at the lake's edge, now circling up into the greenery above. An enormous Bertholletia excelsa, the Brazil nut-tree, towered into the air, its large round pods just ripening, and a few blown down by a recent storm disclosing the beautifully packed nuts inside. A little farther on a tall silkcotton-tree with great buttressed sides was growing, bearing at an angle about sixty feet from the ground a great clump of orchids with drooping sprays of yellow flowers. The glasses revealed a thick tuft of single leaves and some dozen spikes of flowers. From the ground up to where the orchid was growing there were no branches, and the trunk with its uneven buttresses made it impossible to use a rope. The orchid was a very unusual one, and a magnificent specimen, and so the only thing to do was to cut the tree down. It seemed a pity to sacrifice a forest giant, but one could almost console one's self with the thought that, given suitable conditions, an orchid is practically immortal. It took two days to cut and saw the tree down, and what labour! In that still, tropical dampness one was often enough tempted to give up. perspiration wetted one's scant clothing, and tiny bees settled persistently, attracted apparently by the smell. Humming-birds quivered through the air, living jewels; but other life was kept away by sound of axe and saw. In the afternoon of the second day the tree

fell with a resounding crack of the last connecting fibres and a sudden crash; but, alas! great leaves prevented it from falling, and all our work seemed in vain. By climbing a neighbouring tree, infested by fire-ants, by means of a rope, the thickest binding creepers were severed, and by four o'clock the great trunk lay across some smaller trees in an accessible position. The orchid turned out to be a Peristeria, each separate flower of which looked like a hovering dove. It was a magnificent plant, and we were able to saw it away from the tree with much of its original growth undisturbed. Hanging from one of the longer sprays of flowers was a delicately woven humming-birds' nest, with two tiny eggs, which, suspended in their delicate swinging cradle, had not been broken in the series of heavy falls.

neighbouring tree proved a useless inducement.

The canoes were deeply laden, and it being a good season of the year for the orchids to arrive in Europe, a return was made to civilisation to enable the plants to be shipped. Many of them were sold by auction; but one or two of the finer Cattleyas, and the Peristeria which had taken so much time and trouble to obtain, adorn the collection of one of our famous private orchidgrowers. Some months ago I saw it in the full glory of its yellow flowers, and, under vastly different conditions, it brought back with a rush all the memories of trials and triumphs in the dim sizes of the Ameronian forcet.

But the parent birds were nowhere to be seen,

and hanging the nest at a similar altitude in a

dim aisles of the Amazonian forest.

THE HOUSE OF LADDO.

By CHARLES HILTON BROWN.

CHAPTER V.

AS you may well imagine, I had little enough sleep that morning, and was early out of my bed and up to the knoll; but long as I was in advance of my usual hour, Mr Robert was there before me. The fog still lay white and smothering on the land—and thicker still on the seaand I was quite close to the ruined dike before I saw him. He sprang up at my approach, and I saw that his face was pale and drawn, with the big, tired eyes of one who had slept little for some nights past.

'Davy,' cried he, with a gratifying pleasure at my appearance, 'I'm thankful to see you. The

time is now come.'

'What do you mean?' said I

'What I say,' returned he. 'The game is up; we have played our last card, and it has failed us. There has been some cross-work in high places I will not name. I have no time to say more; but I tell you frankly that my father has been too much for us. To-morrow we shall all be on our way to France or to the gallows.'

'Stop a minute,' said I, and I told him the events of the night. To my great vexation, he heard these with a marked impatience and a wandering attention, and in the end he struck

his hands together and stopped me.

This might have been all very well six months ago,' said he, 'and I suppose I should have known and used it then. As it is, it's worse than want. What could we do-a handful of persecuted outlaws, with a price on our heads and a sheriff's officer at our heels—ay, and close at our heels,

'But are you so sure!' I persisted, for I was chagrined to think my night's ordeal had gone

for nothing.

'You young fool!' he roared; 'do you suppose me the sort of man to give in before due time?' And then, seeing me humbled, 'Look here, Davy, you and I must hold together in this. Stand by me now, and I may be able to stand by you. Is it a bargain?'

'Command me,' said I.
'Good lad!' cried he. 'Now, listen. I shall have to tell you everything—which I think I safely can. Come, no speeches,' said he, holding up his hand as I was about to break into some fervent protestations of loyalty; 'we have no time for that, so we'll call it said. Now, do you know the farmhouse at Feathermuir?

I knew it very well, and said so. It was a lonely sort of place standing on the high hillside,

perhaps a mile and a half inland.

'Good,' said he. 'Well, in that place there lie about a score of us, and my father has worked against us to such purpose that if we lie there

much longer we are like to-morrow to lie in our graves.'

He looked round him with an expression of

great bitterness.

'And now comes this fog,' said he. 'I swear the very elements are in league against us. At this very moment there should be a French ship lying ready for us off the Ness, and if it were not for this thrice-cursed fog we should know for certain whether she were there or not. But, after all, it is of little moment; if she be there, we must get to her, fair or foul; and if she be not, we may get to our prayers. After dark to-night boats will put in for us, and into these boats, Davy, we must somehow get, or we are dead men.

'Where will they land ?' I asked.

'You should know,' replied he. 'Where but at the place you saw last night.'

'It should suit very well,' said I. 'And now

what must I do?'

'I will tell you,' said he. 'This business of the ship has been clumsily gone at, and I am ready to stake my life that my father will get some wind of it. He may even have it now. He is a terrible man, Davy, is Hangman Lechmere, and I think the devil is in him—that I should say such a thing of my own father. What you must do is to keep close watch over him this whole day, and if anything happens get yourself somehow up to the Feathermuir to give us warning. It will be neck or nothing then. Will you do it?'

'I swear I will!' cried I.

'Good lad!' said he again more cheerily. 'Now back to Laddo, and keep all your ears open; and if nothing happens, be at the crossroads at Ferlie after dark. You must be guide to half of them.

So back I went to Laddo in a most mighty state of self-importance, and scarce fit to contain myself. But, after all, I had no call to keep my ears on the stretch so very long; for I had not been back an hour when there came a terrific clatter of horse's hoofs through the westward fog, and Patrick Cockburn rode into the yard. He threw himself from his horse like a man possessed, and burst into the house; and a few minutes later I heard my uncle's voice raised in a sort of scream of anger. A door flew open, and he came thundering along the corridor, shouting and swearing as he ran.

'My own daughter!' he cried. 'My blind, miserable daughter! And I blamed the other! By Heaven, she shall pay for it! Oh, by the Lord, how she shall pay for it! Wait-wait;

let her only wait! The others first!'

He came to a halt in the lobby, and I heard him muttering there with Cockburn. Then

presently he ran to the door.

'Rintoul—Rintoul,' he shouted, 'saddle the roan this minute! I must to Cupar without delay.—The soldiers, Cockburn—the soldiers! It can be done!'

He dragged Cockburn off, back to his own room, talking feverishly, and at that my mind was made up. I would fain have stayed by Alice, for I trembled for her now that her brave secret was out; but I reflected that she was safe enough for the time being, whereas others who depended on me were not. I made no doubt my uncle had got wind of the whole business of the ship, and, as Mr Robert had said, it was neck or nothing now; and so I slipped out into the yard where the horse Cockburn had ridden so hard stood steaming with his head down. Rintoul was in the stable, bridling furiously, and with one good spring I was up and in the saddle. My notions of horsemanship were drawn from the occasional riding of raw hill-ponies on the Pentland slopes, but they stood me in wonderful stead. Cockburn's good steed went forward with a leap, and we cleared the yard with a clatter like the North Mail. A hundred yards away was a belt of fir, and we were half-way across the open ground to this when I heard my uncle's voice again behind me. I was too unsteady a horseman to look round; but I knew, as surely as if I saw, that he had thrown up a window in the back of the house and was going to shoot at me. A dreadful sickness came over me, I felt my heart sob in my throat, and I thought I should have fallen from the saddle long before the rifle crashed out. But the ball sang harmlessly over my head, and next minute we were into the fir-belt, and going helter-skelter through the mud for the Feathermuir.

I take it I must have contrived to hold my seat in the saddle, and that Cockburn's horse, spent though he was and hard ridden, won somehow up the long hill to the Feathermuir; but my wits were so scattered by my recent fear and by this close rush of events that my memory serves me little as to the details of that journey. Indeed, the first thing I can clearly recall is sitting in the long, low-roofed kitchen of the farmhouse with a number of strangers about me. They were fine-looking fellows almost to a man, carrying in their aspect and bearing the unmistakable evidences of gentle birth; some of them, moreover, had been much in the field, and bore honourable traces of their service-Murray of Ramsburn, with his arm in a aling; Weir of Spentles, with a bandaged head; and that Farquhar of Dinnie for whom Alice had such praise, with a long, new-healed scar running from eye to chin. I very clearly remember sitting, somewhat out of breath, in a hard wooden chair, and telling them my tale in little jerks and instalments. At the close Andrew Farquhar took paper and a quill, and ran up a few figures.

'If all goes well,' said he, 'we shall have the prettiest race to-night at the fall of dusk that has yet been seen in this country-side.'

'He can never get his soldiers over in time,' said some one.

'If he take the Arncroach road,' said Farquhar, 'he can do it, with something to spare; and I see no reason why he should use any other. The Butcher's men are devils at a march.'

'And if all goes ill?' observed Weir. 'Suppose there be no ship in yonder fog, after all?'

'Then God save Prince Charlie!' cried Murray with spirit; 'I ask no better name to fight for.'

'The ship will be there, sure enough,' said Farquhar. 'Dalmuir will not fail us, though the

day turn to night.'

Robert Lechmere during my narrative had remained somewhat apart, sunk in profound reflection. I fancy that, despite himself, his thoughts lay less with the present company than with Rose; and I know now that in that interval he was making up his mind to stay behind the others and serve her and Alice, willynilly, so far as he could. I dare say, too, he felt some shame that it was his father who had put them all to such concern. Be that as it may, when Farquhar took up the quill to figure out the times and distances, he had turned away to the open door, where on a clear day you could see away down the Lothian and Berwickshire coasts, and I know not how far besides. And now, on the heels of Murray's sentiment, he gave a sudden great shout.

'By the Lord, lads,' cried he, 'the fog's up, and the ship's off the Ness!'

In an instant there was such a rush for the doorway that I thought to be crushed flat in the press; but presently we were all outside and gaping seaward. The fog had thinned all round, and directly to seaward had lifted altogether, so that a great pencil of watery sunlight had broken through upon a mile-wide circle of gray sea. Plumb in the middle of this circle there lay a ship—evidently a foreigner of sorts—closehauled and motionless, exactly as the smugglers' brig had lain when I first sighted her, though a little farther from the land. We saw her none too clearly, and, owing to the strange play of the light, only with the ghostly effect of a reflection; while even as we looked there came a contrary clap of wind, and the fog settled down thick and solid as before. But what we had seen was enough to set us all laughing and talking like so many maniacs; and it was then, by the nonsense of their speech and the fervour of their actions, that one could tell how of late the strain had told on these men's nerves.

And now came almost the hardest trial of all—the wearing of the long afternoon hours, with

the moral certainty in one's head, first, that my uncle must be at the gates of Cupar; then that the bugles were calling out the Hanoverians; then that they must nearly have reached the Peat What made it all ten times worse was the knowledge that if we could but have signalled to the ship—as we conceivably might but for this disastrous fog-and so got in the boats before the appointed time, there was nothing to prevent our all going scot-free. For myself, I was all in a quiver of apprehension and excitement; but after their first rapture, these cool fellows planned and jested and gambled as though nothing unusual were afoot. The only man who betrayed by his bearing any uneasiness of heart was my cousin Robert; but his was a greater responsibility, and, moreover, he had another cause for gravity. But at last the light began to fail, rushlights were brought in, and finally, after a stiff dram all round, we crept out by twos and threes into the darkness.

It was just such another night as the last, cold and clammy with the sea-fog, and so thick that Mr Robert and I had to lay our heads together before we could settle how best to strike the Ferlie cross-roads. The farm lights were swallowed up before we had gone a score of yards, and we dared use none of our own, with the result that our progress was intolerably slow and halting. It was a tedious business for us, whose wits were all called upon to set a lead; and what it must have been for those who only groped blindly in the rear I cannot think. Robert Lechmere was sadly distraught, and I know that it was my news of Alice that had set him thinking. His plan had been to wait and persuade Rose somehow to make a bolt for it with him, inasmuch as he could not well jeopardise all his companions by asking them to delay longer—though, I make no doubt, they would gladly have done so; but, in common humanity, he could not leave Alice now, and it would be all but impossible to get her away. Amid such speculations he and I performed our office as guides, and by the most wearisome stages we got at length across the fields to the cross-roads, and thence I guided them down a long strip of young timber that gave us a line, and so into another, till presently our feet were upon rising ground, and we heard the splash and ripple of the calm sea upon the rocks.

At this moment there occurred one of those startling and theatrical changes which one comes to look for in such weather. There came a sudden keen gust from the east, and with that the mist rolled slowly away like a curtain, to show a most clear and perfect moon riding amidst the few wisps of vapour that raced like stragglers after the main body. We had struck the coast within a few yards of our intended destination, and I was just pluming myself on the excellent conduct I had given them, when Murray gave a kind of choking cry.

'God Almighty!' he screamed; 'the ship's gone!'

'Not gone,' said Farquhar, pointing seaward, 'but going.'

Like one man we followed his pointing finger, and, sure enough, just to the left of the glittering path of the moonlight, there was the ship standing out to sea with every stitch set. I know not whether it was the sight of her with her canvas spread, but on the instant the fell and deadening truth burst upon me.

'Sirs,' I cried, 'we have made the most frightful of errors! That is not your ship, and never was, but merely the smugglers' brig that has been waiting for the fog to clear!'

My words threw them all into a stony silence, in the midst of which there came to us from the land side the soul-stirring sound of horses' hoofs. We all wheeled round, and there was a considerable band of horsemen coming down the straight road by Laddo at a hard trot.

'The Hanoverians!' cried Weir. 'Scatter for your lives!'

'Devil a yard!' roared Murray. 'Stand fast for Charlie!'

'Amen!' cried Mr Robert. 'We are done either way. Stand fast!'

And then, like a prelude to the disaster, there happened a thing which I still see happening in my most evil dreams. The nearest horseman would be perhaps a hundred yards from us, when from out of the bushes in front of him there sprang up the figure of a girl, feeling blindly about with her hands, and evidently lost. It was Alice. I had told her of our plans, and down she had come on some errand of her ownperchance to give a God-speed to her brother, or to Andrew Farquhar, who had now to see her die. For the great galloping horse of this cursed trooper-I can scarce hold pen to write it-struck her full where she stood, and flung her rolling under his hoofs. She gave one choked cry, more of alarm, I think, than pain, and then she must have been blessedly killed on the instant. The whole thing may have taken at the most one minute; but may God defend me from such another!

And then in a clap, just as the first shot went off on either side, down came the fog again, leaving us to struggle, first in the murky twilight, and then in the blackness of the pit. Of the fight I can tell you little, and you must call up the reserves of your fancy to fill it out. There stand out the sensation of striking my cutlass into something soft that gave horridly under the blow; some one's ringing death-yell of agony; a great rushing and shouting and falling to and fro; some one saying the name of Hangman Lechmere; Mr Robert screaming in my ear to cut for it, and what I took for my own voice declaring I would stand; the horror of some one—Weir, I think—falling dead and bleeding across me, and

bearing me with him to the ground; and the dreadful and haunting face of a Hanoverian trooper split fiendishly from brow to chin. And then, to cut short this unholy rant, there came a loud and crashing blow upon my head from

some great thing—a hoof, as like as not—that sent me straightway into a blackness deeper even than that of this fell and murderous night.

(Continued on page 642.)

AN AMERICAN BIRD-WOMAN.

ANIMAL life is being studied to-day with so much enthusiasm, patience, and accuracy, and described with so much realism, that our friends in fur or feather are brought closer to us than ever before. Some write and endow them with almost human attributes, making it evident that men and women find in the woods the things they go there to seek. Others going with a gun, on sport intent, report them wild and shy. To the writer endowed with genius and tenderness, the habits and life-history of the lower animals, when woven into narrative, have often the charm of a human romance. To mention only a few authors who have excelled in this department of literature, we have Seton-Thompson, Jack London, C. G. D. Roberts, W. H. Hudson, and H. Fabre. An American lady, Mrs Gene Stratton-Porter-known all over the United States as the Bird Woman for her admirable camera and pen work in the delineation of birds and moths-also takes high place. She has endured more hardships in bird photography and secured better results than any other woman ever did, and has further developed her gifts and opportunities in stories which have had a wide popular appeal, and have given pleasure to millions.

All her life this Bird Woman has believed that she would be more at home in the woods than elsewhere, and now she is trying it. On her little estate of fifteen acres of wild woods, with primeval trees upon it, near Rome City, Indiana, she has reared a bungalow house, called Limberlost Cabin. The land runs down to a lake-shore; there is a spring, and a cleared hill for garden, orchard, and pasture. Here have been laid off red, white, pink, blue, lavender, and yellow flower-beds of an acre each, in the deep woods running down to the lake-shore, where wild-flowers of each colour named have been planted, beginning at water-growth at the lake, and running back so that each plant has its proper location; vines and wooden fences stand between the beds of flowers. Limberlost Cabin is situated in the middle of the yellow bed; it has eighteen big rooms and four fireplaces, two of which Mrs Porter practically built herself. One is of white glacier formation known as 'pudden stone,' the pebbles being red and blue; and in a big living-room there is one of field boulders split to show many colours and flecked with quartz crystals that sparkle like diamonds in the light. Limberlost Cabin is provided with private gas and electric light plant, waterworks, and telephone, and a good road. The windows in this house are built with broad, deep casements especially to furnish feeding-tables for the birds. Outside, the open porch has a cement floor on which in winter stand sheaves of wheat, apples, and cabbage and celery leaves; and on the broad sills are scattered chopped wheat, ground corn, and baked potatoes, and depending from a rope are raw meat bones and pieces of suet. There revel the chickadees, titmice, nut-hatches, sapsuckers, flickers, song-sparrows, jays, cardinals, and squirrels. A pair of coons inhabit one of the hollow trees, also a pair of big owls. All this seems a suitable environment for the author of The Harvester and The Song of the Cardinal.

Gene Stratton, the twelfth child of Mark Stratton (who came of British ancestry) and Mary Shellenberger, was born at a farm in Wabash County, Indiana, in 1868. In 1886 she married Charles Darwin Porter, president of the Bank of Geneva. There is one daughter by this marriage, who in turn has two daughters. stories of Mrs Stratton-Porter, especially Laddie, contain many autobiographical touches. With inborn genius, and overflowing tenderness for birds which showed itself as soon as she could run about, one of her earliest recollections is of finding a dead woodpecker lying on the grass near a cherry-tree. She picked up the bird, and her childish mind tried to grasp the idea of death. She threw the woodpecker into the air, only to watch it fall helpless at her feet. Stuffing its beak with green gooseberries was of no use. 'I don't think you would like to be shot because you were hungry and ate some cherries,' she said to her father, Mark Stratton, in that Wabash farm garden one day. Her father explained that he did not permit robins, orioles, or any songbird to be killed; but woodpeckers were not musical, and they took a great deal of fruit. She proposed that if he would stop the boys from shooting woodpeckers she would not herself eat another cherry, and her father agreed. But a kind mother broke the bargain.

Gene Stratton cared less for dolls and indoor play than being out of doors amongst her feathered friends. One day, in crossing the orchard, she heard the report of a gun, and saw a big bird swirling earthward. A large chicken-hawk was sitting back on its tail, with one wing extended, broken and bleeding. In the bird's eyes was a pitiful look of pain, fear, and defiance. Her father again raised his gun to fire. But she

sprang forward and sheltered the bird with her body, and narrowly escaped being shot, as the contents of the gun whizzed past her head, and the rush of air struck her face. 'Are you mad?' cried her father. 'I barely missed braining you.' She entreated her father for the life of the bird, and laid her hand upon it. The hawk, realising a friend, huddled against her for protection. She gained her point, and Mark Stratton allowed his daughter to keep the bird, and she fed it and nursed its broken wing in the wood-shed. When she asked her mother for powder to dust the wing and keep off flies the remark was made, 'What a little bird-woman you are!' In two weeks the hawk was well, and took food from her fingers. She became known as a friend of the birds, and every unfortunate caught in a reaping-machine on her father's farm, or hurt in any way, was brought to her to be doctored. No one taught her to care for them; her own natural genius and sympathy with the feathered tribe prompted her to such acts. She studied each case independently, and treated the hurts of the birds much as her mother did the children's wounds and bruises.

Next spring Mark Stratton made her heir to all the birds on the farm. 'He gave me,' she says, 'for my very own the birds with their flashing colour, their thrilling song, their beautiful eggs, their queer little babies.' So her life became full of interest for the sixty nests under her care. She would softly draw near a nest, imitating the call of the bird, and leave near the nest a little food the bird liked. She thus gained their confidence, and could stroke the backs of mothers while brooding. When sent to school she was at first rebellious until allowed to carry off nine of her pet birds along with her. After she had a house of her own she bred canaries and made pets of orioles and parrots, and when she played the piano or violin the birds set up a babel of song. The family parrot Major was the first trophy of her camera, and during her first season of bird-photography she spent two hundred pounds in equipment. Those who have studied her work in the illustrated edition of The Song of the Cardinal or Moths of the Limberlost know how charming it is. She says: 'I no longer needed to keep birds in my home in order to get all the pleasure to be had from them, for God had taught me that my gift endured, that all the birds everywhere were mine, and that the only way to know them right was to study them as they lived their life in the abandonment of perfect freedom.' Thus she secured the best results, and gave pictures of birds in moments of fear, anger, the full tide of song, bathing, or brooding. Her advice to other bird-students is to 'go slow, know birds and understand them, and remain in the woods until you have become so much a part of the daily life of the birds that they will be perfectly natural in your presence.

We are enabled to give an interesting sidelight on her first story, Freckles, through the courtesy of Mr John L. Grant of Utica, U.S.A., to whom the publishers had submitted the manuscript. After reading the story, Mr Grant, on returning the manuscript, strongly advised publication, backing up his words by an order for two hundred and fifty copies. Amongst those to whom a copy was sold was the wife of the late Professor Root of Hamilton College. The professor, a true naturalist, who had been ill, rejoiced in the book, and felt uplifted by the interest of the story and its nature pictures. He wrote as follows to Mr Grant: 'It is an exceedingly fine piece of work. The flavour of the swamp and the timber is not only in it, but comes out of it. In reading I almost felt my feet damp, and I looked lovingly at the spruce, the pines, and elms and ashes and poplars and hemlocks of my home. When one loves nature, how the beauty and delight of it creep into one's soul! And the Bird Woman is fine. It is fine to me because the humanity of it so permeates and informs the nature in it, while the nature takes hold of the human in it, teaches it, uplifts There is the chivalric spirit in it.' Like Sir Walter Scott in scouring the Borders in quest of ballads and legendary stories, Mrs Porter had been 'making herself' while she was for two years editor of the camera department of the periodical Recreation, two years on the natural history staff of Outing, and four years natural history specialist on another periodical. she came to write such books as The Song of the Cardinal, What I have done with Birds, Birds of the Bible, and Music of the Wild, she had strong natural genius and all this experience to draw upon.

During the past ten years Gene Stratton-Porter has written ten books, the sale of which has run into millions. They still keep on selling. The Girl of the Limberlost has had a sale of six hundred and fifty thousand in the United States alone. Of her latest, Laddie, a True-Blue Story, three hundred and twenty-five thousand copies were sold in six months, a feat which beats the sale of Uncle Tom's Cabin in a like period. Humour, realism, and close study of nature are apparent in all she has written. The home-life of an American family was never delineated with greater realism than in Laddie. In her country books she shows how health, wealth, culture, joy, and refinement may appertain to those who live on the land as she has done. Her own life and achievements prove this abundantly. The Limberlost Swamp in north-east Indiana, the scene of her work on birds and moths, has changed since she began her life-work. Commerce has destroyed it as a haunt for natural history specimens. It exists now only in ragged spots and patches. In its time she asked for no better hunting-ground for birds, moths, and flowers. It proved of unspeakable interest to herself; that interest and the knowledge gained thereby she has handed on to others. Without claiming to be a scientific naturalist, she has opened the eyes of thousands to what can be done with birds and moths; and when this mine was so far exhausted the interest was

transferred to the characters in her ever-delightful stories. Through these Mrs Stratton-Porter has given joy and pleasure to others, and through them have come fame and fortune to herself, while she has remained unspoiled, and continues as keen a nature student as ever.

THE POINT OF VIEW.

By ROBERT MACHRAY.

NO. I.

MR HENRY HAGGART, the old school-master, walked briskly down the lane, and his head just topped the hedge on each side. Beyond middle age, and inclined to stoutness, he yet carried himself very erect, as became a former officer of the Volunteers. There was a brave smile in his eyes and a touch of gaiety in his air as he moved along, humming a line from a favourite song, and swinging his cane to the melody. But his dark suit, well brushed, was a little shiny at the seams, and his silk hat, also well brushed, was somewhat noticeably past its first youth.

He was the headmaster and staff all-in-one of the Hogarth Square Academy, a higher-class private school for the children of the better-off folk in oor auld toon, who did not altogether approve of the brand of education provided by the Board. Time was when he had had an assistant, but that was gone by; it was a luxury he could no longer afford. He was not perhaps the best teacher in the world, but he had the best heart; as was said of another, it was almost a fault in him. He had never married, no doubt because he had taken on his shoulders—sometimes, when he was off guard, so to speak, you would see the stoop in them—a widowed sister and three orphaned nieces, the brood of a second sister; a heavy burden, but he never called it that.

As he stepped out that morning he was thinking of the eldest of those three nieces, a bright, eager, and clever girl, and it was his design that she should help him, and herself as well, by undertaking eventually 'the French and music.' With this object in view he was sending her to Paris; all the arrangements had been made, and she was leaving next day. The money had been a great difficulty, and still was so; but it had been overcome, partially at least. He was telling himself that he must be careful and economical. Dear man! not for a decade and more had he had a chance of being anything else. He'd manage it somehow! So Margaret -Maggie to everybody save himself-was going away to Paris on the morrow for a couple of years; it would be a hard struggle to keep her there so long, but it would be such a splendid thing for her! This was why there was that brave smile in his eyes.

At the bottom of the lane he was met by John Jamieson, a coachbuilder whose workshop was close at hand, and a local 'character' famous for his extraordinary ugliness and his 'faithful' dealing with friends as well as foes. Thus, when a certain lady of the neighbourhood once told him that he was the ugliest man she had ever seen, but, noting his instant resentment, immediately sought to pour balm into the wound by assuring him that she 'positively doted' on ugly men, he swiftly retaliated with a pointed, if ungallant, reference to the spareness of her figure: 'Weel, ma'am, ye ken beauty is but skin-deep, an' if we were a' flayed the fattest would be the fairest.'

As the schoolmaster drew near, Jamieson showed him a frowning face. Formidable at all times, that face, which a boy high up in the academy had pertly yet aptly described in an alliterative moment as a 'curiously corrugated and confounding countenance,' was daunting now. Jamieson looked as if he had been awaiting the other's coming—as if he were waylaying him to give him a bit of his mind—as was indeed the case. There was an attachment between the two men, and not of yesterday, for Jamieson had been a sergeant in Haggart's company of the old Volunteers. The schoolmaster smiled on him, but John's stern and menacing expression did not relax.

A bonny morning, Johnny, said Haggart pleasantly. 'How are you the day?'

'Oh, I'm weel enough, an' the mornin''s weel enough tae, Maister Haggart,' returned Jamieson ungraciously. 'But what's yon I'm hearin' aboot Miss Maggie?'

'That she is going away, John? Is that it?'
'Deed, an' it is! To Pay-ris, I'm tel't,
Maister Haggart; but, for my pairt, I canna an'
wunna believe it.'

'It's quite true, John. She leaves to-morrow. To finish her education, you know. It will be a grand thing for the lassie;' and the brave smile came into the old schoolmaster's eyes again.

'But Pay-ris, Maister Haggart!' exclaimed Jamieson in accents of horror, unfeigned and deep. 'Man, man, I won'er at ye! Puir Maggie! Man, do ye no' ken that's where they eat puddicks?'

NO. II.

OR auld toon lies in a sweet and soothing valley, shut in on the north and south by ranges of rounded, peakless hills like gigantic barrows, but open from west to east, as that is the course of the river flowing down to the sea. Pushful persons from the great, bustling city some seventeen miles away, fatuously impatient of its abiding peace, contemptuously call it 'Sleepy Hollow.' In truth it is a slumberous place; there is no strain, no stress, no feverish fret of business; it has never been, and never will be, a roaring mart of trade, though its weekly corn market was once of some importance, for it is the centre of as rich and fertile, if lovely and tranquil, a country as any in the world; but in these days of 'samples' the market has become a small affair. Its population barely remains stationary—tends, if anything, to decline, as most of its young people, exclaiming that there is 'nothing' in the auld toon, leave it for other scenes where life, they think, holds bigger chances. And God go with them!

But let no one scoff at oor auld toon. Granted that its beautiful setting is worthy of something finer, it is not without its points, and still plays a part in the general scheme of things. It has had a long and not inglorious history; a poet might say that mayhap it is of that it dreams, but the fact is that it is more than doubtful if the town ever thinks of it at all; its people cherish a strange but pleasing notion that they are singularly wide awake, and not in the least like men that dream. 'Tis a happy, contenting delusion. It was not always thus. Four or five hundred years ago the town, which was old even then, was almost too much 'in the movement.' In those times that meant war, with all its excursions and alarms. It was assaulted, besieged, stormed, ravished, burned, and not twice or thrice, yet it revived from its ashes; for centuries watchmen stood on its walls, and its streets rang with the cries of soldiers. Kings were born, lived, and were buried there; the site of their palace, vanished 'langsyne,' is now that of the county prison. Sic transit gloria !

Few ancient memorials of its chequered and romantic past are left to the auld toon, which to-day might be said to look old-fashioned rather than old, as a great part of it was rebuilt about the beginning of last century; but there are the church, partly in ruins, known as the 'ayb-by,' a bit of a castle once tenanted by Mary's Bothwell, and the bridge, with the 'hangman's hook' still protruding from its side, now estopped—the bridge, not the hook-from heavy traffic. The omnipresent feature of the town is its deepbrooding quiet, its freedom from hurry, its almost absolute repose, which make it an ideal retreat. To be sure, it has a few commercial enterprises in addition to the necessary shopsas, for instance, a flourmill, and a 'waukmill' which manufactures tweeds; but the two real industries of the town are lunatics and orphans. Both the orphanages and the large lunatic asylum lie on the north side of the place, on the lower slopes of the range of little hills that shut in the valley in that quarter; and the buildings are the best in the town.

The splendid orphanages, which are always full, owe their existence to the munificent charity of a man who made his money elsewhere. but who took a fancy to the quiet and peace of oor auld toon, and gave orders to build them there. They are for girls only, and almost any day you may see these young creatures in 'crocodile' processions demurely promenading the streets; here is 'nothing but well and fair.' The lunatic asylum, standing in its own spacious and beautiful grounds, is a very extensive institution, erected by the county, and looks far other than the sad and dolorous place it must be inside. It, too, is always full, and it has a considerable and efficient staff, including a chaplain, generally one of the ministers of the town. Service is held in the large hall on Sunday afternoons, and on one such occasion the Rev. Thomas Turnbull, minister of the first charge. In the congregation was Charles Smith, a townsman, whose madness alternated between his imagining himself Napoleon the Great and a posched egg. Could topsy-turvydom farther go? Before his malady had overtaken him he had had the reputation of being very 'near.' The clergyman knew Smith well, and spoke to him after the service.

When they had exchanged some remarks on various topics, Smith, who, the minister afterwards admitted, seemed perfectly sane that day, observed, 'They tell me, Maister Turnbull, that you're paid fifty pounds a year to come up here to preach to us dafties. Is't true, sir?'

'Yes, Charles, it's true.'

'Weel, sir, a' I ha'e to say, then, is that it's a clean waste o' guid siller. Man, we're no' worth it'—here Smith's voice suddenly fell to a tone which was meant to be low and confidential, but which was distinctly audible to many of the inmates—'nor are you.'

Chuckling, the minister often told the story against himself, christening it 'A Lucid Interval.'

NO. III.

THE village stands in, or, rather, by the side of, the path of that far-stretching highway which was formerly known as the Great North Road; indeed, the place has an air of holding itself aloof from it. Other villages, to say nothing of cities and towns, have been made by, and belong to, the Road, their main streets being no more than sections, long or short, of its course from north to south. But this village just touches it at an angle, reluctantly as it were, and may be said, almost without an effort of fancy,

thereafter to withdraw disdainfully, and as if it wanted to have as little to do with the Road as possible. The village is very ancient, perhaps more ancient than the Road-old as that is-and this might account for what looks like hauteur.

It is the bend of the river, however, that really gives the place that pose. There is a bridge; over it goes the Road, but the village stops on one side, with that appearance of having gone quite far enough, thank you, and of retiring in scorn from the adventure, in 'sich' company, you know! The hundred buildings or so of various sorts of which the village consists are strung in a double row along one bank of this bend of the stream; and from the other, with its edge of trees and wild-flowers in luxuriant profusion, there extends an enchanting prospect of fields and woodlands, like a great ordered garden, down to the sea. It is a sweet spot, beloved of artists for its beauty, its quaint houses, quiet and dreamy, its old Dutch commill on the haugh still at work after four centuries, and the modern mill, a thing of yesterday, yet already overtaken by disaster and in ruins, beside the roaring linn, which gives the place its name of Lyntown.

Standing not only on the Great North Road, but also on the main line of the railway, the village does not altogether lack some notes of modernity other than that supplied by the ruined mill, which by itself might be taken to suggest that madness lurked that way. There is the station, through which pass, mostly without stopping, some fifty trains a day; and there is a school recently erected according to the obdurate command of the Board of Education Department. Now and again a new house gets built, under the continuous fire of the criticisms of all the villagers, who make a sort of holiday out of it. These worthies, though unconscious of it, add a fresh charm to the place by their naïveté and old-worldliness. Lyntown breeds 'characters' by the score. It is in the morning, between eleven and twelve, that they show themselves in its single street, discuss their friends, do their shopping, and shake doubting heads over the fate of the nation.

One fair and shining forenoon Dr Carmichael, the only medico in the neighbourhood, walked up this street, with a nod, a smile, or a few remarks to those he met-he knew everybody, and everybody knew him; and presently he encountered Mrs Macintosh, a woman of middle age, whose husband was the village shoemaker. It was generally conceded that there was but one 'better man' in Lyntown than Macintosh, and that was his wife. But on this occasion, alas! the lady's face was flushed, her eyes watered, and her speech was indistinct-signs that Carmichael did not fail to observe.

'How are you to-day, Mrs Macintosh?' asked

'How are you was,,
he, looking gravely at her.
'No' sae weel as I wis yesterday, but better
than I wis in the nicht,' said Mrs Macintosh,
and hiccuping. 'I ha'e hed an

awfu' sinkin' kin' o' feelin' in the pit o' ma stummick this mornin', doctor, an' that's the truth, sure as d'aeth!'

'Ah! I know that sinking, Mrs Macintosh,' said Carmichael with a grimace. 'Take my

'Fowk are aye ready wi' that, doctor,' Mrs Macintosh interrupted him; 'but if ye'd tell me noo what to dae?' she asked, in what she thought was an insinuating manner. Here was a chance to get medical advice gratis; she was not too far gone to have that idea in her head.

'A few drops of essence of ginger,' said the

doctor grimly, 'and not a drop of alcohol!'
'Thank ye, doctor. You're a kindly crater,' returned Mrs Macintosh; and away she went, mightily pleased with herself.

A fortnight later, however, she got in a bill from Dr Carmichael for seven-and-six. Next day she met him in the street.

'How are you to-day?' inquired the doctor.
'What's the price o't? Will it be seven-andsax?' she asked bitingly. 'No, no, my man;
you'll get naething mair oot o' me. No, no not again! You an' your "Hoo are ye the day?" Not again—not again!' And she marched off, colours flying.

PLUSCARDEN ABBEY.

'Twas autumn in the quiet glen, Where still the lonely Abbey stands Forsaken, 'mid its ancient lands, With dreams of far-off times again.

A pensive sadness filled the air, And brooded o'er the silent vale; At times I thought the vesper bell Repeated still its call to prayer.

Ah no! the faintly ringing sound
Was pealing but in fancy's ear;
No more the echoes linger here,
No more they haunt the sacred ground.

A broken link in history's chain, A relic from the vanished past Upon our modern landscape cast, The solemn ruins still remain.

No hand can trace the faded lines, Or raise again the crumbling walls, Under the golden light that falls Where all around the ivy twines.

No voice can reach across the gloom That parts their distant age from ours, Who first upreared these falling towers, Or wake an answer from their tomb.

I lingered late within the vale, Watching the mystic hand of eve Slowly its sable curtain weave Until the deepening twilight fell.

So in the darker night of time All things grow dim; the shadow falls, In silence, on the mouldering walls Revered as sacred in their prime.

A CENTURY OF BRITISH RULE IN MALTA.

IN a previous article in Chambers's Journal (August 1913) a brief account was given of the famous island of Malta, and the relation of that little-known country to the British Government. Malta is not known as it should be to people at home; and as an indication of the susceptibility of the Maltese to British opinion, it may be mentioned that the article in question was reproduced in the Malta papers and very freely debated.

There is every evidence that the Home Government is alive to its responsibilities in the Mediterranean; and the possession of Malta is so absolutely essential to the maintenance of our position there that in the popular imagination it is a fortress, and nothing more. Outside the official class, to whom Malta simply means a change of station, there are few visitors to the place; and the tourist or traveller to India and the East, who is given but a few hours in the island, carries away merely the impression of its surpassing beauty and grim, almost unending, fortifications. But its two hundred thousand people are an intensely interesting study, and the patience with which they await a change in their political and economic circumstances is only equalled by their unswerving loyalty to the British Crown.

It is exactly one hundred years since Malta finally came under British domination, and the time is particularly appropriate for a review of our relations with this wonderful little people. The famous Knights of St John had surrendered to the French in 1798; but a revolt speedily followed, and, chiefly by British assistance, the French were driven out. It was then understood that Malta would be restored to the Knights; but this was never done, and as it was impossible for the Maltese to maintain their independence, the island was finally taken over by Great Britain in 1814. The Maltese, always a proud race, regard this as a 'self-cession' to Great Britain; and certainly the negotiations were conducted on that basis, Great Britain giving the most solemn promises that their ancient rights and liberties would be protected. The settled conditions that followed the permanent British occupation, and the immense sums which were spent upon the military and naval expansion of the island, brought about a period of great prosperity; but it was a prosperity economically unsound. The people, instead of becoming

producers and traders, expended their labour in work and services for the Government; and now that the demand for their labour has been so largely reduced, they are realising their helplessness. An end has come to this lavish Government expenditure; and with the developments of other ports of call in the Mediterranean, Malta has fallen on evil days. Wages have shrunk, and there is an alarming increase of poverty and unemployment. The industrial problem is insistent and serious; and in such circumstances it is not surprising that there has been a marked recrudescence of the demand for a further extension of local government.

This question of the Constitution is, after one hundred years of British rule, a matter of supreme importance to the Maltase. The commercial development of Malta, and the progress of the people in all that makes a modern nation, have been, perforce, largely sacrificed to the military exigencies of the island as an indispensable link in the chain of Empire, and we cannot regard the situation which has been created with indifference.

Prior to our occupation the Maltese had their Consiglio Popolare, or Popular Council. This we abolished, and it has never been restored in its entirety. Its history is one of which any people might be proud. This council was first established in A.D. 1090 by the Normans, who drove out the previous Arab holders of the island; and it maintained its continuity and independence through many centuries of vicissitudes. In 1887 the British Government revised the Council of Government it had established, and by giving the elected members a majority of the seats, restored the most characteristic feature of the old Popular Council. But dissension followed, principally upon the education question; and in 1903 another change was made by which the elected members were left in a minority, and consequently powerless. The facts of the present situation are that the elected members have no effective control over public administration, and that on questions of purely local interest the votes of the elected members are overwhelmed by the numerical majority of the permanent official members.

It can be readily conceded that in the present unfortunate circumstances of the island this is felt as a very real grievance, and the Maltese are Reserved. | September 12, 1914.

No. 198.—Vol. IV. [All Rights Reserved.]

practically unanimous in asking for the restoration of the Constitution of 1887. Since 1903, when the present Constitution was established, several general elections have taken place, and the elected members have either resigned after election, as a protest against the helplessness of their position, or the electorate has refused to send representatives to the council.

It is to be feared that the Maltese must continue for a time to exercise their marvellous gift of patience. The Home Government is immersed in affairs of such tremendous importance that it is unlikely the time of Parliament can be immediately spared for a consideration of the Maltese Constitution. But the facts of the case have only to be known to be appreciated, and there is no occasion for controversy. We owe a great debt to the Maltese. They have served us well. In Malta we have the Royal Malta Artillery, officered by Maltese, and possessing an honourable record of service. There is a local Division of Engineers and a serviceable regiment of Militia. They take their part in the defence of the island, and their support would be invaluable in time of war. The dockyard is practically manned by Maltese, and their services to the navy are not inconsiderable. They are all inspired by the strongest sentiments of attachment to the British Empire; and it is not unreasonable that they should be given, through their legitimate representatives, a real power over their local concerns. It should not be beyond the wit and resources of Government to meet their claims.

Malta must not be regarded solely as a fortress. It is the home of an active, industrious population, and its people deserve as full a measure of local government as is consonant with the maintenance of the island as a post of supreme strategic value. It is just how and where to reconcile the imperial and local claims that difficulties arise, and explain the hesitancy of the Home Government to concede to the full the popular demand.

But acquaintance with Maltese people and conditions inspires the belief that, given the opportunity, the people would rise to the level of their responsibilities. Their present circumstances have brought home to them the necessity of bestirring themselves if the island is to be rescued from the moral and economic bankruptcy which is threatening it. Emigration is a poor palliative for economic disorders, and the Maltese are not given to leaving their islands in any considerable numbers. Besides, the success of French colonisation in North Africa, and the establishment of the Italians in Tripoli and Cyrenaica, are tending further to restrict the area of Maltese emigration; and the Maltese have, as a rule, neither the physique nor the adaptability necessary for success in less temperate climes. But given the power to develop their undoubted resources, they could do much toward rehabilitation. An easy task confronts them in the direction of re-establishing their finances and developing the great commercial possibilities of Malta. Property escapes almost scatheless in Malta. There are no rates, no tax on incomes, houses, or land. There are no legacy or succession duties. Money could be readily found for public purposes, at the same time relieving the indirect taxation which falls so heavily upon the very poor. It will surprise most people to learn that a tax is still maintained of ten shillings on every quarter of wheat!

The means of raising a sufficiency of revenue are within easy reach; and if Maltese capitalists have been accused of timidity and lack of commercial enterprise, it must not be forgotten that they have had no effective voice in the revision of their own laws. Responsibility develops the best in individuals and a people; and if the Maltese are given the power to legislate for the betterment of the island, a return to comparative prosperity can be confidently anticipated.

THE HOUSE OF LADDO.

CHAPTER VI.

CAME back by degrees to my senses to the accompaniment of the continued beat and murmur of that same tide which had placidly run its course through all these dreadful happenings. At first the change was merely from darkness to light; then there leapt up before me with sudden clearness the broken face of the dead Hanoverian, with its uncouth grin of death. This horrid object was presently succeeded by a remembrance of Alice Lechmere falling under the horse's hoofs, and at that I sat up with a great shudder and took stock of my surroundings.

Still hearing the water, I had thought to find myself lying on the cliff-head where the fight had taken place; but I now perceived myself to | 'Tell me, how went it?'

be in a kind of cave, very low in the roof and floored with rounded stones. The full daylight outside—for the fog had now evidently lifted filtered in here reduced to a greenish twilight which set the damp rocks ashine; and by the general wetness of the place I judged we were none so far from the high-water mark. I had got thus far in my investigations, when a voice, booming curiously in that hollow place, inquired how I did; and wheeling round, I saw Robert Lechmere sitting on a large boulder in the doorway.

'I am better, I think,' said I, putting my hand to the rough cloth that bandaged my head.

'How could it go?' replied he dismally. 'There was but one end to it from the first. I much misdoubt if any but you and I are come alive out of that business. But for that fog, that cost us so dear, we should not be here.'

It dawned upon me with a curious qualm that I owed him my life; but he would not hear me

'Not yet,' said he. 'This is a thick wood, and we are far from out of it. I might have done better to leave you where you lay; it was the merest chance I came upon you and managed to creep away with you in the fog. This makes the game squarer between us, but we can say no more as yet.

I was putting him some question as to the fight, but he stopped me with a gesture of

intolerance

'Don't talk to me, Davy,' said he, 'if you would do me a kindness. Rest yourself. This night, because it is the last thing wanted, there 'll be a moon like the day, and we must be clear of

this cursed place before it is up.'

Of that dreary and interminable afternoon I can give no account. We scarce spoke a word to one another, he sitting dully on his boulder, sunk in an absolute despond; and I lying back on the roll of coats he had made me, wondering to what pass we should come next. At times the thought of Alice would clutch at my heart with the start and shock of a nightmare, and I should have been less even than a foolish boy had I not shed a few tears for the one human being who had ever been evenly kind to me. Then I was all for grief. And yet at this distance I am tempted to look on it almost as a dispensation of mercy; for I know not how we should have got her away, or how she could have settled in a new place; and at Laddo life held nothing for her but day after day of darkness, and the certain and terrible vengeance of that man of hell, her father. Mr Robert's thoughts during this time I dare not divine, but I fancy he had so many causes for grief that he could attend separately to none of them. He was in that most sorry of positions where a man looks back into a past where he has failed, and forward to a future wherein he can have no possible interest.

I suppose in the end I must have dozed, for Mr Robert's voice came to me at last with a shock of surprise, and, looking up, I found the cave had grown so dark that I could only see

him in silhouette.

'Now, Davy,' said he, 'I have a job for you.'

'Ready,' said I.

'It is now reasonably dark,' said he, 'and in a very short time we must start. I am beaten here for the time being, and there is no sense in not admitting it; but I mean to try to slip round to St Andrews, where I think I can lie up for a time, and perhaps get you clear altogether. Cockburn manages his business before I get back—why, then, I lose the little that's left me;

but I somehow doubt if he will. Do you always believe what women say, Davy?'

'I have been told to,' said I.

'Then give it up,' said he; 'it is a foolish habit. Anyway, in the meantime we can do without women, but we must have food. Can you get some?

'I can get some from the house,' said I; 'or I

can try.

'Good lad!' said he. 'I am glad now I picked you up. Off with you, and be seen by

But when I found myself in the cold air on the cliff-top, the fear, which excitement had so far kept down, came over me like a wave. I think it was not till then that I realised what might very well have happened; and it struck me as a very terrible and frightening thing that Davy Lechmere might at that very moment be lying somewhere cold and stiff and dead. I was not really a hero, but only a half-baked boy, and the thought set me shaking to such a degree that I was near flying back to Mr Robert to beg him to come a little of the way with me; but in the end I fought this craven feeling down, and presently I was creeping through the belt of trees on the east side of the House of Laddo.

The place lay as silent as the grave, not a light showing, and the great square block of the house looming up like some sleeping monster in the gloom. A steady and most mournful chanting came from the coach-house, and that nearly set me laughing in spite of all; for I knew it to be Rintoul possessed of his devil again, and exercising himself in torments over his share in the recent events. I was fain to have a peep at him; but deeming business of the first import, I went to work at the window of the room that had been mine. The thing went up easily enough, and in a very short space of time I had groped my way down into the blackness of the great larder. I had stowed about my person enough to provision a company, and was creeping my way back across the hall, when on a sudden the figure of a woman sprang out at me from the stairfoot.

'It is Davy!' she cried, and clapped a hand over my mouth to smother the cry I could not stop. 'No one is in; but make a noise and I will kill you!'

'Miss Rose,' said I, struggling in her grasp, 'you must please let me go at once.' For, indeed, she was the very last person I had any wish to

'Not till I am done with you,' said she fiercely. 'Tell me at once, where and how is—Robert!'

I told her in as few words as I could, and her

relief was almost painful to witness.
'Thank God!' she said when I had done. thought my folly had lost me all. There are times when one sees things clearly, Davy, and last night was one of them. Now take me to him.'

If I was stupid over this, you must bear in

mind that I had no experience of the ways of lovers, and that I bore the puzzling recollection of their last meeting still in my mind; and so I confess I hesitated here, wondering very much how this would fall in with Mr Robert's devices.

'What of Cockburn?' said I, which was about

the worst thing I could have said.

She stamped her foot. 'Cockburn!' cried she. 'The devil fly off with Cockburn! If you had lived through last night as I lived it, you would have forgotten that such as Cockburn ever existed. Come, take me quickly; we can't stand here all night.'

'You will take a very grave risk,' I began uneasily, and would have gone on to expound this to her very earnestly had she not, to my immense mortification, leant forward and dealt

me a sound box on the ear.

'You havering little fool,' said she, 'will you do as you are told, or must we stand here till to-morrow? Who do you suppose you are, to effer me your idiot advice? Let us out of this while we may, for, upon my word, if your head swells much more I think it will stick in the doorway.'

There was apparently nothing else for it, and so I led the way outside. Rintoul was still howling dismally, and I pictured him daubing away at one of the few remaining woodcuts in the *Pilgrim's Progress*, his short-sighted eyes straining and blinking in the poor light, and a protruding half-inch of tongue following every movement of his brush. The sound cheered us both mightily, and when we were clear of the wood Rose laid her hand kindly on my arm.

'I am sorry if I lost patience, Davy,' said she; 'but you were very exasperating.' And, indeed, at this distance of time, I can only agree with

her.

'I only thought of Mr Robert,' said I. 'I know not how pleased he will be with this.'

'No more do I,' said she, with a new ripple of amusement in her voice, 'and yet I am none so

terribly afraid.'

In the end I brought her to the cave-mouth, at which point I deemed it best to stroll for a little and mark what progress the tide made with its work. They were alone together for some little time, while the moon came lifting up lemonyellow out of the North Sea; and when at last Mr Robert called me back there was a new fire in his eyes, and in Rose's face there was no fear left of any kind.

'Now then, Davy, my lad,' said he, 'boot and saddle. We have lost too much time as it is, and here comes the lady moon stealing a march on us. So if you are ready, let us to it.'

'With all my heart,' said I.

'Very well, then,' said he. 'Our plans must now change. Well enough for you and me to go crawling round the rocks like a couple of freebooters; but the lady is used to a horse, and, by Gad, she shall have one! There are two in the stable at Laddo, and out they shall come.'

'It is safe enough,' said Rose. 'I have no fear of my guardian's return for a good two hours yet.'

'But,' said I, 'Rintoul ?'

'Rintoul!' cried Mr Robert with a great laugh. 'We shall deal with the good Rintoul.

Come, take the road.'

The house still lay dark and silent as before when we approached it, and even Rintoul's singing had stopped. For myself, I thought this enterprise very unnecessary and ill-judged, and could not for the life of me see why Rose could not have footed it well enough; but, as I have said, I was little versed in the ways of lovers. Mr Robert was seemingly designed to carry matters altogether with a high hand, for no sooner did he catch sight of Rintoul's bent form through the coach-house window than he threw open the door and cried, 'Rintoul, saddle me two horses.'

Rintoul fell back in his chair with a crash, and gaped as though he saw one risen from the dead—which I dare say he thought he did.

'Come, man,' said Mr Robert, 'it's not a ghost

Get to work at once.

But Rintoul was not so far gone as we had thought, and was like to have made a tragedy of it all; for suddenly a hard look came into his eyes, and springing nimbly enough to his feet, he snatched down a pistol from the wall. He backed to the far side of the little room, with his ugly teeth bared and a most dangerous look in his dull eyes.

'Ye canna get them,' said he dourly. 'Ye'll

get nae horse here the nicht.'

'Oh, but I will,' said Mr Robert steadily; 'and what is more, you will help me to saddle them.'

At that moment, as he took a step forward, Rintoul's pistol went off—I suspect by accident—and the charge went smashing into the door-post. Mr Robert's patience was at an end; he threw himself upon Rintoul, and, after a brief struggle, tore the pistol from him and threw it crashing into the grate.

into the grate.
'Now,' said he, 'help me to saddle these

horses.'

Rintoul's bravado seemed to have left him with the explosion of his weapon, and in a very short space of time the horses were ready. I led them out through the yard, while Mr Robert drove this most miserable of conspirators back into his coach-house and locked him in. Rose was already mounted, and Mr Robert had a foot in his stirrup, when a sudden cloud crossed his face.

'And now,' said he, 'what are we to do with Davy?'

I verily believe that since these new developments the thought of my future had never seriously presented itself to either of us. He had made sure, I suppose, that I should now stay, and I equally sure that I should go with him. It was a moment full of dreadful possibilities for me.

'Mr Robert,' I cried, 'take me with you!'
But at that Rose burst out, regarding me the
while almost with late.

'He cannot possibly come!' she cried. 'Two will be hard enough, but three'----

'Think of the boy, Rose,' said he.

'How can I think of any one but you?' she cried. 'I will not have you risk yourself for this wretched boy.—Davy, you will stay here, like a good lad.'

'I am sore tempted,' said he in perplexity.—
'Tell me, Davy, how will it go with you if I let

you stay?'

I suppose that had I been indeed a hero of the approved brand, or any fit person to recount these enterprises, I should have assured him of my safety, and begged him to go on his way. As it was, being no such thing, I cried out in despair, 'They will certainly kill me!'

'Then devil take me,' said he, 'if I stir a yard without you! Now, how are we to manage?'

'I can get a pony at the Feathermuir,' said I. 'Do you ride there slowly, and I will run.'

And here, were I given to such practices, I should undoubtedly halt and point a moral; for had selfishness carried the day, and had we not then gone to the Feathermuir, there would have been the saddest cause for regret; indeed, I much doubt if any one of us would be alive at this hour.

It would be about ten of the night when we reached this upland place, the moon now gloriously full and high, and all the flat of land and sea below as clear as day. Gilmour the farmer was not yet bedded, and promised another horse on the instant; but when he heard Mr Robert's plans a gravity came into his face, and he shook his head.

'Ye'll no' can do't,' said he, 'for it's no' t' be dune. There's king's men at every cross-road; an' ye never ken whaur ye'll meet ane next.'

an' ye never ken whaur ye'll meet ane next.'
'It shall be done somehow,' said Mr Robert.
'An' you saddled wi'a wumman an' a lad?' said Gilmour dourly. 'Nivver!'

We were revolving this depressing aspect of affairs, when on a sudden Gilmour's jaw dropped a clear inch, and he made a curious clicking noise in his throat. Without a word he left us and went into the house, returning presently with a huge brass-bound telescope.

'Lad,' said he grimly, 'I doot yer love-makin' has ta'en yer wits. What's yon i' the Forth?'

Like a flash Mr Robert snatched the glass from him. I know what he saw, for I had the next look; it was a big foreign-looking ship, lying within a mile of the Ness, close-hauled as the other had been, but larger, and clearly different. Even as we looked a tiny black speck drew away from the shadow of the hull, and we knew that a boat was pulling in to the shore.

'It's Dalmuir's ship this time,' said Mr Robert

in a strange voice, and fell to sobbing as though his heart were broken. Partly, I dare say, it was relief, and partly the thought of what this would have meant just twenty-four hours earlier.

If I were making a tale of this business, I should have wrought it out in a fine and breathless rush of incident. For instance, I might now have brought down my uncle upon us with his troopers, and maybe killed him off as the villain of the piece. For I observe those dramas which most attract, to finish with a full stage and a prodigal expenditure of human life. I am some tempted to do this even yet, and am only held back by the consideration that, having so far set down the truth, I may as well make a complete job of it, and not mix water with oil. For the truth-for which I crave your pardon-is that from the moment we left the Feathermuir nothing happened at all. We rode down to the Ferlie cross-roads at a cracking pace; and thence, sending Gilmour back with his own horse, and turning the others loose, we made out the rest of the way on foot, and were met without hitch or hindrance by a company of very kind and agreeable persons who had just landed from the boat.

And yet, if you share my curiosity, and are set on a final glimpse of my uncle, you shall have it even as I had it myself. For when we had come the length of Laddo, I slipped away from the other two in the dark, and crept in through the plantation on some idle impulse. The same fathomless silence still brooded over the place, with an added sense of emptiness as of a theatre from which players and audience have just scaled. There was an air of accomplishment about it, as though the very stone and lime and earth and trees were conscious that this play at least was over. But now in the window of my uncle's room on the ground floor was not blackness, but a dim orange-coloured oblong of light; and this it was that so stirred my old and unsatisfied interest in him as to lead me to slip away from Mr Robert and Rose, and to creep forward and peer into the chamber.

I know not what I had expected to see; some disorder, perhaps; at any rate some bustle or activity. I had pictured my uncle returning from scouring the county for us, travel-stained and worn, and scowling with murderous fury; I thought of him as biting his nails and writhing in his chair with impatience. I saw nothing of the kind. My uncle and Steenie sat at the table—the former facing me, the latter with his back to the window. They were poring over a litter of papers as of yore, apparently without interest or passion, as though the documents they handled were farm accounts or bills of lading, and not, as I make no doubt they were, so many death-warrants. Once, as I watched, my uncle raised his head and looked round him with that air of utter abstraction he had worn

when we first met, and I had time to note again his round, full-cheeked face, the almost comically bird-like poise of his head, his dull, weak, and filmy eyes. He looked the most harmless of men; and yet I think I was never more terribly afraid of him than at that moment. He had played his game against us, and he had won, as he had known from the first he would win; the game was over, and now he turned, without pride or passion, to another. His only daughter lay dead somewhere in that house, his ward had fled from under his roof, and his eldest son might be dead or alive, a wanderer or a captive; yet he only

reached for a clean pack, and cut for a fresh deal. Somehow I knew that he would no more lose the new game than he had lost the old; he was Hangman Lechmere, and a man who did not lose. A sickness took me at the sight of him, and I turned suddenly away and ran down after the others to the boat.

And then presently there was left of the Fife coast only a dark line of irregular rocks, flecked out here and there by the moonlight, with ghostly highlands hanging in the sky behind; and of the House of Laddo nothing visible at all.

THE END.

AN ENGLISH-GERMAN SPY IN RUSSIA.

By ALFRED J. LIVERSEDGE, A.M.I.C.E.

THE remarkable journalistic outburst which was seen not long ago in Germany in connection with the possibilities of war between that country and her great northern neighbour, the various spy incidents which have been recently recorded in the public prints, and the state of war which exists at this moment over a large portion of the continent of Europe may give point and interest to the following account of the writer's personal experiences during a recent visit to Russia. The narrative will illustrate the extraordinary degree of suspicion with which the simplest incidents and most ordinary circumstances may be regarded on the frontiers of some of our Continental neighbours.

For the sake of simplicity and directness, the narrative, which is a simple record of facts, without exaggeration or embellishment, is written in the first person singular. Perhaps, by way of premise, it ought to be said that the writer is an Englishman, or, at any rate, British. There is a large proportion of Scotch in his composition, but nothing about him particularly suggestive of Germany. Nevertheless he was arrested in Russia as a German spy, an experience which probably few Englishmen can have had.

My visit to Russia was purely one of business, made in the interests of a large Russian and British manufacturing concern. My destination was Reval, my route $vi\hat{a}$ Berlin and Riga. I crossed the German-Russian frontier late at night, turned out from the German train, and after an interval, which was spent in the restaurant, and made quite interesting by a gentleman who occupied a table next to mine, and ate a large bird cooked in a most appetising fashion, without making any particular use of his knife and fork, their places being taken by his fingers and a large napkin, I boarded the train which was to take me on to Riga.

I had with me a small kodak. During the journey through Germany the kodak was kept in the background and not used; but having entered into Russian territory, I, quite mis-

takenly, felt myself in perhaps less critical quarters, and did not suppose that I should run any risk in taking some pictures with the little instrument. Accordingly, in the early morning, after breakfast in the train, I got down at one of the railway stations, and proceeded to snap a picturesque group of peasants standing on the platform, all of whom appeared quite pleased to be taken. I was looking round for other subjects, when a gendarme came up and told me politely, in German, that it was forbidden to take photographs in the stations. I apologised, closed the camera, and climbed back to my com-The journey was a long and tedious partment. one, and while I attempted no more photographing in the stations, I took several snapshots along the line from the carriage window.

The train reached Riga a little before seven in the evening; there was nearly half-an-hour in which to join the connection, from the same station, to Reval. From the crowd of whitesmocked porters who boarded the train I got one who understood my German, and told him to take my luggage to the Reval train, and to call at the booking-office on the way. When passing through the barrier I noticed that a soldier, a sort of sergeant-looking person, spoke to my porter, but I did not attach any importance to the incident. Presently my man turned into what I supposed would prove to be the booking-office. Passing into a small room, where sat several military-looking persons, he deposited my luggage on the floor, took off his cap, and stood aside, while one of the officials shut the door behind 'Oh,' thought I, 'more customs; octroi, perhaps,' and proceeded to open my things, remarking aloud that I was very anxious to get No one answered, but my the Reval train. porter gave me a distinctly commiserating look and shrugged his shoulders. Presently the sergeant entered, and began to talk to my porter. The sergeant did not appear to know a word of either French or German, and my porter became interpreter. I shall always hold a great respect

for that porter; his German probably was not very good; I know that mine was not, but the man got along extremely well. By this time I was beginning to realise that I was in a way arrested, and asked to be put in communication with the British Consul. I was presently told that it was then too late; I could get him the next day; and when I explained that I was due in Reval the next day, all I got was a shrug from the sergeant, and another look of pity from my porter.

A telegram had been received stating that I had taken photographs in one of the railway stations. Had I taken any more since leaving Koshedary that morning? Was that the camera? I must surrender it. Had I any more photographs in my luggage? I had not; they could search. They did; and nothing being found among my clothing or in my dressing-bag, attention was concentrated on a large letter-case which I carried. This case contained rather a lot of papers; all were turned out and minutely examined.

What was I, and what was I doing in Russia? I was an engineer on professional business; there was my passport. The passport was most carefully examined, back and front, in a strong light. Would I sign my name on this sheet of paper? Passport and signature were taken off by the sergeant into an inner room. What was this paper about Staraya-Russa? Staraya-Russa is an ancient town in the interior, where my principals had a factory. The paper set out an analysis of the river-water of that town. How had I got that? Had some of the water been sent to England? What for? How did I get it? Who had sent it? I explained that the river-water was used in the steam-boilers of the factory, and owing to the large quantities of salts dissolved in it, gave a great deal of trouble in the boilers. An analysis had therefore been made to see if the water could not be rendered more suitable for use. For a considerable time this point was discussed by the officials among themselves. They evidently found the subject one of great interest. In the end—would I sign my name on this piece of paper? Analysis and signature were duly taken off into the private room.

Among my papers was a coloured drawing of an office desk. The sergeant got hold of this drawing upside-down, and, after worrying over it for some time, and discussing it with his colleagues, took it away, still upside-down, into the inner room. I believe he thought it was a plan of a fort. Presently he brought the drawing back, right side up, and very sheepishly put it into my case without a word to anybody.

What was this? Oh! that was the manuscript of a short story by a friend of mine which I had brought to read on the journey. Would I write my name on this sheet of paper? Story and signature were taken off to the private room.

Had I any more photographs in my pockets? I had—quite a number, of members of my family; here they were in my pocket-book. At this moment I got my first real fright. I had quite forgotten the circumstance, but in my pocketbook was a little coil of what looked like a very thick violin-string, but which was really cordite -of all things in the world. I confess that I shook a bit as I began to wonder how I should explain my possession of such a purely military substance as cordite. Fortunately the sergeant was satisfied with what I handed to him out of the book, and did not ask to have the pocketbook in his own hands. All my snapshots were minutely examined on both sides, all ways up, in a powerful light; after which they were taken into the private room. In a while, however, they were all brought back by a polite, little, superior officer, a gentleman, who bowed gravely, handed the photographs to me, bowed again, and then returned to his room.

What was this? And 'this' pretty well finished At first I did not know what it was. My kodak belonged to one of my daughters, and I carried it in the usual canvas case. In the case, unknown to me, was 'this'—a little black-backed penny notebook. I took it from the sergeant's hand, and then found what it was. It was a catalogue of snapshots which my daughter had taken at various times and places. The titles were such as 'Mamma and Laddie,' 'Arthur fishing on the Gryffe,' and so on. The last word in the book was 'Fitz;' and that settled it. It appeared that all my captors could read that word, and that it was about the only word in the book which they could understand; but it was sufficient. Who was Fitz? I explained that Fitz was nothing more than the family cat. Looks of deep intelligence passed from one to the other of the officials standing around. By this time a superior civilian official of the railway station had been summoned, and had assumed the rôle of interpreter. When I had explained who Fitz was, this person laughed most heartily; but not a flicker of a smile displaced the gravity which all the time rested on the countenances of the military persons—they knew better who Fitz was, as I was to learn later. Would I sign my name on this sheet of paper? Signature and little book followed my other property into the private room.

Of course, my train had long departed; it was getting late. What would I do for that night? Well, I must go to an hotel; I would go to the Hôtel de Rome. Yes! I could go there; and after a long consultation between the superior officer and the sergeant in the inner room, I was told that if I would return to that office the next day at two o'clock I might get some of my property back. Thus, after three hours' detention, I was allowed to go, minus camera, little memorandum book, and most of my papers.

Next morning, naturally, I called on the British Consul. The Consul was rather new to his post, and not quite sure of himself. He therefore handed me over to his deputy, the son of a highly respected former Consul who had recently retired. At the appointed time we were at the police station, where the polite little captain received us. All the explanations of the previous evening had to be gone over again; after which some of my papers were given to me, and we were told that if we returned at six o'clock that evening I might perhaps get the remainder. Then I learned that I was suspected of being a spy, and, moreover, a German spy. But I did not know German well, as they must have seen! Oh! that was all my art; I could speak it right enough if I would, and had understood it when I wished to do so. I had been reported from Koshedary, where I had taken the photograph, as a German. But my passport! That was probably the passport of some other person; and the object of getting me to sign my name so many times was to see if I would not forget myself and begin signing my real name—that is, of course, a German one. As to Fitz—the poor blameless pet of a modest household-Fitz was the name of some confederate, and the little penny memorandum book neither more nor less than a secret code.

At six o'clock we were again at the office, and, after a little further chat, the camera was given back to me, minus the film which had been in it; but the papers, including the 'secret code book,' would have to be sent on to headquarters at Wilna. The captain himself now believed in my bona fides, but the matter had been reported, and the district commandant would not take the responsibility of dealing with the affair himself; it must go on to headquarters. that, and thankful for what I had got, I had to be content, and proceeded to take my ticket for Reval and to board my train. I was not, however, to get away without another fright. Among the papers which had been retained was the manuscript story. I had shaken hands with my good friend the Vice-Consul, mounted to my compartment, and was standing at the open door at the end of the carriage, when I caught sight of the captain tearing towards me from the other end of the station, waving a paper in his hand. I felt sure I was about to be rearrested. The captain pushed his way through the crowd of people standing about, and sprang up on to the platform of the carriage as the train began to move. Handing me the paper he carried in his hand, he said breathlessly, 'Roman.' At the last moment he had taken upon himself to return to me the manuscript story. I hastily signed a receipt for the paper, shook hands again with the captain, and the polite little gentleman dropped to the platform as the train was moving out of the station.

I was not free yet, however. Turning to

enter the corridor, I found myself face to face with a soldier in full uniform, a rather handsome fellow, who, as I made to pass along, stood up at one side, smiled, and saluted me in the most respectful military fashion. There were two of them; they had a compartment near to mine, and whenever I entered the corridor, if neither of them was there already, one-generally the handsome one, who was the superior-almost instantly appeared, and remained about until I re-entered my compartment. Apparently by the instructions of the authorities, I had my compartment to myself. In good time I got my bed made up and retired, leaving the door of the compartment on the chain. I had just settled down comfortably, when the door was noiselessly opened as far as the chain would allow, and I saw, through the opening, the handsome soldier looking down upon me. Twice to my knowledge during the night was this proceeding repeated. The two soldiers descended with me at Reval the next morning.

That evening my friends took me to the theatre, where was being given, of all things, Charlie's Aunt in German. During an interval in the performance I descended to a very handsome foyer, where I walked about with the principal of my firm. Several times I saw what seemed a familiar face, but failed to identify it. As I was leaving the theatre, however, I saw this face again, and a slight smile upon it revealed it in a flash; it was the face of my handsome soldier, who was now in civilian dress. It saw me to my hotel. As I reached the top of the few steps at the entrance to the hotel, I turned to take a last look for the night at the outside world, and there, on the far side of the little square, was my friend carefully watching my proceedings. Every night while I remained in Reval was this attention accorded to me. Wherever I roamed—and I am very fond of roaming about the streets of any town new to me, particularly a Continental one, late at night -one or the other of the two soldiers, or policemen, always in civilian attire, would appear and see me to my hotel. When, after some days, I left Reval and travelled into the interior, these polite attentions ceased, or at any rate ceased to be noticeable to me.

A few days before I started on my return journey, I had just had luncheon with one of my directors, and the latter was glancing over a local daily newspaper, when he suddenly observed, 'Hello! here you are; they've got you at last!' He then read to me an account of the arrest of a real German spy which had been effected on the previous day. It appeared that the Russian authorities had been conscious for some time of a more than usual leakage of secret military information across the frontier, by way of the route over which I had travelled, and had been particularly keen to stop it. At last they had really secured

the principal agent, a genuine German spy. A confederate—a woman—had escaped only a few hours before the arrest of the chief actor.

It is, of course, quite easy to understand the great vigilance of the Russian authorities on these parts of their frontiers. The Baltic provinces of Russia, or at least the three lower ones, are in many respects very largely German; and Germany, as we know now, had everything in readiness for an invasion of those provinces, including great numbers of railway wheels and axles to convert their own carriages to suit the gauge of the Russian lines. While these provinces are not particularly rich in any respect, they would nevertheless, with their important

ports of Riga and Reval, make valuable and not unnatural additions to the German Empire. Hence the nervousness of the Russians lest any scrap of information as to their secret arrangements for the defence of these provinces should, accidentally or otherwise, become known across the frontier.

After some lapse of time, all my papers which had been retained, including the film from the camera, came back to me through the British Foreign Office, having, I trust, provided some amusement for that department of Russia's great military organisation at Wilna which looks after suspicious strangers who may cross the frontiers of that great empire.

THE INTERRUPTED WEDDING.

CHAPTER II.

PERHAPS Reichardt thought he had shown his hand too much, for he became more conciliatory, especially as at that moment Bertha came in.

'Now I must go up to see Aunt Elizabeth,' I said.

'And you can take Bertha with you,' he said; 'but mind you are back by ten.'

I thanked him for that, and wondered at his consideration. A straight path nearly opposite the inn led across a field, and went up through a wood, coming out near the church; so, as happy

as ever we could be, she and I set off.

'Oh, to think of your coming back like this,' said my dear old aunt, 'without any notice! What cakes, what pies, I would have made you!'

Ah, what a happy party we were as we sat round the fire and the curtains were drawn! With what wonder they listened to my battles, and all I had to tell; and with what surprise they saw the presents I had brought for them, that I had got at Strasbourg!

'These shawls and things are all too fine for

us,' said my aunt.

'Are they?' I said. 'Well, what do you think of these?' and I produced four gold watches.

'Oh Himmel' cried my aunt, in alarm, 'you must get rid of them somehow. Why, we shall all be murdered.' The tone of alarm in her voice threw Mark and me into fits of laughter.

'Who is going to know anything about it? You can hold your tongue, my darling, can't you?' I said to Bertha.

'I promise you I will,' she replied.

The hours passed so quickly that we had to hasten away to get back to the inn at ten; and if we did kiss each other as we went through the dark pine-wood, there was no harm in that.

The news of my arrival had spread like wildfire. I had wondered why Reichardt had told me I might take Bertha to my home; but he knew, of course, if I did, I must bring her back. The inn was packed, and Reichardt did a fine night's business, especially as I threw a louis on the table for my friends to drink my health. I was warmly welcomed, and besieged with questions about young General Bonaparte and about Egypt; and my sword of honour went round from hand to hand.

'What a pity, sergeant,' said Max Brendel, the blacksmith, 'that you were not here for the hop fête! It was later this year than usual. Ah, we did have a merry time!'

'I'm sorry too, my friends; but I promise you before I return we'll have a farewell supper and dance.'

Those were happy days indeed! Alas, they passed too quickly. Every morning I used to get up and help Bertha with her cows, and even with the churn; for, of course, the sooner she had done her work the more time we had to walk about together. Her father had no objection to this, so long as I came down to 'The Golden Ladder' of an evening, which I did with my brother after our aunt—who suffered terribly from rheumatism, and always went to bed at nine—had retired.

'Now, Jacques,' said Reichardt, 'you have only a few days left. What about the feast you said you would give? I must have time to prepare.'

'All right,' I said; 'but we can't get all the village into your new room'—for he had built a large one for fêtes, with, so my aunt maintained, her husband's money—'so we will have the feast for the elderly ones and the dance for the young ones. All you have got to do is to copy the hop feast, and I will pay you the next day; but I am going to spend my last evening with Bertha and aunt.'

So it was arranged to have the feast on the last evening but one. Our good pastor was kind enough to come down, and he sat on my right

hand and Bertha on my left. I even persuaded my aunt to come, though that was a very difficult matter, as she hated Reichardt so much.

All in their best clothes, Max Brendel the blacksmith (whose red, jovial face and white beard always reminded me of Bacchus), Père Gerbardt the gravedigger, Grunwald the carpenter, Pierre Schuster the Garde Champêtre, and all the elders of the village, with their wives, appeared at five o'clock to partake of my feast; and a very fine one it was, too, though so far as the food was concerned the good people always preferred the same things. So we began, after grace, with eels, very fine rich ones that were caught near the sewer by the bridge; these were followed by roast-pork, and then goose surrounded by gooseberries (which poor Frau Reichardt had prepared in her own inimitable way), and finally black pudding.

The Alsatians are naturally a serious people, and for the first hour or so hardly a word was spoken, in spite, too, of double *bocks*, which Reichardt took good care should be filled up;

but when the omelettes and the Hougeldorf, and the beautiful cakes smothered in cream that Bertha herself had made, and the apples soaked in butter appeared, then they began to relax; when Reichardt had put a bottle of Niersteiner in front of each one to drink my health, and also a pipe and a packet of tobacco, their eyes began to glisten; and when, at eight o'clock, the pastor proposed my health, why, you might have heard the 'Hochs!' up at the church. I am not much of a hand at a speech; but the very first thing I did was to tell them I owed nearly all my success to the pastor making me learn my letters; and then I told them on the spur of the moment that, but for the sad death of Bertha's mother, whose one wish was that I should marry her daughter-

to see how he liked it, but he never said a word—instead of a farewell supper they should have had a wedding-feast. 'But you wait, my friends,' I said, 'till'——
'You come back with your epaulettes,' shouted

and as I said this I looked straight at Reichardt

'Yes, with your epaulettes!' shouted the others.

my brother Mark.

'Then, my friends, you shall have a feast for a week. And now if you want to please me you will drink,' I continued, turning to Bertha, 'to the loveliest girl in Alsace.'

I had gained my object. Whatever tricks her father might play me in my absence, before every one he had to drink his daughter's health as my fiancée, and I chuckled to myself with delight.

As soon as the tables were cleared for the dancing the pastor and my aunt left, and so, alas! did Bertha.

'No, no, dear Jacques,' she said, 'you must not mind, but I am not going to dance. I

cannot make myself do it, though I know dear mother would not have minded. There are plenty of pretty girls—Adeline Brendel is the best; she will be my bride's-maid—and so you will enjoy yourself.' And as I had the pick of all the prettiest girls, I did, too; but, of course, her absence made a great difference.

The Comte de Freminart, who owned most of the land in the district, was still an emigré; but Madame la Comtesse and her two daughters had returned to the château. To our great surprise, just as in the old time before the Revolution, madame and the two young ladies came to our fête! Moreover, they allowed some of the valets de place and filles de service and de chambre to come too. The presence of the comtesse made us rather quiet at first; but I had the honour of a dance with each of the young comtesses. They both, as did the filles de chambre, for the matter of that, danced with such dainty grace, and withal were so lighthearted and merry, that it was quite a pleasure to see them; though they made all the others, encumbered with their sabots, appear clumsy and awkward.

At nine o'clock the dance began. We had two fiddlers. One was a very fine player from Strasbourg. Although he played too fast, I thought, when he was sober, he played like a fiend when he was not. Alas! he soon got too drunk, and fell off his tub. However, he played on the floor for a time, and then he went to sleep, so we dragged him out. After that we had to be content with one.

'Now,' said Reichardt to me, 'every one goes at half-past eleven, and as it is nearly that now, we will finish up with the "Cobbler's Daughter." What do you say to their having some punch? That will put some life into them.'

Of course his idea was to run up the bill; but as it would, I thought at the time, make very little difference, though I bitterly regretted it afterwards, I allowed the avaricious brute to persuade me, and I accordingly consented. In a very short time Reichardt returned with the punch in a stable bucket, and every one had a ladleful; but this did not suit the jovial blacksmith, and he went on his knees and took a fine draught.

Now this pretty dance, which in our district was known by the name of the 'Cobbler's Daughter' (though it has different names in Burgundy and Champagne), is all very well in the open, but it is not really suitable in a crowded room, as there is always a chance of collisions, so that it is necessary to mark the floor with chalk lines,

I had as a partner one of the *filles de chambre* who had come from the château, and who was extremely pretty; and Mark danced with Adeline Brendel, of whom he was very fond.

In the third and last figure, which is the most boisterous, four couples hold ropes of

flowers or hops in the centre of the room. After three sharp taps on the floor with your sabot, you bow to your partner, advance, take her round the waist, and galop sideways round the room, half the dancers going one way close to the wall, and half going the other way more in the centre, each lot being supposed to keep within a chalked line on the floor. Having gone right round till you get to the centre, you twist your partner round and let her go. If she is caught before she has run in and out between those in the centre holding the flowers, a kiss is the reward. Those holding the garlands take very good care she is caught, even if she is tripped up, as then she and her partner have to take their place in the centre, and release two of those who are holding the ropes, who in their turn join in the dance.

Now, in spite of his age, no one entered into the fun more than Max Brendel, the blacksmith; his wife, however, who was dancing on the other side of the room, thought that the jovial old fellow kissed his partner with unnecessary warmth as he caught her under the garlands. Perfectly furious, and leaving her own partner, she actually tried to get across the crowded room, and, of course, this upset everything, for in a moment she brought down one couple, and disconcerted two or three more. Caring nothing for that, the infuriated woman rushed at her husband, who, perfectly innocent of what was coming, was about to hold one of the ropes of flowers.

'You wicked old man,' she cried, 'I will teach you to kiss that hussy!'

'But it's all part of the dance!' expostulated the astonished blacksmith.

'Is it?' she cried; but, instead of attacking him, she flew at his partner, and both rolled on the floor, tripping up a couple, who fell on the top of them. I had seen nothing of this, as my back was turned to them.

'Voyez, voyez, ce diable aux jupes!' suddenly cried the fille de chambre, her bright eyes glistening with merriment. When I realised it I laughed till tears came down my cheeks; but at that moment a couple collided with me, and, being helpless from laughter, I soon found myself on the floor.

'Oh sergeant,' cried my lively partner, trying to pull me to my feet, 'you are droll! Do get up! Just one more turn;' and, catching hold of my belt, she pulled and pulled, and finally I got on to my legs again. But the half-hour struck, and Reichardt began blowing out the candles.

Now as long as I was in the room I was all right, but when I got into the open air it was different. I knew where I was to a certain extent, and what I was doing, which was more than a good many did. I could even appreciate the fun of seeing old Père Gerbardt, the grave-digger, groping his way holding on to some wooden railings, and coming to a stand where

they ended, fearing to trust to his own legs; but I felt that I required assistance, so I called for Mark, only to be told he had gone home. I took it that he had returned with Adeline Brendel, and consequently had gone by the road; so I thought I would go by the fields and the wood, especially as I saw the servants from the château on in front; but I had got hold of the post that supported the signboard, and I did not altogether feel inclined to leave it. However, I made an effort. I found I could walk very well, and followed the path exactly. Up and up I went till I got to the wood, and then I sat down and leant against a tree.

It was a glorious autumn night, without a cloud in the sky, and with a crescent moon just strong enough to show the surrounding country. Above me was the dark-blue vault of heaven; below, the little quiet hamlet, whose simple inmates were now seeking their sweet, innocent slumbers. No wonder that as I gazed on the lovely prospect I felt lifted into a higher sphere, for a holy calm had fallen on the silent landscape. Ah, what sublime thoughts came into my head! I was fascinated by the stars that shone like twinkling jewels in the ethereal space. I knew something about them, too, for a savant in Egypt, whose telescopes I had unpacked, had taught me; and, besides that, I had learnt something from the sailors on board ship. But never had I seen such constellations before, for it seemed to me that they were all shooting stars. I saw Mars chasing Venus all over the heavens; Jupiter, apparently jealous, was going after them; and Castor and Pollux, too, were not far off from them. How they all got into the same quarter at once appeared so strange! Even the North Star had got into the south, and was shining brightly just over the single spire of Strasbourg cathedral. This was very remarkable, and I did not feel equal to making it out. But, after all, what were the stars compared with the pale beauty of the moon? It was wonderful to think that it could be the same moon as I had seen in Egypt; it seemed so strange that it could be in two places at once. The soft influence of its pallid beauty made me quite sentimental. I thought of my own darling Bertha, sleeping gently, with doubtless its silvery rays falling on her silky tresses. I thought of the time when she would be my very own; and that naturally made me think of my jewels, for without these gems I had little chance of getting her father's consent. I always carried the box they were in about with me, and I took it from my pocket and fondly gazed at them, and then put it back. I had hardly done so, when, close to me, I heard a rustle—a distinct rustle. Yes, there was no doubt about it; so I sat up and listened. Instinctively I felt for my sword, for I thought that some one was after my jewels.

Again I heard a movement; and, what's more, I distinctly heard a sigh, a long-drawn-out sigh.

I looked and I saw something white; ay, and it moved! I had heard of ghosts being seen up in the churchyard on the hill, but never had I heard of their coming into the wood. Yet there was no doubt about this one. I looked once more; and, lo and behold! to my horror, if there were not two!

The perspiration broke out on Mon Dieu! my forehead. I was paralysed by fear, and my half-drawn sword fell from my nerveless hand into the scabbard. Again the white figures moved.

This was too much. I tried to get up, but my spurs stuck in the ground. I turned over quickly on all-fours; but in my agitation I tripped over my sword and fell on my face. I rose, frantic with fear, and tore up the hill. Twice I fell over the confounded beech-roots; but little I cared for that, for every moment I expected to feel claws in my neck; so I tore on till I got into the path and reached the stile, where I stopped breathless. The fright had evidently cleared my head. As nothing happened I began to feel myself again. I felt for my box. Yes, the jewels were safe. Every day I had postponed burying them, as my aunt was afraid to have them in the house. Feeling all right again, in an evil moment I said to myself, as all was quiet, 'Why should I not bury them now?'

Accordingly I determined to do so just fifteen paces down the path from the stile, and at the sixth tree from the path to the left. Taking long steps, I counted ein, zwei, drei, to the fünfzehnte. I found the tree, dug a hole and put the box in it, and placed a stone to mark the spot. I then commenced to carve an 'H' on the tree for 'Hier,' but had only made a down-stroke, when I cut my finger, dropped the knife, and went off home swearing. I put my finger, and for the matter of that my head as well, under the pump, and went to bed in my clothes. The next morning I woke as fresh as a lark, but two hours later than usual. I was sorry to be late, as I had meant to help Bertha with her cows.

'Wherever were you last night?' I said to Mark as soon as I saw him.

'Oh, I was very ill,' he replied. 'It was that cream on the top of the pork. Himmel/ I was bad, and I slept in Reichardt's stable with several others; but I did enjoy myself, and I would do the same again. But how did you get on?'

Then I rather foolishly told him of the fright I had had. A scared look of wonder came into his eyes at first, but this was soon followed by a

broad grin.

'Bah! Why, it was only old Gretchen. I put her in the lower field, and she must have got into the wood.'

'Nonsense! I tell you I saw two white

'You couldn't,' he answered. 'Rosalie is the only other white one, and she was in the yard with her calf.'

'Well, never mind that,' I replied sharply. 'Come with me. Now,' I said in a low voice as we got to the stile, 'aunt does not want those jewels in the house, and so I have buried them. I go to-morrow, and in case I never come back you must know where they are.'

We looked round cautiously, but there was

no one in sight.

'Fifteen mètres down the path. You see that?'

He nodded.

'Now,' I continued as I finished pacing it out, 'at the sixth tree to the left. It ought to be here; this is where I began to mark an "H" on the tree.'

We both looked for it, but could not see it. Then we again examined all the trees near. We began quietly, but gradually getting excited, we worked quicker, and finally, in blank despair, stared at each other.

'Good heavens!' I exclaimed savagely; 'suppose we've lost them! It's all your fault,' I continued, getting more and more angry, 'for having swilled such a quantity of that disgusting

'My fault,' he remonstrated, 'when it comes to seeing two ghosts instead of one old cow? I

should say it was your fault.'

'Well, it's no good talking,' I answered sharply; 'let's begin again;' and for an hour we did nothing but search the roots of the trees, but without avail.

For a short time I was almost stunned by my misfortune. At one blow I saw that I should not only lose Bertha, but that all my labours in Egypt on behalf of 'Progress,' 'Humanity,' and the 'Rights of Man' would come to nothing, and I must start life afresh.

Our good aunt thought us very quiet at our midday meal; but she put that down to my coming departure, and we did not undeceive her.

'Why, Jacques,' said Bertha when I got down to the inn, 'you never came to help me with the cows this morning. But what's the matter? You look worried.

'I overslept myself, dearest,' I replied; 'and as for being worried, that is only natural, as I

am leaving you.'

'I fear I shall be down-hearted when you are gone,' she said sadly.

'You must think of my coming back as a captain,' I said, laughing.

'He may be a colonel,' said her father, coming into the room with the bill for the supper in his hand; 'but he must satisfy me as to what amount of money he has.'

'But suppose,' I observed, 'that some one with six thousand francs came along, do you mean to say that he should marry Bertha if he wanted to?

'Decidedly,' he answered.

'Oh, would he?' I cried, with difficulty keeping down my wrath. 'Then you can tell him, and others will tell him, that Bertha will probably be a widow as soon as I do get back.'

Her father remained quiet, uncertain what to say, and finally gave me the bill. I paid it at once; but as I took the notes from my purse a couple of pearls rolled on to the table.

'Those are fine stones,' said Reichardt, opening

his eyes.

'Yes,' I replied casually. 'My captain says they are worth five hundred francs each. I found five of them one day on the body of a

"Mein Gott!" he exclaimed, 'what did you do with the rest?'

'Enjoyed myself,' I answered.

'Look here,' he said; 'give me those two stones and the girl is yours.'

'I want that in black-and-white. Here's one,' I continued, eagerly giving it to him. 'You write it out before two witnesses, and then you shall have the other.'

'Done!' he said.

So I went and fetched Brendel the wheelwright and Gerbardt the gravedigger; and in a very short time I had the paper signed, stating that when I could produce five thousand francs Bertha Reichardt should be my wedded wife.

(Continued on page 659.)

OCTOBER BIRD LIFE.

By G. GRAHAM MURRAY.

AUTUMN has been portrayed as a 'season of mists and mellow fruitfulness,' and surely it is an apt description. There is a haunting sadness in the lingering beauty of October. The wonderful glory of the autumnal foliage reaches its height, and the colours of the woods seem to crown Nature's efforts ere winter enfolds all things in her grasp.

Once again the bird-lover knows the year is reaching its close, for October is, so to speak,

the 'term time' of so many birds:

Round our eaves in autumn, Swallows, as they flit, Give like yearly tenants Notices to quit.

Already it is many weeks since the sandpiper's plaintive and high-pitched whistle was heard on Tayside, whilst the swifts and sandmartins have long since taken their departure. The corn has been cut and the partridges are again strong on the wing, whilst the lordly pheasant has but a short time more of security

ere covert-shooting begins.

One of the conspicuous signs of autumn in the bird world is the assembly of certain birds into little parties. The starlings begin to 'pack' in earnest, flying over the fields in small companies which increase in numbers as the days decrease in length. Finches are also to be seen in companies which fly to and fro, and on Tayside there is usually an incursion of pied wagtails en route for more southern quarters. The cyster-catchers are moving toward the coast, whilst the swallows are preparing for their long journey to far southern climes. There is a general air of activity and briskness, for expiring summer and advancing winter are preparing to join hands.

During this month the autumn migrations of birds reach their greatest magnitude. Vast numbers of summer residents begin to move south from northern Europe, with the result that our country is flooded by successive rushes of migrants. In contradistinction to these departing birds of passage, there is also the arrival of great numbers of winter visitors which have selected the British Isles for their hiemal quarters. With the appearance of autumn and the disappearance of the standing corn, partridges form into larger coveys, becoming each day more wary and difficult to approach. It is not easy to estimate the pace at which a driven partridge will fly, particularly with the wind at its back; but as one watches the rapid skimming flight of these birds one realises how strong they are on the wing.

The woodcock may be found any day in the woods, resting after his arduous journey from Sweden; whilst those of his brethren which nested with us have now joined the rush of

migrants, and are proceeding southward.

Chaffinches and linnets are flocking on the open stubble, and the golden plover have come down from the high ground. There is perhaps nothing more charming to watch than the wonderful aerial evolutions of these neat little birds. With what precision do they wheel and turn, whilst they utter their plaintive, piping whistle, and swish overhead into the next parish! To the Lowlander, the coming of the golden plover is one of the ornithological treats of autumn.

But perhaps the chief feature of October is the settling down of the different birds into their winter quarters, and the local movements of our so-called residential species. Nearly all birds indulge in a certain amount of travelling, be it only of a local nature; the thrushes and finches all move from place to place, as do also the linnets and even the tits. October is the time for these small journeyings, when so many little birds cross over the march, their places being filled by their congeners from the next county. The long-tailed tits form into parties along with other small birds and scour the countryside; whilst the skylark, ... ho is a real overseas traveller, will be joining in the autumnal journey south.

In the garden the robin sings sweetly as he 'eyes the delver's toil;' the tiny wren gives vent to his amazing little volume of song, and ever and anon the tree-creeper flits up the stem of the trees.

Song-thrushes are to be seen in plentiful numbers, whilst redwings and fieldfares usually arrive toward the end of the month from their summer quarters in northern Europe. These latter birds (which belong to the family of thrushes) pass the winter with us, and may be seen until the spring months reappear, when once again they wend their way far northward; for neither fieldfares nor redwings have so far ever been known to nest in Britain.

By October the wild duck are strong on the wing, and may be seen flighting every evening; later in the year the severe weather will bring in many rarer species; but at present there can be no more charming sight than a 'mist o' duck,' as they fly in on a bright moonlight October What music there is in the swish of night. the wild ducks' wings as the flock passes high overhead, adhering to the V formation of flighta music which is only equalled by the honking of the passing wild geese! Strolling over the stubble, one puts up a stray covey of partridges, which whir away at a great pace, whilst a little regiment of starlings wheel over one's head. Parties of siskins and linnets may be seen, and close to the farm-steading one meets a mixed company of sparrows, finches, and yellow-hammers. In the woods the wood-pigeon are feasting on the beech-nuts, and patrol the countryside in flocks. With what speed and vigour do these birds fly, and how difficult it is to approach them!

The gambols of a little party of long-tailed tits are pleasant to watch; these dear little birds have such a charming undulatory flight as they dip

> To and fro And high and low,

ere they finally disappear from one's view.

Truly autumn is a season of mists and mysteries; there is such a sense of fascination in the lifting of the mist, the childish feeling of wonderment as to what is hidden beneath the soft gray folds of an autumn afternoon.

In the other gardens,
And all up the vale,
From the autumn bonfires
See the smoke trail.

Pleasant summer over,
And all the summer flowers,
The red fire blazes,
The gray smoke towers.

Are these not les plaisirs d'automne, plaisirs qui passent si vite?

THE AMAZING ARGENTINE.

As the nineteenth century has seen the enormous development of North America, so I believe that the twentieth will see the great development of South America.—ROOSEVELT.

SINCE an article appeared in these pages in 1911 upon 'Progress in the Argentine' things have still been advancing in that great country. To increase public knowledge many books have been published, one of the best of which is by Mr John Foster Fraser, a wellknown and capable journalist, who records in a volume, The Amazing Argentine (Cassell), impressions and hands on information gathered during a visit. A shrewd, acute, and honest observer, he does not shrink from setting down unpalatable truths; on the whole he is exceedingly fair and just in his estimates. A man who cares to invest from ten to twenty thousand pounds in a cattle-ranch, we are told, can still do well to-day. The case is mentioned of an Irish labourer who became a great stock-raiser, and who died worth four millions sterling. A Scottish farmer who had failed at home, and paid his creditors three shillings in the pound, went to South America, engaged in stock-breeding, returned in ten years, and paid in full every one of his creditors. In good years the estanciero may make 30 per cent. on his capital; he thinks he is doing fairly well if he makes 20 per cent. They want the best of everything, and so a i

breeder astonishes us by paying seven thousand pounds for a pedigree bull. A sale of a herd of sixteen shorthorn bulls in 1913 brought sixteen thousand seven hundred and seventy-six pounds. The Argentine more than rivals Canada and Australia in productiveness, and sends us huge quantities of chilled and frozen beef and mutton, wheat, and maize. It is the largest individual contributor to our food-supply, in value about thirty-five million pounds annually. As Mr Fraser realised its wealth and productiveness he sighed that it was not a British colony.

This great development has followed upon the investment of some five hundred millions of British capital there, three hundred millions of which went into railways, without which progress would have been impossible. The roads are as bad as may be, or non-existent; but railways have been well engineered by British brains. Some two hundred and ninety million acres of land still await development. In spite of what is apparent of immoral conditions prevailing, Mr Fraser says if he had a son with commercial ambitions he would set him to learn Spanish, and send him to the Argentine. The people he calls shallow, yet keen, alert, pagan, courteous, ostentatious, incompetent in practical affairs. The women are graceful until lack of exercise and overeating make them stout. The girls are

modest, with a habit of daubing their faces with powder. This mixed race of Spanish and Indian stock has been supplemented by French, Italians, British, Germans, and other nationalities attracted by the golden magnet. To Mr Fraser it all seemed very wonderful. The confusion, the barbarism, the love of beauty, the display of dollars, the influx of invested gold, the coming of the immigrant, the whirl of business, the big deals, the gambling, the making of fortunes and the losing of fortunes, dazzle the mind.

Buenos Aires is called the Paris of South America, where luxury, money-making, and flamboyant display prevail. In another sense it has been called the London, and Rosario the Liverpool, of the country. The amazing growth in less than a hundred years may be seen at once by turning to such a book as Sir Francis Head's very graphic Rough Notes of his journeys through the pampas in 1826, where he says he enjoyed as beautiful and salubrious an atmosphere as the most healthy parts of Greece and Italy, without being subject to malaria. There is much that is revolting in his description of a Buenos Aires cemetery, and how the cattle were then killed. Some of his stories of Indians of the pampas rival those of Mayne Reid. Quite a truthful modern book, of sixty years later, is E. F. Knight's Cruise of the Falcon, which relates his experiences on the Parana and Paraguay rivers, and of a ride across the pampas to Tucu-

The population of the Argentine has doubled since 1895, and is now over seven millions, and there are some three hundred thousand immigrants annually. There are four towns with universities - Buenos Aires, La Plata, Tucuman, and Cordoba; only 42 per cent. of the children go to school. The population of Buenos Aires is nearly a million and a half, and the other towns in the order of importance are Rosario (with about two hundred and thirty thousand), Cordoba, Tucuman, Bahia Blanca, and Mendoza. Of the seven hundred and ninetyfour newspapers, seven hundred and twenty-two are in Spanish; La Prensa, with an unrivalled cable service, is one of the best-informed journals in the world, and possesses noble buildings in Buenos Aires, having luxurious suites of rooms The imports in 1912 amounted to inside. seventy-six millions sterling, and the exports to ninety-five millions. But, with all its commercial activity, it is a land without ideals except those of money-making, and religion is at a discount.

Like every other visitor, Mr Fraser found Buenos Aires weirdly fascinating, but a very expensive town to live in. A clerk here, in order to live on the same scale as in London, requires three times his former salary. What is called a modest lunch may cost ten shillings, a bottle of beer two shillings, and a cigar worth smoking may cost three shillings and sixpence.

The danger of the silting up of the Parana is mentioned, which would destroy this busy shipping port as well as that of Rosario. It is a town of wide plazas and narrow, congested streets, imposing banks, shipping-offices, skyscrapers, shops as big as those in London, and restaurants as good, with hotels on the Parisian model. The crowded traffic has led to the construction of underground electric trams. Central Argentine Railway has built for itself a new station. There are abundance of expensive motor-cars to be seen in this city of gaiety and luxury. A suburb, Palermo, Mr Fraser calls a combination of Hyde Park and the Bois de Boulogne, while the Grand Stand there is finer than anything in England. Mr Fraser travelled in the train with Government officials between Buenos Aires and La Plata, the capital of the province, fifty miles away. It was a fine train, and the luncheon-car was bigger and the food better than on English lines. Nobody does any work in Government offices in the morning.

While the Argentine women are among the best mothers in the world, there is none of the good fellowship among young men and women characteristic of English life. For a man and a woman to take a walk together would shock the proprieties. While suggestive plays are barred, there are objectionable kinematograph plays for men only.

Rosario, about two hundred miles from Buenos Aires, comes next to that town in importance and keen commercial activity. Its population in 1870 was twenty-one thousand; it is now two hundred and thirty thousand. The railway works of the Central Argentine are in the suburbs, and Mr Fraser prophesies great expansion for the town, when, with extended railway connection between the Argentine, Brazil, and Bolivia, it will be an important railway junction. There are electric trams, big offices, huge goods-sheds, and wharves where wheat, maize, and linseed are loaded into the waiting steamers. The English suburb of Fisherton has a golf-course; other healthy growing suburbs are Funes and Alberdi. Mendoza, at the roots of the mountains on the way to the transandine tunnel, healthiest of all the towns, is where our author would choose to live. It has eight hundred and seventy-three wine-shops for its seventy thousand inhabitants, and its wealth lies in the vineyards. It possesses Besides the vine, the a school for viticulture. fig and cherry grow freely, and Mr Fraser suggests this place as a possible sphere of fruitfarming for discontented Englishmen. place reminded him a little of Salt Lake City.

Tucuman has a school for arboriculture and sugar-making, and is in the centre of the sugarcane district. It was here that the independence of the Republic was proclaimed in 1810, when the overlordship of Spain was repudiated; and in a house within a house is shown the room where was held Argentina's first parliament.

Tucuman claims to have the most beautiful women in South America; it has imposing houses, hotels and restaurants, tramcars, and electric light. Around the town are twenty-five sugar-mills, and thus the Argentine is now quite capable of producing all the sugar it requires. Cordoba, with its old-time languorous atmosphere, is in the centre of the wheat area, and has eighty churches to its eighty thousand Here are a university and the inhabitants. Government Observatory. As the oldest city in the Argentine, Cordoba regards itself as the aristocratic centre of the Republic. It possesses a shoe-factory and several good newspapers. Thence our author had a pleasant excursion to Alta Gracia, a fine village in the hills, with a first-rate mountain hotel and golf-course. The Central Argentine Railway car in which the journey was taken is described: 'There was a pleasant sitting-room, with big easy-chairs and a real English open fireplace. There were three bedrooms, not the cribbed, cabined, confined cabins we have in our "sleepers" at home, and there was the luxury of a bathroom. There was a kitchen, a chef, and a sprightly waiter. The whole car was lit by electricity. So we sat down to dinner: half-a-dozen courses as excellent as can be served at a London restaurant which looks after its reputation. We filled the coach with our tobacco-smoke, we told our best stories, we exchanged yarns about things which had befallen us in distant parts of the worldin Siberia and Australia, Peru and Havana, the Soudan and California—for here the corners of the earth were met in a side-tracked private car in the lee of a pretty holiday village in the middle of Argentina.'

Bahia Blanca, some three hundred and fifty miles south of Buenos Aires, is third among the commercial towns, and has grown with mushroom-like rapidity since the coming of the railways. It is a great shipping port. Mar del Plata is the fashionable bathing-resort, two hundred and fifty miles from Buenos Aires. The Bovril Company have about one hundred and fifty thousand cattle on their estates in Entre Rios and Santa Fé, and between eighty thousand and one hundred thousand animals are annually slaughtered at Santa Elena. Nearly a quarter of a million beasts are slaughtered in Entre Rios every year.

Of the railways, the Central Argentine is one of the most up-to-date lines in the world, with a length of rolling stock which, if placed in a continuous line, would extend to a distance of one hundred and forty-three miles, six hundred passenger-coaches carrying twenty million passengers annually. The Buenos Aires and Pacific strikes westward across the continent for those who wish to cross the Andes to Valparaiso. The Great Southern runs to Bahia Blanca, then west to Neuquén. An extension thence to the Chilian frontier is in progress. The company is carrying

out extensive irrigation works in Neuquén territory, 'which, when completed, will convert the valleys of the upper Rio Negro and Rio Neuquén, hitherto one of the least productive, into one of the most fertile regions in the world.' Each train carries a letter-box, and the mails are conveyed for nothing. On board, in case of emergencies, are a medicine-chest, stretcher, and a bicycle to run for help if required. Every car is disinfected once a month, and all bedding and mattresses are subjected to scientific disinfection. As regards special cars, the Argentine railways reminded Mr Fraser of those in Russia and the United States. There is a buffet-car on all long-distance trains, and dormitory coaches on all night trains. Not only have the railways tapped the sources of agricultural wealth and linked up towns and villages, but incidentally they have brought fortunes to individuals. The case is mentioned of a man who thirty years before bought a piece of land for one thousand six hundred pounds, and sold it to a railway company for over two hundred thousand pounds.

The Argentine is said to possess eight million horses, twenty-eight million cattle, and about sixtymillion sheep; while it holds the first place in the quantity of frozen meat exported. Over eleven millions sterling are invested in freezing-plants. The best lands are given up to wheat, maize, and oats; while the alfalfa, grown for fodder, has proved a gold-mine to the cattle-breeder, and fattens the cattle, which are left out all the year. The Government has afforded every assistance in fighting the scourges of locusts and drought. Early in 1914 there were reports of serious financial stringency, and the ruin of some crops by unfavourable weather; but the country has wonderful recuperative power, and if the political situation remains stable it may deserve the name of the 'Amazing Argentine' for generations to

BLUE DUSK: SOUTH AFRICA.

When the blue dusk with daylight clings Upon a terrace in the South, I sit, and gaze on distant things.

The clouds are golden eagle wings
Poised high above the sun's red mouth.
An unseen cricket chorus sings.

The mountains are a line of kings Robed royally, and set in state. A church-bell in the hollow rings.

The wood of gum-trees lightly swings, The moon slips up, a silver plate. The wood of gum-trees lightly swings.

Oh unplumbed mystery of things!
Of sun and breath, of dark, of death!

Out yonder, look! the day grows late, God wipes the red from His sky slate, And blurs with blue all worldly things. NITA H. PADWICK.

PRAWNING AND PRAWNERS.

By L. B. THOBURN-CLARKE.

THERE is almost a weird fascination about prawning in the early dawn of a September morning. The sea is still held enslaved in the embrace of a silver-gray mist, while the white cliffs tower, grim and mysterious, above one. Underfoot the brown wrack covers the rocks, making walking in the uncertain light a matter of difficulty. For this reason, the Old Prawner and I usually followed the chalked and marked foot-track over the Downs, close to the edge of the cliffs, always used by the coastguard. Though marked by big blocks of chalk, it was none too easy to find the way in the still, weird hour of dawning.

The distant bark of a dog or the tinkle of a sheep-bell alone broke the silence of the sleeping Downs. It was so still that the noise of our footsteps seemed almost crudely riotous. The Old Prawner walked stolidly ahead of me, his collection of 'jins' and poles jingling gently in time to his steps. He was in no mood for talking, and merely grunted a response to my ques-

tions.

Dawn was silvering the sea as we scrambled down to Hope Gap. I could just make out the outlines of the village some one had tried to establish, the ridges of green turf looking like the faint outline of an old Roman camp. Catching hold of the chain, we slithered rather than climbed down through the narrow Gap on to the shingle below. A wide fringe of wrack-covered rocks lay in front of us, appearing grim and black against the pearly gray of the mist-shrouded We cautiously felt our way over sea beyond. The wrack crushed under our feet, and the rocks underneath were wet and slippery with the falling tide. Crabs and innumerable sea things squirmed away as we dug our pointed poles in the cracks and crannies of the rocks to keep ourselves from falling. Even then, unaccustomed to the rocks, I made many a false step, and only saved myself with difficulty from slipping into a deep pool or the narrow waterways called gullies, through which the waves swirled and eddied.

It was about an hour and a half before the tide would be dead out, and during this time and the hour and a half after the tide had commenced to flow, the prawns would be 'on the feed' and ready to take our bait as often as we liked to sink the 'jins.' It was spring-tide, and the rocks were uncovered for a long distance out, so we walked to the farthest rocky point above the sea surface; and, standing with the waves flowing over our feet, we prepared to sink our 'jins' in

the gullies between the rocks.

The 'jins' are made of various sizes, those most commonly used ranging from eight to fourteen inches in diameter. Ours were the latter size, and we had four apiece. 'Jins' are deep nets fastened to a circle of stout iron wire heavy enough to sink the 'jins.' The net portion is about seven inches deep, or a little more, the bait being fastened in with two wooden skewers pointed at one end, flattened and split at the other. The split end is fixed into the mesh of the 'jin,' and the bait secured from slipping. Thin cord is tied across the top of the 'jins' to form a loose handle, and a long piece of the same cord is fastened to the centre of the handle, the other end being attached to a large cork float which is needed to show where the 'jin' is sunk, as the rapidly falling tide soon changes the aspect of the rocks as more and more are uncovered.

The sinking of the 'jins' requires some care. The cork float is held in the hand, and the hook of the pole pressed against the cord until the 'jin' dangles straight above the spot where it is to be sunk. It is then gently lowered into posi-This proceeding is carried out with each until all are set ready for the prawns to come and be caught. The first 'jin' is baited with a savoury fish-bone in order to catch 'jackavels,' which love a 'high' morsel. These unfortunate swimming crabs are used for baiting lobster-pots, prawning 'jins,' and the many nets used by the fishermen around the coast; they are voracious feeders, and once they clutch hold of food, they will almost allow themselves to be torn to pieces before they will let go. When I drew up my 'jin' there were four, two inside and two out, all clinging tightly to the fish-bone. I secured the four easily, and a few minutes later their crushed corpses were skewered into my 'jins,' and were catching prawns at the bottom of a swirling gully.

The manner of raising the 'jins' is much the same as that employed in lowering them; but it has to be quickly and steadily done, or the prawns will jerk themselves away long before the 'jin'

SEPTEMBER 19, 1914.

reaches the surface of the sea. The pole keeps the 'jin' straight and steady. The Old Prawner entreated me to return all the little ones to the sea again, retaining only the big ones. 'How could folk expect to get plenty of prawns year after year when they killed all the little ones?' Seeing the force of his argument, I returned all the small prawns to the sea, while the big ones were consigned to a canvas bag, like a workman's tool-pocket, that I wore slung around my waist.

As we alternately hauled up and set our 'jins' we saw the sun come up, tinting the cliffs with rose, gold, and purple. There is nothing to equal the cliffs at sunset or sunrise. Looking across the Cuckmere Haven toward Birling Gap and Beachy Head, I thought that the Seven Sisters. with their deep indents of brownish green, had never looked more strikingly beautiful, and I had seen them at many times—mist-laden with the haze of a rainy day, storm-racked, with the lightning quivering on their chalky faces, bathed in the glow of a midday sun, but never quite as they looked that morning, appearing rose-tinted over the mists of the still sleeping sea. The seagulls awoke and flew screeching from the ledges of the cliffs. A fisherman drew his brown lobsterpots from a green-gray sea, fast turning to silver; and in the distance brown-sailed fishing-boats made the best of their way to the nearest port.

The Old Prawner gazed at me, his Sussex blue eyes questioning my eager watching of the dawning, his wrinkled sunburnt face puckered into a humorous smile. I had often tried to coax him to tell me of the old, old days when smuggling was the 'legitimate' employment of every Sussex man. He had always evaded my questions, for the 'silly' Sussex man is a difficult man to draw. Unlike the Devon man, he will not talk of the smuggling days, though he will tell you regretfully that money is not near so plentiful as it used to be in the days of his father. I saw a story lurking in the Old Prawner's brain, but I gazed resolutely away, and thought of those 'good old times' when the mariner said a special prayer as he passed the Sussex cliffs, with their companies of 'shags' who lured men and good ships to their doom. The Old Prawner smiled grimly, and, as if replying to my thoughts, said the cliffs were just made for the swinging of lanterns. A man lying on the edge of the cliff could lower one at the end of a rope, and make it appear as if a ship were riding at anchor where there were only rock and shingle. The wrecker's harvest would be ready for his hand before morning dawned.

Once the Old Prawner's tongue was loosened, he was ready enough to tell me tales of his father; of the grim jest of the headless ghost that haunted the road and kept inquisitive folk away—only the 'night folk' who knew the secret were not afraid; of the parson who, when a wreck came on shore, and his congregation stampeded, entreated them to let him start fair. This same parson went to

bed, nailing a notice to the church door saying he was too ill to hold the Sunday services; the real reason being that the smugglers had hidden their barrels of brandy in the church, knowing the preventive men would not search the sacred edifice for the spoil. The same person is also said to have read the burial service over a corpse composed of lace, silk, and gloves, while the preventive men were searching the houses of the suspected men. A coffin was a favourite hidingplace for smuggled goods, as many a good cargo found its way from Cuckmere to Lewes in a coffin carried by the sorrowing mourners over the ridges of the Downs. The vaults in the churchyards belonging to churches whose parsons were content to keep their mouths shut, and accept without comment the mysterious presents of spirits, &c., laid on their doorsteps at night, were also useful depositories for smuggled goods.

When the revenue cutters were too hot in the chase after a smuggler's smack, the latter would secure an anchor to the barrels of brandy and throw them overboard, trusting that the winter storms would bring the anchored spirit on shore. A few years ago some of this anchored spirit was washed up on the beach. The barrels were encrusted with seaweed and shells, but the spirit was still good. The find was kept a dead secret, but the foolish finders drank so deeply of the raw spirit that the doctor had his work cut out to save their lives. At times treasure trove is found among the rocks. Only the day before the Old Prawner's son had scooped up a guinea with his prawning-lade, and it looked as bright and fresh as though it had only just been minted, instead of having lain at the bottom of the sea for over a hundred years.

The Old Prawner's father had once discovered a good treasure trove. It was long before the groynes had been built, and when wrecks were sometimes washed up. The capstan of an old wreck had lain nearly buried under the shingle that formed the 'nine folds of the beach' for more years than any one could remember. It was so solid and heavy that no one had been industrious enough to hew it to pieces for firewood; so it had lain there, sometimes washed almost bare by the shifting shingle, sometimes almost covered. terribly hard winter, when things were very bad in the little town, and wood was scarce, the Prawner's father decided he would chop up the capstan for firewood. He chopped and dug deeper and deeper into the shingle as he hewed out the wood until he had made a hole deep enough to cover himself. Then, just as he had flung out the last piece of the capstan, he saw a glittering pile of golden guineas. He was hurriedly gathering them up, fearful of any one demanding a share, when a harsh voice told him to hand some over. He thought it was the police, but found it was one of his own mates; so, making the best of a bad job, he handed up half of what was lying on the ground, saying nothing, however, of what was already safe in his pocket.

That evening he accidentally overheard some persons say that they would ask for a share or else tell the police; so he quietly slipped out of the town, and went to visit some relatives, until the treesure had been disposed of, and his friends

had forgotten the finding.

In those good old days the pursuit of prawns vered a multitude of sins. The prawner often covered a multitude of sins. acted as a sentry for the smugglers, and the big lades of the shrimpers were convenient to use as scoops to rake up the 'drowned gold' that had been 'spilled' from wrecks. In a quaint old print representing the 'discovery' (the washing up of the wreck) of the Nympha Americana at Birling Gap in 1749, the wreckers are represented as fishing for gold with the big shrimpinglades. This print is amusing, as it shows all the incidents that occurred at the scene of the wreck -the man falling over the cliff, and another who was shot falling dead, and the conflicts between the wreckers and the riding officers. Two French privateers are firing upon the battery, which is replying; while scattered along the beach are the men who were killed by drinking raw spirit, 'sixty roamers, wreckers, and idle and dissolute folk from the country around' having been killed by their indulgence in the fiery spirit washed up with the wreck.

The tide was already flowing in, and the prawns no longer came to our 'jins;' so we hauled them up. The Old Prawner had a goodly number; but I, being perhaps too interested in his stories, had captured only fifty. We walked back across the Downs, the old man showing me the spot where the last large crop of barrels had been landed within the memory of men who were not above their fourscore and ten; and, by the twinkle in his own eye, I think he could remember a bit about it. The crop was to have been landed at Bishopstone, but the preventive men were on the alert; so the barrels were hauled up the cliff at Puck Church Parlour, and carried safely away to Lewes.

He didn't hold with wrecking, but smuggling was another matter; it was only cheating the Government a bit. Then he laughed and told me that wrecking was in the blood. Some years ago a ship came on shore laden with something in sacks. No one knew what it was. It was black and powdery; and at last the men who were salving the cargo could stand it no longer, so they carefully 'ullaged' a sack as it was descending. Alas! the black powdery stuff flew everywhere, borne on the strong breeze that was blowing. The men were sorry for themselves, as they were smothered with the stuff, which resembled lampblack. It was days before they got rid of the taste and smell of it. Yes, wrecking was in the blood, and he wouldn't answer for a cargo if it were left unprotected during the night; though, of course, no one knew who did the deed, as all the folk were honest, and would never think of stealing anything on shore; but when it came from the sea it was different, somehow.

After making arrangements for the evening's prawning, when it would be possible to walk around the shore under the cliffs, we parted, the Old Prawner going back to his home. As he crossed the Steyne I heard him chuckling to himself softly over the plight of the men who had 'ullaged' that awful black stuff.

THE INTERRUPTED WEDDING.

CHAPTER III.

I LEFT the three men drinking, and took Bertha home, stopping every now and then to kiss her, so great was my delight; in fact, I quite forgot all about the loss of the jewels. Fortunately my anxiety about them was soon dispelled, for on returning, just as I reached the house, Mark drew me aside.

'I have got them!' he exclaimed.
'Himmel' I exclaimed, 'however did you do it?'

'Easily enough. I sat on the stile and pondered over the matter. You said you went fifteen metres. Now it follows,' he added slyly, 'as you saw double in the matter of the cows, that you walked double. So I stepped out thirty paces, took a turn to the left, looked round when I thought I was about the twelfth tree, and almost at once I saw the mark on one of them, and the knife at the foot of it; and,' he concluded, giving me the box, 'here they are.'

I wrung his hand in gratitude, and promised, when I went through Strasbourg the next day, to buy him a fine English gun. Then we set to work and buried the box under a large stone by our well.

The next morning, though I started at six, all the village turned out to see me off, and many were the good wishes I received. While I was sad at parting with Bertha, still, with her father's paper with the signature of the two witnesses, I set forth full of hope.

I duly arrived at Marseilles, where I found the captain on the appointed day. He was in

the most exuberant spirits.

'Everything, you can tell my uncle, has gone off all right. I am going to leave the service. I am going to marry his ward. She has come into property in Belgium worth a million francs. I am to become a partner in the bank of her uncles, Roeder Brothers, at Strasbourg, and we have taken a house not far to the south of

the city. These papers,' he continued, 'will explain everything. Now, take great care of them, and on the day that I hear you have safely delivered them five thousand francs shall

be placed to your credit in the bank.

A month later I landed at Suez, and, as it turned out, my second sojourn in Egypt, from the point of view of what Reichardt called 'Progress,' turned out to be more successful than my first, for the colonel was so delighted with the news I brought him that he made me a maréchal de logis-en-chef.

Reichardt had asked me to make inquiries about his nephew, named Jean Boursot, in the 33rd; which I did, and soon after I arrived I found him in hospital at Cairo, half-dead from fever.

'Has he sent me any money?' said the poor wretch, who was so weak that he could not knock the flies off his face. 'Because he's got plenty, and I was robbed, when I was too ill

to help myself, of every sou I had.'

I took a great liking to him at once, owing to his remarkable likeness to Bertha. I gave him some money, also some to those who were supposed to look after him, and promised to come and see him soon; though I really hardly expected to see him alive again. However, he did recover, and he always said it was owing to me.

After Kléber's great victory at Heliopolis, in which my regiment took part, we were quartered at Cairo, where that great General was assassinated in June 1800. Kléber was a born administrator, stern with all cowardly creatures, but always just. He was succeeded by Menou, a man altogether unworthy of such a post; hot and cold by turns, he treated the natives unmercifully one moment, and tried to conciliate them the next. Those Easterns only respect a man as

they fear him.

It happened just after the assassination, when the city was under the strictest martial law, and Menou was in one of his fierce moods, that a sergeant to whom I had rendered a service during an émeute one night in a low quarter of the city came to me, and said he had been told by a private in his regiment named Dellier that the palace of a certain bey—who had been mixed up with the murder of the General, and had fledwas quite deserted, though full of untold riches; and suggested that we three should keep this information to ourselves, and try that night to get into it. I thought at once of Bertha, and willingly consented.

The moon was at its full, and when we got into the garden it seemed as though we had tumbled into fairyland; but we did not trouble to waste our time admiring the beauties of the place. The inmates had evidently fled in the greatest haste, leaving lovely prayer-rugs, some of them of silk, and satin and cashmere robes scattered about; while scimitars and silvermounted pistols were hanging on the walls.

But we wanted something better than these,

and hurried on to the women's quarters. In the harem we thought we might get some jewels. Soon we found ourselves in a small chamber with a gilded roof, from which a fine silver lamp was hanging. Silks and satins were piled up, and we turned them over eagerly, but nothing in the way of gold, silver, or jewels could we find. 'We will have that lamp down, anyway,' remarked the sergeant with an oath. We looked all round the wall to find the chain that lowered it when it was lighted, but could not find one. I was by far the tallest of the three, so we dragged a divan underneath, and I mounted it.

'Give me your gun,' I said to Dellier, with the intention of knocking the whole thing down with the butt; but still I could not quite reach it. 'Hand me up that cushion,' I said, pointing to one on a divan. The sergeant took it up. An exclamation of delight came from his lips, for he caught the gleam of a jewel which had fallen from the neck of some beauty, and had got in between the mattress and the gilded woodwork. In a moment he had drawn out a splendid necklace of thirty-two pearls, all graduated from the We had agreed to share equally, but the middle pearl was such a large one that it must have weighed nearly fifty grains; so we drew lots for it, and the sergeant won, Dellier and I each taking the next two. After that we divided the pearls equally. We were so delighted with our luck that we did not trouble any more about the lamp that night, though within a week we got it and everything else of value.

It was a month later that the sergeant, Dellier, and I were in a café one night, watching some dancing girls, when Dellier happened to say that he had sold one of his pearls to a well-known Greek named Pontiades for two hundred francs. Now both the sergeant and I had also sold one to him, and we had only got one hundred francs. We thought Dellier must have sold one of the largest pearls, but he said it was really the smallest one he had.

'Parbleu / we'll see about that,' said the sergeant angrily; 'he will either have to give us back the pearls or pay us the same price.—Allons, Kleinberg; and you come too, Dellier.'

The Greek's shop, we found, was shut up, for it was getting late; but there was a passage at the side, with a door. We were knocking at this,

when the fellow came up the passage.

'Here, you rogue, you are the very man I want,' said the sergeant, and told him the reason. Without a word the Greek turned and ran for We followed, and Dellier had almost got his bayonet into him, when he turned and shot the poor private dead; but the sergeant at once shot the Greek through the back.

Bending down, we found a belt round Pontiades' waist simply crammed with rings, gold snuff-

boxes—ay, and money all in gold.

'We will divide this afterwards,' said the

sergeant; and he continued, 'We may as well take with us whatever poor Dellier has got.'

On Dellier we found the ten pearls and about three thousand francs. Then we threw the bodies over the wall into the Greek's garden, and decamped. The moon was shining as bright as day, so when we got into a quiet place we divided all that we found on the Greek, and later what Dellier had had, as we could not find out anything about his family. This amounted to five pearls and fifteen hundred francs each.

It was about this time that I received a letter from my brother (one of the very few that got through the British blockade) that caused me a great deal of uneasiness. Reichardt, he said, had married again. His wife, it appeared, was the sister of a rich Strasbourg brewer named Detzler. She was young and pretty, but a perfect idiot. Moreover, on the strength of her money, she gave herself airs. Poor Bertha was greatly distressed at the advent of her new stepmother; but this was not the worst news, for I learnt that the latter's brother, struck by Bertha's great beauty, soon began to pay his attentions to her. All the village, knowing she was betrothed to me, was talking about it. However, Mark, who was nearly as big and strong as myself, soon put a stop to this, as he told Detzler he would break every bone in his body unless he desisted; in fact, Mark frightened him out of his life. But I was yet to learn that the coward had not given up his plans to capture my fiancée.

Though I was angry with this fellow, I was more so with Reichardt for allowing such a thing to take place, and I wrote and told him so very plainly. It was a few months after this that in a skirmish my horse was killed, and in falling I broke my left arm. Unfortunately it was not an ordinary fracture, for it affected the nerves of the limb in such a way that for many weeks I

could not raise my arm higher than my chest; consequently I could not mount a horse; the doctors were doubtful whether I ever should. Thus I was hors de combat. As I was now, owing to the great mortality among our men, the senior non-commissioned officer among those who had originally come out, this was a terrible blow.

It was during my enforced idleness at Cairo that Jean Boursot found me out. 'I have been waiting to see you for weeks,' he said. 'I have a letter from my uncle that you ought to see. I cannot understand it.'

Taking it from his pocket, he read: "Send me word as soon as you can that Sergeant Kleinberg is dead. Say fever, wounds, anything you like; and, when I see you, you shall have thirty thalers."

I took the letter mechanically. I read and What rascally plan this villain had re-read it. got in his head I could not imagine; in fact, for a time I was impotent with rage. For showing me the letter, which he allowed me to keep, I insisted on Boursot accepting the equivalent of thirty thalers; though the worthy follow was loath to do so, as he said I had saved his life. He had written to his uncle, knowing nothing of my accident, saying that I was quite well; so his uncle, whatever his object was, could not pretend I was dead. I knew, alas! how few letters ever reached their destination, so not a ship sailed but I sent letters by her on the chance of one reaching the village. Though I found a certain relief in doing this, I was consumed with anger and jealousy, brought about by the knowledge that I was hundreds of leagues away from Bertha, who was really helpless. From that moment I resolved, as I had a good excuse, to leave the service, and I got a surgeon to make out the papers.

(Continued on page 676.)

POETS AND PENMEN WHO HAVE SOLDIERED.

By Captain OWEN WHEELER, Author of The Story of Our Army, The War Office Past and Present, &c.

AS it would be difficult to avoid some allusion in the course of this sketch to that hackneyed estimate of the relative might of the sword and of the pen, the writer thinks it will be a relief to readers, as well as to himself, to make the allusion, and have done with it, in his opening paragraph. As a matter of fact, his object in putting together the following notes has nothing whatever to do with the specific efficiency, comparative or individual, of either of the weapons in question. He is merely concerned to show how both have been wielded by several men of some, and here and there of great, eminence in English literature. The story, such as it is, does not pretend to be complete, nor is it very convincing. No Briton has excelled to the extent, for instance, that Julius Cæsar did both

as a soldier and a writer. But, as will be shown, apart from the considerable number of British soldiers who have displayed a very pretty literary talent—with these no attempt will be made to deal in this article—there is a good handful of civilian writers who have worn swords and, in some instances, fought in battles. If now and then the military connections have been rather thin, it may be urged that there is no need to take the matter very seriously. The point, if there is a point, is, rather, that in no instance was any one of the writers about to be mentioned any the worse for having dabbled in the profession of arms, and that occasionally the circumstance that he did so may have helped him to strike a truer note or leave a clearer mark than he otherwise might have done.

First on our list comes Geoffrey Chaucer, who is known to have taken part in Edward III.'s French campaign of 1359, which ended rather fruitlessly the following year in the Treaty of Bretigny. Chaucer was then probably about nineteen, and had served previously for two or three years in the household of the king's third son, Prince Lionel. It was probably in Prince Lionel's suite that Chaucer went to the wars, and it was doubtless in one of the foraging operations of which the campaign was largely composed that he was taken prisoner in Brittany. Luckily the tariff for youngsters of his estate—he was not, it will be remembered, of noble birth, but the son of a vintner with a shop in Thames Street, London—was not high, and in March 1360 he was ransomed, the king disbursing for the purpose the sum of sixteen pounds, or thirteen shillings and fourpence less, as one biographer remarks, than His Majesty gave on another occasion for a horse. According to one account, Chancer again went campaigning in 1369. It is on record that Henry de Wakefield advanced him ten pounds in that year for expenses 'in the wars;' but the allusion is rather obscure, and, in any case, the poet does not seem to have distinguished himself any more than he did in his Whether to Chaucer's moderearlier service. ately warlike experiences we owe any part of the delightful description of the 'verray parfit gentil Knight' in the Prologue to the Canterbury Tales is, of course, uncertain. But it is pleasant to think it may be so. Further, we may be sure that Chaucer, even though he may not have been a first-class soldier, was a cheery and popular one; for, though later he lived the life of a recluse, he was never an ascetic, but loved pleasant society, and, as he himself admits, 'his abstinence was but little.

From Chaucer it is a long step to Sir Philip Sidney, and the interval between their military records is not only wide in the matter of time. Sidney may be reckoned, according to contemporary standards, quite a distinguished military man, although, as a matter of fact, he does not seem to have soldiered actively before the campaign of 1585-86, in which he met his death. That he was an accomplished man-at-arms is certain, and he was specially prominent in the great tournament of 1581 held in the tilt-yard at Whitehall, on the site of which the Horse Guards was afterwards built. Also, in 1583 we hear of his being nominated, at the age of twenty-nine, a 'general of horse.' In November 1585 Sidney, with some difficulty, persuaded Queen Elizabeth to allow him to take part in the expedition under the Earl of Leicester to the Low Countries. Flushing having been surrendered, Sidney was made governor of that important town, and later doubled the appointment with the colonelcy of the Zealand Horse. He seems to have preferred his duties in the latter capacity, and to have made a strong bid for

active employment with the main body of the army, from which on one occasion Leicester was constrained to order him back to his post at Flushing. When the attack on Zutphen was arranged, Sidney insisted on joining the force as a volunteer, and, as every schoolboy knows, was mortally wounded, dying some four weeks afterwards. The tale of his giving up his drink of water to a wounded soldier is too familiar to need repetition. But it may be mentioned that before the battle he had, with quixotic generosity of purpose, discarded some of his armour because a comrade-in-arms had come into the field badly equipped, and he would not fight except on even terms with his friend.

Sir Walter Raleigh was a much more experienced soldier than Sidney, but we find only scanty records of his military services, which, again, are largely overshadowed by his naval exploits. Apart from such fighting on land as was included in his various expeditions, he is known to have served in 1569 on the Continent as a volunteer in the Huguenot army, and to have been present at Jarnac and Moncontour. He also took part in the operations in Ireland in 1580–81.

The military experiences of another great Elizabethan, Ben Jonson, are also rather obscure, as well as being somewhat insignificant. Employed in the yard of his step-father, who was a bricklayer, the future great dramatist ran away about 1591 to Flanders, where the English troops were fighting with Spain, and served for a time as a private soldier. It is recorded that in the course of the campaign he challenged one of the enemy to single combat and slew him—which is quite the sort of thing we should expect of a young Ben Jonson temporarily cast for the part of a fighting soldier.

In the dappled period of the great Civil War there were two poets, one on each side, who took up arms-George Wither, and Sir John Denham, the author of Cooper's Hill. Wither had had some previous military experience, for in 1639 he had served as a captain of horse in Charles I.'s expedition against the Covenanters. This does not seem to have improved his sense of loyalty to his sovereign, for in 1642 we find him selling such property as he possessed and raising a troop of horse for Parliament. On his colour he had the motto, 'Pro rege, lege, grege.' Impressed by his display of military ardour, Parliament in October 1642 made Wither captain and commander of Farnham Castle. But he was no soldier, and allowed himself to be persuaded to evacuate his post, with the result that he was soon afterwards captured by a troop of Royalist Things would have gone hardly with him but for the intervention of Sir John Denham, who pleaded that if Wither were shot, he, Denham, would be left to be reckoned the worst poet in England. Wither accordingly escaped, and later rose to the rank of major, but was

subsequently discredited, and deprived of his official status in 1644.

Sir John Denham may have accounted himself a better poet than George Wither, but he was equally incompetent as a soldier. Farnham Castle, after its evacuation by Wither, was occupied by the Royalists, and Denham, who, when the war broke out, had been High-Sheriff of Surrey, was appointed governor. But he was easily driven out by the Parliamentary general, Sir John Walker, and in December 1642 was sent as a prisoner to London. He was subsequently released, and rejoined the Court at Oxford, but did not apparently seek any further military distinction.

The half-dozen writers already mentioned all soldiered more or less in the field. Richard Steele did not do so, but must still be credited with a distinct, if not at all distinguished, military career. In 1694, having left Merton College, Oxford, without taking a degree, he enlisted in the second troop of Life Guards, which was then entirely composed of men of birth and breeding. In fact, in those days commands to this corps used to be prefaced by the words, 'Gentlemen of the Life Guards.' the following year Lord Cutts, colonel of the Coldstream Regiment, now the Coldstream Guards, took Steele into his household, and subsequently gave him a commission in his corps. In 1700 we hear of Captain Steele in various connections, notably as one of the principals in a duel, which made a greater impression upon him than might have been expected in the case of such a gay and careless individual. The production of The Christian Hero in 1701 caused Steele, who had hitherto been reckoned the best of boon companions, to be looked on as rather a dull dog, and he became unpopular in his regiment. In 1702 he transferred himself to a new regiment raised by Lord Lucas, and must shortly afterwards have left the army to pursue with such marked distinction the literary career for which he was so much better fitted than he evidently was for serious soldiering.

John Wilkes was more of a politician than a literary man, but the North Briton gives him a claim to consideration in the latter capacity, and we can hardly exclude him from our list on the ground that his only connection with the army was through the Militia, since in the latter half of the eighteenth century service in the Old Constitutional Force meant quite serious soldiering. In March 1759, in view of the threatened French invasion, the force was embodied for permanent duty. The regiment to which Wilkes belonged was the Bucks Militia, and in 1762 he was in command of it at Southampton under Lord Effingham. He carried his politics into his soldiering, and fell foul over one of the articles in the North Briton with Lord Talbot, who was colonel of the Glamorganshire Militia, and demanded to know

whether Wilkes had written the article in question. Wilkes declined to say, but offered to give Lord Talbot the 'satisfaction becoming a gentleman.' A duel ensued, and shots were exchanged without effect. Wilkes then walked up to Talbot and avowed the authorship of the papers. Talbot responded that he harboured no resentment, and the two adjourned to a neighbouring inn and drank a bottle of claret together. But Wilkes had made other enemies by his political writings, and in May 1763 he was removed from the command of his regiment.

At Southampton Wilkes met Edward Gibbon, the historian, who was then captain of the Grenadier company of the South Hants Militia, and whose military career has been described by Colonel Holden in a very interesting article in a defunct magazine. Gibbon had joined the Militia with his father in 1759, and at one time had been so pleased with his new mode of life that he seriously contemplated a transfer to the regular army. But in time the wish for a purely military career wore off, and in the end the monotony of the annual trainings caused Gibbon to sever his connection with the army after a total service of eleven years. In that period, however, he took his duties very seriously, displayed considerable aptitude, and acquired an appreciation of military details which served him in good stead when he came to settle down to the literary work of his life. At a later epoch he wrote that the discipline and evolution of a modern battalion had given him a clearer notion of the phalanx and the legion, and that the captain of the Hampshire Grenadiers had not been useless to the historian of the Roman Empire. During the time of the embodiment of his own regiment, from 1760 to December 1762, he displayed remarkable keenness, and acted as adjutant in addition to commanding the Grenadier com-At the close of the period of embodiment he was promoted major, and eight years afterwards was given the command of the regiment, which, however, he quickly resigned.

Such a 'totally incapable horseman' as Samuel Taylor Coleridge always was ought never to have thought of entering a cavalry regiment, yet it was in the 15th Dragoons that this wayward individual enlisted when he fled from Cambridge to London in 1793. The name he gave was Silas Tomkyn Comberbach or Comberbatch, and when he joined his regiment at Reading he probably found his new life hard enough at first to make him regret the step he had taken. But he won favour with his comrades in the ranks by writing their letters and tending them in hospital, and the officers seem to have taken kindly notice of him. There is a story that he was employed as a mess waiter, and that one day he ventured to correct a classical quotation made by some one at the table. According to another, he met a Cambridge friend who recognised him as a former promising scholar. Either

one or the other circumstance led to his being discharged in 1794 after only a brief spell of military life, which apparently had little or no effect upon him either as a writer or a man.

In most of the preceding cases the terms of military service recorded were comparatively But William Cobbett served for eight years in a line regiment, in which he enlisted in 1783 at the age of twenty-one, and consolidated his connection with the army by marrying a soldier's daughter. As a recruit at Chatham he devoted himself with extraordinary assiduity to mastering the rules of grammar and to the study of English classics, with the result that he obtained early promotion and was given constant employment in clerkly duties. After serving his term with his regiment in Nova Scotia, he obtained an honourable discharge in 1791. Life in the ranks of the British army in those days was very hard, and the men saw little of their pay. Cobbett himself speaks of the difficulty he had in saving a halfpenny which he proposed to spend on a red herring as an addition to his scanty breakfast. But, alas! the halfpenny was stolen, and Cobbett admits that on discovering his loss he burst into tears. After leaving the

rarmy he charged certain officers with having misappropriated regimental funds, but failed to prove his case. He also supported the movement for an increase of the soldier's pay by writing, or assisting to write, The Soldier's Friend. Later, in 1809, he took part in the campaign against the Duke of York for alleged connivance in the Mary Ann Clarke scandals. Finally, it was a trenchant article on military flogging in Cobbett's Political Register that caused his prosecution by Government, with the result that in 1810 he was fined one thousand pounds and imprisoned for two years.

The above list might no doubt be expanded, more especially by the inclusion of several contemporary writers who have been connected with the army. But it is fairly representative, and may be the more acceptable as it deals with names the mention of which does not as a rule convey any distinct military association. In any case, it will suffice to show that, putting aside the genuine literary distinction which some soldiers have achieved, there have been other alliances of the pen with the sword, attended in some instances by interesting and not unsatisfactory results.

RAWSON'S OPAL-MINE.

By ROBERT M. MACDONALD.

PART I.

BUNDEROO is a hot, dusty township in the back blocks of Queensland. It consists of five hotels, three stores, a post-office, and a cemetery. There are also a number of bark huts, humpies, and bush shades. The population—which is constantly fluctuating, owing to the fact that the nearest hospital and prison are in Googoolgi, twenty miles away—is composed of opal-miners, sheep-shearers, bar-attendants, loafers, one gem-buyer, and a postmaster. To give it full credit, there are in addition five ladies (they own the hotels), four Chinamen, three aboriginals, an Afghan, and a nondescript. Some people might still add a police-trooper, a doctor, a lawyer, a Justice of the Peace, a surveyor, a watch-repairer, and a blacksmith; but as all these have already been enumerated in the person of the postmaster, the actual population would not be increased by their inclusion. The chief man in the town was the gem-buyer. He was an extremely patriotic Briton, bearing the name of Moses Macpherson. He ruled with a high hand and a cheque-book, and advertised in the Googoolgi Watchman—a single sheet of saloon announcements, with an occasional item of belated news, price sixpence—that he would buy opal, opal claims, the men who owned them, with drinks for all who had dealings with him. No man could boast that he ever got the better

of Moses; although one half-drunk miner named Rawson, it was alleged by some, had almost done so in the hoary past. This man, after being swindled in an opal deal, had insinuated that Moses had borrowed the latter half of his name, and when the gem-buyer appealed to the police-trooper, the postmaster, the blacksmith, the watch-mender, the doctor, the surveyor, the lawyer, and the J.P., the miner had thrashed them all. True, the J.P. had got him deported afterwards, and only that fact prevented the aforesaid miner from claiming full honours.

One sultry afternoon, when, according to Dirty Peter, the temperature was one hundred and fifteen degrees in his water-bag, the coach from Googoolgi, the railway terminus, deposited a passenger at Bunderoo. Such an event was unusual, for those of Bunderoo's citizens who were set free in Googoolgi walked back if they couldn't steal a horse. Naturally, therefore, all the population rolled out from the five hotels to see who had been able to afford a coach passage.

But the man was an entire stranger. Only Moses himself thought he had seen him before somewhere; but as Moses always had a faint recollection of any one who might possibly turn out to be of any importance, only those who were very thirsty made any comment on his wonderful memory. The stranger became the centre of

interest at once. Clearly he was a member of the Federal Parliament, or a famous author come out from England to write about the simple sons of the bush; else he was a travelling insurance agent. He was tall and clean shaven. His dress was a thing to dream of, as Shandy Bill remarked to Long Tom. It was a weird and wonderful piece of work, the like of which the majority of those present had never seen before. In fact, it was the Sydney city man's orthodox garb, and was as incongruous as a Bunderoo man's very simple attire would have been in George Street, Sydney.

The crowd surged round, and commented freely in choice vernacular on the visitor's appearance. They also speculated intelligently and tersely as to who he was, his business in Bunderoo, and the nature of his antecedents. Then the object of their curiosity spoke, and a hush fell over all. His voice was of a quality unknown to them. They knew what was said; but the words were spoken so quietly, so leisurely, and with a round-off that brought forth a murmur of admiration. 'Good-afternoon—er—gentlemen. Is this the —er—place where you find opal?'

'Lor'!' muttered Long Tom, 'it's the fellow we saw in the picture in last week's *Bulletin*. He's a new chum who hasn't cut his back-teeth

yet.'

'There has been some opal found near here,' said Moses guardedly. 'Do you wish to puy some nice stones?'

'No. I wish or to find some Con you tell

'No; I wish—er—to find some. Can you tell me where to look for them?'

'Anoder dead-proke fool from Sydney or Melbourne,' Moses commented, turning away.

'Tell him vere he'll find opal, poys.'

'We will!' shouted several, and all the others laughed. This gorgeous new chum was the softest thing they had ever seen in the flesh. All followed him into the Hotel Cecil, a galvanised-iron erection famous far and near for the potency of the liquids it kept, and watched him partake of some food. He did not seem to mind in the slightest, and only raised his eyebrows slightly when the postmaster sat down beside him, with the original observation that it was a warm day.

'Is this—er—really warm for this part of the world?' the stranger asked, trying to rearrange his collar, which was now a sodden rag with perspiration. He looked inquiringly at the man

of many parts as he spoke.

'Well, no; the real hot weather doesn't begin till after Christmas; most of the boys are lying up till then, because this weather is too cold.'

'Dear me!' ejaculated the verdant one; 'I am sure I shall not—er—like any more heat than this'

'I'd haul off my coat if I were you,' the post-master suggested kindly; 'and I'll lend you a soft shirt if you like.'

'Oh, I'll manage all right, thank you. If you

would—er—kindly inform me where the opal is, I think I should like to walk over and—er—get some.'

'Lor'!' gasped the onlookers as one man. Then they gave utterance to several other

expressions, also unanimously.

'Excuse me,' said the postmaster, rising, 'I've got to pull a tooth for Cheery Charlie. You're just a bit too much for me.' He walked away, and the new chum gazed after him surprisedly.

'Don't mind him, Mr New Chum,' spoke Shandy Bill sympathetically; 'he has no manners, an' never had, 'cos he 's so much sense.'

'No, don't mind him,' echoed Dirty Peter. 'Come an' we'll show you where the opal grows. It isn't far, and you can be back for tea.'

The stranger arose at once, and, picking up his suit-case, followed the men out into the street. They led him across the creek and over a sandy plain, until they reached some camps where men were working. The procession had grown as they went along, but some of the men had taken turn about at carrying his suit-case. All the miners left their work to gaze at the new arrival; and when Shandy Bill informed them that the owner of the suit-case had come out to get some opal before tea, they laughed a bit, but agreed that there was any amount of opal in the vicinity if a fellow liked to look for it.

'That is—er—what I came here to do,' the new chum said. 'Just tell me the best place,

and I shall start-er-at once.'

'That's what I call real grit,' commented a tall miner known as Fighting Harry. 'If all you loafers had half as much in you, you might do some good.'

'Come off,' growled Shandy Bill. 'It's this new chum we want to see finding opal. I think that hill up there is a mighty good place.'

'You bet your last week's whiskers it is!' cried another miner; 'but it means deep sinking.'

'Dear me! have you to—er—dig for opal?' queried the gem-seeker. 'I haven't brought any tools with me.'

'Don't let that worry you,' said Fighting Harry. 'We can spare you all you'll need; but you can't very well get down to opal to-night, you know; the opal-bearing level is at least twenty feet under the surface.'

'Oh, I'll get there in time,' drawled the exquisitely dressed one. 'Many thanks—er—for

telling me.'

'Don't mention it,' chorused the crowd; and a few minutes later the stranger had started to sink a shaft on top of the slight elevation known as the 'Hill.' The men stayed by him till sundown, giving wonderful advice, and offering many suggestions as to the easiest method of sinking a shaft; but they were certainly somewhat surprised when they saw the force of his pick-strokes. He seemed to be gifted with abnormal strength.

'Ain't you coming back for some grub,

mister?' Shandy Bill asked at length. 'You

can get on looking for opal to-morrow."

'I think—er—I shall continue during the night,' the tireless worker answered. 'It will be cooler then, and I really am not hungry.' And despite everything that was said, he continued to work; and eventually the miners, shearers, and loafers returned to their various headquarters, marvelling greatly that such a fool as this weirdly dressed new chum could live.

That individual, however, as soon as the crowd had departed, stripped off his stiff shirt and worked with redoubled energy, and long after dark the men of the nearest camp heard his mighty pick-strokes resounding through the sultry

night air.

'It isn't quite playing the game, mates,' one of the men remarked to his comrades as they sat round the cheery camp-fire and discussed the event of the day. 'That fool of a new chum will peg out if he keeps slogging on like what he is doing; and we know he'll never strike opal where he is, even if he sinks down to old Britain. I move we stop him, and ask him to join our little crowd. I'll bet he's hard up, but is too proud to say it.'

'That's all right, Disgrace,' said Fighting Harry thoughtfully; 'but he's a blamed idiot, and has got to be taught a lesson. I rather like him, and I'm glad we've got him out of the hands of the town loafers. Still, a fellow who thinks he can come out here and find opal on the surface is fair game. When he gets tired sinking to the other side of the world, we'll take him on.'

Next day all the town turned out to have a look at the new chum, including three of the ladies, Moses Macpherson, and the police-trooper, &c. Most of the loafers gave advice, the ladies gave sympathy, and Moses magnanimously said he would buy all the opal that came from the new chum's shaft at ten pounds an ounce. This was a remarkable offer, seeing that Moses had never yet given more than two pounds ten shillings per ounce for any opal, although doubtless his reselling price was another matter. But the new chum only smiled; he was now almost hidden in the hole he had made, and he ate his crust of bread when lunch-time came, supremely indifferent to his surroundings.

'Poor fellow!' said Mrs Murphy to Moses.
'Shure, an' he moinds me of ould Murphy when
he was aloive, so poor, handsome, an' proud. Is
it thrue that there cyan't be any opal where he

is worrokin'?'

'If there is, I'll puy it for ten times what it is vorth,' the patriotic Scot replied. 'Ah, Mrs Murphy, don't you preak your leetle heart for him; just think of me, and remember I too am handsome and rich and ready to gif you my all'——

'Shure, an' I don't doubt ye, Mr Macpherson,' returned the widow. 'I heard ye were inquirin' what profits my hotel made'——

'Mein honour, no, Mrs Murphy! I vant you, not the hotel.'

Just then the Disgrace stepped up to the new chum, and all heard his words. 'Look here, mate,' he said, 'I'm only a no-good beggar at the best, I know; but you'll never get opal in that hole. You'd better chuck it.'

'An' come up to my place an' get a decent feed,' added Mrs Murphy. 'You cyan make money by buyin' opal, but not by findin' it.'

'Er—I thank you both,' said the simple miner; 'but I know I shall find a lot of opal here. I—er—dreamt that it is just under me now.'

'But a mighty long way under,' rejoined the Disgrace. 'All the same, if you want to dig a hole I'll help you to stick up a windlass, an' I'll come over from my own shaft at odd times an' haul your mullock.'

Some inaudible reply was made, and soon after the people dispersed; the Disgrace, however, remaining to assist in erecting a borrowed

windlass over the shaft.

That night most of the men of the town and the surrounding camps were gathered in Mrs Murphy's hotel to buy up the assets of Melbourne Mike, in the hope of paying the fine inflicted upon him in Googoolgi by some fool of a magistrate for some little act of playfulness; that is, he had in a moment of abstraction or hilarity set fire to the doctor's house. The trooper, the lawyer, the postmaster, &c. had given evidence against him; and if the damage wasn't paid, the alternative was prison. Hence the sale of his effects on his behalf by his comrades. Good prices had been realised for most things—his blanket, his rifle, his cooking utensils, his tools, his dog, and his claim; but no one seemed to want his horse. It was an 'outlaw;' no man had ever ridden it, although many had tried. Mike himself had bought it one day after a circular tour of the hotels, and consequently he couldn't know that he was acquiring a quadruped of no use to him. But its powers of speed were undoubted, if that meant anything.

'Buck up, boys!' cried Long Tom, who was officiating. 'Surely some of you can find use for a high-spirited animal that knows no master?'

'No fear!' laughed Shandy Bill. 'I don't mind planking down a sovereign for poor old Melbourne Mike, but I ain't wanting his horse.'
'I'll give five pounds!' The voice was re-

'I'll give five pounds!' The voice was recognised by all, and laughter prolonged and hearty resounded during the next few minutes.

'I don't know that it's a fair thing to take your offer, old man,' said Long Tom. 'You'd best go back an' keep lookin' for opal.'

'But I want that horse,' expostulated the new chum from the edge of the crowd. 'I can pay—

er-the five pounds.'

'We don't doubt you on that point,' said Long Tom; 'but, you see, this horse is an outlaw, an' not even Fighting Harry can ride it. Now we are white men here, an' we don't want to take a fellow down even if he is a silly new chum who looks for opals on the top of a ridge.'

'I offer five pounds for that horse' the stranger drawled. 'I saw it outside, and I—er—like it.' Oh, all right,' said Long Tom.—'I am offered five pounds, boys. Any advance on five pounds?'

'We ought to advance the price of a funeral,' laughed Shandy Bill, 'for we'll have to plant the new chum when he tries to ride his horse.'

But the smiling individual got the horse, notwithstanding the attempts made by some of the miners to show him his purchase was worthless. When the sale was over, and the men had lined up three-deep at the 'fountain'—fountain is a colloquialism—the new chum approached Fighting Harry, and after inviting him to name the particular brand of 'stagger-juice' he preferred, said casually, 'The opal-levels are not deep in these parts?'

'No,' answered Harry, 'not very, where most people are working; but I fear you'll have to

dig deep enough.'

'I don't think so. Er—by the way, what is about the value of this kind of stuff?' He handed Harry a piece of absolutely first-class opal.

Harry swore, rubbed his eyes, had another drink, and looked again. 'By thunder!' he

ejaculated, 'that is the best piece of stuff I have ever seen. Where did you get it?'

The new chum smiled his usual innocent smile. 'I dreamt I should get opal soon,' he said, 'but I didn't know it would be of value.'

'Howling dingoes! did that come from your claim?' Harry was certainly excited.

'Dear me! I am sorry,' said the horse-buyer, withdrawing his specimen. 'I didn't know I

was doing wrong in looking for opal.'

Harry gasped, swore, had another drink, and then turned to address Shandy Bill. He spoke fluently and fervently for some minutes, and Shandy answered equally intelligently. Fighting Harry turned to invite the new chum to join him in a thirst-quencher, that person had disappeared; and later investigation brought to light that he had gone out to his own camp, pulling his untamed purchase behind him. Before another hour had passed the news that the silly new chum had struck first-class opal in his shaft was known to every unit in Bunderoo's population; and when it transpired that Mulga Mike, Dirty Peter, Tommy the Kangaroo, and several other notables had also seen the specimen of the mine's product, the excitement grew to fever-heat.

RAILWAY PASSENGERS AND THEIR LUGGAGE.

By J. G. HAMILTON-GRIERSON.

THERE is no event in one's life, however ordinary, to which the law does not apply. The mere fact of purchasing a railway-ticket and entering a train involves a series of legal consequences of which the traveller is, as a rule, in complete ignorance. It is with some of these consequences that this paper proposes to deal, the examples in every instance being taken from actual cases which have been before British courts of law.

Railway companies, being common carriers, are bound to accept any person who offers himself for conveyance, and so high a price is set on the safety of human life that the utmost care and diligence are demanded in the carriage of passengers, any accident fairly attributable to the negligence of the company forming a basis for a good claim of damages. While this is so, they cannot be held responsible for accidents resulting from defects in their lines or carriages, or for other circumstances which no amount of caution or foresight would have revealed; so, where a train was snowed up, and a passenger contracted a severe illness through being exposed to excessive cold, no claim was allowed against the company. Nor, again, are they accountable for the behaviour of their passengers, unless there was good ground for suspicion at the outset; they cannot answer for robberies or assaults committed on their lines; and where, in one case, a passenger received injuries from the explosion of bombs which had been brought into a carriage, the company were freed from liability, as having been under no obligation to contemplate such an occurrence.

Likewise, they are obliged to provide safe means of entrance and exit to and from their carriages and platforms. There have been many cases where trains have stopped short of, or run past, the platform, and passengers, thinking that the proper place for alighting had been reached, have been injured. If the misunderstanding has arisen through the fault of the company, by not giving any warning, or by the name of the station being shouted out, so as to invite the passengers to alight, or by the station being insufficiently lit, damages may be recovered; but not so if the passenger stepped out the moment the train ceased to move, without any reasonable ground for supposing that it had arrived at the platform. If one attempts to enter or alight from a train while it is still in motion, no blame attaches to the company for any resulting accident.

Fatalities have frequently occurred through intending passengers being thrown on to the line by reason of the platform being overcrowded; in such cases the company again

escape, unless it can be shown that a greater number of people were permitted to enter the station than the officials could possibly cope In this connection it may be noted that where one is injured in an attempt to save the life of another who is in danger, as actually occurred in the case of a man leaping in front of a train to save the life of a child who was on the line, the company may be made responsible. American and English jurists favour this view, holding that the effort to preserve human life is a universal obligation of such importance that any one risking his life in the fulfilment of such an obligation is entitled to compensation. tish jurists, however, incline to hold to a maxim of their law which states that any one who voluntarily runs into danger takes the risks of being injured upon himself.

Railway companies are also bound to maintain their premises in a safe condition. In one case an action for damages was successfully brought against a company by a passenger who slipped on a piece of ice on the platform and broke a limb; and it has even been argued that a person who falls by treading on a piece of orange-peel may successfully sue the company for carelessness in failing to sweep the platform properly.

While it is the duty of companies to provide safe entrances and exits, their duty does not extend to seeing passengers safely out of their premises; so, where a porter took a drunken passenger out of the train and left him lying on the platform, the company were held not to have been responsible for his subsequently falling on the line and being run over. On the other hand, if members of the public are permitted within the station, the company must take reasonable precautions for their protection. Thus, on one occasion when a person was seeing a friend off, he was knocked down by a carriage door which had been left open; the company had to pay damages, as he was lawfully on the platform, and the railway officials had failed in their duty to see that all the doors were closed before the The same rule applies where train started. accidents occur to passengers who lean out of the window during the journey, unless, of course, they have been tampering with the door-handle, or have been guilty of some reckless act; for, after all, windows are made to let in light and air and not to be leant upon, and people must to some extent be presumed to know how to take care of themselves. So, where a passenger tried to shut the door of a carriage which flew open while the train was travelling at a high rate of speed, and was thrown out in his endeavour, he alone was held to blame for his injuries; and similarly an old lady who, on putting her head out of the window, was struck by a mail-bag suspended from the carriage roof, and died in consequence, was said to have contributed to her death by her own negligent act.

There is a long series of cases in which

passengers have got into serious trouble through travelling without a ticket or with a wrong It is quite legal for the company's officials not only to eject, but actually to arrest, such passengers, for by taking a ticket one is held to agree tacitly to the by-laws of the company, which usually give their officials such authority. Thus attempts to travel in a firstclass carriage with a third-class ticket, or with the return half of a ticket marked 'not transferable 'and acquired from the original purchaser, or with a week-end, tourist, or season ticket after it has expired, are all attempts to defraud the company, for which one may have to pay not only the excess fare, but the penalty attached to the particular offence, and a refusal to comply with the official's demand entitles him to remove the passenger from his place by force.

It should also be noticed that though the fare to two successive stations is the same, excess must be paid if one travels beyond the destination printed on the ticket, as the contract with the company ended there; and since no one is entitled to travel except under contract with the company, the offender is a mere trespasser, liable to fine and ejection. But where a passenger has lost the return half of his ticket, he cannot legally be ejected, because he has a contract with the company, though he cannot prove it at the time.

for a journey partly over the line of another company are the contracting company, and are liable for mishaps to passengers and their luggage, not only on the company's own line, but on that of the other company, who, for the purposes of the through-ticket, are considered their servants.

Again, the company who issue a through-ticket

With regard to a company's right of summary ejection, a curious case occurred in Scotland a few years ago. A passenger had gathered all the tickets in the carriage and handed them to the collector. On examination, one of the tickets was found to be defective. The official thereupon called on the passenger to make good the defect, and on his refusing to do so, forcibly removed him from the carriage. The court held that a person who collects tickets in this way from his fellow-passengers and gives them to the official does not thereby incur responsibility of any kind, and on that ground found him entitled to damages for illegal ejection.

There have also been a great many decisions by the courts as to the legal position of passengers whose luggage has been either lost or damaged. In the first place, before the company can be made liable, the luggage must be properly entrusted to their control, and they must accept custody. To leave it on the platform or to label it one's self is not enough; it must be expressly placed under the care of a railway official. Once it is thus accepted, the company are bound to take charge of it until the journey is finally completed and delivery taken of it at the place to which it has been booked. The mere throw-

ing of the luggage out of the train on to the platform, where it may be confused with the luggage of other passengers, does not constitute delivery; the owner must actually claim it, within a reasonable time, and if it is handed over to a porter who undertakes to bring it to a conveyance at the station entrance, the company's liability continues until he has placed it on the vehicle. Luggage that is taken into the compartment beside the passenger is thereby taken out of the company's control, and they have no responsibility towards it.

One must remember, too, that under their by-laws companies undertake to carry luggage of only a certain weight and size with the passenger free of charge, and that it is only personal luggage, such as is required for one's own convenience and necessity, that is so carried. For what does not fall under this description there is an extra charge, and if this is not paid the safe carriage of the luggage is not ensured. It is most important to remember this, for if there is packed in a portmanteau anything that is not of the nature of personal luggage, no claim can be made on the company for its loss, for it is just against such occurrences that the companies seek to protect themselves. The following are examples of what the courts have decided not to be 'personal luggage: 'paintings, groceries, legal documents, an invalid-chair, a bicycle, a rocking-horse, bank-notes, furniture, household goods, and merchandise of any kind. So, where a passenger lost luggage containing one hundred and eighty-eight gold and ten silver watches, valued at one thousand eight hundred and ninety pounds, he was allowed to recover nothing, because he had treated these as personal luggage instead of as merchandise; and a master who sent his servants on ahead by an early train with his luggage obtained no compensation for its loss, as it was not the personal luggage of the passengers with whom it had travelled.

Again, by the Carriers Act of 1830, railway companies are not answerable for the loss or damage of goods of a certain class, over the value of ten pounds, unless their value is declared and an extra charge paid. The specified goods are mainly articles small in bulk but large in value, such as jewellery, coins, hand-made lace, or fragile objects, such as glass or china. The company may, however, waive their rights if the contents of the luggage are made known to them, and are accepted without the additional payment being demanded.

In the same way, on leaving luggage at the Left-Luggage Office, it should be noticed that the conditions of deposit are printed on the ticket issued, and that by the acceptance of the ticket one is held to agree to these conditions, which are, again, mainly to the effect of limiting the company's liability for the value of the

goods deposited.

Railway companies, too, are always careful not to guarantee the punctuality of their trains, and if one misses a connection through a train being late, one has no claim against the company, for all they promise is that such a connection exists, and that they will do their best to ensure the trains starting and arriving at the hours stated in their time-tables.

It is thus seen how readily one engages in contracts of the very existence of which one may be totally unaware. Railway companies are now so protected by statutes and by-laws that damages can seldom be recovered unless negligence or misconduct or some felonious act can be proved against the company or their officials. One would do well, therefore, to read the conditions printed in time-tables and on tickets, and to study the regulations of companies, in order to ascertain to what it is one is accustomed to agree, tacitly and unconsciously, every time one undertakes a journey by train.

THE ROOF OF THE WORLD.

By Captain P. T. ETHERTON, F.R.G.S.

NORTHWARD of the great mountain barrier which divides India from Central Asia lie the Pamirs, that region of awe-inspiring immensity fitly termed the 'Roof of the World,' lying as it does at an average elevation of thirteen thousand feet above the sea-level. The Pamirs, forming the nucleus of the Central Asian highland system uniting the Himalayas and the Thian Shan with the Hindu Kush, are a region which attracted much attention some years ago. The 'Roof of the World' is no tableland, but rather a mighty mass of lofty, high-pitched ridges and gables, with narrow valleys, hollows, or leads between. Such soil as there is has been formed by the detritus of avalanche-swept shale and

gravel, and it is amongst these interminable leads of the world's roof the natives subsist by herding a few flocks.

Both from a political and sporting point of view the Pamirs have attracted much attention, though their military value is a negligible quantity. What, it may be asked, was the origin of the Pamirs? The term signifies an upland plain, and embraces the whole of the mountainous region of this remote corner of Central Asia. Their exact origin rests somewhat in obscurity; but authorities on the subject explain them as ancient glacier-beds and moraine which were brought down from the mountains, and which the streams have been unable to carry away.

The total area of the Pamirs is about twenty-five thousand square miles, the greater portion being within Russian jurisdiction. The Taghdumbash Pamir, situated within the boundaries of China, is the only one now available to European travellers, since the Russian Pamirs were closed to foreigners some years ago, a rule Russia rigorously enforces by keeping jealous watch and ward.

The chief object of interest attaching to this bleak and inhospitable land is the *Ovis poli*, whose horns form one of the finest trophies in the sportsman's collection. This grand sheep, the largest of its class, being the size of a donkey, carries long curved horns which impart to it a majestic appearance. The existence of *Ovis poli* was first made known to the world by that famous traveller Marco Polo, who traversed the Pamirs more than six hundred years ago, and from whom the animal derives its name.

The people met with are the nomad Kirghiz, a tribe distributed over Central Asia, whose origin has been subject to considerable speculation. Mention is made of them in Chinese annals as far back as the ninth century A.D.; whilst it has been surmised that they may have been part of the army of Alexander the Great when that famous monarch passed through Central Asia from his invasion of India. In religion the Kirghiz are Mohammedan, albeit they cannot be regarded as strict followers of the Prophet. Their type of feature is distinctly Mongolian, with almond-shaped eyes and prominent cheekbones. In stature they are about the middle height, with thickset frames adapted to withstand the rigours of a climate noted for its severity. As in the case of the Tibetans, they pay scant attention to the old adage that cleanliness is next to godliness, soap and water being practically unknown quantities with them where ablutions are concerned.

The dress of the Kirghiz consists of sheepskin coats and trousers, with leather knee-boots. On the head is worn a fur cap which can be pulled down over the ears. The women dress in a similar manner, with the exception that coats lined with cotton-wool are worn. Their head-dress is peculiar in that it comprises a large square turban of white cloth, those of the wealthier classes being adorned with gold embroidery.

The Kirghiz gain a scanty subsistence by herding their flocks on the bleak uplands of the Pamirs; and during the winter, when the snow and intense cold render life on the higher ground impossible, they retire to the valleys, some of them migrating to the Afghan Pamirs, where the high winds sweep the pasturages bare of snow, affording a meagre grazing. The nomads possess large herds of sheep of a species peculiar to the highlands of Asia. This is the dumba or fat-tailed sheep, an animal, as the name implies, possessing a large tail hanging well down in the

shape of a pear. The fat in the tail is reputed to sustain life when the pasturages are snowed over in winter or the sheep are otherwise unable to find sufficient nourishment. This fatty appendage imparts a curious aspect to the sheep, more especially when running, as it has a 'wobbly' motion that prevents rapid movement.

The habitations of the Kirghiz are the yurts or khirgas constructed of felt on a circular wooden framework, with an opening in the centre at the top to let out smoke. The interior is carpeted with rugs and numdahs, and in the case of the wealthier Kirghiz is hung with embroidered cloths and trappings, imparting a pleasing and artistic effect.

The fuel in use on the Pamirs is yak or camel dung, which emits a pungent but not offensive odour. There is another kind of fuel known as burtsa, a stunted scrub, the roots of which are inflammable, and make an excellent substitute for wood. It is plentiful along the valleys, and collected by the Kirghiz for winter use.

The main articles of diet of the nomads comprise milk, cream, and mutton; while their chief beast of burden is the yak, an animal which is able to live at great elevations and endure intense cold, but which dies in the slightest heat. The yak is a member of the genus ox, his peculiarities being long hair on the body and shoulders, and a big tuft of hair on the tail. He is indigenous to Tibet and the Pamir region of Asia, where the high altitudes are eminently suitable to his constitution. The yak carries his head downward, and this has given rise to a quaint belief amongst the Kirghiz that many centuries ago two yaks wandered on the bleak uplands in company, until one day one of them disappeared, and was never seen again. The survivor wandered far and wide in search of his brother yak, keeping his nose to the ground in the endeavour to pick up the scent; and hence, according to the Kirghiz, the reason for the yak always holding his head downward. These animals are wonderfully sure-footed, and are capable of negotiating ground where it is scarcely possible to find a footing.

The cold on the Pamirs is extreme, at times assuming a rigour that renders life there the reverse of pleasant, with usually a wind resembling such a hurricane as one encounters off Cape Horn in December. Here it is indeed a case of the survival of the fittest, for only the strongest constitution can withstand the Arctic severity of the long winter months.

Ovis poli, the largest of all the wild sheep, is the blue ribbon of mountain sport, a good pair of horns attaining a length of sixty inches and upwards, the record head being one of seventy-five inches. Lying along the valleys and on the slopes of the Pamirs one sees many old horns of poli, silent witnesses to the devastation caused by wolves and the hunting Kirghiz. One day, when out shooting, I came on the scene of a

former Kirghiz drive, counting over sixty heads, some of which would have constituted magnificent trophies. The drives in which the Kirghiz indulge take place in winter, when, the snow being deep and soft, the poli are more easily run down. Drives are conducted somewhat on the following lines. A point is selected, generally a narrow 'nek' or ravine, where low stone sangars are constructed, behind which the Kirghiz marksmen take up their position. The poli are then rounded up by dogs, and manœuvred to make them converge on the 'nek,' through which the majority pass in headlong flight. This is the Kirghiz opportunity for slaughter, an opportunity of which he takes full advantage, usually bagging several poli. The object of these drives is to secure a supply of skins to make boots and clothes, whilst the meat is smoked and stored for consumption during the summer. Wild dogs also infest the Pamirs, and to their ravages the diminution in the numbers of poli is largely due.

Of the region lying beyond the Pamirs some account may prove of interest. Having penetrated the great glacier passes of the Kuen Lun Mountains, fringing the eastern confines of the Pamirs, the traveller reaches the summit of the barrier which stands between him and the plains of Chinese Tartary. From an altitude of nearly twenty thousand feet a grand view unfolds itself. Toward the Pamirs it is a display of snow-capped heights, with great spurs running out parallel to the main range, the valleys and ravines in between being lined along their lowest levels with a thin silvery thread denoting a rushing torrent flowing from its glacier-bed above. Turning to the east, and looking over that portion embracing the plains of Chinese Turkestan, is seen a chaos of lower mountains, and beyond them a level horizon bounding what appears to be a distant sea. These are the deserts of ancient Tartary, and that blue haze conceals towns and provinces which are invested with a halo of romance, and which have, more particularly in recent years, given rise to questions of

deep political import.

With the descent from the Pamirs the hardships of the journey decrease, but its interest and romance increase daily. Strange peoples are encountered who live their lives far away in the heart of Asia, unmoved by the turmoil of the outer world, and oblivious of the mighty march of civilisation and the marvels it brings To them the meanest thing is in its wake. a nine days' wonder, and the passing of the Feringhi from regions beyond their ken is the event of a lifetime; no Parliaments occupy their attention; no Press sways their opinions; no suffragettes exhibit their importunities. With them the struggle for existence is reduced to a minimum, and, content in their humble surroundings, they heed not the passing of empires

and the onward march of progress.

Thus one reaches Yarkand—a walled city in a desert plain-through an imposing gateway in the mud wall some thirty feet high, along the top of which it is possible to drive two carriages abreast. Notable at the gateways of Chinese cities are prisoners condemned for various offences. A common sight is the canque, a heavy square board fastened round the neck, and varying in weight from thirty to fifty pounds. The unfortunate individual undergoing this punishment must perforce carry this formidable instrument during the whole period of his sentence, making sleep a difficulty and life for the time being a torture. Often when thus exposed he is the butt for the jeers and missiles of passers-by. At another of the gateways a striking example of the drastic methods adopted by Celestial justiciars was afforded. There were two malefactors, incorrigible thieves, it appeared, who had become notorious and a source of considerable trouble in the city. To put an end to their practices and prevent their getting about, their ankles had been slit, a knife having been thrust through and the tendons cut. Thus they were crippled for life, and an effectual stop put to their evil-doing, a warning not likely to be without its effect on other would-be male-

The governor of Yarkand is a Chinese of high rank, and the official call on him which one pays is remarkable for the curious customs and observances with which it is associated. A mounted escort precedes one to the yamen, or official residence, to announce the coming, and on arrival at the courtyard one goes through numerous gateways, and then dismounts. After one has passed on to a raised dais more gates are thrown open in succession, and, preceded by a Chinese holding aloft the visiting-card—a long strip of red paper with one's name inscribed thereon in Chinese characters—one reaches the inner courtyard. Here stands the governor, waiting to greet his guest; and then more doorways are passed through to the reception-room, where a chair is placed on each side of a small table laden with sweetmeats and other delicacies. The conversation is then carried on through interpreters, which is a rather wearisome mode of procedure. On the occasion of my visit the governor, or amban, inquired if I had experienced any hardships on the road. I replied that I had, but that the pleasure of coming to Yarkand and meeting him had entirely obliterated them from my memory. He said London must indeed be a gorgeous city; and I answered that it could not be compared with Pekin—a subtle and certainly ambiguous compliment. He thought England was a mighty country, with which remark I mentally agreed; though my reply was to the effect that China was a paradise on earth. He inquired as to the reasons for my indulging in poli shooting on the Pamirs, asking if I converted the horns into medicine, this, in

his opinion, being the only possible use they could be put to. Being obviously dissatisfied with my reply, he then inquired if I had been sent into this distant land of mountains and shikar to learn how to shoot!

During my stay in Yarkand the amban gave a banquet in my honour, and the quality and quantity of the entertainment were proportionate to the great man's dignity. The dinner started at one o'clock with two courses, but these were only a preliminary canter. A short interval supervened, and then we resumed the repast, this time in earnest, the feast lasting until six o'clock. It was a fearful ordeal, course succeeding course until I lost all count after twentyfive. There were sharks' fins, bamboo-shoots and bamboo-roots, pigeons' eggs preserved in chalk, stags' tendons, lotus-seeds, boiled duck (which was served in a dish of beautiful workmanship, the bird being made to appear as though swimming on the water), liver of all kinds, and a host of weird and strange comestibles that might well have appalled a stomach of iron. I suffered the whole programme, even to tackling a sea-slug with as many legs as a centipede. To have passed this delicacy would have been an offence to his Excellency's susceptibilities; so, steeling myself, I swallowed the ghastly thing, and thus The acme of politeness saved the situation. at a Chinese banquet is for the host and others to single out any choice morsels on their own plates, or from the table, and deposit them on the plate of the principal guest. As I had the doubtful honour of fulfilling that rôle, every one proceeded to bombard me with questionable titbits, much to my embarrassment.

Some strange tricks were played at this Chinese banquet, one of them being to hand round a lighted match placed in the end of a matchbox, the unfortunate guest in whose hand the match goes out having to quaff brandy, the results in some cases being highly exciting. Then one of the guests, yelling something in Chinese, will extend three or four fingers to another, who responds by thrusting his hand across the table with a similar yell that sounds like the crack of doom, the loser in this fast and furious game also having to quaff brandy. An old gray-bearded military officer who sat on my right excelled at this pastime, and I imagine lengthy experience in this connection obviated easy defeat.

At six o'clock the amban announced that as, so far, we had not enjoyed anything substantial, he proposed giving us a spread; upon which bowls of meat and rice were brought in, the Chinese guests, whose capacity seemed unlimited, doing ample justice to them. At the close of this Gargantuan repast all present took their departure, one of the customs at a Chinese dinner being for the guests to leave immediately after the function. So, having bade adieu to every one, I mounted my charger and rode away,

after an experience the memories of which will long remain.

During my stay in Yarkand I had an opportunity of seeing something of the Chinese garrison. The troops were of all ages from sixteen to sixty; their armament was decidedly antiquated, some being provided with Tower muskets, blunderbusses, and spears, whilst one man carried a battle-axe! The total strength of the garrison is, I believe, returned at five hundred men, but the actual strength was under a hundred. In this land of sin and corruption every one robs and cheats, and those who are not past-masters in the art of bribery stand no chance in the competition for posts. There is the case of a certain amban whose defalcations were enormous, he having, amongst other things, maintained a force of five hundred men on his books as the strength of the local garrison, and continued to draw pay, rations, and equipment for this number, when in reality he kept but forty-two. This lasted for twelve years, at the end of which he must have been passing rich. Finally, matters reached such a stage that he was dismissed, and ordered to give explanations to the Governor-General. This must have been effected to their mutual satisfaction, for he is now back in his former post. I was informed that shortly before my arrival at Yarkand the officer in charge of the troops had been directed from Pekin to submit a report on the musketry training of the troops under his command. He therefore paraded the garrison in the courtyard of his yamen, where the gallant soldiery blazed off their ammunition in the air, the while his Excellency sat down and smoked the pipe of peace. At the close of this instructive course of training the latest idea in musketry returns was sent in, with an indent for more ammunition!

Despite the general corruption, China appears desirous of consolidating her power. Since the Russo-Japanese war she is awakening to a sense of her responsibilities and the latent strength she possesses, and is doing much to purify the system of administration.

A MESSAGE.

WHEN all the world is wrapped in autumn mist, When autumn winds are blowing as they list, And fallen leaves are deep along the lane;

When in the west the last red streak of day Is blazoned on a sullen ground of gray,
Flinging a dreary gleam upon the plain;

And when you miss my voice and presence most—When thought of me has, like a solemn ghost,
Crept on your mood of mingled joy and pain—

Then let this message all your life enhance:
Though sad the falling of the autumn rain,
Though we are swept apart by circumstance,
Yet spring—yet spring and I shall come again.
ERIC DEXTER.

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, Yesterday.

O, God of battles ! steel my soldiers' hearts.

THE other evening, when in fancy the roaring of cannon and the crackling of the riflefire of miles of infantry across the water destroyed our peace and made a vague, a tremulous uneasiness, we turned over the pages of a little work prepared in the French some years ago by Madame Marie Dronsart upon the life and efforts of Prince Bismarck, and a passage was reached in which we discovered the Chancellor of blood and iron in such a mood of melancholic reflection as sometimes seized him in his later years. decades had gone by since the German victory over the French, when Bismarck was deeply thoughtful one night at Varzin. Alarm and horror grew in his remembering conscience. He was sitting near the fire after dinner, and as he looked into the flames, feeding them in an idle, disconsolate way with fir-cones, he murmured, as he had often done before, that all his tremendous deeds and political activities had gained for him little contentment and even less friend-Nobody liked him for what he had done. He had not, for all his effort, gained the happiness of himself or of his family or of any one else. One of his companions suggested that, after all, he had made the happiness of a great nation. Bismarck answered, 'Yes; but the misfortune of how many? Had it not been for me three great wars would not have taken place; eighty thousand men would not have perished; fathers, mothers, brothers, sisters, widows would not have been plunged into grief and mourning. I have settled all that with my Creator; but I have gained little or no joy from all my work.' At such a moment, and at others that followed it, when he endured humiliations from the young Emperor, who had dreams-foolish dreamsthat were beyond his own practical mind, and arrogantly dismissed him, it was possible to be sorry for even the callous Bismarck, who was known to wonder what Germany would be in the next generation, whether the greatness and security he had given her would remain so strong and firm twenty years after-now.

So it seemed that the remembrance of those eighty thousand slain rankled in the conscience of the aging Bismarck. What, then, of the No. 200.—Vol. IV.

[All Rights Reserved.]

Kaiser Wilhelm, who has so lightly and wantonly made his war against the best part of the world? In the Bismarckian times armies were little things, mere boxes of soldiers, compared with what they are to-day. It was a very great battle that took place at Waterloo, and mighty enough were the issues that were involved; but ten times the number of soldiers have been arrayed against each other in France and Belgium lately. A few fields and a farm-house and a wood or two were once enough for the greatest battles, but now a frontage of something near two hundred miles is needed for the war game of a Kaiser. Two million men or more are brought to face each other at the instance of a demented Hohenzollern. The eighty thousand slain that Bismarck lamented may, alas! be multiplied many times in the appalling conflict that the Emperor William, in his whim, has brought about. Wars of old were innocent pastimes in comparison with the horrors that are perpetrated now. Once it seemed that life had some value even when enemies met in battle. One recalls the early barbarians. methods were simple, and they were blunt. They were savage and cruel perhaps, and yet was there not a certain human spirit and system in their methods? They were cunning—yes; but they seemed to feel imposed upon them by Nature an immovable limitation to the principle that all is fair in love and war. Since the decline of hand-to-hand fighting through the development of long-range gunnery and the possibility of shooting at an enemy and killing him though he be out of vision some miles away, what we may call-and in no light and foolish spirit either—the sport of war has declined also. In the old days warriors played the game. They met in armour on a field of battle, and they fought in the great spirit of those who were playing the most terrible of games. There was enmity enough; the feeling of hatred was as high as ever it was; there were duels to the death. But with the circumscribing of the area, the limitation of the forces engaged, the clashing of steel with steel, the simplicity of methods and weapons, and the lack of that intense organisation and scientific development which have been attached to warfare in these latter days, the human sporting spirit, the sense of the

SEPTEMBER 26, 1914.

game being played, was still a strength, and making an allowance for the weaknesses and the bad instincts of human nature, which may never be entirely suppressed, they were a faint justifi-cation for the wars. We must confess, as we look back along that blood-stained road upon which the poor world has travelled since its birth, that long road of event and disaster and progress with zons for the milestones, and see upon the far horizon of knowledge and imagination the early savages and the body-stained barbarians, there is something to admire in them -more than we had thought-and not a little to envy. Those primal fellows played the game. In that they were but as animals, and warred much as the most intelligent quadrupeds might have done; they kept close to Nature, and those who do so, being natural, are not in the ultimate judgment to be considered as utterly blameful. On and on along this road, past son and son, the world, with its wonders, its increasing organisation, and its fast-developing nerves, has come to this terrifying present. Man, as we understand, is far more civilised than ever before. He has learned more; he has discovered more; he has probed more. With hot irons he has dragged from the earth its most sacred secrets; he has ripped open the bodies of beasts, and, with all science to aid him, has seemed to challenge the Creator in a search for the very secret of life itself. Nature he has fought at every turn. He has flown higher and farther and faster than the birds; the biggest fish of the sea in their own true element are stupid things in comparison with him when he goes to work beneath the waves, and, wrapped in lightning, roams below the mightiest ships. Science has made a new discovery every day, and at once it has been applied to warfare. The aeroplane, the submarine, the wireless messages—oh! everything, each discovery and all of them, must go to the departments of war for this use in the killing of the people. Science, and science alone, with its servant, engineering, has brought us to such an awful pass of over-civilisation, over-development, and fearfully organised and elaborated war-system that, considering now the full account, the profit and loss in the great balance-sheet of humanity, we must feel we have paid out too much—the price of discovery has been too great.

Some of us have been gazing lately on a strange picture that has been presented to us as that of a German siege-gun. It is a reproduction from a photograph, and to the thoughtful mind must be considered the most revolting picture of a piece of machinery that has ever been presented. The heart sickens at the sight of it. Until we looked on this picture, it was not imagined that any piece of machinery, a thing of tubes and wheels so beautifully made and put together by man, could be really revolting. In mere machinery there cannot be much that is

beautiful. There is little of art in nails and screws and cogged wheels. But in the intricacy and ingenuity of a mechanical thing there is at all events something to admire. The cleverness of man is suggested, and most machinery is for industrial purposes, and therefore to the advantage of life. It is very material, but it is most convenient. At its worst, it is a little ugly. No pleasurable emotion is stirred in us as we contemplate a traction-engine. But nearly alone among machinery, even war machinery, this German siege-gun is the very negation of all that is humanly right. It is not only that the true function of machinery is the making of convenience and the facilitating of the speed of life, but here we have the most hellish ingenuity expended for the wholesale destruction of man and all his works as gathered together in his towns and cities; and it is as if for once a Power that is above all men and war had determined that the horror of the thing should not be disguised by smooth steel and delicately fitted wheels, as is done in other instruments of warfare, but that its utter monstrosity should be stamped indelibly upon its countenance. I have been almost pleasantly interested in seeing crackling experiments made with a Maxim-gun, so neat and delicate is it; and I have seen a nobility, a glory of dignity and strength, in the grand guns that send their shattering broadsides from our men-ofwar. But these German siege-guns are in their very appearance outside all human mechanical decency and respectability. Two high, gaping, forbidding tubes pointing upwards to the sky, a mass of complicated cogs and handles below them, two giant wheels for traction purposes, and the gruesomeness of the construction much enhanced by the flapping, clattering, clanking floor that each wheel carries for itself round about its periphery, so that this monster may writhe itself through the fields of golden corn, and a long and ugly tail of steel-this, with vice and evil and loathsomeness stamped upon every inch of its horrible construction, is the German siege-gun—the alligator, the boa-constrictor of machinery. But I think I would rather have an alligator in my garden than a German siegegun, even though the siege-gun were my own. If I have here seemed to dwell overmuch on one piece of modern armament, which happens to be German, when there are many dealing out death more liberally and speedily in this war, it is not because it is German, the thing of the enemy -and, indeed, in effectiveness it may, like so many other German instruments of battle, be a comparatively mild and pussy-cat sort of thing after all—but because of its outward impressive ness, and because in appearance it seems to stand out as an ultimate achievement and application of science and mechanics. Our science and discovery have brought us through many eras to this! Our chemists have experimented in the laboratories, our mechanics have laboured in the

workshops, and day and night our inventors have squeezed their imagination dry, and clawed into the bosom of Nature for another scrap of secret, to produce at the finish the German siege-gun, which is meant to destroy men and all their possessions, their homes, their belongings, their treasures, and their works of art, and to leave nothing behind but a charred and blackened mass of bones, the most awful mockery in the world, a revolting exposure to the blue skies of heaven above them.

Let us go back to the Kaiser and his Germans, this dangerous monarch of Europe who to satisfy ambitious whim would dare an experiment that involved the risk of his empire, the devastation of a continent, the upset of a world, the fighting of millions, and the destruction of appreciable parts of millions. All this is not war. Real war, as we have suggested, has some of the natural sporting attributes of games, and in ages gone it has encouraged the best attributes of manhood; it has uplifted peoples in their spirit. But this conflict, along a frontage of hundreds of miles, of millions of helmeted Teutons, ignorant of whom or where they fight, is not a war. It has not that dignity. Slender as may be the virtues of battles, this European carnage has on the German side not even the slenderest for a saving grace. There is only one description of it. It is the most awful bloody murder that has ever been perpetrated. No accidental disaster on sea or land, no destructive visitation upon the earth of Nature in a vengeful mood, can compare in the awfulness of results with this Kaiser-slaughter. Napoleon was ruthless enough, but he loved the game of war, and he played it like the accomplished master. This Prussian madman, conceiving that in the modern way of doing all things greater than ever before, and determined to war on a grander scale than Napoleon, overlooked many things, and among them that war has limitations, and that in battles of millions there is not war but murder, the simple and useless sacrifice of human life. Marshal Saxe, speaking of armies and the possibilities of generalship in battle, once said, 'Beyond forty thousand I am out of my element.' The Kaiser, this stupid Hohenzollern, obsessed as he has been from his very childhood with a gross exaggeration of the war spirit, has been out of his element all the time in this modern world, and never so much as now, when his time is ending. What an absurdity is the Hohenzollern in the twentieth century! What an irritating reflection on the common-sense of the world!

It is because this impossible monarch conceived that the destiny of the earth was a military spectacle of fire and sword, trumpets and carnage, such as would evoke the admiration of the universe, that the world is now stopped. One suspects that this royal Prussian shuns the

reflection that his earliest ancestors did not come down to earth with the sword in their hands from heaven itself. But the truth—and the curious truth, seeing the overwhelming sway the Kaiser has exerted on the German people-is that the origin of the Hohenzollerns was nothing more than paltry, and only the madness of their conceit and their stupendous presumption in claiming alliance with the Deity in the furtherance of their schemes have held them in their place. Eight hundred years ago the Hohenzollerns, living in southern Germany, taking their name from the place where they dwelt, were of no more account than any other family of no pretensions and achievement. Then came Conrad of Hohenzollern, who did some good service to the Emperor Frederick, called Barbarossa, married a feudal heiress, and became partly by right of marriage and partly by imperial favour hereditary governor of Nuremberg. Three hun-dred years later the family received promotion by Frederick of Hohenzollern being given a high place in imperial favour, receiving the title of Marquis of Brandenberg, and being allotted the task of defending the north-eastern frontier for the Emperor. And from that time these Hohenzollerns have increased in their pretensions and arrogance and their domination of the German people, whom now they have at last led to ruin. In the latest of the Hohenzollerns the accumulating instinct of war, and the madness of belief in a military offensive and defensive alliance with Providence, reaches beyond its limit, and makes ruin with its excess. It is a sad thing for the Kaiser and his unhappy country that his family obsession ripened to its utmost when Germany should be most agreeable to it. If, in the end, science, as is suggested, has turned on the world for its unhappiness and destruction, Germany is the Mecca of modern science. Science stands for materialism, and the modern Germans are the most utterly materialistic people in the world, as they are the greatest in the laboratories and the philosophical schools. But science is not culture, and no greater mistake was ever made than in the description of the modern Germans as a cultured people. In the past their land has been the home of abounding genius. Art and music have bloomed in it most gloriously. Rhineland gave not to a state but to the world the incomparable majesty of the music of Beethoven. Mendelssohn and Wagner, as much magnificent as opposite, raised the artistic rank of Germany in the pre-Kaiser Wilhelm days. True, there are artists and musicians in Germany now, masters of high rank and people of exquisite taste. But as a nation it is not what it was of old. As it has abandoned itself to the plague of science, its inner culture, its soul refinement, has been weakened. Grossness and materialism have cankered it, and now, in a mad fury, it has leapt to an attempted murder of the world. Forces have been at work in many parts of the world for a long time past

that have been conducive to this war. In Britain there have been such forces. We, who, in the best of peaceful faith, have built ships of war because others have done likewise, are not entirely guiltless in the reckoning of the cause. But we and others feared the utmost outrage conceivable against the human race, and shrank from it in horror. Most of Europe, armed to the teeth as it was, would have spared the history of the earth from this appalling murder, unthinkable in its proportions. In times of peace we will spend days and weeks in the most careful trial of some

poor fool who has killed another, and is not entirely without excuse for doing so. King's Counsel will argue, judges will sum up, and juries will most carefully decide. Not the German people, but the military autocracy of Germany, led by the Kaiser, has gone forward to the murder of tens of thousands, and to the perpetration of the most horrible atrocities and cruelties, with the plain motives of lust for blood and conquest. What is to be the end of this Hohenzollern? He and Prince Bismarck may have a pretty meeting in the shades.

THE INTERRUPTED WEDDING.

CHAPTER IV.

ARMED with the surgeon's certificate, once I could get out of Egypt I knew I should be all right. Months and months went by; but at last the war came to an end in May 1802, and we sailed for La belle France, and arrived there after a three weeks' voyage. This voyage had such a beneficial effect on my health that my arm was hardly any source of trouble to me, and I began to fear whether I should be able to make the doctors believe that I was no longer fit for service; this, however, I may say here, I was easily able to do.

When we got to the depot we found a great number of conscripts there. Almost the first I met was Franz Brendel, the blacksmith's son. The young fellow stared open-mouthed at me, as though I were a ghost. 'Donnerwetter' he exclaimed as he saluted, 'is it, can it be, Sergeant

Kleinberg?'

'Of course it is. Why should it not be? And who the deuce are you?' I answered.

'But Reichardt got a letter from Egypt,' he said, after he had told me who he was, 'saying you were dead, and that was a year ago.'

'And what business was that of his? What

reason had he to spread that lie?'

'What business? Well, he is au pied du mur. He sold some pearls you gave him, and speculated in hops with the money he got for them. He made a lot of money at first; but he speculated again, and lost all he had made and a great deal more. He had to go for help to his wife's brother, but that person said he would assist him only on condition that he should marry Bertha. She, gentle as she is, would not consent. Then the letter came, and the poor girl, who was wretched at home, consented to marry him after a year. That time, I should say, is about up. She may be married by now; if not, she will be very soon.'

In a flash I saw the whole diabolical scheme,

In a flash I saw the whole diabolical scheme, and as I realised the depths of Reichardt's villainy I could not trust myself to speak for a little time.

'Come to my quarters,' I said as soon as I had got over the shock.

When we were there Franz Brendel gave me fuller particulars, and he also told me that Mark was going to marry his sister Adeline, and that he himself was going to marry Susanne Reichardt when he could satisfy her father that he had sufficient money. Of course I naturally was interested in all this, but the world seemed to swim round. The thought that perhaps, after all, Bertha was married possessed me. I was consumed with anger. If she was married, Heaven help her father and her husband, for they would get no mercy from me, if I were shot for it. I should have left, in any case, the following day, as I had to take some papers from the colonel to Major de Tocqueville; but I went to the colonel and told him everything, and he gave me permission to start at once.

We had passed Besançon, and were approaching Belfort, slackening our pace going up a hill, when I saw four soldiers in front of us; and, much to my pleasure, one of them was Boursot, who was returning to Metz. He gladly accepted a lift. I was as glad to see him as he was to see me, for we had plenty to tell each other. He, of course, knew nothing of Reichardt's treachery, and, like me, feared that I should arrive too late to prevent the wedding.

Major de Tocqueville welcomed me warmly, and, of course, we had a great deal to talk about. He wanted to know all about his uncle, the regiment, and the battles I had taken part in. I showed him all the jewels I had got, including the fifteen pearls. These latter he showed to his wife. She was a beautiful brunette, and, being very rich, wished to buy them at once. But as none of us had any idea of their true value, the major gave me a letter to a famous jeweller in Paris, saying his wife would give me 20 per cent. more than his price; thus we should both gain, as the jeweller would want at least a profit of 50 per cent. The major would have liked me to stay all night at his home; but I told him Boursot was waiting, and he saw my anxiety to get to Strasbourg. So he arranged that he would be at the bank when it opened the next morning at nine, and give me the five thousand francs, and then I could tear off to Drelheim immediately. We only just managed to reach the city ere the gates closed.

I stayed at a small posting inn called the 'Adler.' I knew the landlord well, and he knew, of course, that I was to be married to Bertha.

'Ma foi!' he exclaimed as soon as ever he saw me, 'can it really be you? Why, we all thought you were killed months ago. You are only just in time; you will only just do it.'

'What do you mean?' I asked in a sinking

voice

'Why, the wedding is to take place to-morrow,' he replied, 'and the gates are closed now, and they won't be open till six to-morrow morning.'

'Where does that rogue Detzler live'—Come on, Boursot. I will give him the greatest hiding

he ever had in his life.

The landlord fetched a stout riding-whip, and we all three started; but the old housekeeper at Detzler's told us that her master had gone to Drelheim, and that the brewery would be closed the next day, as the men were all going to the wedding. Not finding Detzler was a bitter disappointment; but I consoled myself with the knowledge that I should soon get level with him, and so we returned to the inn and arranged that Boursot should set off at six the next morning to tell Reichardt I was coming.

At an early hour the carriage was ready, and I wrote two notes, one to Mark and another to the pastor, and arranged that the lad who drove should leave Boursot at the inn, then drive on at once to deliver the letters, and Boursot would follow him. To ensure quickness I gave the lad a louis, and promised him another if he fulfilled

his mission.

I engaged another carriage, and chose good horses, and after a substantial breakfast I went round to the bank. At nine o'clock, temps militaire, the major's beautiful calèche drove up. In a few words I told him the dilemma I was in.

'Allons!' he cried as we hurried into the bank. 'There,' he said as he gave me five one-thousand-franc notes (or, rather, their equivalent in thalers); 'and that's for interest,' he added, putting down some more for one hundred francs each. 'You will be in time; but hurry up, and good luck to you; and if I can I will come over

myself for the wedding-breakfast.'

'Thirty thalers if we do it in time,' I said to the post-boy after I had thanked the good major, and the next minute we were off. We drove quickly along the narrow streets of the old town, but, mon Dieu! once we were through the gate we simply tore, for the road was nice and level, and the first league was done well under a quarter of an hour; then it got more uneven as we approached the mountains. But the post-boy knew his business and his horses, and I was quite content as we finished the second league. There was

not quite a league between us and the village now; but, alas! the way was all uphill. More and more familiar became the country. I knew the names of those who lived on the farms and in the cottages, I beheld the woods where I had sought for birds'-nests as a boy, and soon I saw the golden cock shining on the little church amid the pines, and then I saw the village.

I had thought it was not a good thing to depend entirely on Boursot; and I was right, for this is what happened. Arriving at the 'Golden Ladder,' he found Reichardt, the bridegroom, and many of his friends, all arrayed in their best clothes, smoking and drinking. The information that I was coming fell like a bombshell among them, and for a moment they were speechless. It meant almost as much to Reichardt as to Detzler, as the former was up to his neck in debt to him. He was the first to find his head. He had not been a soldier for nothing.

'Oh, he will be here, will he?' he said; and, seeing his opportunity, he threw himself on Boursot. 'Now, my lads' he cried, 'into the cellar with him; we'll keep him there till the parson has done his work.'

Against so many, and taken at a disadvantage, poor Boursot had no chance, and into the cellar he was thrown.

'Now,' said Reichardt, 'four of you go down the road, and if you have any pluck you will stop the carriage, pull Kleinberg out, and bind him.'

Detzler, delighted at this arrangement, promised to reward the men well. Thus, at a moment when my thoughts were far, far away from any danger, four men armed with sticks and bludgeons suddenly rushed out from behind the hedge, shouting to the post-boy to stop. Carrying so many jewels and valuables, I always had two pistols on me ready loaded. 'Is Kleinberg there?' shouted one of them, seizing the horses' heads, while another opened the door.

'Yes, he is,' I shouted, as I shot the nearest through the arm. This reply was so quick and so unexpected that the others hesitated, and gave me the chance of hitting another in the leg.

'You devils!' I cried, seizing my sword and springing out, 'do you want any more?' But they had had enough. Two of them ran like rabbits, leaving one of their confederates groaning in the road and the other swearing by the hedge.

Without troubling more about them, I told the lad to hurry on; and soon, just by the 'Golden Ladder,' which was all decorated with garlands of flowers, and had even bouquets suspended on the signpost, I saw Mark, who knew nothing of what had occurred, awaiting me.

'It's all right,' he cried. 'They have all gone up to the church; but I have seen the pastor, and the wedding won't take place.'

In another moment he was seated beside me, and we were hurrying on.

'But where is Boursot?' I asked.

'Boursot? I know nothing about him,' said Mark. 'I expect Reichardt must have bribed him to keep quiet.'

'No, you don't know Boursot,' I said; 'nothing

will make me believe that.'

Still, at the time, it all seemed very extraordinary, and I thanked my stars that I had not

relied entirely on him.

'Here we are!' cried Mark, and in another moment we were in the little church, which was crammed full. I was reassured at once, for I saw that the pastor had not got his gown on. Up by the chancel I saw my darling Bertha all in white, with a fellow beside her. Followed by Mark, I hurried up the aisle. The pastor saw me, Bertha turned and gave a cry, and in a second her arms were round my neck. One look was enough for the bridegroom. He bolted through the vestry. Bertha was clinging to me, and I could not follow him. 'Catch him!' I oried to Mark, and in a moment, like a grayhound, he was after the fugitive. The whole church was in a commotion. Reichardt's wife, as soon as she saw her brother fly, gave a shriek and went into hysterics.

'Oh, God has heard my prayers!' cried Bertha. 'Aunt said He would never desert me.' The poor girl was trembling all over, and as

white as a sheet.

The sight of her distress angered me, and I turned savagely to her father. 'You'—

turned savagely to her father. 'You'—
But the pastor stopped me. 'Remember you are in God's house. Come into the vestry.'
So I took Bertha, and, followed by Reichardt,

So I took Bertha, and, followed by Reichardt, Susanne, Adeline Brendel, and the chief guests, we all went in there.

'I thought you were dead,' said Reichardt.
'My nephew in the 33rd said in his letter'----

'It's a lie, and you know it, Hans Reichardt! You know you have seen him this very morning,' I answered. 'Besides, here is your own letter asking him to say so,' I continued, producing it, and giving it to the pastor.

'Let us see Boursot's letter,' cried those

around us.

'Mein Gott /' cried Reichardt, turning pale.

'This is horrible!' said the pastor. 'Why, I might have married them.'

All eyes were turned on Reichardt; and as for Bertha, poor girl! the colour came into her cheeks with shame.

With an effort, however, the rogue determined to brazen it out. 'I am the bride's father, and before this marriage shall take place,' he said, turning to me, 'you must produce five thousand francs.'

'That's easy enough,' I answered, and I produced the notes; 'and if you had wanted fifty thousand, I reckon I could find it.'

Old Brendel the blacksmith would not come to the wedding, because he did not like it. He knew how wretched Bertha had been all the time; but, hearing of my arrival, he now turned up in his shirt-sleeves, and on hearing my last statement he could not hide his delight.

'Very well,' said Reichardt, 'let the wedding

go on.'

'There's no hurry,' I answered, for in truth the shock had been too great, and Bertha was half-fainting.

'Listen, meine Geliebt,' I said to her tenderly.
'Wait for a week if you like;' and her bride's-maids and every one told her the same.

'No, no,' she murmured. 'I have been in purgatory for months; let's get it over. Take me away, Jacques; let me get away from here.'

I looked at the pastor.

'Very well, my child,' he said gently to her,

'let us proceed.'

He had just put on his gown, when Mark, with a broken cane in his hand, burst in. He was so flushed and breathless that he could hardly speak. 'I got him. I caught him at last down by the "Golden Ladder," and I broke this stick on his back.'

'Where is he?' I asked with a laugh.

'Goodness knows. They have sent for a doctor.'

I almost felt sorry for Detzler, because, after all, he was not so much of a rogue as Reichardt.

We got through the service somehow. I said 'Ja' in the proper place, I suppose, but I did not know much about it. Then we returned to the vestry and signed the register, and I pressed a hundred france into the pastor's hand; and ere the good, simple man could get over his surprise I took Bertha to the carriage. She was still trembling.

'Oh Jacques,' she sobbed, 'whatever must you think of me? But father told every one that

you were killed.'

I reassured her, and kissed her tears away.

'Oh, look at those lovely horses!' she cried as we approached the inn; and, sure enough, I recognised the major's carriage.

'Well, sergeant,' he exclaimed merrily, 'you see I have come to the wedding after all.' He was in boisterous spirits, but he soon saw that something was amiss, and I told him everything.

Even as I was speaking they were bringing the two men I had wounded into the house.

It was a splendid breakfast, for the brewer had given Reichardt carte blanche. But a gloom hung over everything. Upstairs Reichardt's wife was in hysterics, which did not cease till she realised that no one took any notice, least of all her husband, who was like a bear with a sore head because he feared that he would not be paid for the breakfast. However, nothing could for long damp the major's spirits. He proposed my health, and chaffed the girls, and really put a little life into the proceedings; but, for all that, Bertha was uneasy. She looked very beautiful

in her fine white silk dress, which the brewer had paid for and insisted on her wearing; but it was hateful to her.

'Jacques,' she whispered, 'I am going to put on my Sunday clothes. I can't bear this finery. Then let us go anywhere you like to get away from here.'

The fact of it was the poor girl was afraid of

her rogue of a father.

'All right, ma chérie,' I answered. And soon afterwards we started for Paris, though we took ten days to get there, for time was nothing to us. When we did arrive we got a letter from Mark, who informed us that Reichardt, after taking all the valuables his wife possessed, had disappeared the day after the wedding; and I may add that we never heard anything more of him. My pearls and other jewels realised nearly

one hundred and fifty thousand francs. With part of this money I bought, besides some fine hopfields, the old farm, where we resided with Aunt Elizabeth as long as she lived. I also bought the 'Golden Ladder' for Mark, who soon after our return married old Brendel's daughter, much to her father's delight, as shoeing horses is warm work, and he was able to assuage his thirst with nothing to pay. My own wedding had not taken place under the happiest circumstances, but I was determined that that should not be the case with Mark's. The festivities lasted a week, and from that day to this the whole district declared that there never had been such a wedding before or since, and till some of my own children are married I don't suppose there ever will be such another.

THE END

GERMAN OFFICERS AT WILHELMSHAVEN.

By LUKE HARRUNEY.

SOME time ago the writer spent a winter at Wilhelmshaven as teacher of English to the naval officers, so that the names and characters of many of those who are now fighting against our own navy are familiar to him. German naval officers all know more or less English; and my task was merely to perfect them in their reading, and to see that they spoke our tongue correctly.

When they had finished their course with me many of these officers applied for a certificate of proficiency, armed with which extra pay was granted them in order that they might reside for some months and qualify for the post of dolmetscher, or interpreter, to which extra pay is attached. But the number of those making this application to me was certainly in excess of the number of posts vacant; and since my return to England I have often read with amusement of the arrest of German spies over here. Even when these latter have not been drawn from the same class as my quondam pupils, I have never for a moment doubted that they were at the back of the spies all the time. Many a nice young German gentleman, staying for a holiday in the Isle of Wight or elsewhere, has, I am convinced, carried back with him plans or other details that the spies risked so much to obtain. British authorities were for a long time supine to this process of obtaining information, and it is only quite recently that they have become aware of what has been going on.

The only wonder is that we have not been at war with Germany long before this. Even at Wilhelmshaven, where the officers were most courteous in every way to the writer, there never was the slightest concealment of the fact that the German navy had been brought to such a high pitch of preparation for war simply and

solely to oust Great Britain from her position of mistress of the seas; and this idea was expressed in rancous tones of dislike by civilians.

When I first arrived in the town I stayed en pension with a German lady, who, I afterwards found, charged me nearly double the amount she obtained from her other pensionnaires. Her great idea was that the German fleet should give us the coup de grâce when we were at war with some other country. One day she asked me what we should do if Russia sent a great army to England to attack London. 'Send a fleet to Moscow!' I replied, with the result that she actually shook her fist at me. So I consulted one of my officer-pupils, who advised me to take rooms and live as he himself did. I followed his advice, and for nearly six months copied the habits of a German bachelor, with results that I have always looked back upon with pleasure. For two pounds a month—payments are always made monthly in Germany-I hired two excellent rooms, with attendance, of a kind that I could not have obtained at home for treble the money. My meals I arranged in German fashion, contenting myself with a cup of coffee and a roll and butter in the morning, and with tea-a great deal of tea from Kiau-Tchau is drunk at Wilhelmshaven-and a kieler bückling (cold smoked bloater), raw ham, sliced sausage, &c., in the evening. For my dinner, which was at midday, I had an abonnement, or subscription, at a local hotel for its table d'hôte. This cost one mark (a shilling) a day, payable, together with the amount due for beer or wine and a tip to the waiter, at the end of each month. This kind of arrangement is universal throughout Germany; and, except in the larger towns, it is rare indeed for an abonnement to cost more than a mark a day, even though the ordinary charge

for a table d'hôte is usually a mark and a half, or even more. For this sum, soup, three courses, and a cup of coffee were given; and I think that nothing so cheap and good is obtainable anywhere else in the world. Of course, some of the dishes were extraordinary, and such as the ordinary tourist does not encounter; and the unusual way in which stewed fruit of all kinds is eaten with roast beef or mutton is not attractive to foreigners. And I shall never forget that my Christmas dinner—it was a pouring-wet daywound up with vanilla ices, served up as an extra treat in lieu of our national plum-pudding. On New Year's Day a band was hired for the occasion, and the meal comprised the great German dainty in the way of fish—carp au bleu. French was never to be seen on the menu-cards, which, in consequence, were difficult to translate.

After my evening tea-supper I used to go to a café and read the Times, which was taken in there, as well as some forty or fifty German papers and magazines. Sometimes I found an antagonist with whom to play a game of chess, and often I took a hand in a game of skaat, an excellent card-game which many people consider better than whist. Skaat is a national game, and has been honoured by a monumental fountain in the town of its origin—Saxe-Altenburg—the summit of which is crowned by a group of the four knaves (the highest trumps) contending together for the mastery.

German officers, I found, were 'sticks,' as a rule, and not easy to get on with, though there were some good fellows among them. This did not arise entirely from the fact that they are all terribly absorbed in their own calling, and nervously eager that their navy and themselves should be respected, but chiefly from the absence of a common ground upon which to meet them. They do not indulge in games. Skittles and lawn-tennis, played on a gravel court—the nature of the soil precludes a lawn-were the only exceptions; and of other outside interests they had none. Some are musical; and one I contrived to fascinate with 'Sally in our Alley.' All the others were obsessed with the 'coming-war' idea. Even my most especial friend, with whom I used to go for walks—one who had an English mother-could not conceal his Anglophobia. He spoke regretfully one day of the fact that we had not gone to war with Russia over the North Sea incident. When I asked him why, he candidly acknowledged that if we had done so, his own navy would have at once joined Russia and France against us—the one ideal alliance from the German point of view.

Some of my readers may know Niemann's The Coming Conquest of England, a book which, under its German title of Der Welt-krieg, or 'World's War,' describes the downfall of Britain at the hands of these three allies, and the resulting appropriation by Germany of Australia,

South Africa, and many other British possessions. This book was conspicuously in evidence in every bookseller's shop in Wilhelmshaven when I was there, some time after its publication; and those with whom it was then so popular must now find food for thought in the fact that, now that the 'World's War' is really taking place, Britain's position has changed to that of Germany. Perhaps they are now asking themselves what will become of their own Australasian and African colonies.

The writer was often asked whether it would not be better for Rotterdam and Antwerp to be in German hands rather than in those of Holland and Belgium, if only from the point of view of the resulting increase of their trade. Nothing is more common than for these two great ports to be marked down as future German appanages. It is this appalling lack of reticence about their aims and plans that has made the Germans to be so cordially detested all over Europe; for it must be remembered that this kind of talk is infinitely more irritating to a Dutchman or a

Belgian than to a Briton.

Many people are inclined to cast all the blame for the present war upon the German Emperor. Such an accusation is wrong and unfair. A certain amount of blame must fall upon him, if only because he is the head of the officer class; but it is unjust to represent him as the evil genius of his nation. Personally, megalomania apart, he is an amiable and a generous man. He is, it is true, the creator of the German navy, and without his fostering care it would never have attained its present formidable No figure is more familiar in strength. Wilhelmshaven, and no one more enthusiastically acclaimed there, than Kaiser Wilhelm II. Twice did he visit the town when I was there, and on each occasion he made the most minute inspection of all the works in hand, scattering the praises and the presents, of which he is so lavish, everywhere. There is hardly an officer whom he does not know. But when all is said, it is the officer caste, of whom he is the chief, that has sedulously instilled the idea into the German nation that a war with Britain was a supreme necessity for German trade. An immense pamphlet-literature connected with the subject has grown up, and travellers in any of the German coast-towns will remember that the titles of many of them involve the idea of a covert threat against our own country. More often than not German naval officers are the authors of these 'paper-pellets,' as they used to be called in seventeenth-century England.

It is hardly possible for the untravelled Briton to realise how this officer caste dominates Germany. Poor and proud, whether high-born or not (they are rarely drawn from the ranks), with the right to draw their swords upon any mere civilian who affronts them, they are hardly ever to be seen out of uniform. When they fall out among themselves, duels of the most savage kind not infrequently result, and they exact the most exaggerated deference from all those over whom they are in authority. A simple seaman who encounters an officer in the streets must halt at once, clap his hands to his sides, and stand at attention until the officer has passed. In the principal restaurant in Wilhelmshaven the burly warrant-officer at supper with his friends must drop his knife and fork, rise, and stand until the young sub-lieutenant who has chanced to enter has passed by, or graciously waves to him to sit down again. The slightest infraction of discipline is visited with severe penalties, and the kriegsgerichtsrat, or naval judge, has always plenty to do.

Any officer passing another officer always salutes him, whether he knows him or not. When I accompanied my naval friends on their walks I found that while it was de rigueur for

me to raise my hat when my friend saluted a brother-officer, I must on no account do so when a mere warrant-officer saluted my friend. German punctilio is strict on such points.

Officers and men alike work hard, and opportunities for relaxation are few. The Carnival is It is whispered the only occasion for frivolity. that even the Kaiser himself delights in witnessing the frolics that then take place in the officers' casino. Certain it is that the game of 'hot cockles' is not unknown on his own imperial yacht, and he does not object to an occasional practical joke.

Before I went away my pupils sent for champagne (German champagne, it goes without saying), and in German fashion solemnly pledged my health and wished me prosperity with much clinking of glasses. I fear that many of the faces I recollect so well will never be seen by

RAWSON'S OPAL-MINE.

PART II.

NEXT day was Sunday, a fact hitherto of no special significance to any one, as the saloons were always open, and the weekly wash was by no means a lengthy affair. But now the disadvantages of having a Sunday were appreciated to a remarkable degree. The law of the Commonwealth of Australia and of the State of Queensland said that no claims pegged out on Sunday would be valid, and thus the entire population of Bunderoo was forced to waste nerve-tissue and its ready money in waiting until Monday to peg out claims adjoining the new chum's. All had suddenly remembered the adage that it is the unexpected that invariably happens, and some even recollected instances when opal had been found where it was absolutely impossible, according to all known laws, that it could exist. A few loafers went further, and asserted that they had felt quite certain that the new chum would strike opal on the Hill, because opal was always found where it shouldn't be; and that, anyhow, those who followed opal-mining as a profession never knew anything.

The excitement increased all day, and when the story went round that a syndicate had been formed to buy the new chum's claim the loafers worked themselves into such a state that extra assistance had to be employed at the bars. But Moses Macpherson had not wasted his time. He had driven out to see the new chum during the day, and seen the sample of the wonderful opal, although his request to see the bottom of the shaft had been smilingly, politely, but emphatically refused.

'But I vill buy your opal,' remonstrated Moses.

'I don't think I wish to sell any, the fortunate owner answered thoughtfully. 'I like opal '-

'I vill puy your claim, den.'

'Oh, I don't mind that very much. I can go a little bit away and take up another claim.'

Moses could hardly repress a laugh at the man's ignorance. Well he knew that the fact of striking opal at one point was no guarantee that it existed elsewhere. The sample that the new chum showed was worth almost any figure per ounce, and Moses had decided that he simply must have it all.

But the ignorant one finally decided he would not part with his claim just then. 'I will do some more work, and think over-er-the matter,' he said; and, after wasting much eloquence, Moses drove back to town for lunch. During the afternoon he heard of the proposed syndicate, and the doctor had to be called in for him. He came in the guise of the blacksmith, explaining that he was overworked in that line making tools for the new syndicate. He treated Moses successfully, however; and at sundown the latter again drove out to the famous new chum's mine.

'I am in a hurry,' he said when the new chum climbed out of his shaft to see who his visitor was, 'unt I vant to know once for all if you vill sell your opal or your mine.'
'What offer do you make me?' asked the

'I vill gif five pounds for every ounce you haf of de kind you showed me.

'Thanks-er-I prefer to keep it.'

'Den vat do you vant for your mine? You can easily go and find anoder one.'

'I think a thousand pounds would pay me well enough for this one.

'A thousand pounds!' gasped Moses. 'It is

your mine I vant, not Queensland.'

'Good-evening, then. I'm going down to work some more.

'Shtay! Let me go down and see vat your

show is like,' Moses cried.

'Oh, I don't mind; but let me warn you that I know the ways of gem-buyers, and if you go too near my opals I will-er-thrash you.

'Mein gracious! are you shpeaking to me?'

gasped Moses.

'Yes; you are the only buyer—er—here, are you not?'

'Ha! ha! you are fond of a joke,' Moses laughed, his face purple with anger, but his cupidity in no way lessened. 'I vill touch

nodink.

The new chum must have been very silly or he would have known that Moses could not be treated with much disrespect with impunity. But, bottling his rage, Moses climbed down the shaft after the owner. He would get even before long. At the bottom of the shaft it was as dark as could be, and the new chum lit a candle and flashed it around, showing to full advantage the nature of his find. Moses sat down on the ground with an exclamation of piety. Such a display of opal he had never seen before. It scintillated in the walls of the little pocket gouged out at the bottom, in ever-changing colours. It blinded him with its iridescent splendour. All varieties were there—red, green, orange, blue, and blends of colours he did not previously know existed. As the new chum flashed his candle the gems blazed out as if alive, and myriads of points of variegated fire shot athwart their surfaces.

'Mein Gott!' Moses exclaimed feebly, 'I vill

gif you five hundred pounds.'

'Er-I have no doubt; but that is not my

price.'

'One thousand, then; but I am ruined!' cried Moses, starting up and grasping at the fiery mass

of gems.

The new chum pushed him back upon the ground. 'You must not touch,' he said. 'This is my property. My price is twelve hundred now.

Moses groaned. 'But you said'-— he began. 'Yes, I know; but—er—I have changed my mind. Get out now. I'm tired of you, and other people are coming here to-night.'

'I vill gif the twelve hundred!' screamed

'All right; hand it over. You see I-er-

know your tribe.'

'My cheque-book is in the hotel. I vill pay you in town ven you come in.' Moses was frantic. The opals in sight looked value for anything.

'I don't know that I should take your cheque

at all,' the miner mused. 'I am giving a mine for a piece of paper.'

'Vich can be turned into gold at the bank in

Googoolgi to-morrow morning.

'Maybe. In any case, I shall-er-risk it. I'll come in to-morrow and-er-collect it.' The innocent one appeared to be thinking.

So was Moses. 'No, no; come now,' he cried.

'I vish to close the deal at once.'

'I exceedingly regret I can't go into town now,' the new chum said, after more thought. 'You see-er-I wish to look for-er-another claim to-night. I give you my word, however, that I shall-er-present myself at your hotel at eight o'clock to-morrow morning, and hand you a written-er-transfer of this mine in return for your cheque.'

Moses was afraid that the new chum might again change his mind when the local syndicate approached him; but as he knew all its members were susceptible to certain inducements which he could offer at the bars, he consoled himself with the thought that it was not at all probable they would visit the new chum that night. But a sudden fear assailed him when he got out on the surface again.

'How am I to know,' he asked, 'that you vill not remove all the opals showing through the

night?' He was certainly anxious.

'I don't-er-really know,' the new chum drawled. 'I do not intend going down my shaft again to-night; but you can easily, I presume, employ—er—one of your satellites to watch the claim. If I or any one else goes below, he can inform you; and if he goes down, I shall-ershoot him.' There was no dubiety about the new chum's words; and Moses, after making arrange-

ments accordingly, went back to town.

At eight next morning the stranger joined Moses at the breakfast-table in Mrs Murphy's hotel, received his cheque, and handed over a written transfer of his claim. He was now a sort of hero in the eyes of the populace who had not yet gone out to stake off claims; and when he invited all to imbibe their pleasure at his expense, his popularity was unbounded. It was, therefore, with mingled feelings the people regarded things when, after Moses had departed to take over his property, without even having glanced at the signature on the transfer, the new chum prepared to mount his notorious horse, which the Disgrace had brought round saddled and bridled. They thought the new chum was suffering a little from swelled head, and several told him that although he had found opal, he might easily end his earthly career a few seconds after he had mounted Melbourne Mike's horse.

'Oh, I think I can ride him,' the new chum drawled; 'at least, I will try, for I must be at the bank in Googoolgi-er-when it opens. I have important business there.

'Then leave me your coat, old man,' the Dis-

grace requested. 'I'd like to remember you

after you are planted.

'I had forgotten,' the new chum answered, pulling off the elaborate garment. 'It is yours Mr-er-Disgrace; and if I don't come back, you can also take my suit-case, and all that it-ercontains. Now help me up, please.'

The Disgrace gave him a 'leg up' into the saddle, and the crowd retreated as far as possible. The untamable steed bucked, tried to stand on his head, rolled over, and generally did his best to justify his name; but his rider didn't seem to be unduly inconvenienced. Perhaps he didn't

know enough to be aware of his danger.

'Ah, Mr Disgrace,' he remarked coolly, as the horse rested, 'you might oblige me by giving Mr Macpherson this letter when he comes back. I had nearly—er—overlooked it.' He handed down an envelope addressed to the gem-buyer, and next moment was heading for Googoolgi like a 'greased streak of lightning,' as was afterwards remarked. When the dust raised obscured him from view, the gaping crowd looked at each other, swore, and turned in to slake their thirst at the Disgrace's invitation. While they were still doing so Moses reeled into the hotel, and fell upon the floor. The doctor was at once summoned from the next hotel; but when Moses saw him he cried, 'No, no! It is the troopers I vant.'

The doctor ran out, and came back with a helmet on his head. 'I must caution you,' he said, 'that anything you say may be used against you.'

'Shtop him! Shtop him!' screamed Moses.

'He has schwindled me '-

'I see it is the J.P. you want,' observed the trooper. 'But who has swindled you, anyhow?'

'The new chum! He has ruined me. Shtop him! Shoot him! Oh, mein Gott!' Moses rolled over and gasped for breath.

'Talking about the new chum,' said the Disgrace casually, 'he left this note for you, Moses.'

'Open it,' ordered the J.P., and a second later the contents were known. They were not much. A single line in pencil said: 'With Rawson's compliments. We are square now.'

Moses groaned, kicked, swore, and finally struggled to his feet. 'Shtop him!' he yelled. 'A hundred pounds to the man who shtops him

before he gets into the bank!'

'Can't do it, old man,' said the trooper, &c. 'He's pretty near Googoolgi now, if his neck isn't broken. His horse can give points in speed to anything on feet hereabouts.

'What do you want to stop him for, anyhow?' asked the Disgrace. 'You've got his claim all

right.'

'His claim!' Moses screamed. 'He has got my cheque. He is no new chum'-

'Well, ain't the claim worth it?' asked Shandy Bill. 'It was jammed full of first-class opal.'

'Opal!' wailed Moses. 'Oh yes, it vas filled with first-class opal—beautiful green and red opal stuck in the valls everywere; but it was all made of broken bottles!'

Every one now remembered Rawson, the daredevil rider and miner, who had sworn to get even with Moses, and it was a week before the various camps ceased celebrating.

THE END.

AUSTRIA AT SERAJEVO: THIRTY YEARS AFTER.

By PERCY CROSS STANDING.

T was at the close of the Russo-Turkish struggle, and as an immediate outcome of the Berlin Congress, that Austria first determined upon the occupation of the provinces of Bosnia and Herzegovina. Turkey, exhausted and humiliated after her crushing defeat by Russia, had no alternative but to acquiesce in this occupation of the Danubian provinces by an Austro-Hungarian army; nevertheless the Sultan and his advisors could not be expected to jump for joy at the prospect. But, said the terms of an Austro-Hungarian proclamation addressed to the peoples of the two provinces, 'the Emperor and King could no longer look on and see violence and discontent reigning in the vicinity of his territories, distrust and misery knocking at the frontiers of his states. In the counsels of the peoples it was unanimously resolved that Austria-Hungary should restore the peace and welfare so long missed. The Emperor and King knows your troubles, and wishes your good. Under his powerful sceptre many peoples dwell together,

each one speaking his own tongue. He rules over the votaries of many religions, and each one is free to profess his own faith.

The astute Count Andrassy acted as the mouthpiece of the Dual Monarchy during these delicate, not to say critical, events of 1876-78. The House of Hapsburg had put its hand to the plough, and the legions of the Emperor Francis Joseph were launched into Bosnia and Herzegovina immediately after the 'findings' of the Berlin Congress decreed that such an occupation was to take place. The Austrian commander-inchief was the General Baron Philippovitch, who in an Order of the Day advised his troops not to count upon a mere picnic. He was not going to lead them 'on a triumphal march, but to hard work undertaken in the service of humanity and civilisation.'

And what was the immediate effect of this diplomatic move in Serajevo, the capital of Bosnia, and in Mostar, the capital of Herzegovina! In the former picturesque but intensely polyglot city one Hadji Loja called upon the Mussulman population to rise a hundred thousand strong against the Austrian intruders. At Mostar a bloodthirsty 'popular' outbreak resulted in the slaying of the Mufti and the nomination of an Ulema as governor. Certainly no country could be better suited to the familiar tactics of guerilla warfare than those rocky gorges and defiles, and the local leaders promptly prepared an elaborate resistance. The Austrian advance moved simultaneously into Bosnia and Herzegovina, the Archduke John Salvator's division crossing the Save at Brod on July 29, 1878. On August 4-5 the fiery insurgent chieftains gave battle to the army of occupation at a day's march from Mostar, which was entered by the Austrian forces at nightfall. At this point the opposition was somewhat half-hearted, as the Turkish garrison of the city did not co-operate to any serious extent with the partisan force.

But it was far otherwise in Bosnia, where Hadji Loja had got his resistance calculated on a much better and bigger basis, and where it was believed that Ottoman gold and influence had been freely used to inflame the popular passions. On 1st August Philippovitch's chief of the staff, Captain Milinkovitch, met with a prolonged opposition at Maglai, a town well placed for defence in a rocky defile on the right bank of the Bosna. Milinkovitch had a small force of hussars with him, and this handful were handled with terrible roughness by a large body of Mohammedans who were well fortified. 'There was no by-road except up steep hills,' said a Vienna newspaper's account of the transaction. 'It was terrible to see the horsemen, when in the narrow lane, shot down, and, falling from dying horses, blocking the road against those who were follow-Into this confused mass of men and horses a cross-fire was poured from all sides.' Eventually the demoralised troopers, thoroughly defeated, got back to the Austrian headquarters, whence a day or two later the whole army marched out to inflict summary chastisement upon the mountaineers. It was the last stand of a warlike and fanatical people, and though it could only end in one way, the resistance while it lasted was of the most heroic kind.

Hadji Loja, the Mussulmans' fierce and hardy leader in this warfare, is described as having been 'the tallest man in Bosnia.' He went barefooted both in summer and winter, and, such was the extent of his religious fanaticism, during the 'Ramazan' period he stripped himself almost naked. In time of peace he followed the calling of a mendicant, and when excited by his racial and Mohammedan prejudices he would kill any Christian who crossed his path. Truly a powerful asset to a cause such as that to which he had pledged himself.

Maglai fell into Austrian hands by August 8, but not without some severe fighting, in the course of which General Philippovitch himself

had a narrow escape. It was seen that a number of Turkish regular troops were fighting side by side with the Bosnian mountaineers, but such of these regulars as were taken prisoners hastened to explain that they had no choice in the matter, but had been forced to fight by the insurrectionary government. In this really sharp handto-hand fighting the defending force lost some five hundred killed and wounded, and the conflict lasted until dusk. It ended in the occupation of Zepce as well as Maglai by the Austrians, who found their difficulties greatly enhanced by the tempestuous weather, intense heat-several of the soldiers dying of sunstroke—the awkward country to be fought over, and the bitter animosity of the inhabitants. It was believed that the insurgents had one hundred thousand men under arms. They were generally well armed and equipped, they had several mountain-guns, and their mollahs went about among them preaching the 'jehad' or Holy War.

The Emperor Francis Joseph and his advisers were doubtless somewhat nonplussed by the strength and persistence of the enemy, but it was determined to reinforce General Philippovitch very heavily. On August 8, in fact, the 7th Austrian Division was worsted by a force of five thousand insurgents, and the 20th Division had to fight for its very existence. The Duke of Würtemberg's division fared somewhat better, forcing the enemy's entrenched position between Travnik and Serajevo after three days' obstinate conflict; yet by the middle of August the Austrian casualties amounted to almost a thousand in killed, wounded, and missing. The emperor-king 'was both surprised and distressed at the resistance offered to his troops, for he had been under the impression that they would be received with enthusiasm by the Bosnian population. The truth is that he had believed what he desired to believe, and the awakening was of that rough and painful kind which is the usual termination of such misleading dreams.' Next the insurgents were forced at the bayonet's point out of the fortified position of Han-Belalovac, but again at the cost of much loss of life. The crux of the fighting was now to come in the onslaught upon the Bosnian capital, General Philippovitch's force having in the meantime been raised to the great strength of nearly one hundred and thirty thousand of all arms.

Serajevo, or 'Bosna-Seraï,' had been powerfully prepared for defence. Its outworks bristled with armed men and heavy guns, the key of the position being the Saluting or Yellow Battery. At 6.30 A.M. on August 19 the 13th Army Corps advanced to the assault under a withering fusillade. By 10.30 the 46th Infantry had stormed the Saluting Battery with the bayonet, but it was three hours later ere the Austrians could force their way into the town itself. Even then, from the windows of all the houses, from

the very hospital itself, a tremendous fire was maintained. After the entry, martial law was at once proclaimed by the conquerors. persons found with arms in their hands were to be summarily put to death, and it is to be feared that in a few instances this order was acted upon too literally. As illustrating the reigning spirit of savagery and fanaticism, a Serajevo leader named Hadji Jamarkovic was led out to be shot, but before he reached the appointed place he managed to snatch a rifle from his escort and fire it among the crowd. Of the large number of prisoners taken at Serajevo, fifty-five officers and eight hundred and thirty regular Turkish soldiers were removed under guard to Brod. It was stated by the Austrian Generalissimo that in about a week some six thousand insurgent rifles had been 'collected.'

It says something for the tenacity of the Bosnian defence generally that in September the strength of the Austro-Hungarian host had been raised to two hundred and eight thousand men, with thirty-six thousand horses and four hundred and eighty guns, or something approximating to our own army's strength in the theatre of war in South Africa when this country was subjugating the Boers. It may sound a little like 'breaking a butterfly,' but those hardy mountaineers simply revelled in a fight. In some instances the defence was aided by Turkish regular troops, notably that of the town of Bihac, which had eventually to be taken by assault by General Zach.

At the same time, the reduction of Serajevo was not without its moral effect, and by the close of September General Philippovitch found himself able to report to Vienna the almost total subjugation of these unhappy and blood-drenched provinces. Councils took place at Vienna for the formation of a code of laws for the future government of the fresh acquisition, and large numbers of the native population, Mohammedans included, flocked back into Serajevo and the other towns in order to place themselves under Austrian protection. The Sublime Porte confirmed and strengthened this by issuing a manifesto both repudiating and deprecating the recent prolonged and bitter resistance to the Austrian arms on the part of the humbled Bosnians and Herzegovinians.

Such were, in a nutshell, the dramatic and sanguinary events attendant upon the Dual Monarchy's original acquisition of these troublesome territories upwards of thirty years ago. Whether the game has been worth the candle is another matter altogether. Servia, then just emancipated with the assistance of her powerful patron and ally, Russia, looked sullenly on, but The awful sequel which could do nothing. came so swiftly and suddenly during the summer of 1914, in the shocking and indefensible assassination of the Austrian heir-apparent and his consort while sojourning in this self-same illomened city of Serajevo, was even then, maybe, seething in the minds of the disillusioned and jealous Servian agitators.

THE MONTH: SCIENCE AND ARTS.

AN AUTOMATIC HYGIENIC OPEN-AIR SEAT.

THE ordinary type of outdoor seat is a source of considerable danger to physical health. It is exposed to all the variations of the weather, so that the user is liable to contract rheumatism and other similar complaints arising from dampness. In order to remove this disability, a new type of open-air seat, which possesses many interesting features, has been placed on the market. When not in use, the seat is folded vertically and is housed beneath a canopy, so that complete protection from weather, dust, and other objectionable matter is obtained. The seat is automatic in its action. Directly it is vacated the seat flies up into a closed position. The seats are disposed in units, the frame carrying the canopy being mounted upon wheels to ensure portability while at the same time the seats can be turned round to the most comfortable position. Another distinctive feature is the open character of the materials of which they are made. The construction is carried out in such a way as to ensure a free and constant current of air through every part, so that the nuisance of dust, germs, or insects is reduced to the minimum. The scats are of substantial construction, and are made from materials which are naturally suited to outdoor conditions. The operating mechanism is of the simplest character, so that the liability to break-down is remote, while maintenance expenses are practically nil. The seats are especially adapted for use in pleasure-gardens, sanatoria, hospitals, and convalescent homes, as well as in open spaces, parks, railway stations, or private grounds.

FIRELESS LOCOMOTIVES.

There are many industrial occupations where the conditions are extremely dangerous, thereby rendering the question of economic intermovement of materials somewhat difficult. The transportation of materials in explosive depots is an interesting illustration of this problem. The issue has been solved, however, in a great measure by recourse to fireless locomotives. As the designation implies, the locomotives conform to the general design, but are not provided with a fire or heating device of any kind. Instead there is a reservoir or boiler, which is filled partly

with water and partly with high-pressure steam. The latter is pumped into the boiler from a steam-raising station outside the danger-zone, to which the locomotive is taken from time to time. The construction of this type of locomotive has been brought to a high standard of perfection in Germany, the leading locomotive manufacturing firms specialising in this class of engine; while certain American manufacturers also have devoted their energies to the same problem. In Great Britain the possibilities of this form of transportation have been appreciated, and are receiv-The Admiralty recently ing greater attention. acquired a locomotive of this type for use in the explosive danger-zones. The engine is able to run for several hours upon one charge of steam, and, owing to the system of heat insulation adopted, the locomotive may be left standing for a period of twelve hours in the open air without appreciable loss of energy. The engine is easy to handle; in fact, it is operated in exactly the same manner as the ordinary locomotive, except that firing is eliminated. The control is precisely similar. Not only is the engine fireless, but all the rubbing faces, such as the brake-blocks and the impact-points represented by the buffers, are rendered sparkless by the use of special facing These engines have been extensively materials. adopted in dangerous mines where access to the workings is provided by gradients instead of shafts.

THE AUDRIFFEN REFRIGERATING MACHINE.

Several months ago attention was drawn in 'The Month' to the exceedingly simple and novel refrigerating-machine which had been devised by a French inventor named Audriffen. Since then certain improvements have been effected, and the completed machine aroused considerable attention at the recent Royal Agricultural Show. The refrigerator consists essentially of two vessels, one being a spheroidal condenser, while the other is a cylindrical evaporator. The two are connected by a hollow shaft. The condenser is immersed in the cooling medium, while the evaporator is similarly immersed in the liquid to be cooled. There is an air-compressor working upon the ordinary cycle, and the arrangement is such that while the condenser and evaporator are revolved by an outside drivingpulley, the compressor itself is kept in a vertical position. The gas after compression passes into the condenser, which revolves in the cooling medium, composed of brine or some other similar liquid. Here the heat of the gas is extracted, and its temperature lowered to such a degree as to bring about liquefaction. The liquid gas now flows through the hollow pipe into the evaporator. This vessel is revolved simultaneously with the condenser, but through the liquid to be cooled. Entering the evaporator, the gas extracts the heat from the liquid to be cooled, but in so doing becomes reconverted to its vapour state. In this latter form it returns once more through a second pipe to the compressor, where it is recompressed and reliquefied by the cooling solution in the condenser, then passes again into the evaporator, and returns in the gaseous condition to the compressor. The cycle is continuous, the gas which is alternately liquefied and reconverted to vapour being unable to escape, because the whole of the working parts are completely enclosed and hermetically sealed. It is one of the most interesting and novel refrigerating systems which have ever been devised, and it is extremely effective. The plant occupies little space, and the liquid to be cooled may be reduced to any desired temperature within a very short time and at a low cost.

STERILISING MILK BY ELECTRICITY.

The provision of a supply of germ-proof milk for the rearing of the young is acknowledged to be one of the most pressing problems of the day. The city of Liverpool is at present using an electrical system which has been found to be highly successful, and a large plant is now in operation at the Corporation milk depot. The practicability of sterilising milk by electricity was tried for the first time in 1911, but the results were disappointing. However, the authorities continued their lines of investigation, and have now perfected a system which meets all requirements What is known as a lethal tube is successfully. used, and from experience it is shown that while the milk may not be completely sterilised, yet all dangerous bacteria are removed or rendered innocuous. The present plant is able to deal with one hundred to one hundred and twentyfive gallons of milk daily, which is distributed in three thousand bottles. Although the milk is rendered perfectly free from diseasegerms by the electrical treatment, the grave risk of recontamination from contact with the bottles and during handling arose. To overcome this disability, the shape of the bottle was changed to facilitate thorough cleansing, while a simple bottling apparatus and the ordinary cork have been adopted. Milk treated in this manner and kept under proper conditions will retain its sweetness for three or four days, or even longer if all precautions against after-contamination are practised. The success of the experiments at Liverpool, together with the simplicity of the apparatus, should go a long way toward the solution of a difficult problem, and should be available to the health departments of other cities.

THE ELECTRICAL FARM.

Strenuous efforts are being made to emphasise electricity as an indispensable handmaid for all work upon a farm. At the recent agricultural show held in Christiania an interesting model farm conducted on this principle constituted a prominent feature. The energy for this farm

was supposed to come from a small waterfall in the vicinity, which had been duly harnessed. The healthy crops in the fields had been raised upon fertilisers electrically manufactured. The farm-house and all the outbuildings were electrically lighted, an electrical stove was in the kitchen, while every heating and cooking operation was conducted by electricity. The selfsame agent was utilised also for producing unlimited quantities of hot water. Knives, boots, and culinary utensils were cleaned by its means; while coffee was ground, bread was cut, and juice-pressing machines were likewise oper-Electric radiators heated every room, and the farmer was supplied with a device for heating his shaving-water in the bedroom; while his wife was provided with electrically heated curling-tongs. In the scullery small motors drove the washing-machine and turned scrubber and mangle; while currents of hot air supplied by electrical agency dried the clothes, and an electric iron completed the laundry operations. Workshops were fitted with electrically driven tools; the food for the stock was prepared by electricity; while even grooming and sheep-shearing were carried out with electrically driven implements. The cows were milked by electric machines, and the incubators were electrically heated.

A BOOK ABOUT TWENTY-ONE THOUSAND NOTABLE AMERICANS.

In our volume for 1912 there was a notice of the seventh issue of a really useful and indispensable book, of which the eighth issue is now to hand, entitled, Who's Who in America, a Biographical Dictionary of Notable Living Men and Women of the United States, edited by A. N. Marquis (Chicago: Marquis & Co.; London: Stanley, Paul, & Co.). While on somewhat similar lines to our own Who's Who, it has several original features of its own. Notices are given of the best-known men and women of the United States, whether living in America or in any other part of the world. This new issue has four thousand four hundred and twenty-six sketches which have not previously appeared. It has grown since 1899 from a volume of eight hundred and twenty-seven pages, with eight thousand six hundred and two notices, to one of two thousand nine hundred and twenty pages, with twenty-one thousand four hundred and fifty-nine notices. A change in political parties accounts for the insertion of many new names. The book supplies brief, crisp, personal sketches of every living American whose position or achievements make his personality of general interest, and gives those facts about them which the intelligent inquirer wishes to know. The states which have contributed the largest number of subjects in order of importance are New York (three thousand three hundred and twenty-two), and, in a descending scale, Massachusetts (one thousand nine hundred and seventy-eight), Penn-

sylvania, Ohio, Illinois, Indiana, and Connecticut. We notice that Mr Roosevelt has now twenty-five volumes to his credit; his political and big game exploits are duly noted, and his visit to South America is mentioned, but not his discovery of the Duvida River, or River of Doubt. President Woodrow Wilson, of Scottish and Irish ancestry, is credited with ten volumes dealing with political, biographical, and historical subjects. Mr James Wilson, the ex-Secretary of Agriculture, migrated from the west of Scotland with his parents in 1851. Andrew Carnegie's benefactions are set down as exceeding thirty-five millions sterling. Mr W. Dean Howells has now over sixty volumes to his credit, and we hear from another source that he is writing his autobiography. Mr Howells has himself edited eight volumes of Choice Autobiography, with essays on each. Mr S. S. McClure, a well-known publisher, founder of McClure's Magazine, who was born in County Antrim in 1857, has also written a volume of Recollections.

SYDNEY HARBOUR AND HOBART.

To our May (1914) issue Mr F. A. W. Gisborne contributed a paper entitled 'Hobert: the Future Deep-Water Port of the Australian Commonwealth.' This seaport he described as rivalling the natural beauty of Sydney Harbour and Rio de Janeiro, and as excelling both in suitability for the purposes of commerce. The natural beauty of Hobart and its environs attracts each summer thousands of tourists. He prophesied that in times not far distant it would be known as the great aorta of Australian maritime trade, and the first landing-place in the Antipodes of thousands of the Commonwealth's future citizens. This article has naturally awakened criticism in New South Wales, and has not passed unchallenged. Mr H. P. Curtis, solicitor, Sydney, writes that some of the statements regarding Sydney Harbour are not in accordance with facts. At the same time, he expresses no desire to detract from the merits of the seaport of Hobart. He says that undoubtedly it has an excellent deepwater harbour, though somewhat distant from the busy hub. Mr Curtis contradicts Mr Gisborne's statement that the depth of water at the entrance of Sydney Harbour is twenty-seven feet at low-tide, and thirty-one feet at high-tide. The depth at low-tide in June 1913 was between forty and sixty feet, with no ocean waves whatever. The deepest-draught ships in the world could navigate safely in and out. The White Star steamer the Ceramic, drawing thirty-four and a half feet, has berthed at a wharf in Sydney, and no vessel has ever been turned away. In regard to Mr Gisborne's statement that the Sow and Pigs Reef is an obstruction across the entrance which would cost two millions sterling to remove, Mr Curtis says that the reef is some distance inside the Heads, and at right angles to an imaginary line connecting them.

between, and not across, the channels, sheltered by cliffs three hundred feet high. It separates what will ultimately become the incoming and outgoing channels, and forms a fine natural base for a light for shipping. The bottom, consisting of sand, has been deepened, and can be further deepened to any extent demanded by the traffic. There is a scheme of wharf extension about Darling Harbour, and similar work can be put in hand at many other places round Port Jackson as occasion arises. Improvements are made to keep pace with the increased patronage the port is receiving. Mr Curtis says, 'If the harbour, as Mr Gisborne asserts, has already fallen behind, no one else seems to have noticed it; but so far from this being the case, the business of the port of Sydney has doubled in ten years.'

EDUCATIONAL VALUE OF MUSEUMS.

Lord Sudeley, F.R.S., in addressing a gathering of one thousand five hundred London school teachers on 'The Public Utility of Museums, Picture Galleries, &c.,' said that in the museums they had a means of infusing the new blood that was wanted in education. In 1911 the system of having popular guides to give short lectures was started in the British Museum, and the Natural History Museum and the Victoria and Albert Museum had since followed suit, with the result that sixty thousand eager students had availed themselves of this opportunity. The London County Council have agreed that the teachers must act as guides to the children, and it was indispensable that they should first obtain the necessary knowledge from the lecturers of the museums themselves. This was being done. They had the sympathy of Mr Pease, the Minister for Education, who wrote to Lord Sudeley saying that the reports from his inspectors were unanimous in emphasising the value derived by the children from these visits when properly conducted. In 1913 there were nine hundred and forty-seven thousand visitors at the British Museum, compared with seven hundred and fiftyfour thousand in 1911; while the sale of catalogues and post-cards brought in one thousand five hundred pounds, as compared with five hundred pounds two years before. This enormous increase was believed to be due principally to the interest and pleasure which the guide system had created in the Museum. It may be added that a series of public lectures by experts in each department of the Edinburgh Royal Scottish Museum has been attended by a gratifying measure of success. Popular lectures on painting and painters at the Edinburgh National Gallery of Paintings have been equally well appreciated.

RADIUMISING THE SOIL.

The discovery of radium has excited the wonder and interest not only of chemists but also

of thousands of people to whom the mysteries of chemistry are little known. What is radium? Science replies, 'An element.' The scientist and the 'man in the street' stand amazed at its wondrous powers: is it 'incarnate electricity'? Such seems a poetical, if somewhat unscientific, description of this extraordinary substance. The columns of the daily press have informed the public of the uses of radium in medicine and surgical operations, and now the effects of radium on plant life have introduced a new era in the science of agriculture. In a recent lecture before the Royal Society of Arts, Mr T. Thorne Baker described the results of plant-growing in soil that had been made very slightly radio-active; experiments on the Continent confirmed these results. Radishes were obtained nearly five times as large as those grown in ordinary soil at the same time. The expense of radium has hitherto stood in the way of a general adoption of this radiumising process; but the recent discovery by Messieurs Detaille and Lafayaise of Paris, and Professor Scammell, M.S.C.I., of West View, Hadleigh, Essex, of a low-priced radium-bearing product places the process of radiumising the soil within the reach of agriculturists all over the world, with results of untold benefit to humanity. An increased output of fruits, vegetables, and cereals can now be obtained of the annual value of many millions of pounds, and this money, being kept in Great Britain instead of being paid away abroad, will run like a refreshing stream all over the countryside. This radium-bearing substance, 'lignaite,' can be obtained in fine powder, at a cost of only a few shillings a ton, from natural deposits in many parts of Great Britain and France; and the discoverers of this material are sending full details of the best methods of using it to all agriculturists who apply to them. The struggle of mankind for increased supplies of food-stuffs is now more strenuous than ever before; each and every country is slowly but surely increasing the consumption of its own products, a factor of overwhelming importance to Great Britain, the great importer of produce from all parts of the world; and an increased home production is a problem of the greatest gravity to all of us. Chemistry has now come to the aid of agriculture, and assists us to solve this problem.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

* TO CONTRIBUTORS.

1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2nd. For its return in case of ineligibility, postage-atamps should accompany every manuscript.

3rd. To secure their safe return if ineligible, ALL MANU-SCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.

4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

THE COMMAND OF THE SEA.

By W. D. GRAY.

CHAPTER I.

'LUCK,' said Captain Vincent, half-aloud—'luck's a rum thing, when you think about it. A devilish rum thing.'

Having given utterance to this profound thought, he chewed the end of his black cigar

and gazed meditatively at the sea.

The long, sweltering day was drawing to a close, and the short tropic twilight was approaching on swift wings. The bay of San Juan was a sheet of hammered gold under the rays of the setting sun, and the town of San Juan glowed like a jewel as the light struck full upon it. The captain eyed it thoughtfully. Beautiful enough it seemed, that little city, with its white houses, its greenery, and the great, dark-blue mountains beyond it. But Captain Vincent was not of a very romantic temperament, and, moreover, he was aware that on closer acquaintance

its glamour faded.

Once, some hundreds of years ago, San Juan had indeed been a place of romance. It had known the hot, feverish life of the Spanish-American empire; upon this port the gold-trains had converged; upon the placid waters of the bay the plate-ships had floated at anchor, to carry immense fortunes below the horizon, returning the next year to find fresh fortunes awaiting them. Spanish cavaliers, fiery, eager soldiers, had pushed out from here into the unknown to seek for El Dorado, and to find only fever and death. This bay had seen Drake's ships, had heard the thunder of English cannon and the cheers of English seamen. A hundred years later Morgan and his crew of fiends had swooped down upon it, had plundered and tortured for three days and nights, and had finally sent it flaming up to heaven.

But now San Juan seemed dull and stagnant. There was a strange, decayed look about it—a breath, a faint whisper of that great Spanish empire which had once overshadowed the New World. On the rising ground beyond the town were still to be seen green mounds, which had once been the Spanish governor's great mansion; and farther back other mounds, half-hidden amidst the trees, were all that were left of the big barrack-like structures where the gold-trains and their mules found shelter while they waited

for the plate-ships to arrive.

No. 201.-Vol. IV.

At this time San Juan was the chief, indeed the only, city of the great and free republic of Almaceda, whose fame has doubtless reached you. If not, the loss is yours. Though, indeed, if you ask me outright in what consists the fame of Almaceda, I must reply that—well, that there you have me. In revolutions, perhaps—or bananas! Bananas especially; they are what might be called Almaceda's strong suit. And then Almaceda had a navy. Not, it must be confessed, one of the great navies of the world; it came on the last page of the Naval Annuals under the heading 'Minor Naval Powers, and unfeeling editors dismissed it in some four lines. Still, undoubtedly it was a navy. It consisted of three vessels. Two of them were old iron gunboats, built on the Thames in the early eighties, whose engines complained clamorously if they were ever made to revolve. But the third ship was a vessel any Power might have been proud to possess. She was a fine modern cruiser of four thousand tons, built by the great Elswick yard only three years ago, and purchased by Almaceda, with borrowed money, in a fit of splendid extravagance. She could do her twenty-one knots when her stokers did their duty; she carried an eight-inch gun forward and another aft, and four six-inch guns on each broadside, besides smaller quick-firers. She was manned by a crew of three hundred and As she lay at anchor in San Juan fifty men. bay she had the aspect of a beautiful yacht. Finally, she was called the Mendoza, and Captain Vincent was her commander.

The captain was leaning over the rail of the chart-house this hot evening, surveying his ship as she lay beneath him, and taking the air. He was a big, tall man, with a swarthy face and a small, pointed, black beard. Indeed, but for his size and something aggressive and hard in his whole attitude, he might have been taken for a native of Almaceda. He was dressed in a smart white uniform, profusely decorated with gold lace. Gold lace adorned the band of his peaked cap; gold lace slashed his white sleeves to the elbow; gold lace, of a dazzling quality, travelled down his trousers. There was no false modesty about the naval uniform of Almaceda. Sometimes Captain Vincent would grin at himself in

[All Rights Reserved.]

OCTOBER 3, 1914.

the glass when he dressed, but latterly he had come to accept these glories as only his due.

His luck, as he put it, had been in. A captain in the British merchant service, but cursed with an irresistible love of wandering, for twenty years or more he had led an adventurous life. And he had come to be fairly well known in a certain circle. At times he commanded the ordinary tramp of sea commerce, when he could get nothing else; but revolutions, gun-runnings, doubtful salvage cases were what he would have called his special lines. He had come to Almaceda some six months before. Why he came there no man knew. He had arrived by the monthly steamer from Kingston, Jamaica. And now he commanded the Mendoza. What lay between; how he had ingratiated himself with the President of the republic and that lesser light, the Minister of Marine; whether his knowledge of Spanish and his irresistible and vigorous personality had imposed itself upon them-all this must be a matter of conjecture. It was known that he had superintended the repair of the Mendoza; she had been lying in dock on his arrival, with a hole in her bows, where her previous captain had spiked her on a rock. Possibly the President considered that this might happen again if a native of Almaceda remained in command. At any rate, by some means or other, Captain Vincent became the commander of a modern cruiser.

Since then he had not wasted his time. He had picked up a couple of Englishmen of his own kidney—one an engineer, and the other a gray-haired, stalwart man named Fenning, who had served twelve years in the Royal Navy, and whom the captain made boatswain of the Mendoza. - Save for these, he had done his work alone. But he had taken things seriously, and his broken but vigorous Spanish had helped him. He had even bought naval books, he who never read a page if he could help it, and pored painfully over technical works and the volumes of Mahan and Corbett. And he had had his reward; his dark, active sailors were men made over again; they sprang to his orders; they were emulous to serve him; and though he had never cared much for Dagos, he appreciated their smartness. There was, perhaps, one small flaw, one speck upon this great man's character. The captain suffered from a quenchless thirst. The wine of the country, aquardiente, did not appeal to him much, and he was unhappy until he had written to Jamaica for a certain brand of whisky. The captain, however, was a man of method; he only exceeded the limit when on shore, and on shipboard his drink was water.

He sat down on a camp-stool as the lights began to twinkle in San Juan, and puffed at his cigar. There were a few other ships anchored in the bay, the nearest being a rusty British tramp-steamer of a desolating ugliness. The captain looked at her and smiled grimly.

'Yes,' he muttered complacently. 'Yes, by George! my luck is in. A year ago I was in charge of a tin tank like that, from Cardiff to Bilbao.'

He looked up and down the Mendoza's decks, taking in each detail lovingly-her fine lines, her two tall buff funnels, her trim boats, her guns, the white-clad figures of some of her crew lounging on the forecastle.

'A fine ship!' he said. 'A fine ship! And yet I sometimes wish she flew the old red duster instead of that yellow rag. Well, I suppose, you can't have-Hallo! what's up?'

The tramp-steamer was lowering a boat, which

presently began to row towards the Mendoza. Captain Vincent eyed it in some surprise. 'What do they want with us?' he said. 'And who's that chap in the stern sheets? Seems to me I know him.

He waited on the chart-house roof until the boat came alongside and a man ran up the ladder. He was heard inquiring for the captain, speaking loudly and slowly, as Englishmen do when they wish to make the foolish foreigner understand them.

'I want the captain,' said the voice. 'The captain—el capitan—Captain Vincent. You understand me—comprenny?

'By George!' muttered Vincent excitedly, and ran down the ladder to the quarter-deck. A short, thick-set individual stood there, facing the Almacedan lieutenant on duty. The captain strode forward with outstretched hand.

'I thought I knew your voice,' he said heartily.

'It is Jack Collins, isn't it?'

The Englishman turned round sharply. 'Hallo, old son!' he cried; 'I've found you, have I! How are you, eh?

'I'm all right,' replied Vincent. 'Glad to see you, old man. How did you find me out?'

'Chap I met on shore told me this ship was commanded by a Captain Vincent,' said the other. 'And when he described you, I was sure it was my old pal. Gad! you're a devil of a swell; I like your rig-out.'

The captain smiled a little confusedly, for he felt that the lieutenant was taking the whole 'Come along down to my cabin,' he scene in. said loudly, 'and let's hear the news.

The man named Collins followed him, and they entered the cabin together.

'What's it to be?' asked the captain briefly,

ringing for his steward.

'Whisky for me, thanks,' said Collins carelessly. 'My word! you've got a good job here, old man. This is a bit better than carting coals from Swansea to the Baltic, eh?'

'Yes,' said Vincent curtly; 'yes it is.'

The steward entered, and the captain filled a single glass.

'Same old game Collins eyed it with a grin. with you, eh?' he said. 'Don't drink on your

ship, but make up for it on shore.'

'That's so,' answered the captain, with a slight frown. He did not care to hear his little 'Have a cigar?' weakness commented upon. he added.

'Thanks,' said the other. 'Well, here's happy days.' He tossed off the drink, and set the glass down sharply. He was a clean-shaven, brownfaced man, apparently of about Vincent's own There was something morose and brooding about his aspect—something which did not seem natural to him, for his clear eyes expressed only good-heartedness and a certain reckless humour. He put his peaked cap on the table and looked about him with a kind of gloomy envy.

'Well,' said Captain Vincent cheerfully, 'you haven't told me how you're getting along. Are you in charge of that steamer yonder?

'In charge of her?' repeated the other harshly.

'No; I'm her chief mate.'

'But you've a master's certificate,' said the captain, 'and you've been commanding ships for years.'

'Ay, that's right!' said Collins with a short laugh. 'But you've got to take what you can get these days.

One of Heldsworth's boats, isn't she?' asked

'One of Heldsworth's blistered tanks,' said Collins vindictively. 'She is. The Vulcan is And a devil of a time I'm having on her. My owners are swine. The crew are the sweepings of the streets, and the skipper's worse than both of 'em put together. Oh! it's a sweet life. I can't stand much more of it. I could do with a job like yours, my boy.

'Yes,' said the captain with a certain con-raint. 'It's not a bad berth; but I've had straint.

to work hard, all the same.'

'I dare say,' said Collins. 'Anyway, you look the complete naval officer now. But it's

the sort of thing I could do, I believe.'

Captain Vincent nodded, and refilled his friend's glass. 'You and I have done some things in our time, Jack,' he said. ''Member those old days, gun-running in Cuba? And you were seeing life in the Russo-Jap war, weren't vou? Took a cargo into Port Arthur during the blockade, or something ?'

'Yes, I did,' answered his friend. 'Cargo of picric acid at that. If the Japs had caught me I'd have been a goner. But it was better than this slave-driving game.' He sighed again, and

lit his cigar.

'Where are you bound to from here?' asked the captain.

'Down the coast to Quibo,' said Collins-'another of your tin-pot republics—and then home.'

The captain smiled. 'Quibo may be a tin-pot republic, he said; but Almaceda's a great country, my lad, and its President is my pet particular pal.

Collins stood up and reached for his cap. 'Very fine for you,' he said enviously. I think I shall punch my skipper on the nose, and clear out when we get to Quibo. I tell you he's a jewel; insults me before the men, and has other jolly little habits as well. However, I didn't come here to whine about myself. I must be going.'

'Let's show you round the ship first,' said

Vincent eagerly. 'She's worth seeing.'

The other laughed a little bitterly. on, Admiral Cochrane,' he said, half-mockingly. 'Lord! though, I wish I had your chance.'

Captain Vincent made no reply to this, but preceded his friend out of the cabin, and they began their tour of inspection. The captain was an enthusiast, and Collins, whether he wanted it or not, was given a very thorough view of the Mendoza. He saw her engine-room, her gunhouses, her six-inch battery, her lower-deck flats and living accommodation; he was presented to two or three of her smiling, dark-eyed officers; he took stock of her sailors and stokers; and finally, after greeting Fenning, the ex-naval man, he was led on to her quarter-deck again.

'Well,' said Captain Vincent proudly, 'she's

a smart ship, isn't she?'

Collins shook hands silently. 'She is,' he answered simply. 'Old man, I congratulate you. It's the sort of thing I've always-but never mind that. I must get back to my own blooming steam-yacht. So long, and good luck to you. We'll meet again some day-when things are a bit different with me, I hope.

'We will,' said the captain cheerily. long; and keep your hands off your skipper if you can. That sort of thing doesn't pay, as a rule.'

Collins made no reply, but sprang down the ladder to his boat. Captain Vincent stood watching until the little craft had vanished in the quick-coming darkness, which now hid the Vulcan from sight. Then, with a little shake of the head, he turned on his heel and went down to his cabin once more.

(Continued on page 706.)

FOUND IN MY HAVERSACK.

By IGNOTUS.

IT is a source of much regret, now that Emancipation Day for me in the Service has dawned and passed, affording such financial aid as His Majesty's Paymaster-General may be pleased to | cording all the humorous incidents occurring and

allow me in my retirement, that I did not avail myself during my years of soldiering of the opportunities that presented themselves for reunexpected situations arising in the course of duty or pleasure. Nevertheless, certain features of bygone years stand out clear-cut; and, having exchanged the trade of swashbuckler for that of ink-slinger—for so my friends delicately put it—I find it easier than I at first anticipated to remember past times.

The private soldier—known as Thomas Atkins to the British public for many years past, owing to the War Office selecting the name at random for a specimen page of accounts—sympathetically studied, affords many opportunities of quiet enjoyment. The delightful way in which, having entered the barrack gate, he sloughs his previous status with his clothes, and affects to look down on 'civvies' (civilians), as he calls them, blissfully regardless of the fact that they are his paymasters, has always amused me, no less than his cherished delusion, immediately upon landing in a foreign country, that he is a linguist. Be it India, Burma, or South Africa, or, as at present, a European country, Tommy never troubles himself to learn the language; but, picking up here and there a word, he interlards his acquirements with his native tongue, and finally crowns his achievements by affecting a pitiful contempt for the unfortunate native who fails to understand him! I remember well hearing one morning, in South Africa, a confused noise outside my quarters, and, looking out to ascertain the cause, I discovered Private Fitzpatrick, whose knowledge of the Kafir tongue was limited to one word, lapa, meaning 'there,' instructing a native in the vernacular to help him in carrying a big box across the square. The instruction was somewhat after this wise. Fitzpatrick, finding the box too big for him to carry alone, shouted to the Kafir, "Ere, chum, give us a 'and.' The Kafir naturally stood still. He was then gently walked to the box to the accompaniment of 'Pick it up, mate, lapa up.' By dint of the native's hands being forcibly clasped round the box he was made to understand; whereupon, the white man at one end and the black at the other, the box slowly travelled towards my quarters. On its arrival, what brought me to the door was the sound of 'Lapa down, mate; put it down,' followed by Fitz's end being dropped bang, while the native clung like death to his end till firmly dragged away. It is self-reliance such as this that has made us the nation we are.

Tommy has a very pretty wit, exercised most scathingly on the peculiarities of such officers as fail to win his approval, and not even sparing those he likes; while to his comrades he is mordant. Unfortunately the exigencies of discipline generally prevent an officer from hearing his barrack-room nickname, unless quite by accident it comes out in conversation with a trusted N.C.O. (one of a grand body of men) or in similar subterranean fashion; but it may be taken for granted that 90 per cent. of the officers

in a regiment have a nickname, and it fits them à merveille.

As an illustration, I may cite the case of an officer named Anstruther, who came to my battalion, and being a very keen, smart, capable man, insisted on the utmost efficiency in his company. The floors of his barrack-rooms did not please him, and he ordered them to be scrubbed once a week; and, since this work is done by Tommy on his knees, for the rest of his service the officer was known in the battalion as Andscrubber, a delicate play on his name as well as an allusion to the instrument employed.

The reticence noted above naturally enough does not characterise Tommy's association with his equals; and on manœuvres or route marching, when the command 'March at ease!' loosened aching tongues, I have hugged myself with quiet enjoyment at the sallies and chaff that went on behind my back. It should perhaps be explained here that the order 'March at ease!' gives the men permission to talk, smoke, and carry their arms as they please, provided they keep their dressing and step.

I was particularly amused on one occasion when the men in the section of fours just behind me began to brag of their occupations prior to enlistment, each man seeking to outdo the other. Two had already had a try, when the third man, a heavy, clumsy fellow, and the most unlikely figure imaginable, volunteered the information that he had been a jockey. There was a moment's silence, which No. 4 interrupted with the comment that that must have been the time he had heard of, when they 'use ter 'ave donkey-races at 'Urst Park.' The succeeding roar of laughter drowned the unfortunate victim's denial.

Let it not be imagined, however, that all the humour is in the barrack-room, and none in the officers' mess. Such indeed is not the case, as anybody fortunate enough to have lived in close association with young officers can testify. The wit there is equally keen, and opportunity occasionally admits of its very serviceable exercise. The following yarn is in my opinion well worthy of record, though it did not happen in my battalion, being related to me by an officer whom I met at a school of instruction, and who I should imagine had a good deal to do with it.

When his battalion was quartered in Ireland, an officer asked for and obtained a few days' leave to go off to an inaccessible bog for some snipe-shooting. Gaily he departed, found the sport all that he had expected—lucky man!—and, with a happy blend of gratitude and foresight, sent to the battalion a handsome present of birds. The mess was very pleased, and wired back at once to thank him. In due course a letter arrived from the absent sportsman explaining that while he was delighted to hear the birds had arrived safely and were appreciated, he hoped they would not wire again unless for a matter of urgency, since, owing to the inaccess-

ibility of his shooting quarters, he had had to pay three shillings and sixpence porterage on their telegram of thanks. Distressed to learn of the annoyance to which he had been subjected through their action, the mess decided to apologise, and forthwith wired back: 'Sorry!'

The mention of shooting always suggests to me fishing—why, I do not know, except that directly the shooting is over fishing begins in most of the Irish rivers and lakes—and that brings to my mind an irresistibly humorous incident that happened to a fisherman on the Dovey in North Wales when I was staying there. The river had not been in very good ply, or he was not a very skilled fisherman; I forget which, but I incline to the latter theory.

Anyhow, when he had tried in turn nearly every fly in his book, he at length got fast in a good fish, and after he had played it well for some time, the salmon came to the top of the water, beat, and the gillie was enabled to gaff it and lift it ashore. The fisherman was at the moment standing on a grassy mound about three feet sheer above the water, and at once took the fly out of the fish's mouth, the gillie of course withdrawing the gaff. Mightily pleased with himself, the fisherman pulled out his flask, and both men poured a bountiful libation to Bacchus, while they admired the fish, lying like a silver bar on the grass. Suddenly, gasping for breath as fish do when out of the water, the salmon curled up till its head and tail touched, and before it could be stopped had tumbled off the bank and was back in the water.

Moral: never neglect to knock your fish on

the head before pouring libations!

To use Tommy's pet expression, 'One word leads to another;' and talking of fish reminds me of an amusing fish yarn, the hero of which was a great friend of mine, formerly in a very distinguished corps, and now resident in the most charming county in England. This vague description will offend nobody, and still enable me to retain my opinion unchallenged.

Before going further, it is necessary to say that English people living abroad often find that the best way to punish native servants for trifling mistakes, generally due to carelessness, is to fine them. After he has been warned once or twice, the infliction of a fine corresponding to one or two pence from a man's wages makes an impression on his memory that nothing else can do, and is infinitely to be preferred to beating him. Even fining, however, can be abused, as a well-known Indian story testifies—namely, that of a subaltern who, being sued by his servant for ten rupees deficit of wages due, set up the defence that, far from his owing ten rupees, the man owed him five, since his fines for last month came to fifteen rupees! All this by the way.

My friend who, through the death of a relative, came into a delightful property found when he succeeded that it was in a very dilapi-

dated state in many respects, and he had to spend several thousands of pounds in getting it again into order. Amongst other things, the drive from the lodge gates to the house had sunk some two feet below the level of the grass on either side, and a great many cartloads of broken bricks and rubbish had to be laid down before the gravel could be put on to bring it up to the proper level. The main drive leads past the side of the house to the servants' quarters and stables; and, as it had to be used by all the tradespeople, my friend warned them that while it was under repair all horses must proceed only at a walk in the demesne grounds to avoid scoring the road surface still further.

Bueno !

One morning in February, after a rather bad night, the Major looked out of his dressing-room window, and, to his annoyance, saw the local fishmonger with a smart cob scoring the gravel inches deep as he proceeded at a fast trot towards the kitchen. Up went the window, and out leant the Major, his habits of the East still strong upon him. 'D—— you, sir, what the devil do you mean by trotting up my drive when I told you to walk?' he shouted. 'I'll fine you a herring.'

Nothing daunted, the sporting fishmonger looked up, smiled, and shouted back, 'All right, Major, take it off the bill; precious glad it isn't a salmon, that's all;' and, without pulling up, he disappeared round the corner. The significance of his remark will be better appreciated when I say that most of the rivers were just opening, and salmon was anything-you-like a

pound.

An illuminating instance of the ignorance regarding the British uniform occurred during the army manœuvres near Oxford a year or two ago.

The old city was the headquarters of the foreign military attachés officially accredited during the manœuvres; and, wishing to do honour to the gallant strangers in their midst, the authorities of a certain college asked them to dinner. They accepted the invitation, duly arrived in a body, and were received by the chairman of the entertainment committee, who, on the first officer entering the anteroom, shook him courteously by the hand and begged that he might be informed in what army the officer had the honour to serve. Unfortunately, in his desire to do honour, the chairman had failed to acquaint himself with the uniforms of his own country, the first to enter being one of the British officers to whom the care of the foreign delegates had been confided!

The extraordinary strides that the British nation has made towards sobriety in recent years are noticeable to any observer, and nowhere has drunkenness decreased more than in the Service. This is not to be wondered at when we remember that the change occurs through impressing upon the rising generation

the advantages of moderation; and, since the rising generation in turn feeds the ranks of the Service, its influence in the course of a very few years is bound to be felt. Whether the pendulum is not swinging a bit too far in the other direction, and a man is better for a pint of beer at midday instead of a bottle of 'pop,' is a point on which opinions differ; but doubtless, with our national spirit of compromise, we shall erelong strike the happy medium, and regard with equal dislike the red-faced drunkard and the whey-faced fanatical abstainer.

The abstainer at any rate could not have afforded the amusement I once saw created in an Irish militia regiment by an over-indulgence in 'porther.' The regiment had been dismissed drill at half-past twelve, and had to parade again at two P.M. for 'fatigue'—that is, work of any arduous nature, such as coal-carrying or loading

When the men paraded at two P.M., having had dinner and time to visit the canteen, Private Murphy was hopelessly drunk, and discovered

himself as follows.

On the bugle sounding, the men walked on to the parade-ground in a mass and fell in, in two ranks, Murphy being shepherded by two pals, who stood one on each side of him. order was given to number down from the right. One of the pals stood No. 10 on parade, then came Murphy (No. 11), and then the other pal, No. 12. Murphy being too drunk to articulate, No. 10 shouted Murphy's number for himnamely, eleven—and it passed unnoticed.

The order was then given to 'form fours'that is, to get into ranks of four men, preparatory to marching off. The method of executing this manœuvre is for all even-numbered men to take a pace to the rear; and, as there was no help for it, Nos. 10 and 12 stepped to the rear, leaving Murphy unsupported, who at once disclosed the situation by falling flat on his face. At first sight he appeared to have a fit; but when it was found that it was only a case of 'dhrunk,' he was picked up and conveyed to the guardroom, to await the dawn of the morrow ushering in the high justice, the middle, and the low.

A most amusing comment on a situation was that made by the witty wife of a friend of mine, in a garrison abroad, on her husband's performance in winning the monthly golf medal. For some reason, which I now forget, the cards handed in on this occasion were few; but amongst them was that of Major H., the lady's husband, who had only recently taken up golf, of which he was enamoured, though, needless to say, he was not a star performer. His score was high, but so was his handicap; and as the other cards handed in showed very bad scores, Major H. quite unexpectedly and much to his delight found himself the winner of the monthly medal. He quickly apprised his wife of his good fortune; and she, with a twinkle in her eye, summed up the situation very neatly in the words, 'Disgraced, my dear boy; but, thank goodness, not beaten.

It will no doubt generally be recalled what unusual efforts were made to render the Jubilee and the Diamond Jubilee of our late beloved Queen not only historic but instructive to the ordinary stay-at-home citizen by bringing to England from all corners of the globe small detachments of our native forces, which added greatly to the brilliant effect of the various ceremonies.

On these two occasions, particularly the latter, many residents abroad came 'home' to see England and do honour to their sovereign; and, to the credit of the English people be it said, the Colonials one and all were received with the most open-hearted hospitality and fêted and entertained to their hearts' content. Some of these visitors were white, others black, and yet a third section showed a blend of both colours; but no difference was thereby made in their reception, and it is not going too far to say that the welcome given them did much to knit the

bonds of Empire closer.

In a colony I knew abroad, one of the residents, who had returned greatly elated with the reception he had received, and was determined that nothing should be left to the imagination of the stay-at-home members of the local club, proceeded to weary them, day in, day out, with accounts of his experiences: how he had dined with the Duke of This, lunched with Lord That, and stayed at the country house of Sir Somebody This monologue threatened to be-Something. come an intolerable nuisance, till it was unexpectedly put a stop to one day by the returned traveller asking an English planter whether he, too, had a royal time whenever he went home, knowing full well that the man addressed had

'No,' said the bored planter; 'I haven't, and shall I tell you why?' Without waiting for a reply he continued, 'Because, when I go home, I go as a plain English gentleman; but when you go home you go as a bally curiosity!'

Thereafter the annoyance ceased.

I wonder whether it has ever occurred to the authorities to make use of cold water in dispersing crowds. At the time of the coal and railway strikes in 1911 and 1912, when much bad blood was shown, and incidentally shed, the same result—that is, dispersion of mobs intent on mischief—could have been far more quickly and easily achieved by ordering out a few fire-engines and turning the hose on the rioters, without leaving any ill-feeling behind. Cold water has an extraordinarily quietening effect on the most aggressive, and when it is delivered from a hose played by a skilful fireman nothing can stand against it; the crowd must dissolve into its constituent elements, and the ridicule that will unfailingly greet the victims from those who

bave fortunately escaped the jet will go far to prevent the reassembling of similar mobs.

I am moved to this suggestion by the remembrance of what I once saw at Haiti, in the West Indies. Haiti is, so far as I know, one of the only two negro republics in the world, Liberia being the other, and the insolence of the negroes to white men must be seen to be believed. No white man, so far as my recollection serves me, can hold land in Haiti unless he is married to a negress; cannibalism used to prevail; and, for other reasons into which it is needless to enter here, the tourist generally gives it a wide berth if his steamer happens to touch there.

On this occasion we had dropped anchor in the roadstead, and after the doctor had given the ship a clean bill of health the lighters waiting in the stream came alongside to ferry ashore some merchandise we had on board. The goods were to be unloaded into the lighters of one particular firm; but notwithstanding this a few private lighters hovered like vultures near by, hoping to get a share of the carrying charges. Time and again the chief officer ordered them to sheer off, and they grumblingly obeyed; but one particularly daring fellow, watching his opportunity, worked his barge alongside with his great sweep, and actually made fast to the ship's side with his ropes. Foul abuse was the only response to the chief officer's orders to cast loose and drop astern, coupled with a threat that he intended to stay there till he got his share of the cargo.

This could not be borne, as the man was taking up the room of the lighters which were entitled to come alongside; so the officer quietly turned to a quartermaster and ordered him to rig a hose. Once more the fellow was told to go, and refused; whereupon the chief officer, without taking his eyes off the lighter, shouted, 'Let drive, quarter-

master!' and a stream of cold sea-water met the man full in the face, knocking him off the thwart into the bottom of his barge and following him to and fro till he could only gasp for breath. If I close my eyes I can see the scene now! The hose was then turned off, and the fellow given another chance to go, when, without a word, he cast loose his painter and floated away with the tide. The wetting was nothing, for no native of that type wears more than a pair of thin cotton trousers, a shirt, and a battered straw hat, and in that country one can hardly catch cold; but he had learned a lesson of the resourceful power of the white man that would be likely to stand him in good stead for the rest of his life.

Though it was hardly so disagreeable as the bargee's awakening, I had a very unpleasant surprise one evening soon after I joined my regiment in the West Indies. I was playing billiards with a brother-officer after dinner, when something fell plop on the floor from the barn-like rafters of the roof, just missing my face by inches. I looked, and, to my disgust, saw a small, most repulsive-looking reptile squirming on the floor.

One of our majors, sitting on the couch, got up and said, 'Now you had better take your first good look at a scorpion; and beware of them in future, for they are not nice beasts.' So saying, he put his foot lightly on the horror, which immediately curled its tail backward on to his boot and tried to sting him before it was crushed out of existence, and a man called to remove it. The poisonous sting of these reptiles can make a very nasty mess of a man's head or face, as many know to their cost; and they are particularly fond of getting into the rafters of old buildings such as that mess, to bask, I suppose, in the warmth striking upward from the lamps.

AN AFFAIR BETWEEN THREE.

By Colin C. Palmerston.

PART I.

JACK DUGGAN was the hook-tender for Side No. 2 in camp No. 12 of the Bridge Creek Logging Company. Twelve years before he had been the hook-tender on the same Side No. 2—though the camp then had been No. 1, and it had been the first year of the Bridge Creek Company's operation in that part of the country.

For the benefit of those who have never had cause to become acquainted with the terms of logging, it might be explained that a hook-tender is the foreman of a 'donkey' crew, and that a 'donkey' crew is one complete unit for the removal of logs from where they have fallen to earth to the 'flats' or 'sets' or cars upon which they are hauled to the boom in the river some

forty miles from where they lay. The hooktender is a man thoroughly acquainted with all the finest details of the operation, from the falling of the timber to its loading, and, as a general rule, would be able to step in and fill the vacancy of any position or job that might be wanting a man, even to the running of the engines (large two-drum machines built on the lines of a hoisting-engine, except that the logs are dragged along the ground instead of being lifted into the air).

When we say that Jack Duggan was a hooktender we make no reservations; for, besides having all the necessary knowledge of his position, he had as well the knowledge of men; he had the energy to use this knowledge from the time the whistle blew in the morning until the time it whistled them off at night; and, furthermore, he was a giant of a man, who would have been able, had the occasion demanded, thoroughly to man-handle any one of his crew, a rough lot at the best. But the very fact that he was never called upon to use the physical force with which nature had endowed him was perhaps the reason of his supreme usefulness to the company, for Jack's crew was always the same from spring until fall—after perhaps a new man or two had been weeded out on account of laziness. His very sternness seemed to bring Jack popularity with the best class of men in the woods, and things ran so smoothly that the only use he ever found for his great deep voice was in calling to the signal 'punk,' or in summoning the sniper for an occasional undersnipe (the bevel chopped around the front end of a log that it might run through the 'road' smoothly and without injury to the timber), or, when they were changing line to the new road, to call that the haul-back was pulled up to the 'main' with a lusty shout of 'Line!' Finally, Jack was the top notch 'hooker' in the company's employ, and in consequence received the highest pay of them all, and was also allowed, with his crew, a bonus whenever the weekly scale ran above a certain mark.

But the logger's usual life of travel and romance had not been entirely neglected by Jack in tending hook for the Bridge Creek Company. There had been days—in fact, years—before he had commenced work for them, when he had wandered about like the rest of his class, and had piled up large 'stakes' during the summer, only to dissipate them in but a few nights' debauchery in town. He had roamed from one camp to another, using the slightest pretext as an excuse to quit and start for the next camp in his line of travel. In this manner he had covered the entire area of the logging world of North America, with the exception of the hardwood forests of the east and the cypress of the south. Throughout the pine districts of Idaho and Montana, the fir and cedar of western Canada, Oregon, and Washington, the sugar pine of southern Oregon, California, and Mexico, and the redwood in California again—he had known them all; knew the methods of getting them out. And along with this he had accumulated a thorough knowledge of the tender-loin districts of all the large cities within or adjacent to the timber-belt. Furthermore, on account of his size and his ability to give a good account of himself in any kind of job or fight that might come to hand, his name was ever remembered in the places he had passed through as one of the biggest, the hardiest, the grittiest, and most devil-may-care spirits of his class.

But at the bottom of it all Jack had had a mental element in his make-up that was to bring

him out of this wandering period, the only reservation being that it required a woman to make him acquainted with this element.

We shall not dwell upon the affair, since Jack had lost very ungracefully to a camp foreman for the simple reason that the woman had been blessed with a sense of calculation, and the foreman was a man who had hoarded his earnings for some years, while Jack was but little more than out of debt to the commissary of the camp wherein he had started to work a short time before. However, the matter had made a deep and lasting impression upon him, and he had made up his mind never to be caught short a second time. Not that he so much regretted the loss of the woman, but merely that he hated to be beaten.

A little later he had taken the position with the Bridge Creek Company, with whom he had since remained. They had presented him with a small cabin for himself, so that he might not be forced to spend all but his working hours in the crowded and not too sweetly odoured bunkhouses, and this isolation as much as anything had impressed upon him the fact that he was lonely; but, even so, he cared little for the company of his fellows after work was over, and spent the most of his spare time in studying his daily paper and in little household duties that were to be done about the cabin. So it had gone on year after year as he had grown older, quieter, and more stern, until the coming of Alvin Johnson, whistle-punk.

Not that Alvin's entrance into camp was heralded by any particular notice or comment, for the lad was the acme of meekness and unobtrusiveness, and, furthermore, had not the slightest idea of logging, its operation, or its purposes. He was a waif and a physical incompetent, drifted out from the slums of a city where he had been badly treated throughout the entire course of his ill-starred existence. He had asked the superintendent for work before venturing into the hills (the superintendent having happened to be at the lower end of the logging road at the time); and that ex-logger, one of the shrewdest, coldest, and yet fairest in the business, feeling a glow of pity for the misshapen form before him, acknowledged to himself that there might be something the lad could do.

It was the superintendent's secret pride that no one ever knew whether he was joking or in earnest, and it was through the clever intermingling of the two that he generally managed to pay the smallest wages of any one in that part of the country, and at the same time run one of the largest and most up-to-date camps. No one had ever been able to 'bluff' him into an increase of pay through the hint of his leaving, for he never considered it even worth while to ask why the man was going. As a rule he would nod his head cheerfully at the

announcement, and reply, 'Yours truly,' as though it were an everyday occurrence with him; and it was.

When Alvin came up to ask for work, the superintendent saw at a glance that the lad was not capable of undertaking any but the lightest of tasks, though with the same glance he noted that this was not the ordinary type of tramp. He decided to draw him out.

'Ever been in a logging camp?' he asked brusquely.

'No, sir.'

'They're a bad sort of a place for a lad like you.'

'Yes, sir.'

'You gotta be tougher'n the devil if you ever want to be a logger.'

'Yes, sir.'

'Do you think you could stay with 'er if I give you a job?'

'Yes, sir.'

'Well, then, climb on to that speeder, and I'll give you a job makin' music on a steam-whistle.' Then he noticed the violin-case the lad carried, and added, 'Looks like you're born to music, anyway—eh?'

'Yes, sir.'

'I believe if I told him to go to hell, he'd say, "Yes, sir," mused the superintendent as they sped away up the grade against the wind, with the unmuffled engines of the speeder barking like an intermittent volley of small cannon.

In camp the superintendent personally effected an introduction of the boy to the foreman, as otherwise that gentleman, also an ex-logger, but with more brutality and less generosity than his superior, would have been very apt to think slightingly of the lad's capacity for work, and it is certain that he could have served no other purpose in a logging-camp.

The result of it all was that Alvin was sent to fill the recently vacated position of whistlepunk, or the manipulator of the whistle wire, for

Jack's crew at No. 2 landing.

Now Jack had seen nothing of the lad's arrival with the superintendent, and it would have made but little difference if he had, for the one factor demanded at No. 2 was efficiency, and it seemed doubtful whether Alvin could supply the demand even in the position of whistle-punk. But the foreman had sent him, and there was no alternative but to give him a chance.

Even greater became Jack's uncertainty when he learned that the lad had not the slightest idea of signals; but he showed him how to stand with the wire over his shoulder so that he might gain the greatest possible leverage in pulling down with his hands to blow the whistle on the donkey-engine some fifteen hundred to two thousand feet away. It cut Alvin's shoulder frightfully, and his bare fingers soon began to ache from the cramped holding of the small

steel wire; but Jack had told him the meaning of the signals, and as the crew called he pulled as best he could, suffering in silence. It was the stoicism of the poverty-stricken, the abused, and the hungry, for a pain in the hand and shoulder must be endured so that the emptiness of the stomach may be filled thereby.

The following morning Alvin had a pad for his shoulder (a potato-sack folded several times), so that the wire would cut no more; also gloves, in order that his fingers might be protected at the same time; and the signals went so much better and faster that Jack found little to complain of, and finally almost forgot the new whistle-punk entirely.

But this was not true of the remainder of the crew, as they had reason to know him better and better as time went on. Jack's ignorance was due to the fact that he lived apart, and thus was not always aware of what was going

on in the bunk-houses.

Mitchell, the commissary-man and time-keeper, had come to know the lad first of all—that is, to learn his unusual qualities other than his puny appearance—and his knowledge was due to the fact that Alvin had come into camp without a 'sugan' or blankets of his own, and therefore had nothing to sleep in. The company provided no more than the bunks and springs.

He applied to Mitchell to get the required articles from the commissary; but as it was not the custom of the company to deal out goods until the applicant had put in enough time to offset the value of the goods received, Alvin learned that he had not as yet paid his monthly hospital fee of one dollar and his bed rent of

fifty cents.

Mitchell informed him of the rules, and then turned to the next customer, for he had been in the camp so long that he had been called upon to quote the above rule no less than a thousand times. At first he had sometimes relied upon the integrity of the applicant, but experience had taught him that this was a losing policy, and he therefore discarded it altogether. However, he saw that the lad was not the usual run of logger—penniless from a recent debauch. He noticed the large, soft eyes of a sixteen-year-old boy set so strangely in the pinched, starved face of an old man, and other things that made him wonder—for Mitchell was an observer of men—and he made up his mind that he would see that the lad had a place to sleep and bedclothes to sleep in.

He finished waiting upon his customer, and was about to address a question to Alvin, when it was discovered that the boy had slipped silently out of the office and was gone; but while Mitchell was debating with himself as to the advisability of calling him back the lad returned, bearing under his arm the battered black violin-case, which, without ceremony, he

placed upon the counter.

'Will ye take this for me sugans till I get the time comin' to pay ye?' he said.

Mitchell was curious about the lad, and that probably accounts for his unusual action toward

'Let's see your fiddle.'

The boy opened the case, and disclosed the violin wrapped carefully in an old piece of silk rather soiled with age and use, unwrapped the silk, and held the instrument towards Mitchell. But the latter did not seem to desire the possession of it.

'Can you play?' he asked.

'Oh, a little.

'Go ahead!'

Alvin looked at the time-keeper strangely, for this was an unusual course of procedure for one bargaining for bedding, and Alvin had been warned beforehand by the men of the bunkhouse in which he had found a vacant bunk that he would have difficulty in gaining a concession from that office.

Mitchell was the mystery of the camp, and had been so ever since his arrival there; no more to the men, however, than to the company itself, the foreman, the superintendent, and the general manager, for the simple reason that he never did quite what an ordinary person would be expected to do. No one had ever known him intimately, for the reason that the only personal expression ever allowed to escape his lips was one of the sharpest scepticism, and because, during the period of the camp's activity, he had never been known to associate with a soul. He was civil to the foreman, and with the superintendent even went so far as to deal in his own kind of humour; but to the remainder of the camp he was a closed door. Immediately the clock announced eight-thirty in the evening he shut up the office and retired to his own cabin, where he pursued some sort of reading or study until late in the night; no one ever knew how late, for his light was always the last one in camp to be extinguished.

Once the superintendent, who was a curious little man, inquired as to the nature of his evenings' occupation; but Mitchell had replied that he was just doing a little reading, and the superintendent had judged forthwith that it was considered none of his affair—which he admitted to himself it was not-and so there was nothing

further said upon the subject.

Mitchell, by the by, was the only man in camp outside of Jack Duggan's immediate crew in whom that gentleman ever took any permanent sort of interest; this interest, however,

being due to a long-nourished dislike.

At times, when Jack, with a view to attracting Mitchell's attention to himself, had complained of the quality of the goods he purchased from the commissary, or of the amount of his cheque for the month, Mitchell had merely looked at him coldly, as was his custom, and replied,

'Take it or leave it, just as you like;' or, in the case of the cheque, 'Speak to Mr Manning about it to-morrow'—Mr Manning was the superintendent—and then turned to his next customer, as though the matter made not the slightest difference to him whatever.

With another man Jack might have sought a quarrel on these occasions; but with Mitchellthough he knew the lean form of the man could not for a moment stand up against him-there was always the fear of the sharp wit that never failed to bring embarrassment to its object, and at the same time never left its promulgator open

for a personal quarrel.

Once inside that little cabin of Mitchell's, one would have found a revelation like suddenly piercing through the outer shell of the man and beholding his mind, his visions, and his soul; none of the loggers, at least, had ever entered his sanctum, and so had never beheld the array of books along the wall, the large table in the centre of the room covered with magazines and journals of a more conservative order, the pictures upon the walls, small and inexpensive, but tasteful and well chosen. At one end of the room, by the bed that was used as a couch during the day, was a rug that had been kept clean. There were also a victrola and a cabinet of records, a music-stand, a violin-case, a table with a typewriter upon it, and numerous collections of notes, hung in clips to the wall above the table. Throughout all there was an atmosphere of thought, taste, appreciation of the truly beautiful; one of the few habitations in the woods—at least the commercial woods—that expressed within its walls what the beauty of nature expressed without.

Strangely, too, no one but the scaler, who was allowed to invade this sacred domain, had ever heard the sound of the victrols or of the violin, due largely to the fact that they had never been played upon until after the men were asleep, and that Mitchell's cabin was set some distance apart from the remainder of the camp. But still it remained that there were these things so truly indicative of character that had never been discovered, but which might explain why Mitchell was curious to know if the lad could play.

True, there were many men who came into the camp with their different musical instruments, men who could play after a fashion, mostly dance-music of a purely rustic order; but there was that which the time-keeper read in Alvin's face and eyes promising something far beyond the ordinary, and he was desirous of hearing its expression.

The lad tuned the instrument carefully, though with a certain easy dexterity that showed him to be thoroughly accustomed to the practice, and looked rather shyly at his prospective listener, as though trying to puzzle out what type of music would please him best.

'What'd ye like to hear?' he asked.

'Music,' answered Mitchell plainly.

Alvin could not quite assure himself that this man meant what he said, for he was accustomed to the tastes of most of the class with whom he had come in contact—one of the crudest popularity. But he decided to take Mitchell at his word, and with half-closed eyes, his body swaying to the rhythm of the piece, he struck into a Russian dance, a strange, weird melody that vibrated with an undercurrent of evil forewarned.

Mitchell watched the lad, his thin, emaciated frame, upon which the ragged, ill-fitting clothes hung as loosely as those of a carelessly made scarecrow. His hair was of the tawny, ungovernable description seen in many of the descendants of the Vikings, his features thin and pinched, his neck scraggy. But while he played all these things were forgotten, and the eyes alone seemed to breathe the fire and spirit of his soul.

His playing on the whole was rough, and the technique crude, but the pitch was absolutely true and the tempo perfect. Furthermore, there was that vibrancy to the bowing and strength to the touch that is born in the heart of the musician, not cultivated through practice alone.

Two or three times during the playing the lad looked up into the eyes of the listener, and those eyes seemed to be understanding, though one could never be certain. The features were as immobile as those of a sphinx.

When the tune was finished, it was noticed that one of the loggers had heard the music and strayed in to listen. He seemed to realise that it was music of an unusual order, for he immediately inquired whether the musician could play the 'Irish Washerwoman,' which the musician, always anxious to use his instrument for the pleasure of others, proceeded to play with the utmost ease and abandon, as though he had played it a thousand times—which undoubtedly he had.

One might have noticed the trace of a smile in Mitchell's eyes as he turned to the back of the office to get the required bedding. The bedding, by the by, he placed upon the counter, indicating to Alvin that he might take it.

The lad, after having wrapped up his instrument, replaced it in the case, and passed it across the counter toward Mitchell; but the latter waved it back.

'Never mind the fiddle, son; you might need it for a pillow,' he said; and then to the rest of the company that had gathered suddenly from out of the night in answer to perhaps the best-known piece of music of the American logging-camp, 'Clear out now, you fellows; it's time to close up the office.'

All agreed that he was queer; that there never seemed to be any normal reason for what he

(Continued on page 712,)

FOUR EAST COAST 'NORTHERN LIGHTS.'

By ARTHUR O. COOKE.

FOR those who live south of the Tweed, and even possibly for some of Scottish birth, it may be necessary to explain those picturesque The 'Northern high-sounding final words. Lights'-lighthouses, lightships, beacons-are all such as stand around the coast of Scotland and the Isle of Man, and are ruled over by the Commissioners of Northern Lighthouses. Board, as do the Trinity for England and the Irish Lights Commission for the little sister, the distressful isle, work under Board of Trade control; but, subject to that high authority, each Board conducts its business and regulates the management of its lights and lightkeepers in its own peculiar way.

Most people know a lighthouse when they see it, and are more or less aware that the life lived on a 'rock' tower by its keepers must be lonely and monotonous. There, save for one person in ten thousand, knowledge ends; and yet few subjects are more fascinating than lighthouses and lightships, and few better repay the trouble of inquiry.

Much enlightenment to those curious in the matter may be found in the exhaustive and voluminous Report of the Royal Commission

on British Lighthouses which sat in 1908. There, for instance, the Englishman will learn, perhaps not without surprise, that Scotland has around her coast more lighthouses than has her sister of the south. The intricate, deeply indented nature of the west coast of Scotland largely accounts for this. On the other hand, Scotland possesses only one 'attended' light-vessel, while England has over fifty of these craft; a fact at once explained by the almost total absence of large sandbanks from the Scottish

Some differences of management between the English and the Scottish lighthouse Boards may first be noticed briefly here. English lighthouse-keepers, as also the crews of lightships, spend two months at their isolated post of duty, followed by a month's 'relief' on shore. Both lighthouses and lightships are 'relieved' by steamers from the shore once every month. This applies only to 'rock' lighthouses; such, that is, as are situated on a reef or isolated rock, or on an island uninhabited by others than the lighthouse staff. 'Shore' lighthouses, of course, require no such periodical relief.

A Scottish lightkeeper spends six weeks on his

rock or island, then two weeks on shore. The 'relief' thus necessarily takes place every fortnight; and this fortnightly relief of every isolated Northern Light is carried out by the almost incredibly small number of four steamers. The headquarters of two of these is Granton, while the others have their home at Oban and

Stromness respectively.

In Scotland, as in England, four lightkeepers are attached to a rock light; three are on duty, while the fourth, each man in turn, enjoys his spell ashore. In England the services of a 'super' are required every third month, otherwise each keeper would not get his one month out of three on shore. These 'supers,' young men who have recently joined the service, spend their first year or two in relieving sick or absent keepers before being appointed to a settled post. On Scottish lights, where each man is ashore one fortnight out of four, 'relief' works automatically, and 'supers' are unknown; 'occasional' keepers are employed to take the place of absent or disabled men.

Two other differences of method call for notice. Rock lightkeepers in Scotland keep a three-hour 'watch,' those of the English service keeping one of four hours, as on board a ship. each English keeper receives for every day that he is on his rock a money allowance in addition to his wages, and with this he finds himself in He has liberty to spend it as he likes, and may dine daily on champagne and truffles—if he can! The Scottish lightkeepers have the same daily sum expended for them by their Board.

With regard to these differences of system, doubtless much may be said on both sides; the pros and cons of each would take too long to argue here. But the investigations of the 1908 commission brought to light the fact that the working of the Northern Lighthouse Board was the most economical of the three; and this in spite of a fortnightly 'relief,' given by only four steamers to the whole of Scotland and the Isle of Man.

The report, interesting as it is, yet taught the writer of this paper little that he did not know before. Not only has he visited each one of the four Northern Lights about to be described, but upon one of them he made a fortnight's stay, having already spent a week upon a famous English tower. The Northern Lighthouses which seem good specimens from which to learn a little of the methods necessary to maintain from sunset until sunrise the long chain of warning beacons round our coast are those upon the Isle of May, Fidra, the Bass, and the world-famous Inchcape, or Bell Rock, a 'light' the very name of which should make all Scottish hearts beat high with

Of these four lights, that on the Isle of May has, for the possible inquirer, the great advantage of being easily accessible from shore. All through the summer months excursion steamers land their passengers upon the long, low rocky

island several times a week; and only an order from the Commissioners of Northern Lighthouses is needed for admission to the lighthouse tower.

It is in some ways the most interesting, and yet in others the least so, of all the lighthouses that we have seen. It is a little too magnificent and too unique to give a wholly satisfactory specimen of lighthouse life; for the illuminant employed is electricity, giving a light of some six million candle-power, by far the most powerful of all Scottish lights; and the electric power for the light, together with the mechanism for the working of the fog-horn, needs a staff of seven men. There are two lightkeepers, three engineers, and two more men; one of these last being chiefly occupied with superintending the hauling up from landing-stage to store of the large supplies of coal consumed, a work done by the island horse. Dogs, too, are on the island, and gardens, fowls, and even a golf-course—all the amenities

The keepers need them, for 'relief' in its full sense comes only once a year. Having their wives and families beside them, they are looked upon as being 'at home,' and get no respite but an annual fortnight's holiday on shore. The two lightkeepers, like the keepers of 'shore' lighthouses, keep an alternate four-hour 'watch,' one 'on,' the other 'off.' No wonder, to our mind at least, that a 'rock' keeper said not long ago, 'Thank you, no island life for me! Give me a good rock station, with my six weeks on and fortnight off.' Still, keepers must needs go where they are sent.

The lantern of the May is a group-flashing and revolving one, giving four flashes shown in quick succession, followed by several seconds of obscurity; the whole period of flashes and succeeding darkness lasting thirty seconds Different indeed was the light shown for close upon two centuries—from 1636 to 1816—from the old tower standing fifty yards away, the glare often obscured by smoke of coal burnt in a 'choffer' on the tower's top. This light was probably the first to be exhibited upon the Scottish coast.

'What of the children on May Island and sewhere?' some reader asks. When they elsewhere?' some reader asks. attain school age they must be sent to the mainland for education, and the Lighthouse Board makes an allowance towards their maintenance ashore.

Fidra, again, is somewhat like the Isle of May; but with a difference, and on an infinitely smaller scale. The tiny island, lying some three miles to the westward of North Berwick, has accommodation for the keepers' families. But its light is given by the simple and old-fashioned method of wick-lamps; there is no fog-horn no electric power. Therefore two keepers are sufficient for the lighthouse needs. They keep four-hour watches, go ashore a fortnight in the year, and live as do the keepers on the Isle of May. In one respect, indeed, they are more favoured than their fellows of the larger isle. Each Sunday during summer, weather permitting, comes the 'lighthouse boatman' from 'North Berwick, and a keeper (his wife also if she chooses) goes ashore to church, being brought back in the afternoon. This Sunday visit gives any one who cares to do so an opportunity to land for half-an-hour on the island; there are seats vacant and to spare—for a consideration—in the boatman's sturdy craft.

The tower on Fidra is, we think, the one unwhitewashed lighthouse on the British Isles; the owner's mansion faces the island from the shore, and this was made a stipulation in allowing the lighthouse to be built. The keepers' quarters, too, are built as inconspicuously as possible. To each his taste; for our own part we can conceive few better ornaments for a lone island than a

snowy lighthouse tower.

Fidra, as also the May Island, has a creek which forms a safe, commodious harbour for the relieving steamer's boat. The creek, indeed, well-nigh cuts Fidra in two parts. On its one side there stands the jutting Castle Rock, a fine square mass. The main part of the island has a natural arch, well seen when one is passing it on the north side. On Fidra, as upon the May, are the ruins of a religious house.

Eastward, five miles away, stands 'Bass amid the waters,' with its lighthouse built in 1902. Here, though the mighty rock is covered with some six or seven acres of short turf, we are approaching nearer to true lighthouse life. There are no wives or children, no 'homes,' here; only the tower, the adjoining quarters for the keepers, and the engine-room. The Bass is in every respect a 'rock' station, having four men attached to it.

The lighthouse stands above the ruins of the old fortress on the rock's south side, facing Tantallon Castle on the cliffs two miles away. There are two landing-places, one with a little quay and a long flight of steps immediately below the tower, the other in a natural creek a little to the east. No matter at which port he goes ashore, the visitor will pass between the crumbling walls and underneath the mouldering gateways of the ancient keep. Here Lauderdale immured his Covenanting prisoners in the seventeenth century; among them Alexander Peden and (strange company for him and others of his kind) a curate of the Church of England and a Roman Catholic priest. Here, too, in 1691, came prisoners of a different sort—determined Jacobites, who rose one day and overpowered the small garrison, and then held out for three whole years against besieging ships. One learns with no regret that such a gallant little band at length capitulated upon honourable terms.

Interesting though such ancient history of the Bass may be, to ornithologists its chief delights are of the present, for it is a well-known haunt

of solan geese. Whether the Commissioners of Northern Lighthouses considered this when sending to the rock the present principal keeper of the light we cannot say; fortunately for his own tastes, and also for the information of the Scottish public, he is well known as an observer of sea-birds. Not a week passes but he sends some news ashore—the doings of the rock's chief inhabitants themselves, the presence of some migrant or some rare winged visitor. These solan geese, or gannets, of the Bass are at the breeding season worth travelling far to see.

The tower's lantern gives a revolving and group-flashing light, showing six flashes in a group. It is lit by oil, as are most modern lighthouses not fitted with electric light; or, to be exact, oil vapour is burnt in an incandescent mantle, the oil being forced up to a heated vaporiser by compressed air. Compressed air, too, it is which sounds the fog-horn standing high upon the cliff on the rock's northern side, the air being carried to the horn through a long line of pipes. The horn is situated where it is of most utility to ships at sea; but almost the whole thickness of the rock is interposed between it and the engine-room, and it would be impossible for the keeper upon duty in the latter place to catch the sound of its deep, bellowing note. To obviate this defect, a telephone connects the horn and the engine-room, and by this means the keeper knows that all is working well.

Were we on board the steamer making a 'relief' a run of two-and-twenty miles would lie before us from the Bass to the Bell Rock, a tower in many ways more interesting than any other on our coasts. The famous Eddystone of Smeaton has been taken down; rather, indeed, because its rock foundations were discovered to be perishing than owing to any fault in Smeaton's honest work. Within the last three-quarters of a century the splendid lighthouses of Skerryvore and of Dhuheartach have arisen in the west to brave the wild Atlantic gales. But Stevenson's old tower on the Bell Rock reef stands all unyielding and unchanged to-day after a hundred years and more of battle against wind and sea. Save for the addition of some modern fittings and an incandescent light, it is unaltered and unsuperseded, staunch and useful still as when, upon the 1st of February 1811, its bright light first flashed across the sea. It is indeed a very veteran-shall we say the Grand Old Man of lighthouse towers?

And here the keepers live the lighthouse life in all its full intensity of loneliness and isolation from their kind. No golf-course here, as on the Isle of May; this is no Fidra, with a lively watering-place in view two miles away, no Bass on which to wander during idle hours. The Bell Rock reef is, it is true, laid bare to the extent of a few acres at low tide, but even in calm weather not always sufficiently so to form a promenade. And at high water some twelve

feet of ocean rolls across the reef, hiding the spreading bell-shaped structure of the tower's base. At such a moment, on a day of calm, there often seems indeed to be 'no stir in the air, no stir on the sea;' yet through the calm will sometimes come a roller which, in passing, strikes the tower with a sudden blow as of a thunder-clap, and makes its massive fabric shake.

Is there a good foundation for the story of the abbot and his bell? Probably not; each in its turn those pleasant legends of our childhood are being proved by critics to be myths. Stevenson noticed that one small portion of the reef was of a bell-like shape, and judged that this might be the reason of the name. As to 'Inchcape,' that doubtless means the 'inch' or island of the neighbouring Redhead Point, a little to the north. But happily the men who toiled for four long years upon the reef a century since were not so critical; they gave each bare or tangle-covered ledge its name, and so we see to-day the Abbot's Rock and Ralph the Rover's Ledge, with twenty more.

The tower, though comparatively small beside such as the present Eddystone and Skerryvore, is very comfortably fitted up. A general lighthouse plan of modern times is to allow the inner surface of the walls to rest in all its bare simplicity of stone, unpainted and unlined in any way, partly to avoid expenditure of paint and cleaning, partly also as a safeguard against fire. But the inner walls of the Bell Rock are painted, and the kitchen panelled half-way up its height. The 'library,' a room intended for the use of engineers and other such officials as may have occasion to remain a night or even a few hours on the rock, is, save as to actual size, a magnificent apartmenthand-painted ceiling, handsome carved oak furniture, some interesting curiosities, and a marble bust and tablet to the builder of the tower.

Electric bells connect the bedrooms with the little kitchen, and the light-room with them both. A hand-pump raises up oil from the iron gangway where 'relief' boats land to cisterns in the store, thence daily to the 'containers' in the light-room. Nothing is wanting that can aid the men in doing their duty or that can in any manner add a little to the comfort of their lonely lives.

The light shown is a single white flash alternating with a red, the period covered by the flashes and the intervening darkness being one minute. It is interesting to note that the red flash is obtained, not by the use of coloured glass for prisms and bull's-eyes, but by the interposing of a very thin red sheet of glass; and even this thin sheet is only coloured for a small portion of its thickness. The reason for this is the large amount of light—no less than 60 per cent.—lost by the interposition of red glass. A large proportion of the great revolving 'drum' or lens is occupied by reflecting prisms concentrated on the portion giving the red flash. The fog-signal is explosive.

The keepers and their families live in a 'barrack' at Arbroath, eleven miles away, though they are carried to and from their duty by the Granton steamer, as are those of other east coast lights. Granted bright sunshine, each day sees them signalling by heliograph to the 'shore' keeper at Arbroath; after the official message of 'All's Well,' the conversation often takes a more or less facetious turn!

Such are the posts of duty of some Scottish light-keepers—men in great measure lost to public sight, who keep their watch when others sleep, who often, as on Skerryvore, are dragged at each 'relief' through blinding surf to reach or leave their work; soldiers of a small gallant army guarding the fleets of Britain from the perils of her coast.

THE CAMPHOR MONOPOLY.

By Romney.

INDUSTRIAL history contains few more interesting studies than that of the failure of the Japanese attempt to corner camphor. Its history is little known except to the chemist and to the industrialist, and of these it is probable that not many understand the international importance of the rapid rise in the price of camphor after the Russo-Japanese war; yet few events caused the Governments of the world more serious anxiety, a fact to which the large expenditure upon secret-service work and chemical investigation in this connection bears witness.

Ten years ago the world enjoyed two varieties of camphor. There was Borneo camphor, the purer quality, of which comparatively small quantities were produced, and which was used mainly for medicinal purposes. In addition to

this there was the coarser common camphor of commerce, whose use had increased enormously since the discovery of its employment in making celluloid by the Englishman Parkes in 1858, and since it had been employed as an indispensable ingredient in the manufacture of smokeless explosives.

Camphor is extracted by distillation from the camphor laurel (Cinnamomum Camphora), a tree which flourishes in Japan, Formosa, parts of southern China, Cochin-China, and Java, but whose preference for Japan and Formosa is shown by the fact that in 1905 over 90 per cent. of the world's supply came from those islands. In that year the total export of the Japanese Empire (the most of which came from Formosa) amounted to over six million pounds. The Japanese, who

annexed the island after the Chinese war, made the sale of camphor a Government monopoly in They seem to have done so at first without any clear intention of making a 'corner.' Rather would their action appear to have been determined by the increasing deforestation of the island, a problem which had troubled the Chinese before them, for we find that in 1720 no less than two hundred persons were decapitated for disobeying an edict against felling trees, as the traditional Chinese method of distilling camphor from the wood of the trunk necessitated felling the whole tree, with the result that the island was becoming rapidly denuded. The laurels still flourished in the interior; but this was owing to the presence of the aborigines, who were in constant rebellion against both Chinese and Japanese rule, and who in 1898, the year of the establishment of the monopoly, killed no fewer than six hundred and thirty-five persons in their raids. Such was the constant interference of these barbarians with the industry that in 1885, when one of their fiercest rebellions occurred, the quantity of camphor exported fell to the nominal figure of four hundred pounds.

This the Japanese proceeded to remedy. The commercial side of the industry was regulated by entrusting the selling agency to an English firm. Producers, on the other hand, were compelled to sell to the Government under the direst penalties, and a large police force was organised to prevent illicit dealing. This force was composed of fifteen hundred armed Formosans, under about fifty Japanese, and the methods of dealing with the subject population were not more gentle than the ways of such forces usually are. The plantations of camphor laurels were encircled by live wires, upon which the innocent perished with the guilty, in common ignorance of the danger. At the same time, military expeditions were sent into the interior to punish the aborigines for their contumely, and to tap regions which had hitherto been rendered inaccessible. of these measures were doubtless unavoidable in the interests of peace and commerce; but, over and above this, there are tales of atrocities which equal anything reported from the Congo. Fifty years of superficial civilisation have not altered the Japanese nature, except when it is necessary to conciliate European opinion; and the exploitation of Korea is a very good clue to what goes on behind the veil in Formosa. In the words of a Japanese author, 'a certain writer does not exaggerate when he says that a few pounds of camphor, which looks so much like snow, represent so many drops of human blood.'

It appears to have been after the Russian war that the Japanese Government first awoke to the possibilities of their practical monopoly. 'As the production of camphor is practically limited to Formosa and Japan, we now control the supply of the world,' wrote Yosaboro Takekoshi in 1905. Synthetic camphor had already made its appear-

ance in 1903, but at a prohibitive price. formula discovered by the German Komppa required the oil of turpentine, which in itself is scarce, and becoming scarcer. It was accordingly hoped by the Japanese that they would be able to force up the price to a figure limited, of course, by the possibilities of synthetic camphor, but still high enough. 'We cannot,' said Takekoshi, 'permanently monopolise the industry;' but it was hoped to derive sufficient profit from a transient monopoly to finance some of Japan's naval schemes, and to relieve the very heavy taxation which oppressed the country after the war. It was realised that the camphor laurel would flourish elsewhere than in Japan and Formosa. But the Japanese seem to have been inspired with unjustified confidence in the security of the moment by the traditional methods of the Chinese distillers; for it was a dogma among the Chinese that trees could not be felled with profit for distillation until they had stood for fifty years, and it apparently did not occur to the Japanese to question this belief, which, if correct, would have meant a fifty years' monopoly to themselves, even if the laurels could be cultivated elsewhere. They seem accordingly to have been confident of their power to squeeze the world for a considerable period, and to retain in their hands the monopoly of an ingredient indispensable in the manufacture of explosives. They did not, therefore, hesitate to raise the price of the article some 70 per cent., and to ensure their own supplies by stimulating reafforestation. In 1906 they planted three hundred and forty-six thousand trees; in 1907, one million three hundred thousand; in 1908, four million eight hundred and thirty thousand; in 1909, five million and sixty thousand. The work of harrying the aborigines was redoubled. Unfortunately for the Japanese, their energy only served to call attention to their monopoly, and to nerve the world to efforts to nullify it-efforts which were very soon to be successful.

Most Governments, and particularly those of Germany, Great Britain, and the United States. devoted themselves resolutely, if unostentatiously, to experiments in producing camphor. Americans, in particular, feared a monopoly of their Asiatic rivals in an article of military necessity, and their Department of Agriculture, by every means in its power, fostered experiments in growing camphor-trees. Seeds were procured from Formosa by secret agents-not without trouble, for the Japanese were watchful—and efforts at culture were made by the British in Ceylon, by the French in the Midi and in Madagascar, by the Germans at Anani in German East Africa, and by the United States in Texas and Florida. In 1907 the camphor acreage in Ceylon increased from one hundred and forty-two acres to one thousand one hundred and six. was also found that the laurel flourished in Italy, and, lastly, but most important of all, in Jamaica.

Jamaica has always been renowned for its production of essential oils. It now has another advantage over Formosa in the cheapness of its labour-supply. Negroes can be obtained at one shilling a day. The Japanese are reported to be paying as much as four shillings a day in Formosa—why, it is hard to say, unless it has been found that with a lower rate of wages the monopoly is not secure against betrayal. The difference speaks for itself.

But since, even in the most favourable circumstances, some ten years are required for trees to attain their maturity, all this would not of itself have procured immediate relief if the world had been content to go on believing with the Chinese and Formosans that the precious drug could not be extracted with profit from trees that have stood for less than half a century. However, it was soon discovered that the Celestials had as little reason for this superstition as for many In Florida and Texas excellent results were obtained from trees of five years' growth. Some enterprising individuals went further, and reaped the young shrubs when three feet high by means of a machine similar to that used in reaping corn. The experiment was successful. Finally, an astonishing discovery was made which gave the coup de grâce to the moribund monopoly.

The story runs as follows; it is impossible to verify it, but it is highly probable, and there is no doubt of the solid results. It illustrates what is going on daily in the industrial world. A German chemist analysed the wood of the camphor laurel, and discovered that it yielded ·61 per cent. of camphor. With this many men would have remained content; the Chinese, for example, had remained content with far less for many thousands of years. But the German, being patient and methodical, went on to analyse the twigs. He found that these yielded 1.05 per cent. He then proceeded to the green leaves, which gave 2.37 per cent., and to the dried leaves, which yielded 2.52 per cent. The dead leaves showed a fall to 1.39 per cent. It was also discovered that the leaves can be gathered without injury to the tree.

The commercial moral is obvious. It is easier to harvest leaves than to fell and chop up trees. Even if the yield was not greater, it would still be more profitable, for the tree which is stripped will bear again in a year's time, while for the tree that is felled another requires to be replanted and allowed to grow. Add to this the fact that, as we have already seen, the price of labour in Jamaica is only a quarter of what is paid in Formosa, and it will become obvious that the days of the Japanese monopoly were numbered. So far, the German chemist had been most successful; but a certain impracticability prevented him from putting his discovery to immediate commercial use. In addition, he registered it in America. Now there exist in America quite a number of persons who

make a steady income by adapting impracticable German patents to American requirements—a fact which speaks volumes as to the character of the two peoples. One of these, noticing the German's patent, lost no time in travelling to Jamaica, where he put the discovery to practical use, with the assistance of an old-established planter. Since the Japanese have remained unable to introduce the improved methods into Formosa—probably because of the native obstinacy of the inhabitants, who adhere blindly to traditional methods—the corner is broken. It only remains to be seen whether the camphor laurel will permanently flourish in Jamaica, or whether, like Cannabis Indica, it will alter its characteristics after a prolonged sojourn in the new soil.

It may be mentioned that military students have remarked a similar minute attention to detail, accompanied by a want of breadth of intellect and inability to depart from recognised models, in the Japanese conduct of the recent war. The history of the camphor monopoly is comforting to those Europeans who are disposed to exaggerate the Asiatic revival at the cost of their own just and long-established reputation.

ESTRANGED FROM LIFE.

As in some dim and ancient glass
That mirrors forth a shadowy world,
Strange hurrying crowds before me pass
With banners gay unfurled—
A world with joy and gladness rife.
The leader with triumphant eyes,
An unsheathed sword in his right hand,
Points on to future victories
In an unseen, enchanted land—
I stand alone, estranged from life.

I catch the tumult of a war,
The trumpets blare unceasingly,
And through a narrow gate ajar
Soft echoes fall unmeaningly.
Mingling with shouts of hate and strife
Low honeyed words of tenderness
Falter through tones now sharp, now keen,
Vague as some gentle, soft caress
That memory tells us might have been—
Alone I stand, estranged from life.

Pursuers follow beckoning fame,
And snatch at bubbles blown in space,
Foolish as in some childish game
Played with sad eyes and anxious face
By one who once has felt the knife.
Familiar sounds haunt my dull ear,
Though nothing stirs my silent heart,
Something is lost of peace and fear,
Some tender grace, some bitter smart—
I stand alone, estranged from life.

The cumbrous trammels of the flesh
Forbid the soaring spirit's flight,
Though far away as through a mesh
Dull ears still catch the clash of fight,
But lost the thrill of drum and life.
Vanished the meanings rich and grand,
The battle on enchanted ground,
The sword drops from my nerveless hand
While carelessly I look around
And stand estranged from life.

BEATRICE ALLHUSEN.

HILL-TOWNS OF PROVENCE.

By MARY GRAEME.

DURING the course of his reign Charlemagne, by royal decree, restored to Bérenger, Bishop of Marseilles, the town of Seillans, which had been stolen by the Moors and had suffered many things at the hand of Italian hordes.

In early days the houses clustered round the Chapel of Notre Dame de l'Ormeau, on the wide, sunny plain lying between the Basses Alpes and

the spurs of the Estérel.

Perhaps the sweet influence of the Monks of the Lérins affected the people, or the piety of the good Fathers of the Abbey of St Victor at Marseilles, under whose care and jurisdiction Whatever the reason, they seem to they lived. have been religiously and devoutly disposed. While they were gathered at Our Lady of the Elm to celebrate the fête of some saint, their faith must have been sorely tried when the Saracens descended on the village, and from the plains of Lombardy armed men who stole their goods and burned their houses, and they, returning, found only smoke and flame and desolation. frightened people took refuge in the forests till order came and hope revived. Emerging from the woods, and discovering a strong tower already built on a rock commanding the valley, they chose this spot, and began to encircle the crag on the warm southern slope with their new home, surrounding it with powerful ramparts Much of this can still be and strong gates. seen, washed by the rain and mellowed by the sun of eight or nine centuries, massive ruined walls covered with ivy and moss, walls that have done good work in their time.

This little hill-town of steep, winding streets and tawny, weather-beaten roofs is the Seillans the wanderer will find to-day; the houses in the plain exist no more. Only, from time to time the labourers find a tomb where the great Mother Earth held some of these men of old, or a graven stone, or an urn, the last gift to a lonely traveller. And Our Lady of the Elm still

watches from her place.

The religious festival of La Bravade—still held in Provence, in which men take part, walking in the procession in uniform and carrying arms-originated from this early disaster. Had they, on that far-off day, been armed and ready, they might at the first alarm have saved their home and their property. Now peace !

reigns. The people no longer watch the valley for the glint of steel or listen for the galloping of horses; their thoughts are turned to industry. The gathering and the pressing of olives in the flat baskets plaited to contain the ripe fruit, the quantity of oil they can squeeze through the loosely woven straw, and the quality and flavour of the same fill their mind. Then the tasting on a bit of toasted bread dipped in oil, sprinkled with salt, and just touched with garlic. rustide this is called, and a savoury morsel it

is, with a fresh, nutty flavour.

When the last drop of oil has been extracted from the olive-pulp the crushed stones (grignons) make an excellent fuel. Still here and there in Provence one comes across beautiful tall jars wherein some household or monastery kept its store of oil; those from an abbey usually have the sign and seal of the Order marked on the side. Near the oil-press masses of cork bark brought down from the woods are piled close to a building where corks of every size and quality are sorted, cut, pared, and rounded. finished, the corks are poured into a grooved machine holding a certain number. A hundred or a thousand, according to the order, can thus be counted in a few moments.

In a neighbouring house excellent honey may be bought—honey with the flavour one would expect from bees with such opportunities, such fragrant hills of wild thyme, myrtle, rosemary, and honeysuckle from which to compound their

wares

Thirty years ago the charming and clever young Marquise de Rostaing came to visit her land in the south. To help the people and to utilise the rich earth that she saw would speedily make a garden, she planted flowers instead On the hill above the village, roses, of trees. jasmine, violets, and jonquils divide the berges where once the olives grew. She hired experts to teach the art of distilling the essence from flowers. Now the parfumeric de Seillans rivals that of Grasse, and the kind lady who has brought about this prosperity has taken the chief prizes at all the exhibitions in Europe. Thanks, also, to the untiring efforts of this lover of beauty and antiquity, the Saracen Gate at Seillans has been saved from destruction, and classed among the historical monuments of France.

No. 202.-Vol. IV.

[All Rights Reserved.]

OCTOBER 10, 1914.

It is a pretty sight to watch the farandole danced in the twilight, to hear the ancient music of fife and drum, and to see the procession, with twinkling lanterns, winding through the narrow streets up to this pointed archway of the Moors.

Not far from Seillans is the small town of Brignolles, the life of whose curé Victor Hugo so much admired that he drew from him the portrait of his good bishop, Monseigneur Myriel, in Les Misérables. Wheat and tares were, nevertheless, mixed in the neighbourhood of Brignolles, as elsewhere in this world. Notwithstanding the fact that the Order was composed of the oldest and noblest names of Provence, the doings of the nuns in the Convent of La Celle were peculiar. As a French writer observes, le Malin passed that way, and certainly the devil had reason to be proud of his handiwork. Their turbulence reached such a point that the community was removed to Aix, and Anne of Austria and Mazarin were requested to come and restore peace and propriety among the Dames de la Celle-with which request they complied. The same French writer remarks that the ways of Providence are past finding out. Truly, neither Anne nor Mazarin is exactly the source to which one would have turned for inspiration on the subject of schools and families.

At Barjols there is great rejoicing on the 17th January, the fête of their Bishop St Marcel, a holy man of the fifth century. Service on the vigil is followed by, so to speak, the tuning of the fiddles and a mild dress rehearsal. Next day, after a High Mass, at which every man, woman, and child in the town is present, the chants turn to a dancing measure, and immediately the whole congregation is pirouetting, the choir-boys holding up their cassocks the better to join in the dance. Then suddenly the music ceases, and the people go forth to end the day with feasting; and an ox is roasted whole in the street. When this is finished the fête of les tripettes is over. But why the memory of a saintly man who lived fourteen hundred years

ago should be celebrated by jigs and beefsteak is more than difficult to say.

All these little towns of Provence, basking on the warm southern slopes of the low Alps like autumnal fruits, ruddy and brown and ever ripening in the hot sun, have an ancient charm. What a rush of air comes over the wide plain, where wars and rumours of wars have been drowned in oil and wine! The great bottles, like giant melons, that one sees cased in straw in the vine districts had a curious beginning. 'La Reino Jeanno,' as she is called of the people, was driving through her land of Provence. At Trans her wagon broke down, and while it was mending she asked what was to be seen in Trans. 'Nothing, madame,' they answered. 'Here we only make bottles for the wine.' 'I should like to see them made,' said Jeanne. The most expert glass-blower was called; and he, to do honour to the queen and to Trans, blew so hard that the bottle swelled to six times its ordinary size. In memory of that day these great bottles are still made, and have ever since been called 'Dame Jeannes.' Perhaps our old English measure 'demi-john' is related to 'Dame Jeanne.

Provence is a pleasant country to wander in, not only for the solitary beauty of the valleys, the quiet paths among the oak-trees, with here and there the blue, curling smoke of the charcoalburners and the lovely murmur of the water; but here Nature, and the Great Power that lies behind Nature, are together placed before one's eyes. By the way there are many shrines; and as one looks up, the little mountain chapels stand fast in the mists and the winds like staunch souls undismayed by ill-fortune. Governments come and go, but still sprigs of rosemary and wild anemones are laid before country altars; vines are tended and olives crushed; the people dance and sing, and eat thrushes stuffed with juniper. May the land of Provence long remain, as of old, the land of the troubadours, blue, sunny, and bewitching.

THE COMMAND OF THE SEA.

CHAPTER II.

ON another hot evening some three weeks later Captain Vincent was walking across the queer little naval dockyard on his way to his lodgings in San Juan. The Mendoza had returned from a cruise only that morning; the captain was looking forward to reading the sixweeks' old English papers, and he was also somewhat thirsty. As he left the dockyard gate, however, and began to stride down the broad, tree-shaded road leading to the town, a magnificently attired official greeted him and handed him a letter.

It was from none other than the illustrious

President of the republic himself—a flowery missive, begging the captain to call upon him without loss of time.

Captain Vincent growled in his beard, for he was not very pleased. 'The yellow-faced blighter don't give you much peace,' he muttered. 'Very well,' he said aloud. 'Give his Excellency my compliments, and say I will wait upon him immediately.'

Half-an-hour later he was ushered into the big, cool, white room where President Cisneros sat alone at his desk. The President was a middle-aged, lean man, with a thin, clean-shaven

face and long, lank, black hair. His small black eyes were very bright, and he seemed to distrust their brightness, for he seldom looked one in the face. He was a man of some polish and attainments, had travelled, and knew the cities of Europe; in fact, he grew almost rhapsodical when speaking of Paris, which was the true city of his dreams. He must, indeed, have had a touch of genius about him, for he had now held his office for over two years, a thing unprecedented in all the glorious history of Almaceda.

He greeted Captain Vincent charmingly, pressed him into a chair, poured out wine for him, and handed him a box of excellent cigars.

'Thank you, sir; thank you,' said the captain, a little flattered at this courtesy. 'I hope I

haven't kept you waiting?'

'By no means, my dear captain,' said the President in excellent English—'by no means. It is I who should apologise. You only arrived at San Juan to-day, I believe!'

'That's so,' said Captain Vincent, sipping his wine with gusto. 'We've been on a cruise,

you know.

'Precisely,' said President Cisneros, beaming on him as on a long-lost brother. 'And how is our beautiful Mendoza, captain?'

'She's all right, sir,' said Vincent. 'In firstclass order, though I say it. Ready for any-

'Excellent, my friend,' cooed the President; 'excellent.' He lay back in his chair and lighted a cigar. Captain Vincent poured himself out another glass of wine unasked. He really felt he needed it.

'I have sent for you, my friend,' Cisneros went on, 'to have some private conversation with you on a rather important matter. Before I begin, I must ask you to give me your word that you will—how do you say it?—keep it to yourself-keep it secret absolutely, you under-

'Right you are, sir,' said the captain airily.

'I give you my word on that.'

For a moment the President looked him in the face. 'Thank you,' he said. 'Ah! it is at such times that I am so glad to deal with one of your great nation. "Word of an Englishman," as they used to say in Spain. Do we not all know what that means?

Captain Vincent bowed awkwardly and drank some more wine. 'You're right, old cock,' he murmured in his beard. 'If I were one of your own half-breed lot now it 'ud be different.' He had the grace to keep his rather truculent patriotism to himself, however. 'Well, sir,' he said aloud, 'I do know how to keep my mouth shut; and I am at your orders.

President Cisneros seemed rather at a loss as to how he should begin his important conversation. His black eyes wandered vaguely round the big empty room, and he put straight some papers on his desk. 'You have been with us | there, in Germany, it would appear they have

some six months now, captain,' he said abruptly. 'Have you ever given much consideration towhat is the proper phrase —to the internal affairs of this country?'

'No, sir,' replied the captain, in a rather sur-'Not much, I confess. I know prised tone. that we are always pretty hard up for money.'

'True,' said the President, frowning. 'That is one of my difficulties. And there are others which, I will own to you, are becoming acute.'

'Sorry to hear it,' said Vincent heartily.

'You've treated me very well, sir.'

'My country-The other glanced at him again. men,' he said slowly-'they are not stable, not constant, like you Englishmen. They desire change; they are restless—excitable. For two years I have held my position here in the face of much opposition. And now they are beginning to make outcries against me; they tell me I should retire, and they even threaten to force me to retire. You have heard of this, captain? he added quickly.

'No, sir,' answered Vincent frankly. 'I fear I have not taken much notice of your politics.

Didn't seem to be any business of mine.

'Yet it might come to be, my friend,' said the President darkly. 'Listen. There is a man, one Pedro Lopez, who is the principal mover in this agitation. It would appear that this'—he hesitated for a word—'that this damn scoundrel, as you say, is aspiring to my position. He has many friends; he is getting more. . . . In a word, my dear captain, this unhappy country is threatened with a revolution, such as we have had to deplore many times in our past history.'

The captain whistled, and then smiled. 'Well, you're right there, sir,' he said. 'I've always heard that the position of President here is what Mr Chucks would call "precarious and not

at all permanent."'

'Mr Shucks?' repeated Cisneros, question-

ingly.
'He's a character in an English novel called Peter Simple,' explained the captain.

'Ah! I'm not well read in your fiction, captain,' said the President, smiling. that of France I am more familiar.'

'Yes,' said Captain Vincent dryly; 'no doubt, sir. But I interrupted you. You were saying you thought there would be a row.

The other's face darkened again. 'Truly,' he said. 'What you would call "devil of a row." But I have a plan to prevent it, my friend. Yes, I will keep my position despite that halfcaste scum Lopez, who boasts of his Castilian ancestors. It is amusing, his impertinence . . . eh! my friend?'

'Very,' said the captain. 'But what do you

propose to do, sir?

Again the President's eyes wandered round the room. 'I have been studying the affairs of Europe,' he said, after a pause. 'Now, over Socialists and others who agitate and demand greater share in the government of the country. And it seems that when they grow too loud the German Government seeks to divert the attention of the people, and makes them patriotic by quarrelling with another nation, or pretending to do so. So they did in Morocco, you will remember. It seems to me to be clever. People forget to quarrel with themselves when they are angry with another country. Is it not so, my dear friend?

The President's dear friend looked at him with mingled surprise and respect. 'Why, yes, sir,' he said slowly. 'No doubt it's so, though

it never struck me before.'

Cisneros smiled at him again. 'You see, I have to think about such questions,' he said simply. 'Now I propose to divert the attention of my so excitable countrymen. The occasion is ready to our hands, captain. I shall quarrel with the republic of Quibo.'

'The devil you will!' exclaimed the captain. 'Well, you're a cool hand, sir. Do you mean

you will make war?'

'I do, my friend,' said the President gravely.
'I shall make a glorious and successful war, and so save my country from revolution.'

Captain Vincent chuckled. 'Well, I'm blowed!' he said in an admiring voice. 'But

suppose Quibo licked you?'

'They will not beat us, captain,' said the other proudly. 'We can put five thousand good soldiers in the field against their three thousand. And you, captain, with our navy—you will blockade their coast and establish what I think you call the command of the sea.'

'Oh! will I?' said the captain blankly.
'You don't say!' He drank another glass of

wine somewhat hastily.

'Assuredly,' said the President with composure.
'That is what I wished to talk of with you more particularly, my friend. You will not fail us, I'm sure.'

Captain Vincent sat upright in his chair, his calmness recovered. 'Very good of you, sir,' he said briskly; 'but let's go into details. All this tosh about command of the sea, and so on, is a bit above my head. What I've got to do is to take out the *Mendoza* and fight them. That's it, isn't it?'

'Why, yes, captain,' said Cisneros, smiling.

'Well, then,' Captain Vincent went on, 'let's see. I've told you the *Mendoza* is all right. She can make her speed, her men know their business, and she's in good order—ready for sea in twenty-four hours. But those two old gunboats of ours—the *Independencia* and the *Constitution*—I tell you frankly, sir, they're a scratch pair. It 'ud be murder to send men to sea in them, even if their rattle-trap engines would take them out of the harbour.'

'I realise that, captain,' said the President, sighing. 'You confirm my own ideas. It is a

pity; but my poor country has no money for

their repair.'

'Right, sir!' cried the captain, warming to his subject. 'Well, then, about Quibo. They've got one old gunboat—I forget her name—but she's no better than ours, I know. If they sent her to sea she couldn't catch a hearse, and I'd engage to sink her in five minutes. So we can tick her off. Then they've got their cruiser, the Libertad; she's just over three thousand tons, so she's a good bit smaller than the Mendoza. She's a knot slower, too, and she only mounts eight six-inch guns against our two eight-inch and eight six-inch. We can beat her, sir, by George! I'll engage to beat her, even though I am no royal naval brass hat. So that ticks her off, sir.'

'Good!' said the President, his eyes very

bright. 'Continue, my dear friend.'

'Then there's their third ship,' the captain went on. 'It's her I feel a shade doubtful about—their torpedo-boat destroyer, you know. She's a Stettin-built boat. They bought her from the Germans only two years ago; and though the Deutschers are no pals of mine, they know how to build destroyers. She's a good boat-five hundred tons, mounts two twentythree pounders and three tubes, and can do her thirty knots with decent stoking. And if we came across her one dark night I shouldn't be altogether happy. You see, my chaps are a good crowd, but they 've had no experience of torpedo work, and they might get nervy and excited. Yes, we might have a rotten time of it. Anyway. that's the situation, sir.'

'Not quite, captain,' said the President with a triumphant smile. 'You have not heard that this torpedo-boat destroyer you speak of ran aground last week, and that it will take some months to repair her. I have this news from a

sure source.'

'Then we'll beat 'em!' cried the captain, springing to his feet. 'Yes, we'll give 'em ginger—I mean, we'll establish the command of the sea.' He laughed excitedly, and began to

pace to and fro.

President Cisneros also rose to his feet, and seemed as though he would embrace his companion. 'I knew you would not fail me,' he cried emotionally. 'Captain, this is a great opportunity for you. Your nation has a glorious, a magnificent navy, but not one of its officers can say he has fought a modern naval action and defeated his adversary, as you will be able to say.'

Captain Vincent's swarthy face seemed to glow a little. 'No,' he said in a serious voice. 'I shall be able to brag about it to the brass hats all right—if I win. When do you reckon we're going to start the band playing?'

'It must be soon,' answered the President, lowering his voice, 'or else it will be too late. That vile Lopez is very active, you understand.

In two days' time I make a speech. You do not know, perhaps, that many years ago Quibo took from us certain territory which we say should be ours. I refer to this in my speech; I call upon all good patriots to remember that shameful act. I hint at a possibility of our recovering it. That will—how do you say it?start the ball rolling-eh? They will be very angry in Quibo when they hear; they reply to me; the people here grow excited. Oh, it will be so simple, my dear friend-you will see.'

The captain chuckled. 'Very simple,' he said dryly. 'You know, sir, you ought to be a Prime Minister or something big in Europe; you're wasted here. Well, all's fair in love and war, they say. And, anyhow, I'll keep my mouth shut, and have the Mendoza ready for when

she's wanted.

'That is all I ask, my dear captain,' said Cisneros. 'Farewell for the present; you shall

hear from me again very soon.

As Captain Vincent walked to his lodgings in the moonlight he was filled with a curious mixture of emotions—astonishment, exultation, a few doubts and questionings, and a great deal

of amusement. He took off his belaced cap and mopped his forehead.

'You're in for it now, my lad,' he muttered. 'Me—to command a modern cruiser in a modern naval action! It'll get into the papers, I shouldn't wonder. "The commander of the Almacedan vessel was an Englishman named Vincent!" You'll be famous, my boy. You'll be like Cochrane in Chili. "Almaceda expects that every yellow-faced blighter will do his duty!" And that old beggar Cisneros-what a wily old bird!' He chuckled again as he thought of the past interview, then suddenly became serious. 'After all,' he murmured, 'it sounds like comic opera, but it'll be serious enough for some of my chaps-maybe for me. But that's all in the day's work.'

He reached his house, and strode up to his 'I'll have a drink on the strength of it,' he said. He produced a bottle of whisky, and filled himself a glass. 'What was that old naval toast, now?' he muttered, questioningly. 'Oh yes—"Here's to good sea-room and a willing enemy."

(Continued on page 723.)

SOME DIFFERENCES BETWEEN ENGLISH AND GERMAN LIFE AND CHARACTER.

THE only people who are capable of contrasting the manners and customs of two countries with any success are those who have lived in both of them, and not merely as travellers or passing visitors who are shown round. Those who know most about the Anglo-German question are probably the Germansand there are a great many of them-who have made their home in England for some years. Those who know the Continent, and particularly Germany, will agree that the American is far more in evidence in the centres of business there nowadays than the Englishman. What is the reason why the Germans came over here in shoals, and got on, while the Englishman, unless he happened to be connected with the diplomatic or some other important service-mere travellers for pleasure don't count-found the utmost difficulty in creating a position for himself in Germany? One side of the question is that the average young German commercial man possesses more grit and thrift, and is more practically and thoroughly equipped by his education. On the other hand, the English nation is generous to a fault in affording opportunity to outsiders. Hundreds of young Germans learn our language in our families and boarding-houses, accepting subordinate situations, where they are sometimes treated kindly, and sometimes, I am afraid, not; but they learn it all the same, and at little or no cost to themselves. They gradually work their way up,

forming clubs and various commercial organisations, in conjunction with their compatriots, and obtain power and influence, without encountering any serious, any organised-I will not call it 'opposition,' but 'competition.

But did an Englishman do the same in Germany? I have, while moderately successful myself, seen scores try and fail. Some of these were, no doubt, mere casual teachers of their own native language. But nowhere is there more rivalry than in Germany among private individuals who teach foreign languages. Such are the methods adopted that a person unqualified to teach will never get a start, and one who is qualified will have every link in his armour tested before he finds himself able to establish a connection.

In Germany every one, along with his current address, is known to the police. You could not sleep for a single night anywhere in Germany without announcing yourself to the police. You must always have with you your certificate of birth; you must give your age and your Standthat is, what you do, or don't do, for a living. If you were merely travelling, every opportunity was afforded you to register yourself zum Besuch —that is, for a visit—and with such a certificate you might remain several weeks, and even more, in the same place. But the waiting for one's turn in some of the police bureaus was often extremely wearisome. The clerks in these offices were, as a rule, polite and agreeable, but they

had a colossal amount of work to get through, and they did it-patiently, accurately. The chief objects of all this were (1) nationality, which is always a more complicated and important problem on the Continent than in Britain; (2) military service; (3) income-tax; (4) the detection of criminals; (5) public convenience. The chief argument against the system appears to me to be the enormous amount of work and the consequent loss of time and expense which it entails. On the other hand, a person can always be found. I once quitted Hamburg before the expiry of the period assigned for the estimation of income-tax. I went to Berlin, Potsdam, Dresden, Munich, Vienna, and a great many other places; but a year and a half after, I found myself, by chance, resident in Saxony, and paying income-tax. One morning I received an envelope, covered with every imaginable postmark, annotated with inquiries and their results, here, there, and everywhere. It contained a claim for income-tax, on the Hamburg rate, excluding of course the subsequent periods, when I had been zum Besuch in other parts of Germany. It was an exceedingly moderate claim, for Hamburg was a rich, generous city—the best home for an Englishman, I venture to think, in Germany. Of course I settled it by return. The delay was quite possibly owing to inadvertence on my part, and a thoughtful post-card would, I dare say, have saved much of the trouble, but no complaint was made. What the German obtains by slow and plodding work he certainly deserves.

The rate of income-tax varies in different German states. In Hamburg it is very moderate; in Prussia it is higher; in Saxony, where they have not yet recovered from the exhausting effects of the wars of Napoleonic and later times, and where the fiscal arrangements are largely in the hands of the Jews, it is heavy. In Germany every one pays income-tax, even a Dienstmädschen (general servant), whose contribution comes to about fifty pfennigs—that is, sixpence.

But take another illustration. I once left London for a rather prolonged sojourn abroad. In the rooms I had last occupied I left behind me some property, articles of furniture, and a large American chest, bought in the Southern States, crammed with superfluous clothes and many articles of considerable value—at any rate, to myself. I neglected to keep the people-to whom, I may mention, I did not owe anythingacquainted with my address. On my return the man who had occupied the house was dead; his wife had sold up the home and gone away, and to this day I have never been able to ascertain what became of my property. It was no doubt largely my own fault; but had it been in Germany, I should, at least, have found no difficulty in satisfying my curiosity. I should add that I never had the slightest reason to suspect the occupiers of the house of being capable of any dishonest transaction.

Clearly the German is a patient, plodding creature, whether he be recovering a small amount of income-tax, or whether he is building a fleet. And he is not quarrelsome by nature, As I was crossing a street crowded with vehicles in a large German town, a bicyclist—there were several of them-shot up from behind unexpectedly, and I found my extended leg involved in the spokes of his front-wheel. He had a very nasty fall on his back; but he got up, knocked the dust off his coat, picked up his machine, and in response to the—somewhat qualified, I must admit—apology which I proffered, for I did not consider it my fault, he looked at me-well, just a little reproachfully, and rode off without saying a single word. I certainly never ride a bicycle at such a spanking rate in similar places myself, but it might quite easily have been a serious and expensive accident for him. On the other hand, I was once myself on a bike, proceeding almost at a walking pace, near the corner of the Earl's Court Road, when two hulks of loafers got in front of me, and although I rang my bell repeatedly and shouted, they refused to budge; in fact, one of them deliberately put his back up against my frontwheel, and compelled me to dismount at the imminent risk of getting my foot under a wheel. Then they turned round and overwhelmed me with a flow of 'langwidge.'

There is one thing in Germany to which I have always had a peculiar objection, and which, I fancy, most other Englishmen share. I allude to the folding-doors between rooms let off singly. Rent is cheaper on the whole in Germany than in England, and the rooms themselves are well and substantially furnished, almost every respectable room containing a really well-made Schreibtisch or writing-table, a settee, good sound chairs, nice curtains, well-fitting windows, and rarely any rubbish. But when you rent a single room in a flat (most Germans live in flats) or apartment-house, you are tolerably certain to find one, if not indeed two, communicating doors. They are often overhung with curtains, or perhaps stopped up with a mattress, but even that does not prevent sounds, not to say whole conversations, becoming audible. For people who are strangers to one another, I have always considered this peculiarly objectionable; and in the case of musical instruments, sewing-machines, and such things, it may be positively odious. The conditions as to these things are, as a rule, well arranged in Germany: either music is allowed and arranged for, or it is not. But I remember a young difficulties will arise. musician who returned to his room in Berlin about one in the morning after a concert, but who found himself quite unable to sleep owing to the peculiarly audible conversation of a lady and gentleman on the other side of his nearest door. After vain efforts to ignore the position, he at length got out of bed,

took up his violin from the settee, and played the first eight bars of Mendelssohn's Wedding March. After that there was peace. Not a word was said about the matter next morning. And he was not staying in a jerry-built house; it was, in fact, in the Luisenstrasse, which leads out of Unter den Linden, the finest street in Berlin, and was occupied by several young officers and merchants, and by a member of the Reichstag when it was sitting. I used to think sometimes I would write to the Kaiser and suggest the futility of such doors in houses likely to be let off in single rooms. But I fear my letter would have produced little more effect than if I had pointed out that in his Siegesallée in the Tiergarten (the large and beautiful park of Berlin), which is adorned on both sides with impressive statues of distinguished men, Emmanuel Kant's nose appeared to have become exceedingly dusty, which it certainly was the last time I was there. Not that there is any resemblance between the two cases, except perhaps the reverence for a certain philosophic calm! And then I hardly know what the German authorities might think of some of the wretched little flats which are being built around London just now, with tiny little rooms not much too large for a princess's doll.

The young German single-roomer, be he Voluntär, clerk, or student, generally takes his Mittagstisch, or dinner, in a private restaurantthat is, with a reduced or poor family-where they cater for visitors. He generally comes in between twelve and one; for, however early he has risen, he will have had nothing in the morning beyond rolls and coffee, often swallowed hastily, for he is rarely late; and on entering such a dining-room he says, 'Mahlzeit' (a greeting); and those already present reply, 'Mahlzeit.' The same ceremony is repeated on leaving, and the host, or hostess, must not be forgotten. These dinners are cheaper than going to a regular restaurant, the price—a monthly arrangement is expected—ranging from sixty pfennigs to one mark fifty pfennigs. For eighty pfennigs you will get a meat or vegetable soup, or in the summer sometimes fruit soups, which are really delicious, if you don't take too much of them; meat with vegetables; and generally a Nachtisch, such as stewed apples, or cranberries, or any fruit which chances to be in season. The German cranberries are far superior to the English fruit, and also cheaper. On Sundays the price of dinner will generally be a mark; and in south Germany you will frequently get hare, which the Germans certainly do not cook so well as the English, the current-jelly and stuffballs being generally conspicuous by their absence, and jugged hare apparently unknown. You can always get a small bottle of light beer for ten or twelve pfennigs, and on Sundays sometimes coffee and cakes are included.

Abendessen, or supper, can generally be arranged

Of course there are superior restaurants innumerable, where the prices range higher. But of home-cooking where lodgers are taken there is little. Should you prefer, as I generally did, to take your supper at home, you will find no difficulty in getting ham, cold meats, liver sausage, smoked salmon, Kiel sprats, &c. in the cookshops, which are to be seen everywhere. You can get a dozen different kinds of cheese-French or German Camembert, Brie, with small cheeses from the Harz Mountains, rather rank and peculiar in flavour, at two or three a penny. The German cheeses are not equal to the English and American cheeses, but they are very tasty all the same. You can also get apple-pasties all the year round, and other fruit pasties in season, the tart variety generally including some cream, and being rather more expensive, but still very cheap. I have never found any of these unpleasantly greasy. I never buy cheap pastry in London, but in Germany I used to eat some almost every day. You must be careful to time your hours of purchase, as the times of closing in Germany are rigidly enforced by law. And on certain holidays, or so-called penitence days, after a certain time you will be able to get nothing, except in a restaurant. There are, however, sure to be all-night cafés and restaurants; so that, whatever the exigencies of life, you need never starve.

More beer is undoubtedly drunk in Germany than in England. But it is a light and nonintoxicating beer, the Munich variety being the most popular. I found, even in taverns of low degree, very little really badly adulterated In the cheaper resorts you will get a large helles (light straw colour) or dunkles (dark brown) for ten or fifteen pfennigs. In the superior cafés you will require to pay twenty-five; but you will have a good choice of newspapers to read, including English ones; you will have an excellent small orchestra to listen to; and you will be well served. The Germans, both men and women, almost live in their cafés in the evening when work is done. I have accompanied, by invitation, a party of genial and kindly merchants, with their wives or friends, from one café to another during an entire evening. A table reserved for a particular set of cardplayers, convivial friends, or students is called a Stammtisch, and no one else is allowed to intrude upon it. The reception an unknown Englishman met with in these places varied according to the political atmosphere at the moment and the state or town. Being a chessplayer, I once went into a well-known and superior café in Hamburg, where I very soon found an opponent, and I subsequently spent many pleasant evenings there; and the proprietor himself would often sit by my side and watch the game. But I happened to find myself in Munich shortly after the two English officers of the Secret Service had been tried and sentenced

as spies in Leipzig. Whether what happened to me was owing to this or not I cannot say; but having a spare evening, I had entered a somewhat similar café in Munich, and noticing chess-boards about, I sent a waiter to inquire if any one would care for a game with an English stranger; whereupon the proprietor of the place approached me and said, 'There is no one; Ich bin Soldat gewesen' ('I have been a soldier'). Just that and nothing more. Needless to say, I shrugged my shoulders, and speedily left him to reflect upon his military experiences, if he chose to do so. The fact is that in Hamburg the English are known and understood; in south Germanywell, with the exception of occasional art and music students, not very well. Nor have these increased in number since the time of the Boer war. The Hamburger Fremdenblatt (newspaper) was far better disposed to the English than the Leipziger Nachrichten; but I have been a subscriber to both in my time, and used them for advertisements, &c., and personally I have been treated with equal courtesy by both.

The street policeman in Germany, in his gray military suit, is a smart official. They have all been soldiers, and if you do not forget to give them the military salute when you address them, they will reply to your queries with the utmost courtesy. I have frequently been indebted to them, and have never met with a discourtesy; though once I remember arriving in a strange town, and inquiring of a policeman the way to the Rathhaus (town-hall). He replied, with unintentional humour, that every child knew where the Rathhaus was, and I am afraid he thought me rather a 'weak-head.' But he was unmistakably of

rural birth.

I will conclude these few remarks by recommending any young man who may have the intention at any time of proceeding to Germany, or, I might well add, to some parts of America, to make himself as thoroughly acquainted with the language as he can before

he starts. An enormous amount of patient work is required to master a foreign language so as to be able to use it practically and with success and profit. The ordinary school education, the grammar, and even being able to read and understand quite easy German -these things are only the beginning. Let him work through a good commercial correspondence book—one of the best I know is published by Longmans at two shillings and sixpence; there is a corresponding one in French—and let him take lessons either from a German or from an Englishman who has been some years resident in Germany, and who knows the country and its customs and what words and things are in practical use there.

The facilities and opportunities which a German finds in England, whether they are a testimony to Christian kindliness or whether they are not, an Englishman will not find so prolific in Germany. If he wants a railway-ticket, or a postal order, or a transfer for the cars, he will be expected to give his instructions comprehensively there and then, and to answer the necessary questions; and if he cannot—well, he will have to wait until some good-natured Deutscher comes along to help him. It is rarely that one meets a German in London in a similar position. There are plenty of excellent German commercial schools with very moderate fees, but they are of course conducted in German, and presuppose at least an elementary knowledge of the language. There are many facilities and privileges for students, almost free of cost. The young Englishman will not find it at all difficult to make acquaintances; but unless he be of fairly strong character, he will find that they will learn a great deal more English from him than he will learn German from them. I remember hearing of an English gentleman in Germany who engaged a German servant. At the end of a year the German spoke English fluently, but the Englishman did not know a single word of German.

AN AFFAIR BETWEEN THREE.

PART II.

FROM that time forward Alvin—soon christened 'the Kid,' or 'Kid,' or 'Punk,' according to the taste of the person addressing him—became perhaps the best-known person in the lower camp, the central attraction of about two hundred men—two hundred of the flux of the melting-pot of all nationalities gathered together in the Western Hemisphere. Still there were some—in fact, quite a number—who objected to the playing of a violin and the consequent gatherings in the bunk-houses where the playing was going on after eight-thirty at night, which is the retiring hour of the older type of loggers, whose ideas of luxury in camp are to

eat and sleep as much as possible. With this type of men, impervious to the seduction of music, Alvin was exceedingly unpopular; but the majority ruled in his favour, and his evenings continued for some time to be a succession of popular concerts, comprising a repertoire of innumerable pieces gathered into his memory through the medium of his acute hearing.

At first this unusual popularity was exceedingly pleasurable to him, for he had never before enjoyed a like distinction; but the type of music he was called upon to play was not of the type his own heart called for, and he soon commenced to grow weary of the constant repetition, as well as to long for the expression of what was in reality within his soul.

As mortal man becomes surfeited with all things but life, provided he has enough of them, so the camp gradually began to lose interest in the newly acquired whistle-punk and musician, until at last the lad would lie in his bunk in the evenings with the old violin and play so softly for the most part that no one was conscious of the sound, and even the complaints ceased. He lad suddenly become a forgotten part of the logging and human organisation of the camp, and the performance of his duty was all that was required of him. That is to say, forgotten by all but two—Mitchell and Jack Duggan.

At this time, though Mitchell had promised himself to see much more of Alvin, he was so busy during the day with the duties of the camp, and so engrossed during the evening in the bringing to a close of one of his works of mystery within the confines of his cabin, that he could not find a spare moment in which to talk to the lad or to bring him to the cabin to hear more of his playing. It was a habit of years with Mitchell to work relentlessly evening after evening, never allowing anything but serious illness among the men to divert his attention or interrupt a certain schedule. For this reason, then, in regard to the lad, he procrastinated, and later came to regret it.

Jack did not forget the boy, because he was part of the machinery of No. 2 crew, and because his mind never lost track of even the smallest unit of the organisation. Furthermore, he continually expected the strained vigilance of the lad to relax, for his previous experience with 'gutter-snipes,' as he termed them, was that they were soon played out and became utterly worthless for any of the duties of a logger.

Gradually the summer wore away, and with it went the myriads of white millars Alvin had watched with such wonder in the trees, thinking of them as the snowflakes of summer that never fell to earth; also the swarms of gnats that had never allowed him to rest in peace when in the shade, and some of the birds. The days grew perceptibly shorter, and the mornings were cool and frosty, so that the boy built fires by the wire in order to keep warm. All this was beautiful, however, because it was clear, sharp, and invigorating; but then the rains set in, and everything was suddenly changed.

The rainy season in the woods was something Alvin had heard the men speak of in the bunkhouses, and he had dreaded its coming. Once it had arrived he found that the entire aspect of things was changed. The clouds and mist, swinging down from the sky and stealing up through the canons, shut out the distant mountains the men's eyes had been used to rest upon, and confined their attention to objects closer at hand, as though the world had suddenly drawn apart and the community had become a unit by itself. The men

lost the jocularity with which they had been wont to work, and went about their duties silently and sternly, clothed in black slickers and paraffined trousers to keep out as much of the wet as possible, and when standing still, drawing into their clothes like turtles into their shells.

It was no longer the pleasant work it had been, with the sun shining and everything and every one bright and gay. It had to be done, however, and had always been done, and so Alvin refrained from joining the little band that 'went down the track' to avoid it, but stood by his wire unfalteringly, though he had contracted a deep cough that he seemed unable to shake off.

To all appearances, as soon as Jack had made up his mind that his new punk would be able to fill his post, he paid no more attention to him—that is to say, he did not appear to, though he was ever vaguely conscious that the lad was there, and was doing his work as well as it was possible for the work to be done. Perhaps deep down in his heart Jack admired him for this, though he never mentioned it to him or to any of the others. Once only did he exhibit a protective interest in him, and that perhaps as much to chastise a would-be bully as to save Alvin.

One forenoon when they were walking in to camp, all of the crew in a body, as well as some of the buckers and fallers from farther on up the road, one of these buckers, with a malicious wink at his companion, stepped quickly forward, and with his toe caught one of Alvin's heels, while with his shoulder he pushed him sharply to one side, throwing him headlong down the bank, where he finally came to a stop in the soft earth of the grading. The feat seemed to please the man mightily, for he was laughing in great glee—as were some of the others who had witnessed it—at the prostrate form of the lad trying to separate himself from the soft dirt, when suddenly he felt a grip of steel about his wrist, and, before he knew what was happening, found himself in a heap also in the soft earth, but some ten feet below and beyond the lad.

Later the bucker had come to Jack with the remonstrance that he was merely playing with the boy, and Jack had replied gruffly, 'Well, find a man to play with after this.'

But the cold and wet weather, with sometimes occasional snow, was telling upon Alvin's frail constitution, and his cough became deeper and deeper, racking his delicate frame and stealing all the strength he had gained during the summer.

Mitchell had attempted to doctor him up with various remedies from the camp medicine-chest, and had served out to him the regular loggers' clothes and boots, that kept him drier and warmer than those in which he had come to camp; but it was apparent that Alvin needed a different kind of treatment, and Mitchell was debating the question of sending him down to the doctor, when the matter came to a climax.

One afternoon, when about four inches of soft wet snow had fallen, and even the hardiest of the men were complaining, Jack was himself doing the heaviest of the work, so that he might impart more willingness and energy to the men by his own example. He was 'slinging rigging' for the most part in the bottom of the road, up to his knees in mud and slush, his gloves limp and wet, his face and form generously bespattered with mud, and he was not in a humour, as his fluent profanity gave ample evidence, to have anything additional go wrong; but just then it did.

He had sent in a signal for the log to go ahead; but because the road was rough and stumpy, and the log a large one, it was not long before there was a 'hang up' in a narrow place. Jack signalled for a stop; but when the usual time had elapsed for the signal to travel the length of the wire, and the whistle to return its warning to them, there was no sound, and the tension on the main line had not slackened.

Jack signalled a second time in some agitation, but it was too late. The engineer, thinking he had an extra heavy pull, had turned on all the pressure at his command, and the powerful machine snapped the steel cable as though it had been twine. Still there was no signal; but the sudden give at the engine had warned its operator of what had happened, so that he had at once shut off all steam, and there was no further damage done.

Jack was in a fury, for there was no apparent reason why the signal should not have gone in, and he was not in a mood to have any one 'sleep on the job,' even though it was cold. Full of a desire for vengeance, and cursing with every breath, he climbed over the rise that for the time being cut the whistle-punk off from the rest of the crew, roaring in deep-voiced rage; but there he stopped, for instead of finding the punk, as he had expected, huddled over the fire, he found him lying helpless in a convulsion of coughing, the snow showing a patch of crimson at his mouth.

For a moment the big man stood voiceless and still, gazing in consternation upon the pitiable sight before him, having entirely forgotten his reason for coming.

Stepping quickly to the top of the rise, he bellowed down to the crew, 'Lou, you take charge, and splice up that line!—Come here, one of you choker-setters, and punk this whistle!'

As the men hastened to obey, he returned to where the lad lay, picked him up in his great arms as though he were a child—at the same time marvelling at the lad's lightness—and, encouraging him with the promise that he would soon be beside a warm fire, carried him into camp.

The office was shut when he arrived, Mitchell being out at the time, and the scaler busy with a train of logs that was about to be taken out; so Jack took the lad to his own cabin,

wrapped him well in blankets, and soon had a roaring fire burning in the stove. After that there seemed nothing else to do; so he sat beside the bed, his great shoulders hunched forward and his eyes staring into the distance while he chafed the lad's thin hands between his own hardened palms, so that he might enliven the circulation. Also he watched through his window for the return of Mitchell, muttering to himself, 'What the devil does he have to stay out all afternoon for?'

At the same time Jack made up his mind that Alvin should have other treatment besides Mitchell's. Like a great many who have suddenly come to realise that they have been negligent, he was so extremely anxious that there was nothing too difficult for him to plan out. At times he even thought of leaving camp himself, so that he might personally see to it that the lad received the best of attention.

But Mitchell was not so easily excited; or, at any rate, if he was it did not come to the surface. He followed Jack's recitation without the slightest shadow of expression crossing his face, and as soon as it was finished went with him to the cabin, where he found Alvin lying upon the bed, quite quiet and comfortable now, though very weak from the sickness. Deftly and gently he felt the lad's forehead to ascertain the degree of fever, if any, and asked him a few questions. Then he turned to Jack and said, 'Are you going to keep him here?'

'If I don't take him down to the doctor,' replied Jack.

Mitchell considered the matter settled. 'Rig him up a bed,' he said, 'while I go and get some clean bedclothes. Bring his stuff out of the bunk-house, and make him as comfortable as you can. I'll send for the doctor to come up here. I do not want the boy to ride down there in the cold unless he has to.'

With that he strode off toward the office, leaving Jack to follow out his instructions; while Jack wondered how it was that Mitchell always gave him that feeling of helpless incompetence. Jack had puzzled as to what he should do for the lad, but the other had outthought him at one definite stroke, and he resented it.

That night Jack sat by the stove and regarded his new protégé with a speculation unusual to him. Unusual also was the fact that he had gone out of doors for his evening pipe in order that there might be none but pure air in the cabin.

At eight-thirty there was a knock at the door, and, without waiting for an answer, Mitchell stepped in, took Alvin's temperature, felt his pulse, and, evidently satisfied that his condition was no worse, turned to Jack with the explanation that the doctor would come up by the morning train, and until then he thought the patient would do very well.

'Do you think I'd better wait in camp to see the doctor?' asked Jack—for he wished to be certain that no precaution necessary for the lad's welfare should be overlooked.

'Not unless you personally wish to hear what he says.'

Jack was a little irritated with Mitchell for his interpretation of the question, but made up his mind that nothing better could be expected of the man, and at the time he was serving Jack's ends well enough. He only said, 'You won't mind coming down to look after the fire when I go out to work?'

'No,' Mitchell said, as he slipped out of the room, and went away without any further remarks.

Alvin, in his bed, realised that there must be some sort of difference between these two men, but had no idea of what it could be. It seemed to him rather a pity, for he understood in a hazy way that they were the two strongest spirits of the camp, and the only ones who had shown him any particular generosity—though there were others who would have done so willingly had they realised the need of it soon enough—and he thought at the time there should be some way of bringing them together. He sincerely hoped there might.

MEN AND METHODS IN THE NAVY TWO HUNDRED YEARS AGO.

By Douglas G. Browne.

THOSE who have read of the press-master and the crimp, of the starvation wage and the starvation diet, of the filth, the monotony, the brutality, and all the other horrors of the lower deck at the beginning of the eighteenth century, and, indeed, for long after, may have wondered how any man could join the navy of his own freewill. Yet every year great numbers did so join it. Some of them were landsmen pure and simple, who did not know the bow of a ship from her stern; others, a shade more nautical, had perhaps eked out some long-shore livelihood with shake-nets between the water-marks; others again would be those strange hybrids who were fishermen three months out of the twelve and husbandmen the other nine. The best were naturally the genuine seamen from the merchant ships. As life on a merchant ship, with all its drawbacks, must have been infinitely preferable in many respects to life on a man-of-war, it may seem strange that any one should desert the one for the other. Yet even this was often done; for, after all, the prospects on board a Newcastle collier, a Bristol tramp, or even an East Indiaman were not brilliant. The pay was poor, the voyages tedious, the drink limited; and if adventures should be encountered, they usually took the form of French privateers and French prisons. And so many a man of spirit would one day, if the press had overlooked him, stow his few belongings in a bag, draw his pay, if he could get it, and slip on board the nearest manof-war, where, if there happened to be a dearth of good seamen at the time, he must have been received as a gift from Providence, who, in good times and bad, notoriously looked after the British nation.

Such a man seems to have been William Stone, one of those half-seen figures who, by some turn of chance, are now and then cast up out of the impenetrable shadows of the past to catch our eye for a moment before they fall back into the dark again. Stone had risen at one period to be boatswain of a merchantman, but when we

meet him, in 1707, he was serving as an ordinary seaman on board a brigantine tramp called the Moses. This little vessel anchored one day among the ships of war at Spithead; and Stone, tired of the life, and perhaps in bad odour with his captain, slipped off to the Oxford, a fourthrater of fifty-four guns. Having left all his kit on board the tramp, he presently returned for it, when the master refused to let him have it, alleging that it was now buried out of reach beneath the cargo. Stone was a man of sufficient value to enlist the help of the Oxford's captain, who condescended to wage a controversy with the insignificant master of the Moses. Whether the ex-boatswain retrieved his kit does not transpire—he and the brigantine and her master vanish from our sight; and the chief interest of this little episode lies in the kit-bag itself. There has come down to us Stone's own list of his belongings, with his estimate of their value. This estimate is probably excessive; but even so, when we remember that money was worth much more then than it is now, the list shows us that seamen in those days were not necessarily downtrodden, improvident, and destitute. Perhaps it was while Stone was a boatswain that he acquired some of the following articles:

some of an intra the states.

Callemance, it may be remarked, was a woollen material finished with a glaze, and much in use at this time among the shopkeepers and trading class. By vittery Mr Stone meant vitry, a kind

This item looks very much like of fine canvas. a boatswain's perquisite. He was, perhaps, something of a dandy, for he seems to have paid good prices for his clothes, if the valuation is at all trustworthy. As the captain of the Oxford took his case up, he probably recovered his

things, nutmegs and all.

Although we do not meet with William Stone again, we can obtain some idea of the ship and service to which he had transferred his fortunes. The Oxford was an old-fashioned fourth-rater, mounting fifty-four guns on two decks. She was probably pierced for sixty or more pieces, a few vacant portholes being left on either quarter, which in action could be filled with guns from the side not engaged. Her burden was probably under seven hundred tons, her length of keel perhaps one hundred and ten feet; and she carried some three hundred men. The crowding on these ships was terrible. The men lived and slept and fought on decks considerably less than a hundred feet long and, at the outside, six feet in height, lighted by ports which, on the lower gun-deck at least, were closed in anything of a sea, and encumbered with the long cannon with their clumsy carriages. Some of the ratings had their quarters on the orlop-deck, below the gundeck; and here there was very little air, and no natural light at all. Hammocks were slung at night, and stowed away between the guns during the day. The ship was painted red between decks to minimise the effect of blood-splashes in battle.

The treatment of the men seems to our minds extraordinarily inhuman. For the most trivial offences they were spread-eagled on a grating and given a number of lashes—the number being a matter entirely within the officer's discretion. Sometimes a man would be sentenced to a dozen lashes alongside every ship in the fleet. He might already have been kept in irons for weeks awaiting a court-martial; and some of these irons were extremely fiendish instruments. Yet this discipline does not seem to have been thought too brutal by the men themselves. While there have been many mutinies on the score of bad food, or low pay, or insufficient leave, those which sprang from ill-treatment were by com-parison rare. The most celebrated cases which occur to one's mind took place much later in the eighteenth century, when the general conditions of life at sea were presumably improved; and it will be found that in all these cases the mutinies were brought about by the conduct of individual officers, not by the severity of the code. So it was with the *Bounty* and the *Hermione*, and with the disaffection that lost the *Africaine*; and of the officers concerned, Pigott of the Hermione was certainly little better than a fiend. In fact, the seaman of that age was a rough customer, and he expected and understood rough treatment. His compensations do not seem to have been many, but apparently they sufficed.

He was, of course, allowed a great deal of license in his own quarters when his watch was off duty; and he had a virtually unlimited supply of rum, which he could drink neat. Admiral Vernon's breeches had not yet provided a contemptuous nickname for the diluted article.

As for the officers, Macaulay's celebrated epigram was now out of date. A very large proportion of them must have been both seamen and gentlemen. They necessarily possessed the manners of their time; and the quality of the material they commanded, which called for so Draconian a penal code, must have influenced their outlook. They were often overbearing and brutal; they drank, and swore, and gambled a great deal; and occasionally they embezzled His Majesty's stores, an offence which, in an age when everybody embezzled something, was comparatively venial. There was to be found among them the inevitable proportion of fools and cowards—more, perhaps, than flourished a century later; less, certainly, than had flourished a generation before. Benbow's captains were not typical Most individual ships were proof their class. bably handled admirably; but as yet there was no surplus of science in the higher commands In fact, the navy was passing through a transitional stage, and in any case it is unfair to compare it with the navy of Monk or the navy of Nelson. For Monk had to fight De Ruyter and Van Tromp; and if Nelson's personal opponents were hardly worthy of him, the navy of his day had to face a task that demanded the most extraordinary exertions, and could not fail

to encourage and reward ability.

The navy under William and Anne had to face no such opponents and no such task. For, although the situation of this country was during many years extremely critical, the danger came as much from within as from without; and the part the navy might have played in warding of that danger was very imperfectly understood No one dreamed of a continual blockade of the French coast. It was not then believed that large fleets could remain at sea for more than a month or two at a time. The opposing battlesquadrons went into winter quarters as regularly as the opposing armies. The time and skill of the officers were wasted in convoy duty, in chasing privateers, in cruises to the Soundings and back again, in expeditions which threw a few red-hot shot into Dunkirk or St Malo, and then came home to be laid up in ordinary for the rest of the year. Moreover, the expenditure on account of the almost universal European wars was enormous. The number of ships at one time or another in commission during the reigns of William and Anne would have been thought incredible a few years earlier. Russell's fleet, which, in company with the Dutch squadron, defeated Tourville in 1692, numbered upwards of sixty sail of the line. At the same time, the largest professional army England had known since the New Model was

fighting the battles of the coalition in Flanders, and subsidies, only second in amount to those of the younger Pitt, were poured forth annually to Electors and Princes of the Empire, to the Emperor himself, to Savoy, and to Spain. It is little wonder that there did not seem enough

money to go round.

The crisis came in the year 1696, when the drastic restoration of the currency reduced the nation for a few months to a state of impotence and almost of despair. The Treasury was brought to the gravest straits. The army went unpaid; and the navy suffered with the army. At the end of July, when the shortage of actual coin was most serious, the Victuallers to the Fleet wrote that they required immediately eighty-six thousand pounds in specie, apart from any other demands they might have to make later in the year; adding that so heavy and so far behindhand were the debts of the office that further credit could not be obtained unless the Treasury at once issued Exchequer bonds which could be taken in payment. 'There is owing to the Cheesemongers,' wrote the Victualling Office, 'thirteen thousand nine hundred and twentyseven pounds, twelve shillings, and one penny. They refuse to deliver more butter and cheese without payment of a good part thereof; we suppose they will expect six thousand pounds at least.' For beef and pork upwards of twenty thousand pounds was owing; and the arrears of pay up to midsummer reached the enormous total of over one million two hundred thousand pounds.

Times were not always so bad as this; but they were never good. They would have been far worse had the Commissioners of the Admiralty not kept a very strict eye on the accounts which the various captains and lieutenants were continually submitting to them. Many of these gentlemen were only too ready to confuse their private with their public expenditure. Thus Commodore Wright, travelling from London to Plymouth to hoist his flag at the latter port, sent to the Admiralty a bill for twenty-nine pounds for the expenses of his journey-expenses to which, in the first place, he was not entitled at all. For coach fare he had paid eighteen pounds; for luggage, thirteen pounds twelve shillings and fourpence. These sums were doubtless correct, for they could be checked; although, when we consider the value of money in those days, they seem excessive. But of the commodore's other disbursements, we find that whereas he got dinner at Salisbury for four shillings, and again at Winterbourne for five shillings and eightpence, he had paid seventeen shillings and a penny for the same meal at Egham, and fourteen shillings and eightpence at Honiton; while a few hours' sojourn at Exeter cost him one pound four shillings. It certainly looks as if he had entertained friends by the way. He had every right to do so; but if he expected to recover all or any of these sums from the public purse he was disappointed. He was curtly reminded that as he was merely moving from one station to another, his expenses would not be defrayed by the

It should be added that among the other problems of the Government during the first part of William's reign was the serious doubt as to how far the naval officers could be trusted. The senior service had been under the especial favour of James the Second; and Russell, who for many years held the highest posts both in the Admiralty and at sea, was suspected—and justly suspected—of being in communication with St Germains. James confidently relied on the greater part of the fleet coming over to him, and he deluded the French Government into the same When the pinch came Russell and practically the whole of the officers stood by William, a result largely due, no doubt, to their hereditary hatred of the French. The so-called Admiral Cammock seems to have been almost the only officer of any eminence or rank in the service who went over to the exiled king.

On the whole, it cannot be admitted that the tone of the commissioned ranks was as bad as we have often been led to believe. For if officers were too overbearing or corrupt, too negligent or incompetent, they were usually brought speedily to book. Courts-martial were continually sitting; and a study of some of their records convinces one that, with a few notorious exceptions, they performed their duties with great care and impartiality. The most trifling complaints of the sailors were laboriously examined. And it was not always the sailors who had reason to complain. They were sometimes induced by malice or some sense of injury to contrive elaborate plots for the ruin of their officers. A curious case of this kind occurred in 1704. The Solebay, a sixth-rater of twenty-four guns, was stationed at King's Lynn to watch over the shipping of that port. Her captain, John Aldred, was summoned before a court-martial and accused of deserting ships at sea after he had taken their convoy money, of lending his own men to merchant ships for hire, and of other irregularities. The evidence against him was summed up in two petitions, the one from his own ship's company, the other, as it appeared, from the inhabitants and traders of King's Lynn. This latter petition was at once proved to be a forgery. Affidavits arrived from the town repudiating the signatures and expressing the highest esteem for Captain Aldred. Who originated this extraordinary fraud is not discoverable; but presumably it sprang from the same source as the petition of the Solebay's crew. For the signatories to this, examined upon oath, admitted that their declarations therein were malicious, false, and scandalous; and they affirmed that the carpenter and cook had, in some manner unexplained, forced them into the conspiracy. The causes underlying this strange affair remain a mystery.

It does not appear whether anything was done to the carpenter; but the cook was very properly sent to jail. Aldred was, of course, com-

pletely exonerated.

On board ship, while the sailors were herded like cattle on the gun-deck, the officers might enjoy quite comfortable quarters. Most of their cabins, however, were of a temporary nature, the bulkheads which formed them being taken down before the ship went into action. Many of them contained guns; and even the sacred retreat of the captain or admiral would be cramped by the presence of a couple of bulky twelve-pounders. One result of the movable nature of the cabins was that ships were apt to be overcrowded with them; the small fourth and fifth raters, in particular, were often considered to have too many for their 'The Mersey,' wrote Admiral Aylmer in 1710, 'is too much pestered up with cabins. I have ordered some of them to be taken down.' Sometimes in these small ships even the warrantofficers had cabins to themselves.

These warrant-officers, drawn from the most intelligent of the able seamen, answered to the non-commissioned officers of the army, and, like the latter, were an invaluable class. They rose to be lieutenants, captains, and even admirals. In the light craft—the sloops, brigs, and bombketches—they occupied a position of importance and promise, and were often able to show their These vessels would probably possess quality. only one lieutenant in addition to the commander; and if either of these was incapacitated in action, the boatswain or gunner was temporarily promoted, and might even come to command the ship for a time.

Of the midshipmen of this period there is little to be said. They entered the service very young, and went straight to sea, not as officers, but virtually as ship's-boys, as their name implies. At the age when a modern boy would be thinking of entering a public school or a training-ship, they were learning to drink and swear and gamble with the sailors. On the whole, the results of this system, like the results of so many other barbarous systems, were surprisingly good; but until they had served for some years the midshipmen must have been more of a nuisance than an asset to a ship of war. On the larger rates they were nominally kept in order by a schoolmaster. A curious little tragi-comedy which took place on a ship we have already mentioned—the Oxford -throws some light on both pupil and guardian. The schoolmasters do not seem always to have stood very worthily in loco parentis. The story forms an illustrative postscript to this sketch of seamen and sea manners

In the year 1704 the Oxford was commanded by Captain Joshua Moore, a man evidently possessed of an arbitrary temper. His second lieutenant, Toby Lisle, appears, on the other hand, to have wanted the necessary strength of character for his post. We find him giving orders which he had not enough authority to enforce. find him also assuming powers which he did not possess—a common characteristic of weak natures. Such a captain as Moore may well have been irritated by such a subordinate as Lisle. On the night of the 11th May, the ship being then at sea in company with another fourth-rater, the Falkland, Toby Lisle was in charge of the watch on deck. Two midshipmen, Grymes and Emmery, who were in his watch, approached, coming from the forecastle, where they had no business to be Lisle ordered them sharply to return to duty and set about bracing the fore-topsail. They refused, 'Tho',' says Lisle, and Grymes was insolent. 'I order'd him to be silent, he would not, but still continued his impertinent discourse; then I beat him, and bid him hold his peace and not be saucy, but he would not.' The affair apparently blew over. The night passed. The following day Lisle sent for the schoolmaster, one Taylor, and ordered him to teach his (Lisle's) servant navigation. The man refused, although he was at this time teaching the other officers Lisle's usual substitute for argument seems to have been his fists, and so he beat Taylor, who went and complained to the captain. The second lieutenant was thereupon informed that the schoolmaster could not be compelled to teach any of the servants. The same night, Lisle again having the watch on deck, Grymes and Emmery were again insolent. A little later the lieutenant, having occasion to go to the head of the ship, passed through the forecastle, where he found the same pair sitting drinking and fiddling with the schoolmaster and a fellowmidshipman. Lisle, who had thrashed Taylor without excuse earlier in the day, now merely asked him how he dared sit drinking with the midshipmen of the watch, and then went on his way. The unrepentant Grymes, however, followed him, and was abusive; and to him Lisle administered another thrashing.

The next day was the 13th, a bad omen for Toby Lisle. Some time before midday the captain left the ship to pay a visit to the Falkland. It was the business of Grymes to stand by with the trumpeter and drummer and sound him into his gig. When the captain had gone, Lisle foolishly ordered Grymes to play another tune. He refused; and on the trumpeter putting the instrument to his mouth, told him to put it by. 'Yn,' says Lisle. 'I order'd him into ye Bilboes;' but presently the midshipman was discovered drinking with the others in the forecastle.

Lisle, in fact, had gone too far. He should have waited to report to the captain before he put Grymes in 'ye Bilboes.' When Moore returned to the ship the tables were turned with a vengeance. The unfortunate Lisle was at once sent to his cabin under arrest for having exceeded his duty. The window was boarded up, the halfport caulked, and a sentry was stood over the door. His fault had not been very serious; a

few days' confinement, or even a reprimand, would have met the case; but the captain evidently had a grudge against him. There seems to have been some old cause of friction in a matter of prizes or prize-money. In any case, the lieutenant was kept in close confinement for many weeks-as it seems, indeed, until the Oxford returned to England in August. For she was bound for the West Indies; and she crossed the Atlantic and recrossed again, and still Lisle was a prisoner. He wrote long, pathetic letters to the captain; he complained that his health was giving way. Once Moore wrote back to taunt him with the prospect of losing his commission; at another time he wrote quite temperately; but he would neither see him nor release him. In his turn Moore had gone too far. The Oxford returned from the West Indies in company with several other ships, and Lisle wrote two or three times to the commodore of the squadron. These letters produced no apparent result; but at length, more than three months after the incident of the trumpeter, the Oxford dropped anchor once more at Spithead. Lisle was released. He at once lodged a complaint of ill-usage against Captain Moore, and demanded a court-martial. This was granted; and the court sat on board the Edgar at Spithead on 4th September, Sir Stafford Fairborne, Vice-Admiral of the Red, presiding. whole storm in a tea-cup was argued through again. And now Lisle got some of his own back. He was, indeed, himself reprimanded for confining the midshipman without first acquainting his commander; but Captain Moore, for his ill-usage of his lieutenant, was fined three months' pay. Perhaps these mild punishments indicated the court's sense of the absurdity of the whole affair.

DRUMMED OUT OF THE ARMY.

By Colonel R. H. MACKENZIE, F.S.A.Scot.

IT was on a dull November morning late in the 'sixties that the bugles of a well-known infantry regiment quartered in Aldershot sounded the 'Fall in' on the barrack-square. It was not an ordinary parade, nor yet one altogether uncommon. It was one of those occasions, distasteful to soldiers, which compelled them to be the witnesses of the humiliation of a comradethe promulgation of the sentence of a district court-martial involving his degradation, the branding of the culprit, his discharge with ignominy, and subsequent imprisonment with hard labour. When it is considered that in no other army in the world at the present day is military discipline maintained more in accord with the dictates of reason and mutual sympathy between officer and man, and with such an excellent result, than in that of Great Britain, the more difficult will it be to realise that in the not far distant past, and during the service of many officers now living, it was considered neither advisable to attempt, nor possible to preserve, order amongst British soldiers except by methods the majority of which can only be described as vindictive, tyrannical, and even brutal in severity. How a voluntary system of recruiting held its own at all in the circumstances is remarkable; for it would almost seem as if the war-presiding genii had of set purpose essayed to make soldiering as distasteful as possible to mankind. Firmness we can understand. We know that soldiers without discipline become a mob, and, when armed, the most dangerous to society of all mobs; so that it is essential, as Macaulay puts it, that they be subjected to a sharper penal code, and to a more stringent course of procedure, than is administered by ordinary tribunals. innocent perhaps in the citizen, or only punishable slightly, become serious crimes when committed by soldiers. All this is intelligible enough; but what of the punishments which the ingenuity of man must have found it no easy matter to devise? It is doubtful whether the Inquisition itself could have conceived more revolting penalties than some which were inflicted by courts-martial, and even by commanding officers on their own responsibility, in former times. The voluntary sufferings of the saints, the tortures of the religious orders of olden days, pale before the cruelty involved in the various forms of the death-penalty, the riding of the wooden horse, picketing, running the gauntlet, branding, and flogging. It is comforting that these punishments have gradually succumbed to the force of public opinion and the progress of civilisation.

Drumming out of the army—or trumpeting, as it was called in the cavalry and artillery—the ceremony with which we are more immediately concerned, was of a different character. It was vindictive, unnecessarily so, but not brutal or even painful. It was quaint, and at the present day might almost have been considered theatrical. The prisoner, handcuffed, was brought from the guardroom to the paradeground under escort. The crime of which he had been found guilty, and the sentence of the court-martial, were read aloud by the adjutant; he was to be degraded, branded as a bad character with the letters B.C., discharged from the service with ignominy, and to suffer a term of imprisonment with hard labour. In the process of degradation, the buttons, braid, badges, facings, and even the medal which he had earned in the second China war were stripped from his tunic. Then came the branding. There is nothing necessarily degrading in branding. All recruits in the Roman army, for instance, were branded on final approval; but its infliction as a punishment is another matter altogether, and not so easily defended. It was apparently a custom peculiar to the British army. During the reign of George the First deserters were 'stigmatised on the forehead; at a later period in history they were branded on the left side two inches below the armpit, and at the time of which we treat, generally on the arm. The tattooing was applied with a brass instrument containing a series of needle-points, the punctures made by which were rubbed with a composition of pulverised indigo, Indian ink, and water. It was administered by the drum-major, under the supervision of the medical officer, in the presence of the regiment on parade; and, in justice to the authorities, it must be admitted that it was accomplished with as little pain as possible. Further than that there is little that can be urged in its justification. Branding was a relic of bad times, and carried something revolting to humanity along with it. Any indelible stigma or brand of infamy is a fearful punishment. For one thing, the infliction was completely irremissible. It could be removed neither by repentance nor by any subsequent period of good conduct. To brand a soldier, and then discharge him from the service, as in this case, was to turn him adrift in the world with greatly impaired means of earning an honest livelihood. Hunger frequently urges its victims to follow dishonest courses; and what else could be expected from a branded and discharged soldier, precluded from all honest means of future support? It was a cowardly and vindictive form of punishment, since its infliction could neither promote the amendment of the offender nor render him more subordinate.

The last scene in the drama of drumming out of the army was perhaps the quaintest. regiment being formed in line, with a sufficient interval between the front and rear ranks, the prisoner was escorted down the ranks, followed by the band playing what was known as the 'Rogue's March.' In this manner he was practically turned out of barracks, the escort finally marching him to the military prison to undergo his sentence of hard labour. In cases where a man was discharged with ignominy without imprisonment, his exit from the barracks was not infrequently accompanied by a kick from the youngest drummer. Formerly he was conducted by the drummers of the regiment through the streets of the camp or garrison, with a halter round his neck and a written label containing the particulars of his crime.

Publicity seems to have been the accompaniment of military punishments at all times, under the impression, no doubt, that it acted as a deterrent to others. It more often happened that what was intended to degrade attracted the

sympathy of the man's comrades, the victim being frequently a loyal and brave soldier in spite of his delinquencies. In the case we have quoted the prisoner was known to be loyal to the Queen, and had proved himself a brave soldier in the field in China; but he became hardened and refractory by constant ill-treatment, for he had been frequently flogged for what to men of a certain class would be considered trivial offences. There is not an instance in a thousand where severe punishment has made a soldier a better man; there are thousands where it has rendered those who were forgetful and careless, rather than vicious, insensible to honour and abandoned to crime. It is undeniable that many a good soldier has been lost to the army who by sympathetic treatment and an appeal to his better feelings might have been redeemed in character. Such a man was the unfortunate soldier whose downfall we have described, the type of man that stormed Badajos, and the type immortalised by Sir Francis Doyle in his drunken private of the Buffs. We are wiser in the present day. The truth of what the Duke of York prophesied a century ago has at length been recognised in the British army. The personal intercourse of the officer with his men, and his personal example, repaid, as it is sure to be, by their confidence and attachment, is the only efficacious means of preventing military offences.

AN OCHIL EYRIE.

I SCLIMBED auld Seamab's* rugged face Ae sunny morn in May,
An' sune my circlin' e'e beheld
Lochleven Castle gray;
Cleish† an' the Lomon's‡ brak in view,
The Forth's broad waters gleamed,
While nearer still, by wood an' hill,
The silver Devon streamed;
Syne cam' in sicht the Roman camp
High up on Dunehill broo—
A lanesome hare whiles crooches there,
Nae warrior gairds it noo.
Far to the north the glance could pierce
Through wild Gleneagles Pass
To whaur the michty Grampians rear
Their grim, unconquered mass;
A laverock filled the lift abune
Wi' strong an' tireless throat,
An', swoopin' by, the peeweep's cry
Mixed wi' the whaup's sad note.
Perchance on Seamab's stany crest
I ne'er may stand again,
Perchance my een may never mair
Alicht on Devon Glen;
But aft in mony a dreary oor,
Hemmed in by hoose an' wa',
The mem'ry born o' that May morn
I'll wistfully reca'.
Whate'er the web o' years may haud
Man can but thole an' bide,
Yet frae the urn I'd fain return
To haunt sweet Devon side!
W. G. MILLER.

OUR STONE CIRCLES.

HERE and there in our pleasant land—from one extremity to another, from Cornwall to the Orkney Islands—there are huge stones, some standing and others prostrate, that in some remote time beyond recognition or computation have been placed in circles more or less exact. stones are of great height and girth, and in some instances stand in couples which are surmounted by a similar stone placed horizontally on their summits and resting on them like lintels on doorposts. Some of the circles were originally encompassed by ditches, moat-fashion, with the earth taken out of them formed into embankments; some were approached through avenues of monoliths of the same kind as those of which they were composed. They have different dimensions, some having diameters exceeding three hundred feet, and others measuring less Looking at them collectively, than one hundred. it is a marvel we do not attach more importance to them, for they are all august, mysteriously impressive, alluring, and inscrutably reticent.

In the course of centuries these great circles have been utilised as convenient quarries from which to obtain materials for roadmaking and fences. Fortunately this indiscriminate destruction has now ceased, and a more appreciative estimate of their curiosity and interest has set in, and private owners as well as the Inspector of Ancient Monuments under the Works and Public Buildings Department alike endeavour to preserve them from further disappearance. We hear of the lifting up of some of the prostrate stones, the filling in of fissures threatening disintegration, and of careful excavations for examination. For the most part they stand on high ground, on heather-clad moors or other uplands, evidently pointing to a long-past time for their erection when low-lying lands were not suitable for human occupation.

There is a branch of the Office of Works and Public Buildings entrusted with the administration of the existing Acts respecting ancient monuments and historic buildings. The State does not undertake the guardianship or arrange for the protection of any monument except with the consent and desire of the owner. When the State has assumed control, the monument is thereafter protected from damage and destruction. The Commissioners of Works are bound to maintain the monument out of money provided by Parliament for the purpose, and maintain after-

wards 'the fencing, repairing, cleansing, covering in, or doing any other act or thing which may be required for the purpose of repairing any monument or protecting the same from injury or decay.' The Inspector of Ancient Monuments and Historic Buildings reported in 1912 that one hundred and sixteen monuments were under his care, including most of the circles mentioned in this article.

Stonehenge, the well-known and oft described and pictured 'hanging stones' on Salisbury Plain, will come first to mind. Not long ago a minute and comprehensive survey of this grand circle was made from a balloon, but even this scrutiny afforded no new light as to its original intention or builders. We may all see that within the great outer circle there was an inner one of smaller stones, which some antiquaries think may have been the older of the two, and carefully enclosed by the builders of the outer one when they were able to undertake their more considerable work. The Amesbury example, but a few miles away in the same county, is second only in consequence, and has the addition of a wellmarked avenue; but notwithstanding various investigations no definite information has been Whether they were obtained as to its purpose. places of convocation, temples for religious rites, including sacrifices (suggested by a central slab in some instances), or for sun-worship or serpentworship, or merely centres for assemblies or ceremonies, or sites of battlefields, has yet to be ascertained. Whether the great stones were brought to their present circles in palæolithic or neolithic or later times we can but conjecture. Many early antiquaries assign them to the Druids or to the Ancient Britons, or to the harassing Picts; and there were not wanting many more who assigned them to the Vikings and their followers; but they are now commonly regarded as relics of an earlier age. Inigo Jones attributed them to the Romans. The prodigious number of them adds to their mystery.

In Cornwall there are as many as five circles on Bodmin Moor, two of which are within sight of each other, or only three-quarters of a mile apart; and there are more in other parts of the county. At Stanton Drew, a name suggestive of 'the stones of the town of the Druids,' a large circle is supplemented with traces of a much smaller one on either side of it; and some others have additional stones at slight distances that

No. 203.-Vol. IV.

[All Rights Reserved.]

OCTOBER 17, 1914.

must have had a purpose. Besides these, there are solitary stones, in some places of a much larger bulk, standing afar off, concerning which there are many conjectures. Derbyshire has circles on Stanton Moor ('stones on the moor'), Hartle Moor, Hathersage Moor, and Olney Moor, all of small dimensions, and a more considerable one at Arbour Low, encompassed by a ditch, which, when surveyed by Dr Pegge in the last century, consisted of about thirty large stones with about fourteen smaller ones that had the appearance of having been a circle within the other. In the centre of it at that date was a stone thirteen feet long and eight wide, which gave countenance to the impression that sacrificial rites may have been performed on it. Eyam Moor has a circle of a hundred feet in circumference.

Cumberland is rich in these remains, one of which is well known as Long Meg and her Daughters. The great size of the standing stone called Long Meg associates it with the larger stones which are sometimes found at a distance from the rest, and which have been accounted for as indicating some solar particulars to be acted upon in rites of sun-worship. In an Orcadian instance one of these solitary stones is about twenty feet high and six feet broad. circle near Keswick, known as the Druids' Stones, has about thirty-eight stones, and is supplemented by a smaller group of ten stones on the eastern

side, the largest about seven feet high.

The kind of stone selected varies according to the locality. The Stonehenge blocks are of sandstone in the outer circle and of hornstone in the inner one. They have been examined for the incised cups and concentric circles found on various rocks in Northumberland and elsewhere in our own time, with only a negative result. The Derbyshire blocks are of gritstone. A circle in the Cheviot district in a valley near a stream known as the Three Stone Burn, of which there are still thirteen stones in evidence, is formed of a single ring of syenite. They vary from four to nearly six feet in height. The circles in Cornwall are all of granite. The largest of these is at Fernacre. It is composed of seventy-one stones, of which thirty-nine are standing. Second only to this is the Stripple Circle, in which considerable excavation has been carried out under the presidency of Mr Gray, a local authority on such matters. It consists of twenty-eight stones in a bent ring measuring two hundred and eighty feet by two hundred and fifty-five. This ring, of which most of the stones are now prostrate, is surrounded by a ditch or fosse and an embankment. The longest of the prostrate stones is about twelve feet in length; the largest left standing is but six feet nine inches above the ground. There are many hut-circles in the neighbourhood. The diggings consisted of twenty-five cuttings made into it by seven men under a foreman accustomed to antiquarian investigations. The results communicated to the archeological world inform us that no traces of burials were found, only three flint flakes, a portion of the radius of an ox, and a few pieces of wood rewarding the searchers. As the flints were come upon eight feet below the surface of the peaty soil, it is assumed that this depth had been formed in the centuries that had passed since they were lost or left there. Mr Gray suggests that the fosse may have been intended for draining purposes on account of the wetness of the site. A circle at Stannon has seventy-nine stones, of which forty-one are standing and the rest sinking into the peat. Another of these granite circles, at Trippet, three-quarters of a mile from that at Stripple, has but eight stones standing and four prostrate in the peat, out of the original number of twenty-six; and a mile and a half away, at Leaze, there are ten stones standing and six prostrate out of an original number of twenty-two.

The Brogar circles are of the old red sandstone. There are two of them, a little more than half a mile apart, close to the Loch of Stenniss. And not very far from them is a huge monolith now known as the Witch Stone. The larger circle has a diameter of about three hundred and forty feet, and a fosse or trench round it about twenty-nine feet wide and six deep. It is computed there were about sixty stones when it was erected, some of which have disappeared and some are prostrate, leaving, since recent restorations, twenty-one now stand-The smaller circle has been reduced more considerably, and might have disappeared altogether but for the help of the Office of Works. Only two stones, about fifteen and eighteen feet high respectively, were left standing, and one prostrate that measured twenty feet. In the centre of the circle a mass of stone, suggesting a cromlech, has been placed in position.

For canopy these mysterious rings, and many more than those mentioned, have above them the immeasurable sky with its ever-passing clouds, and have been lit with its shining heavenly bodies day by day and night by night; for company and searching they have the ever-changing winds and the frequent rains and opal mists; for solace and enrichment the ecstasy of sunshine lighting up their gray-green and amber lichens and mosses, and casting shadows from them all. Peat or heather, furze, bracken, and bent, and other grasses and wildings of many kinds, glance up from their feet; and over all there is an atmosphere of loneliness, seclusion, and aloofness. We think of them chiefly, however, as in a silent setting of moors, lakes, and hills, with grave-mounds or barrows and hut-circles sparsely strewn around some of them, and of all as keep ing their secret tantalisingly and successfully.

Not only has it been passed down by tradition in some places that it is unlucky to count the stones, but in others that it is impossible to do 80 owing to a constant variation in the com-Another singularity in the way of putation. folklore connected with them in Scotland is the fact that they are sometimes spoken of as | known as the Twelve Apostles.

the Nine Stanes when their number does not correspond with that appellation. At Holywood in Dumfriesshire a fine circle of eleven stones is

THE COMMAND OF THE SEA.

CHAPTER III.

A WEEK later the Mendoza was leaving the harbour of San Juan. She was leaving it with great pomp and circumstance; her crew lined the deck, and her band was on the quarter-deck, braying out the national air of Almaceda, which is a loud and heart-stirring piece of music. From her fore and main masts and her stern there flaunted the yellow flag of the republic; her guns and brass-work glittered in the bright On the sea-front of San Juan a multicoloured throng gesticulated and cried shrill farewells, whilst President Cisneros eyed her excitedly from the flat roof of his palace.

All had fallen out as that great man had planned. War was declared; that arrogant and sword-rattling power Quibo was to be taught a severe lesson; too long, men declared loudly, had Almaceda borne with her insults and her pretensions. But that was now to end; the forces of the republic were mobilised; the army-five thousand sallow-faced little soldiers in untidy cotton uniforms-was even now marching enthusiastically for the frontier. And the navy was leaving port to play its part in the campaign.

Captain Vincent stood upon the bridge of the Mendoza, looking back at San Juan. He smoked a black cigar, and his eyes were rather brighter than usual. He discovered, somewhat to his disgust, that he was a little excited. He chided himself, and turned his face to the sea.

'Well, we're great dogs now, Mr Fenning,' he said to his ex-naval boatswain; 'but I wonder what we'll be like when we're up against the real thing.'

Fenning grinned deferentially, and wiped his mouth. 'Reckon we'll do all right, sir,' he said 'You know, sir, these Dagos ain't half a bad lot. Course they haven't got the service polish on 'em, but they're as willin' as foxterriers. They'll back you up, sir, if you ask me.'

Despite himself, the captain smiled complacently. Hitherto he had been a little distant with old Fenning; the man had been rather too fond of comparing the Mendoza with the Rodney of the Royal Navy. 'My last ship, sir, she was,' he would say, 'the old Rodney of the Channel Fleet. She was a happy ship, sir, if you like; you should have seen her at evolutions, when we was competin' with the rest of the squadron! Still, o' course, this here *Mendoza's* none so bad.' At which Captain Vincent would glare a little, and thank him ironically. But

now, he felt, the other was not such a fool, after

'I'm glad to hear you say that, Mr Fenning,' he said, squaring his shoulders. 'You see more of the men than I do, and you should understand them.'

'Well, it's you that's made men of 'em, sir,' answered Fenning. 'The little blighters fair worship you, as far as I can make out. Course, I'm not sayin' but what they might be better. I remember our Number One on the Rodney, he used to make us'-

'I know all about your blighted brass hats, thank you, Mr Fenning; broke in Captain Vincent with some heat. You might go and tell that band to stop its row; we're out of the bay now.

San Juan was indeed fading away into the distance, the coast-line opened out wider and wider on either hand, and they were beginning to feel the long, regular heave of the ocean. The Mendoza turned southwards and put on speed. Santa Maria, the port of Quibo, was a good two hundred miles away, and Captain Vincent desired to reach it quickly; he wanted the thing to be over and done with as soon as possible. not known what the enemy proposed to do, though there had been rumours in San Juan that their cruiser, the Libertad, was preparing The captain hoped the rumours were correct, for he felt that the newly created discipline of his crew might fade and wither in longdrawn-out blockade work.

The hours went by; the sun climbed overhead and shone down fiercely; the distant shore slid past, faint and shimmering in the heat; the sea was of an oily calm and intensely blue. Mendoza might have been engaged on a pleasure cruise were it not for her guns and the eager, excited faces of the men on her decks.

'I'll have the ship cleared for action,' said Captain Vincent suddenly, 'in case.' He barked out orders; bugles sounded shrilly; his first lieutenaut, an excitable Almacedan, mounted the bridge and gesticulated passionately. The cruiser's men scurried to and fro, and the ship was like a disturbed ant-hill. Soon all was ready; the Mendoza had a bare, stripped appearance which made her ugly and menacing. Her rails and ventilators were levelled to the deck; her guns were run out; men were wrapping ropes round her boats, and filling them with water to prevent fires; the deck around the guns was

sanded ominously, and bags of coal were placed round the bases of the funnels. Captain Vincent made a tour of inspection as the bugles sounded the 'still' in true naval fashion. There was little that escaped him, for he spent over half-anhour at it. He came to the bridge again in a great state of heat, but hugely satisfied.

'And that's all right,' he said aloud. 'Eh, Mr

Fenning ?'

'Yes, sir!' Fenning hastened to answer. 'Re-

markable smart it was, sir.'

'That must be the coast of Quibo we're passing now,' the captain went on, his binoculars to his eyes. 'I know those mountains.'

He pointed to the distant blue land, and Fenning nodded assent. 'We've been doin' a good eighteen, sir, and it's four hours since we

left port,' he said.

Captain Vincent searched the blue sea with his glass, and then glanced at the Mendoza's funnels, from which came only a thin filmy

'Good coal,' he said briefly; 'and good stoking too. By George! I wonder if the Libertad has put to sea. If she has, we may sight her

any minute.

He sent a couple of men up to the lookout station on the foremast, and resumed his eager staring. The Mendoza was very quiet; few men were on her decks; they were all at their allotted stations for action—in the eight-inch gun-houses, clustered round the six-inch guns in the battery, or below, at ammunition-hoists and magazines. The ship's powerful engines drove her onward with a kind of pulling motion; her decks vibrated a little, and a long trail of dazzling whiteness stretched away from her stern.

Suddenly a hail came down from the lookout station, and at the same moment Fenning raised his arm and pointed. Right ahead, very far away, a thin brown smear rose up above the

clear-cut line of the horizon.

'Steamer's smoke, sir,' said the naval man

quietly.

Captain Vincent raised his glasses, his heart beating quick and loud. Beyond doubt it was a steamer's smoke; but no more could be said of it for the present.

'Might be a tramp-or anything,' said the

captain quickly. 'Maybe, sir. But that's just where the Libertad 'ud show up, if she's come out.'

The captain made no reply, but eyed the smoke thirstily. The Mendoza was heading directly towards it. The smoke grew denser and hardened.

The captain lowered his binoculars. 'I make out two pole masts and two very tall funnels,' he said. 'That's the Libertad, Mr Fenning?'

'Should be, sir,' answered the other, his clear eyes very bright. 'May I have a squint at her?'

Captain Vincent handed over the glasses.

'That's her, sir!' cried Fenning excitedly and ungrammatically. 'I know her. They bought her from the States, you know, sir. From Cramps of Philadelphia. That's why she's got such long smoke stacks, like all the Yankee cruisers.

The captain squared his shoulders, and scemed to give a searching look along his ship's deck. He rang for full speed, and the Mendoza bounded

under them in answer.

'She's standing towards us,' exclaimed Vincent suddenly. 'Coming along at a fine pace, too. You can see her gun-deck already. She's the Libertad all right.'

He summoned his four lieutenants for a last hurried conference. They came swiftly-four short, sallow-faced men, their black eyes alive

and glowing with excitement.

The captain spoke sharply in his harsh, halting Spanish; the officers listened attentively, their eyes fixed on his dark-bearded face as he towered over them. The conference did not last long; Captain Vincent was not a man of many words; and the officers saluted and trooped back to their

'Come into the conning-tower, Mr Fenning,' said the captain abruptly. 'You'll steer, while

I fight the ship.

They entered the tower together. It was a small metal chamber with steel walls six inches thick, studded with tubes and voice-pipes. slit beneath the roof, running right round the tower, gave an open view on all sides. Fenning grasped the little wheel; the captain stared fixedly at the fast-approaching Libertad. She was a high-built ship, looking more than her three thousand tons, painted French gray, the blue-and-white flag of Quibo streaming gaily from her stern.

'She's closing the range fast,' the captain muttered. 'Could reach her with the eight-inch now. But we'll wait—— Ah! there she goes!'

There was a vivid wink of flame from the Libertad's forward gun, and a momentary fountain sprang up from the sea right ahead of the Mendoza. A dull boom came down with the wind.

'Short, my friends-short!' exclaimed Vincent cheerfully. 'Good line, though. There's another!

A second six-inch shell buried itself in the sea, this time only a hundred yards from the cruiser's bows, and Captain Vincent's face seemed to glow and harden, and his black beard bristled. He spoke down a voice-pipe to the forward eightinch turret, and a few ininutes later the gun bellowed out in answer. The two-hundred-pound shell wailed right over the Libertad, and sent a great spout of water up from the sea beyond her. The action had begun in earnest.

Captain Vincent's idea was to run down to within fifteen hundred yards, and, keeping at that comparatively short range by means of his superior speed, to overwhelm the enemy as quickly as possible with his heavier armament. The Libertad showed no desire to avoid the close fighting, and the two vessels stood on a parallel course, firing savagely, as fast as their wildly excited men could load their guns. The red prongs of flame were almost incessant; the earsplitting reports of the quick-firers seemed to dull, yet perturb, the senses; and the deeper boom of the Mendoza's two eight-inch guns rang out every few moments, like the bass notes of some terrible symphony.

'Not much comic opera about this,' Captain Vincent muttered, gazing through his binoculars.

He was amazed, and even somewhat disturbed, to see how the Libertad stood to it. At the short range, the Mendoza's heavy guns were doing fearful execution. One of the Libertad's tall funnels was gone, her fore-bridge was smashed to splinters, one of her six-inch guns was dashed from its mountings, and great jagged holes gaped in her sides. But she fired on gallantly with every gun she had left in action; and the Mendoza was not getting off scathless. two eight-inch guns were impervious behind their heavy steel armour; but amidships, where her six-inch guns were mounted, things seemed to be far from well. Shells were bursting inboard; the captain smelt burning woodwork; the firing seemed to be slackening, and he saw men rushing up from below as though panic-stricken.

He roared down the speaking-tube, but got no answer; and, with an angry exclamation, he ran swiftly down to the battery. It was not a pretty sight. The four six-inch guns were undamaged, for they were protected by steel shields, but shells had crashed through the ship's sides; there was an acrid, sickly smell of high explosives, the deck was littered and cumbered with wreckage, and two or three silent figures lay around each gun in stiff, grotesque attitudes. The rest of the gun crews had either abandoned their guns or were loading and firing like men in a dream, with slow mechanical motions. Captain Vincent stormed down amongst them like an angry whirlwind.

'Get back, you shirkers!' he roared in English, with furious gestures. 'Back to your stations—pronto / You hear me?' Out of it! Vamos / Get back to your guns; do you hear me?'

They did not understand him, but the fierce scorn of his tones, the vigour, the whole magnetic personality of the man, sent them back to their stations like men stung. The four guns began anew a furious fire; the *Libertad's* fire slackened in its turn, and she was covered with a cloud of bursting shells; her remaining funnel toppled and fell, and another of her six-inch guns was disabled, its long muzzle cocked up to the blue sky. Yet still she fought on with her only two six-inch guns which would bear.

'She's a marvel!' muttered Captain Vincent, back in the conning-tower. 'By heaven! she's

great. I'd never have thought that—— Ah! at last! at last!'

An eight-inch shell from the *Mendoza's* forward gun had smashed into her gallant enemy amidships, evidently doing immense damage. The *Libertad's* guns ceased firing, and a minute later her blue-and-white flag came down, jerkily and reluctantly. The fight was over.

reluctantly. The fight was over.

Captain Vincent stepped from the conningtower into the hot sunlight. His ornate uniform was soiled and stained, a shell-splinter had slashed his coat open without touching him, but his face was cut and bleeding. He had had his binoculars to his eyes at the moment when his ship had fired her eight-inch guns simultaneously, and the concussion had driven the glasses against his forehead. He blinked a little in the glare, and gazed frowningly but exultantly at his prize. As he looked his men came flooding out from below, from the guns, the magazines, even the engine-room and stokehold. They waved their caps and shouted; they embraced each other; there were many shrill 'Vivas!' and voices called out the captain's name. A strange crowd they seemed, all dirty and blackened, some bleeding from shell-splinters, some with their arms or heads roughly bandaged. And down below, around the guns, twenty-seven of them were lying who would never shout again.

The captain suddenly squared his shoulders. 'I'm going over to take possession of her,' he

said. 'Better see to that myself.'

By good fortune a sound boat was discovered. She was lowered, crammed full of armed sailors, and moved swiftly over the calm sea to the silent Libertad. As they approached her Captain Vincent saw more clearly the effects of his fire. The stricken cruiser was a mere splintered steel box; both her funnels were gone, her bridge and upper works were jagged and serrated as though beaten by hammers, a score of ugly holes gaped in her sides, and she seemed to be listing over to port. As they swung alongside, Vincent noted, with a slight shudder, that there were ominous brown stains around one of the shattered six-inch gun casements. 'This is pretty bad,' he muttered in his beard. He sprang on deck, a dozen men at his heels.

No one greeted him; the deck was cumbered with an extraordinary mass of wreckage, dead bodies lay around on all sides, and there were only some half-dozen begrimed, sullen sailors to be seen.

'Where is the captain?' said Vincent to one of these, after endeavouring to pick out an officer.

The man muttered something in Spanish and spat, lowering his eyes.

'Sulky devil,' said the captain cheerfully. He ordered two of his own men to follow him, and picked his way forward to the conning-tower.

The tower was very much shattered, and had evidently been wrecked by a shell. A great part

of the massive steel wall was gone, and the heavy roof was crushed and splintered. The captain halted for a moment, drew his revolver, and

walked in, with his senses alert.

A man was lying on the floor of the tower, his head turned a little to one side. A thin red stream meandered from him and ebbed to and fro as the ship rose and fell on the slight sea. Captain Vincent put back his pistol and stepped up to him. 'I am sorry, señor,' he began in Spanish; 'I fear'—— But what it was he feared will never be known, for the wounded man turned his head on hearing the voice; and Captain Vincent saw that the commander of the Libertad was his friend Collins.

For a moment Vincent stood speechless, clutching at the jagged wall of the tower to steady

himself.

'Jack!' he said at last in a gasping voice.
'Jack! Good Lord! it's not really you?' He fell on his knees and raised the other up.

Collins looked at him, and his dull, glazing eyes seemed to light up a little. 'It's me, all right,' he said feebly. 'Glad to see you, old son. Wondered if I should—before I went out.'

'I can't believe it,' exclaimed the captain wildly. 'Why, how did you get here? Are you

really the captain of this ship?

The other gave a little pathetic laugh. 'You bet,' he murmured. 'I was, at least, until you smashed us up. Been in charge of her for a fortnight. I cleared out of the Vulcan at Quibo, as I told you I should, and I got the job. Their other captain had just died, and I found a pal in Santa Maria—fellow who had a pull with the President of Quibo'—— He broke off suddenly, and closed his eyes.

Vincent bent over him. 'You're not badly hurt?' he said tenderly. 'Jack, old pal, you're

not really much hurt, are you?'

Collins opened his eyes again. 'All up with me,' he whispered. 'One of your jolly old shells, it was. I've got it all right; haven't been risking my life for twenty years without knowing when the game's finished. Have you—have you got a drop of brandy?'

With something like a groan, Captain Vincent

whipped out a flask at once.

'Yes,' whispered the other, with a feeble smile. 'Yes—you would have a brandy-fleek'

He drank a little and sank back. Vincent looked at him with a contorted face.

'You're not going to die!' he exclaimed. 'I'm d—d if you shall die! Look here, I've got a good doctor on the Mendoza. I'll send for him'——

'No use,' muttered Collins. 'I'll be dead before he could come.'

There was a short silence. 'Old man,' said Vincent suddenly, 'why didn't you let me know! I'd never have fought against you if I'd known. Why did you fight me? Good Lord! if I'd known you were in command here'——

Collins tried to sit up. A little colour seemed to fleck his white cheeks. 'If you'd known, you'd have fought me just the same,' he said. 'Just as I did you. We'd got to do our duty, even though we weren't blooming Nelsons. Of course, when I got the command I didn't know there would be a war. But I couldn't back out, could I?'

'I suppose not,' groaned Captain Vincent. 'But it seems horrible to think about.'

The other sank back again. 'Oh, I don't know,' he muttered vaguely. 'I don't know. It might have been you. And, anyway, I've had my chance. I'm dying in command of a warship, after all.' He fixed his eyes upon Vincent's, and motioned feebly with his head 'You won't mind,' he whispered. 'But—well,

we gave you a good run for your money; we made a good fight of it—eh?'
'You did!' said the captain, with a catch in

his voice. 'By the Lord, you did!'

'Yes,' murmured Collins faintly. 'That's something.' His voice failed him. He gave a little shiver, and his head fell back.

Vincent bent over him once more. 'Jack!' he cried passionately. 'Jack, old pal!—

Jack!'

But the captain of the Libertad was dead.

An hour later Captain Vincent was rowed back to the *Mendoza*. His men thronged the rails to welcome him; their cries rang out over the sea, and the men in his boat shouted exultantly in answer. But the captain took no heed, though behind him the battered *Libertad*, with a prize crew on board, was waiting to be towed to San Juan. Vincent turned round and looked at her with sombre eyes.

'Well, I've got Cisneros his command of the sea,' he reflected bitterly. 'And I've killed a man worth ten of him in doing it. I've had enough of Almaceda and its blighted navy. It's

not much of a job, after all.'

THE END.

MOTORING AND ITS INDUSTRY.

WHAT THEY ARE AND WHAT THEY MEAN TO THE COUNTRY.

By HENRY STURMEY.

IT is less than fifteen years since a Mayor of Coventry, when a new motormaking company was projected for the city, exclaimed, 'Motors! Motors! Would any one ever buy them if they were made?' And it is but a year more since I drove from John o' Groat's to Land's End, and all the schools along the road from Exeter to Penzance were given a half-holiday 'to see the motor go by.' Just keep this short period of years in your mind, and then compare such incidents with the growing use of motors of all kinds which pertains to-day, and some idea of the rapidity of the progress of the revolution which is being made in our methods of transportation may be appreciated.

Five years ago enthusiasts were wont to assert, in reply to pessimists, that 'the motor has come to stay.' But no one, I take it, would to-day venture an opposite opinion, for the motor is 'here,' in a way which renders its disappearance unthinkable. It has, as the Yankees say, 'made good.' Yet few, I fancy, have any true idea of what motoring really is at the present time, what the ramifications and dimensions of its industry are, and what the construction and use of the motor really mean to the country.

'I am told that you people spend more than a million of money on cars every year,' remarked a man to a motoring friend not long since. 'More like five millions,' was the reply; and the first speaker thought his friend was romancing. But even the latter figure, large as it may appear, is but as a tug-boat to a liner compared with the actual amount.

Lord Montagu has been at the pains of collecting from the registration offices throughout the country a record of all the motor vehicles in use as shown by their payment of registration fees —in this country up to the end of October 1913; and with these figures to work upon, we have the means of arriving at a fairly accurate approximation of the magnitude of motoring in all its phases, the result of which is very valuable and interesting. Lord Montagu's figures show the enormous increase of eighty-seven thousand five hundred and thirty-six in the number of motor vehicles of all kinds during the twelve months prior to the date on which his records were taken—an increase which is at the rate of approximately 20 per cent. per annum on the machines in use a year previously; and, taking this rate of increase to have been maintained until the end of the year, there should have been on 1st January 1914 over four hundred and forty thousand motors in use on the roads of the British Isles, of which over two hundred and fifty-four thousand were cars—touring, public service, and commercial—and the rest motorcycles. Moreover, at the rate of increase recorded above, it will be seen that close on seventeen hundred additional motor vehicles are being added to this substantial total every week!

What an enormous amount of motoring this means can be readily approximated by calculation. We know by experience the average mileage of motor cars and cycles of different types, and we also know the amount of fuel they consume, or, rather, the approximate number of miles motorcars will run per gallon of fuel used; and a calculation based upon this knowledge shows us that motor vehicles cover in the aggregate over three thousand one hundred million miles of our country's roads in a year; the accuracy of these figures being roughly verified by the Government records of the quantity of petrol imported, so that this immense mileage may be accepted as approximately correct. What this distance really means may perhaps be better grasped when it is pointed out that it is equal to more than one hundred and twenty-four thousand times the circumference of the earth, or nearly seventeen times the distance from the earth to the sun and back! I do not know the approximate aggregate mileage of other forms of locomotion; but apart from the usefulness and the amount of pleasure and health given, if the number of accidents which occur annually in connection with motoring is compared with that of other transportation systems and their respective mileage, I believe it will be abundantly proved that, mile for mile run—and this is the only sound method of comparison-motoring is not only the safest form of travel known, so far as the passengers in the vehicles are concerned, but by a long way the safest form of traffic which uses the high-roads, so far as the general public are concerned.

As may be surmised when such figures can be adduced, the cult of motoring has been the means of building up an industry the dimensions of which, as well as of motoring, can hardly be guessed at by the general public, and which will, I think, astonish even those who are more or less intimately in touch with it. Lord Montagu's figures of increase above alluded to enable us to base our calculations upon firm ground, and it may here be incidentally mentioned that an examination of the Board of Trade returns shows us that the popular idea that foreign cars are in the majority, and that our own foreign trade is small in comparison with that of other nations, is erroneous; for although figures show that in point of numbers we import four thousand more cars than we send abroad, on the other hand we export more than sixteen thousand five

hundred motor-cycles against less than fourteen hundred imported. The cars exported are of so much higher a per-unit value that the financial balance against us, so far as these are concerned, is but two hundred and eight thousand pounds; whilst the balance in our favour in regard to motor-cycles being seven hundred and twenty-one thousand pounds, we are over half-amillion sterling to the good on gross turnoverwhich speaks very well for the vitality of the home industry, when it is remembered that but a decade since our export trade was negligible and the bulk of the cars in use at home were foreign. In point of fact, last year, in spite of the large number of very cheap cars which are now being imported from America, 73.87 per cent. of the cars and 96.87 per cent. of the motor-cycles bought by British motorists were of British manufacture; and if a comparison were taken on the values, the percentage would be higher still. As regards values, it will be seen that, the balance on exports over imports being in our favour, the volume of trade done by the British motor industry may be taken to equal the total of the purchases of the home market plus the odd half-million of the balance; so that, with this difference, in stating the dimensions of the home trade I am stating also the magnitude of the British motor industry itself, and we shall see that both are of a very substantial

Before dealing with the present annual trade done in motors, however, it may be incidentally mentioned that it can be safely computed that the cars and cycles at present running in Great Britain and Ireland aggregate a present value of approximately fifty-five million pounds; whilst their first cost—the money spent on the purchase of motors during, say, the last ten years—cannot be far short of one hundred and twenty millions sterling! Prodigious, is it not?

And now let us see what our annual account with the motor trade for the purchase of new goods amounts to. The purchase price of motorcycles averages about fifty pounds, and the price of cars ranges from as low as seventy-five pounds for a cycle-car to twelve or fifteen hundred pounds for a lordly six-cylinder limousine; and although a large number of the new light cars are being turned out, the one-thousand-pound vehicle is by no means extinct, one firm, for example, building nothing else. In order to find a fair figure of average unit-value, I revert to our export returns, in which the Board of Trade gives us both the aggregate values and the number of units exported; and if we take our exports fairly to represent the proportion of types absorbed by the home market, and allow for retail prices as against the 'export prices' given in the returns, both as regards the home product and the imports, we get a figure of close on twenty millions—to be exact, nineteen million nine hundred and twelve thousand four hundred and twenty-eight pounds —as the sum spent on the purchase of new motorcars by British motorists last year. But to this has to be added the value of the 'spares' and accessories, the supply of which forms a very substantial branch of the motor trade; and, again drawing a line through our exports, and assuming the proportion of accessories to cars to be the same for the home trade as for export, we get the large figure of five million seven hundred and seventy-three thousand three hundred and ninetysix pounds, giving a total of approximately twentyfive and three-quarter millions sterling as Britain's motor bill, and twenty-six and a quarter millions sterling as the value of the British motor trade taken as a whole.

But this is only half the trade; for, large as it is, the annual expenditure on new purchases is completely dwarfed by the cost of running the motor vehicles which are now upon the road, as I will show. With more than two hundred and fifty-four thousand motor-cars and one hundred and eighty-six thousand motor-cycles in daily use, running from three thousand to thirty thousand miles annually, the consumption of tireswhich is the motorist's chief 'upkeep' expenseis enormous, and calculations based on mileage and average wear and cost of tires show that motoring has been responsible for building up an industry in the manufacturing of tires which is almost as large as that of the motor-car building trade itself, as I make our annual tire consumption to approximate fourteen million five hundred and twenty-one thousand pounds.

Next to tires, the cost of petrol and lubrication bulks heaviest in the motorist's expenditure, and here again we find an old industry expanded to enormous proportions, for the fuel and oil bill works out at close on eight and a half millions sterling; in addition to which we have the cost of repairs, renovations, and periodical 'overhauls,' amounting to over six millions; whilst the payments made by motorists in registration fees and licenses for cars and drivers and their expenditure with the insurance companies cannot be far off a couple of millions more.

Whilst many, probably most, motorists keep their machines in an old coach-house converted to a new use, large numbers of cars are stored in public garages or in buildings specially rented for the purpose; and even where the coach-house forms part of an existing establishment, its existence will have been taken into consideration in fixing the rent, so that the safe storage of a car costs something. Allowing a very moderate average for this, the figure for rent and garage accommodation, as I make it, tots up to the respectable figure of two and a half millions; whilst the heaviest aggregate expense of all deals with the looking after, driving, and care of the cars, the need for which has opened up a new calling, whose members in themselves form a large army-I refer to the chauffeurs-and the

wages bill to chauffeurs and helpers (those engaged 'in and about' cars, as they say in the boating world) is a heavy one. Just how many get their living in this way it is difficult to say, but it is shown by Lord Montagu that the number of drivers' licenses exceeds the number of car and motor-cycle licenses by one hundred and eightyone thousand. Of course motor-cyclists require no chauffeurs, and in many car-owning households more than one member holds a driving license; but, on the other hand, many people own cars to-day who do not and cannot drive themselves. Then there are the taxi-drivers and trade-drivers all over the country; so that in taking the figure of one hundred thousand as the number of professional chauffeurs I believe I am under rather than over the mark. If we include the large number of men who are employed 'about' cars—as, for instance, the cleaners in public garages and the conductors and helpers in the employ of motor omnibus and cab companiesthe London General Omnibus Company, for instance, employs close on thirteen thousand hands, of whom not more than about a third are drivers—we shall have not far off one hundred and fifty thousand; and if we consider the very large number of part-time men employed by ownerdrivers to clean and help with their cars, and throw the proportion of wages received by them for such services into the general aggregate of remuneration, I do not think I shall be far out for the purpose of calculation if I average the wages of the one hundred and fifty thousand chauffeurs and men employed about cars at thirty-five shillings per week, which gives us the large sum of thirteen million six hundred and fifty thousand pounds as the wages paid by motorists to chauffeurs and others in connection with the driving and care of their cars. These several items together amount to over fortyseven million one hundred and seventy-one thousand pounds as the 'running expenses' of the motorists; and this added to the cost of new cars dealt with above gives us the enormous aggregate of close on seventy-three millions sterling as the amount of money spent on motoring annually by British motorists. And it may be pointed out that these figures take into account only the direct expenditure upon cars and their running, and take no account of the money expended indirectly in connection with motoring, such as, for instance, on suitable clothes for motoring, and in hotel and travelling expenses when touring about, which will certainly add several millions to the aggregate amount.

Now let us see how all this affects the country, and particularly the working-classes, and what is its influence on the question of employment. Motoring has been sneered at and upbraided by demagogue orators as 'the plaything of the idle rich;' but whatever it may have been seven or eight years ago, it is far from being that to-day;

for whilst, of course, motor-cars are in use universally by the rich, idle and otherwise—all rich people are not necessarily idle, you know-their usefulness is such that the large majority are used as aids to business as well as instruments of health and enjoyment. Even the poorest amongst us are motorists, as the ubiquitous motor-bus will carry us for a penny; and the extent to which this popular form of motoring is patronised may be gathered when I say that the London General Omnibus Company alone last year carried over five hundred million 'fares;' whilst a man need not be a capitalist or own a car to enjoy a drive in the country for pleasure and health so long as a luxurious taxi-cab may be hired for the afternoon for a few shillings. But even were the use of the car confined to the service only of the 'idle rich,' what better means of distributing their wealth could be found? The mere possession of wealth does no one any good, not even the possessor of it! It is the distribution of wealth—the 'turning over' of money—which provides pleasure for the distributor and employment and profit for those amongst whom it is distributed, and to cavil at a vehicle which is the means of distributing more than seventy millions annually is to display a dense ignorance of the first principles of economics. This distributing of wealth, this spending of money, affects, directly or indirectly, an enormous number of people; and a little examination will show that, quite apart from the benefits secured in health and pleasure, the saving of time and the facilitation of business, by those who own and use the cars, it is the industrial classes—the people as a whole -who get the real financial benefit from motoring and its industry, and neither the 'idle rich' nor the capitalist, great or small. It is true that the latter, in his capacity as a shareholder in motor companies, has of late been getting dividends ranging from 10 per cent. to 100 per cent.; but that is because of the quantity of cars which can now be turned out, and not because of any inordinate profit on the cars themselves; and I think I shall be able to show that labour gets the lion's share in this enormous distribution.

Let us analyse matters a little. The proportion of direct labour expended in the actual production of a car varies greatly according to the conditions under which the car is produced. It is lower where highly organised machineshops can be and are employed, as in the production of the standardised mechanical details of the chassis, and higher in regard to such parts as the body, where the standardisation with machine-tools is but little in evidence, and where, as a consequence, the bulk of the work is hand-work; but I do not think we shall be far out if we take the average of direct labour on the whole car at 20 per cent. This does not, however, by any means cover the entire labour cost to the manufacturer; it only covers the

labour directly employed on construction in the motor factories themselves.

Experience shows that '100 per cent. on labour' is a fair figure to allow for covering 'factory expenses,' which in themselves cover a large amount of labour, but not of course directly productive labour. There are, in addition to the items of rent, heating, lighting, power, rates and taxes, the wages of the unskilled helpers throughout the works, the salaries of the works manager and his staff of supervisors, of the clerical staff which deals with supplies and keeps check on the work, and of the highly skilled drawing-staff and expert testers of the finished car, so that a very large proportion of this 100 per cent. addition also represents labour, although of a different sort. And then it may be pointed out that the manufacturer's purchases are high in the way of material, and that his 'material' is not 'raw' material, but the finished and partly finished products of other trades. All the electrical fittings and accessories and attachments to a car are purchased universally in a finished state; whilst such items as frames and springs, castings and forgings, which form the bulk of the weighty parts of the car, as well as the leather and wood and metal panelling for the body, are all products of separate branches of industry. whole of these industries, it will be seen, are benefiting enormously by the prosperity of the motor trade; and not only do all these goods, in their turn, bear their own proportion of labour cost, but the industries correspondingly depend upon others for their own raw material. Smelters and steel producers for the raw material in steel and iron, the timber trade for the wood, the tanners, curriers, and leather-workers, the workers in the textile trades which weave the material for the upholstering, the paintmakers and varnishmakers, the rubber goods houses, the nail and screw makers, and makers of curled hair, with many others in a lesser degree, are all called upon to furnish material and supplies for the motor-car. And when all this is done and the machine is finished, there is still more labour required for its distribution and sale. is the large staff of clerks in the commercial departments of the different firms interested, managers, travellers, and salesmen, and thousands of depots and agencies all over the country, all employing more or less labour in taking care of, and demonstrating and selling, the cars entrusted to their charge; so that, without going further into details, it will be readily understood that, from first to last, at least 60 per cent. of the cost of a motor-car represents labour, the balance being not manufacturers' 'profit,' but rent, rates, taxes, fuel, lighting, heating, advertising, travelling expenses and carriage, office expenses, agents' commission, depreciation of machinery, buildings, and stock-which is oncost; and, lastly, the 'profit' which can be distributed in dividends, which may represent not more than some 10 or 15 per cent. of the whole; whilst even in the numerous items mentioned as making up the balance of 40 per cent, an appreciable amount is made up of labour, in one form or another.

Apart from the cars themselves, if we similarly analyse the other items comprising the motorist's expenditure, as already set out, we shall find that they all pay their quota to labour. Tire prices, for instance, probably cover a 40 per cent. proportion of wages to British workers, apart from their influence on labour abroad in the cotton and rubber plantations. Fuel and oil, whilst produced almost entirely abroad, call for work in home refineries, in canning and canmaking, and in handling and distributing, which will account for some 20 per cent. of their prices. The cost of repairs and renewals will be very largely made up of labour cost, and to take the proportion here at 50 per cent. will be assuredly under the mark; whilst even such items as garage expenses, licenses, and insurance mean the employment of a proportion of labour for helpers, collectors, and clerical staff. Taking all the heads of the motorist's expenditure, as enumerated in the early part of this article, I calculate that, of the aggregate sum expended on the purchase and running of their cars by British motorists, apart altogether from the beneficial effect upon foreign producing industries, such as those of cotton, rubber, and oil, and a proportion of wages paid to transport workers and to men in our mercantile marine service—a fleet of some two hundred oil-carrying ships is maintained by the oil industry alone, employing some seven thousand or eight thousand hands—the benefit, directly and indirectly, to British labour aggregates thirtyseven million five hundred and fifty thousand pounds. If we average the wages and salaries of all engaged in the motor trade and its allied industries as high as one hundred pounds per annum, this means that three hundred and seventy-five thousand five hundred people, directly or indirectly, obtain their employment, and about a million of the population of the British Isles their support, from motoring and its industry!

In conclusion, it may be noted that the above figures take no cognisance of the already important industries and pursuits of motor-boating and aviation, both of which owe their existence directly to the motor-car, and the industries in connection with which are really as much branches of the motor industry as is that of motor-cycle construction, which I have included. By the inclusion of these all of the above figures would be substantially increased. If these two items are considered, it is certain that, at the present rate of increase, the gross expenditure upon all branches of motoring will, before the present year is out, reach not far off the enormous annual figure of NINETY MILLIONS

STERLING!

AN AFFAIR BETWEEN THREE.

PART III.

THE doctor had come on the morning following Alvin's removal to Jack's cabin, and had pronounced his case to be one of no immediate danger; though he added that the lad was not, and never would be, in a condition to work safely in the wet and cold, and that good care must be taken of him until the critical stage was got through. He supplied Mitchell with medicines and instructions as to their use, saying that there was no need for his being taken to the hospital; for that matter, he was better off in the open air so long as he was kept warm and dry.

Jack was extremely pleased when he learned

that Alvin was to remain in camp.

'I think we can manage to take care of him all right, in case you'd rather be alone,' Mitchell had added when repeating the doctor's advice; 'the company will assume all responsibility.'

'The company be d—d!' roared Jack.
'I've started to take care of that kid, and I reckon I can keep it up for a while, anyway.
What would I want to be alone for?'

'Just as you say,' replied Mitchell mildly, and

turned into the mess-tent.

'By God!' muttered Jack to himself after Mitchell had gone, 'he did that on purpose to see what I'd say.'

From that time on life assumed an entirely different aspect for Alvin, as he received from Jack the gentleness, affection (though undemonstrative), and solicitude of a father. He was given the man's innermost confidences, in return for which he gave his own, and they had soon come into a relationship that required but few words of encouragement from either party.

Their mode of life was simple enough, for the camp operated on Sundays and weekdays alike, and Jack was always away to his breakfast at six, returning to get his gloves and rain-clothes before going to work at seven, and again for a wash before each meal, finally settling down to the enjoyment of his daily paper as soon as he had divested himself of his wet garments in the evening. During the reading of the paper Alvin would usually sit upon his stool by the stove and play his violin; though here he was never called upon to play popular airs. Jack cared for that type of music only when he was in town, where there were things to drink and bright lights and women; and, though he did not particularly appreciate music of a classical nature, he was pleased to be conscious of the playing of it during his reading. Then it cost him no mental effort to listen. The paper finished, they would play pedro until nine o'clock, when both parties retired for the night.

During the day, as soon as Alvin had, to

some extent, regained his health, he would first thoroughly sweep out the cabin and make the beds, attend to the drying of any wet clothes that had been brought in the night before, and wash every Monday morning. Jack had informed him from the beginning that none of this was necessary if he did not feel equal to it; but the lad was only too glad to do something for the big man who had so generously befriended him. The remainder of the time he strolled about in the timber or played his violin.

about in the timber or played his violin.

One morning, when he had been but a short time up after his illness, Mitchell, seeing him walking about, signalled him to come over to his cabin. Alvin's surprise was shown in his hesitancy to accept the invitation, for he knew that none of the loggers had ever seen the inside of that cabin unless they had taken occasion to do so in moving it about from one camp to another. Mitchell called him again, however, and he went without further hesitation.

Once within Mitchell's abode, Alvin felt that he had met the man for the first time. He had never before been within a room that bore the same atmosphere, and he felt as though he were treading upon sacred ground. The books awed him; the tasteful furniture, the rug on the floor, the burlap on the walls—all imbued the place with a distinctiveness that he had never before seen other than through a furniture-dealer's window, and this had a personal element that even the windows with their more gorgeous decorations had lacked.

For a time his host seemed buried in thought, taking no notice of the lad's embarrassment, though contemplating just which course he should follow. Then he turned to where his violin-case rested upon a shelf built especially for it, took out the instrument, unwrapped it carefully, as Alvin had done his own, and then tuned it, touching the strings so lightly that he could only hear the note plainly enough to get its pitch. Finally he turned to where the boy sat, and handing him the instrument, said, 'Play your Russian dance on this one'

Alvin took the instrument gingerly, for it seemed to him a part of this dwelling that he did not understand; but once his fingers closed upon the neck of the violin and the bow rested upon the strings—the soft Italian strings that he had never been able to afford—his musical nature overcame his reserve, and he found himself playing as he had never played before—playing an instrument that was a perfect human voice, rich, pure, deep, and strong, responding to every impulse, every passion and sentiment, of the dance he played. When he had finished the

piece he lowered the instrument to his lap and looked at it in silence, a tear stealing into

his eves.

Then Mitchell, without speaking, took the violin from the lad's unresisting hands, and played something which showed that he too was a musician; for his playing, though lacking the dash and fire of the boy's, was far more smoothly done, and with a technique that is acquired only with a great amount of practice. The boy understood him thoroughly now, and was no longer afraid. He had suddenly discovered a new friend in this man whom the others all deemed so cold and distant.

From that time on, until the camp closed down for the winter, life to Alvin was but one rose-garden of music; for, with the encouragement and instruction of Mitchell, he progressed as he had never before dreamt of doing. Furthermore, Mitchell had music—volumes of it—that was a treasure-house of the possibilities of his art. And besides all this, Mitchell was teaching him as much of harmony as the time would allow.

There was something about the life there in the mountains, in the fresh air, without the thought of having to slave through the wet and cold, that imbued the lad with a new energy,

a new mentality, and a new ambition.

One day in the latter part of November, when the weather, for a change, seemed to promise a dry afternoon, Alvin went forth with Mitchell on his daily rounds to see the men at work. It was crisp and cold, and they walked rapidly up the track, so that they might first visit the crew working at the end of the right-of-way. inspection of this crew required but a moment, and they passed on around the mountain, along the side of which the grade was to be constructed. Suddenly, as they put the timber between them and the whistling and puffing engine, and the crashing of the smaller trees as the fallen logs were jerked violently through them, there was a strange hush throughout the trees. When they had gone two or three hundred yards farther this hush had become an absolute silence. It was the first time Alvin had been clear beyond the logging on the mountain-side, the first time he had ever felt entirely cut off from the rest of the world.

The trees were standing so thickly as to form a maize-like wall on every side—a wall that gave way before their advance and closed in behind them, ever maintaining the same distance and the same appearance of solidity, while the branches above were so thick as to allow only glimpses of the sky. To see out into the distance was an impossibility.

There, within a mile of them, were at least five hundred human souls working to their utmost, driving thousands of horse-power in the engines—engines all vomiting smoke, barking with the violence of their effort, and whistling their changes of procedure; dragging sections of

huge fallen trees along the ground over stumps and through the second growth as though they were matches; either that or snapping heavy steel cables in the attempt. And yet not even a whisper of all this penetrated to where they stood; only the voice of a happy stream broke the primeval silence.

'Say, but it's quiet, ain't it?' murmured

Alvin, his voice hollow with awe.

Mitchell smiled, for it had been with the view that the lad might sense this that he had led him there. 'This is what I want you to feel in your music,' he explained—'this great big silence first of all, and then to notice the change as we go back to where the men are working. Some people cry for motives for composition; here is one of the greatest that ever existed, and yet none of them has ever found it. If you could put this into music, son, you'd be one of the greatest composers that ever lived.'

Alvin said nothing, for his mind was too full of the new idea, and he walked back to camp in a state of seeming coma, so engrossed was he with the thought of putting all those wonderful

things into his composition.

'Then,' continued the other, 'when you get that, there are the different seasons of the year. First, the frozen winter, with its bleak winds and its deep snow, until there is an almost inaudible song of the little streams coming into life underneath, the new movement as this running water takes the place of the moaning wind. Then the birds sing, and the flowers bloom, and the forest awakes with a new life altogether, in which the running water is all but entirely submerged by the volume of the greater sounds of summer, which in their turn die down amid the rustling of the dried and golden leaves of autumn, and are replaced once more by the rains and the streams, until the streams in turn are covered with ice and snow, and their voices become suffocated in the great white winter and the moaning of desolate winds. Through it all there is the voice of the great firs breathing above the smaller maples of the undergrowth, and that should be the basic movement of the entire motive. These great fir-trees, son, are the ruling spirits of these mountains, and we are cutting them down ruthlessly and sending them to the mills. That might be the motive of another piece. There are thousands of these motives in the timber if one could only hear them.

Alvin looked at his companion, and wondered how many would have believed the silent Mitchell capable of speaking thus.

Soon after this they again heard the donkeywhistles and the faller's call of

to warn whoever might be in danger of this

falling plume of the sky; for these plumes fall with the crash and echo of thunder, and an impact terrific enough to shake the earth for hundreds of feet. From that time Mitchell was busy, and

they said no more.

When they passed down by No. 2 side Jack saw the two together-saw the new light within the eyes of his protégé, and knew that Mitchell had touched a hidden depth within him that he, Jack, could never hope to reach, and into his heart there came the fear that perhaps Mitchell was taking his place in the affections of the lad; but if such was the case, Alvin showed no sign of it.

After the walk with Mitchell, Alvin practised more than ever, and with a deep concentration that sometimes worried his teacher as a possible harm to his health; but Mitchell also noticed that the lad was working toward a new end, disregarding the music that heretofore he had followed so closely, and striving toward expression of his own.

'I believe he'll make it yet,' thought Mitchell many times, as he watched and listened to this

new music coming into life.

One morning Alvin let himself into Mitchell's cabin—for he had been told to enter whenever he chose-and found him sitting at his writing-table with a new book in his hands.

Though he looked up and nodded when Alvin entered, Mitchell seemed immediately to forget his presence, so intent was he upon the inspection of the volume, turning every page carefully, though he did no more than scan it hurriedly.

Alvin did not long restrain his curiosity.

'Got a new book, eh?' he asked.

'Yes,' answered the other, and handed him the volume, which the lad found to bear under the title, in large letters of gold, the name of his friend and teacher. For a moment, however, he did not realise just what the name meant. for he had never dreamt that Mitchell was a writer of books. But slowly his different conjectures eliminated themselves, and he looked up into the eyes of the author with an expression of infinite wonder. Not that he had the slightest idea of what the subject-matter might bea treatise on philosophy or a shilling novel; the fact remained that Mitchell was the author of the book, one of those never before seen individuals whom he had always considered to be a species apart, a race especially adapted to the weaving of romance, for the only literature that Alvin had ever indulged in was that of a highly romantic order.

'You wrote it?' he finally voiced his aston-

ishment.

Mitchell nodded his head.

'Honest, now?' Alvin could not quite comprehend it all. 'When did you write it?'

'I've been writing it for the last twelve years,' replied Mitchell, smiling thoughtfully.

'Hu!' said the lad, for it seemed entirely possible that such a feat would require fully that amount of time. He appeared to be satisfied now. 'Ken I read it?'

'It would afford me the greatest pleasure,'

replied Mitchell with mock seriousness.
'Aw, g'wan!' replied the lad with a grin, for there was nothing that amused him more than these moments of humour in Mitchell. In another minute he was deeply engrossed in the perusal of the new book, having quite forgotten his errand to the cabin.

As Mitchell had said, the book had been in progress for a good part of twelve years, for he had commenced work for the Bridge Creek Company at the same time with Jack Duggan, and the idea of writing the book had been born shortly after. Though the company had offered to advance him to the main office in Portland, he had replied that the freedom of the life in the woods was worth more to him than an increase in salary. He felt that he needed the fresh air of the mountains; and though, to outward appearances, he seemed to evince little enough interest in the men of the camp or their activities, one of his main objects in remaining was to observe the characteristics of the loggers. As a class he liked them, and also some of the higher types personally, though he never allowed them to know it, on account of his business relationship with them. Being of a direct nature himself, he admired and appreciated it in others, and directness is one of the logger's principal characteristics.

The reason he had come there was primarily in order to gain a livelihood; for his father, although in life possessed of a moderate income, had left him at twenty with nothing more than a good education and a knowledge of music acquired by constant study. Music had been his stumbling-block; for it was with the idea of perfecting himself in the art that he had set to work in early youth, disregarding the necessity of making his way in the world by any other method, until he found himself alone and without means, his health broken from too close application, and an insufficient ability ever to be more than a mediocre violinist. difficulty was that he had not the original talent, and rather than attempt to eke out a precarious livelihood by teaching or in orchestral work, he had suddenly made up his mind to discard it all and go into the woods as a time-keeper, a position that required no more than a knowledge of figures, and which was not too difficult to obtain at the time.

After he had become established, and the company had learned of his willingness and steadiness, they allowed him a salary that provided for the gratification of his taste for

music and books and such luxuries as could be contained within the four walls of his small cabin, built so that it could be put upon a flat-car and moved about from one place to another as the progress of the logging demanded.

During the winter months, when the camp had closed down each year, he had taken advantage of the leisure time to further his work, and to become more intimately acquainted with the forest, as well as the local characters who were to supply him with material for his story.

Finally had come the long struggle to have his work accepted, for publishers were not quick to take up with an unknown author; but he had managed to place a piece here and a piece there, until at last the novel had been accepted, twelve years after his first attempt to express himself in written words.

It was not to be wondered at, then, that he appreciated the interest Alvin displayed in his book, for the lad was the only one in all those twelve long years to whom he had opened his emotional nature, and from whom in return he had accepted affection, admiration, and devotion second only to that which Alvin maintained for Jack. As Mitchell stood there watching the boy's eager perusal of the book, there passed through his mind the thought of how the matter was to end. True, he had made up his mind to leave the camp at the end of the season, and go for a time out into the world, where he hoped to find the companionship of people of his own temperament and enlightenment, perhaps also the companionship of women, that had so long been denied him. Then it occurred to him that the lad would also benefit by going into the world—not as he had been, a waif on the streets, but as a student striving to attain the height of his art; for Mitchell realised that Alvin was possessed of that which he lacked, the irresistible fire that is the foundation of great music.

'Look here, son!'

The boy looked up expectantly.

'I've been a-thinking that you and I would make a pretty good team to go out in the world together. What do you think about it?'

Alvin's wide-open eyes showed his lack of enlightenment on the subject; so Mitchell continued: 'It's just like this; you need to go where you can study music right—where you can study to be one of the biggest in the business. You may not think so now; but that is what you need, all the same—the stimulation of other big men, and there is no chance of your ever getting it here in the woods. Now this is the secret. I'm going to leave camp as soon as it shuts down this year, and I'm never coming back again that I know of,

unless it is to see how the old place looks. If you want to come too, we'll just pack up and go together like we were a pair of brothers, and that is all that this part of the country will ever know about us until they see your name at the head of the theatrical sheet announcing that you're going to give a concert in Portland—that's what they'll see, and then all these loggers'll remember that you used to play to them for nothing. Even the superintendent'll go around bragging that he was the one who gave you the job in the first place. How would that suit you?'

Dream of all dreams that the boy had visioned from infancy; dreams that had flooded through his mind when he had heard the playing of some artist whose position he prayed for; dreams of the long hours when he had attempted to put his pent-up soul into the unresponsive strings of his cheap violin; dreams of the long days of hunger and toil; dreams of the starlit nights when he had first come into the mountains; and, greater than all, the dreams since he had been able to practise without hindrance upon a violin that responded to his touch. And since Mitchell had opened his soul to all the possibilities of his art, it was the one great dream of them all, and this man was offering it to him in reality. His throat became congested and his voice came haltingly, so powerful was the emotion within him, and with every impulse of his body and mind he wanted to accept; but there was something that held him back—some thing that had never before interfered with his relationship with this man.

'I—I'd like to go, Mr Mitchell; but I gotta ask Jack about it first.'

It was then that Mitchell came fully to regret his procrastination in taking up the case of the lad; for he knew that therein he had allowed Jack to gain the first hold on his affection, and, through his affection, his sense of duty. He had forgotten Jack for the moment; but he realised his prior right to Alvin, and also realised with a pang that Jack was not likely to feel the importance of the lad's education. However, there was still in his mind the hope that he might be brought to see the necessity.

'Well, listen here, son,' Mitchell said thoughtfully; 'you tell Jack to-night what I've told you, and ask him what he thinks about it. If he doesn't like the idea—why, then, we won't say

anything more about it-eh?'

'All right,' assented Alvin, thoughtfully too; and though after a time he turned again to the perusal of the book, this thought of going out to study never left his mind for an instant until he was sitting with Jack that evening in their own cabin.

It was difficult for one of his conversational powers to bring the subject round so that it would appear in the right light, for he dimly realised that Jack would never be willing that he should leave, even though he might consent to his so doing. And, furthermore, Alvin knew that he would not leave unless Jack desired it. But still there was the chance, as well as the fact that he had promised Mitchell to bring the matter up, so he plunged into it the best way he knew.

Jack listened in silence to the entire explanation. When it was finished he said, 'And do

you want to go, kid?'

'Not unless I might be in the way here, not bein' able to work and all'—— Alvin wanted to give Jack ample opportunity to dismiss him if he chose to do so.

'You'd never be in the way here, kid, not so long as I'm here; but then there's something else'—— Jack paused, and was silent for a moment before he continued: 'What

do you think about this studyin' business? Do you think you ought to go away and learn to fiddle, or do you think you could get along here for a while longer—say two or three years maybe?'

Alvin knew what the man desired, though he had framed the question so that he, Alvin, could do as he pleased. It was a moment when the lad was called upon for all the strength of his character, and he was not then quite sure that he was right; but he loved the great giant of a man before him so much that he forced his dreams and his ambition out of his sight for the moment. He lied, so that he might make the man a little happier; and thus the matter was settled against Mitchell for all time, and Jack felt that at last he had accomplished a certain retribution.

THE LOSS OF THE GOLD-SHIP 'MADAGASCAR.'

IN an article on 'A Lost Treasure in the Great Southern Ocean' in our March issue (1914), the statement was made that of the fleet of goldships which carried the wealth of Australia to the Old Country only two failed to make their ports in safety—the General Grant and the Royal Charter. Another gold-ship, the Madagascar, the fate of which is shrouded in mystery, must be added to the list. Mr J. P. Christoe, of Mackay, North Queensland, writes to point this out, and encloses some interesting details.

The Madagascar, of over one thousand tons burden, one of Green's Blackwall liners, sailed from Melbourne in August 1853 for England, by way of the Horn, and had on board the largest shipment of gold that was ever sent in a ship before or since. She never reached her destination. Through the courtesy of Mr Christoe we are able to give the following details of what is known and conjectured as to her fate.

Mr Christoe's personal narrative, contributed to a local paper in Queensland, is as follows: 'I was one of the very last that ever saw the ship Madagascar on her voyage round the Horn, and am able to give a few particulars of her loss. In July 1853, while I was assayer and submanager of the Kapunda Mine in South Australia, I received a letter from my relatives, Henry Bath & Son, the great ore merchants, Swansea, South Wales, offering me the position of assayer under them, and asking me to leave for Swansea as soon as possible. Accordingly I left with my wife early in August, and took passage in one of the Aberdeen clippers from Port Adelaide in order to take passage from Melbourne to England in the Madagascar; and but for very light winds that delayed us I should have been in Melbourne in good time to take passage by the Madagascar.

'On taking our pilot on board in Hobson's Bay I asked him if the ship had sailed, and he replied, "Yes; she sailed early this morning, and we shall pass her in the afternoon."

'So I went to the captain, and asked him if he would put my wife and me on board, explaining my position to him. Our luggage was on deck, ready by the time the *Madagascar* hove in sight, when the pilot told me to tell the captain. The captain said, "No, I will not put you on board her, as the chances are she is a full ship; and as you may not be able to get away from Melbourne for a fortnight or more, and living in Melbourne is very expensive, my ship shall be your home for the time." Eventually we took passage in the auxiliary screw-ship Argo, going round the Horn, and reached Plymouth in fifty-five days.

'Some months afterwards I was in London, and noticed that the Madagascar had been posted at Lloyd's as some months overdue, and fears as to her safety were expressed. I left England again in 1858 for New South Wales, with a furnace-mason and two smelters, to erect furnaces at Brown's Creek, near Orange. I used to look carefully through the shipping notices in the Sydney Morning Herald, and not until 1863 or 1864 did I notice anything concerning the One of the steerage passengers Madagascar. on board that ship, when on the point of dying, sent for a Roman Catholic priest, and stated that he wanted to give publicity to the facts relating to the loss of the Madagascar. He said, "When some distance south of New Zealand the crew took possession of the ship, knowing that she had a most valuable consignment of gold on board. They put all the officers and saloon passengers into the ship's lifeboat, with a very scanty supply of food and water, and

gave the steerage passengers the choice to join with them or go in the boat. The ship was sailed for the southern portion of California, and run ashore at a convenient spot; and, after all the gold and everything else that the mutineers considered of value was taken out of her, she was set on fire." Subsequently one of the sailors was met in Melbourne by a man who knew him well, but the police were unable to secure him. For many years what remained of the *Madagascar* was a derelict in the South Pacific.'

Another possible explanation of her fate is given in Bannerman's Wrecks of Southern New Zealand. and in the current traditions that a mysterious treasure-laden ship was wrecked near Doughty Bay, on the west coast of Stewart Island. An old Maori still living alleges that he saw a vessel wrecked in a storm near Doughty Bay at the When more definite details period indicated. are asked he replies, 'I will say where in my will. I will not tell.' Another man is reported to have seen the Madagascar in bad weather off Stewart Island. Other old hands still believe in the tradition, and maintain that at Stewart Island there lies a treasure-ship as rich in gold as the General Grant, lost at the Auckland Islands in 1866. So far as Lloyd's is concerned, nothing official has been set down as to the Madagascar's fate. Detective Tuckwell, who arrested a highwayman on board the vessel before she sailed, gives a picture of the scene on board:

'The Madagascar, one of Green's Blackwall liners, a frigate-built, square-rigged ship of over one thousand tons, lay snug at her moorings in Hobson's Bay, with hatches battened down. Some six hundred passengers were on board, and there was a heavy freight of gold-dust in her lazaret. The scene that revealed itself baffled all description, and will for ever remain fresh in my memory. Drunkenness, fighting, swearing; men, women, and children in a state of semi-nudity, howling like wild animals. The crew was composed of men who were the most villainous and motley that ever signed articles on a capstan-head. Some of the passengers were a rough lot, escaped convicts of the worst type. A pang of horror shot through me as the thought rose to my brain: should evil overtake the Madagascar, what would become of the women and the young girls, and the better class of passengers? Several days later the ship slipped her moorings and proceeded down the bay in the charge of a pilot. She passed safely through the Rip, and after getting an offing of about seven miles dropped the pilot into his dingy. From that moment to the present she has never been seen or heard of.

Another solution of the mystery of her fate is given, which differs somewhat from that told by Mr Christoe. It occurs in Mr John Sadlier's Recollections of a Police Officer, in which appears a dying confession by a woman in New Zealand to a clergyman. This confession states that the

Madagascar was robbed, set on fire, and scuttled off the coast of South America. The captain and officers and some of the passengers were murdered by a mutinous crew, and six of those on board escaped, but afterwards succumbed to fever.

THE GATES OF THE BORDERLAND.

OH for a day on the Border hills,
Wi' their brackens waving high!
Where the moorcock whirs, and the plover trills,
And the bleating flocks reply;
To gaze afar o'er the purple heath
Or away to the Cheviots grand,
Where the warders watched in the days of old,
And the beacons blazed, and the slogan rolled,
Where the brave and the valiant met the bold,
At the Gates of the Borderland.

There's a valorsome spell on the Border braes
That nane but her children ken,
For the Border mithers crooned the lays
That mettled the Border men.
As visions rise on the bare hillsides,
And the flames of romance are fanned,
I can see the reivers ride the swire,
And the flashing steel on a field of fire,
Or a Douglas stand with a tiger's ire,
At the Gates of the Borderland.

There's a dool and a wae in the Border glens,
And their sabbin' bodes an omen;
There's a lanesome licht in the Dowie Dens
Or Kilmeny's haunted gloamin'.
But I wadna turn, though I dree my weird,
Or the ferlie waved her wand,
And beckoned me doon by the Eildon tree
Where the Queen and the Rhymer rode the lea,
And passed to their deathless mysterie
Through the Gates of the Borderland.

There's a glorious peace in the Border howmes,
And a harp on her silver river;
And saft is the tongue of the maid who sang
The songs that shall live for ever.
So memory dwells on the 'leal and true'
Who peopled the strath and the strand;
In the auld kirkyaird their rest is aweet,
Wi' the stars lookin' doon on the lown retreat,
But their spirit lives in the hearts that beat
At the Gates of the Borderland.

AUSTRIA'S REBEL ARMY.

By JEAN VICTOR BATES.

O you see these troops?' said the Ober-'They cannot speak our lanlieutenant. guage. They dislike us. They will one day I hate them!' betray us.

The Oberlieutenant was an Austrian. looked and spoke as, long ago, a Roman centurion might have looked and spoken when reviewing a troop of barbarians. The barbarians the Oberlieutenant of Imperial Austria was contemplating with such scorn were the two Croatian regiments stationed last January in the garrison town of

Karlovac, in Croatia.

Another day I went to see a kinema show in this same Croatian town. I was accompanied by an Austrian officer of the Ninety-seventh Regiment of infantry, who, of course, wore the imperial uniform. The small hall was packed to suffocation with townspeople, all Serbo-Croats and Croats proper. Two empty chairs attracted us, and thither we threaded our way amongst a gathering decidedly sulky, to put it mildly. sulkiness was due to the presence of the Austrian. Just as I was about to sit down on one of the seats it was roughly wrenched away, and a Croat hissed furiously, 'These chairs are not for such as you!' Evidently the speaker mistook me for an Austrian. Whereupon a tremendous row seemed unavoidable. Infuriated at the insult to his friend and to his own uniform, the officer drew his sword—as the Austrian law permits officers to do when insulted—and the offending Croat would in all probability have been stabbed, and the crowd would have rushed upon the Austrian, but for my protestations and entreaties; for I knew only too well that such rows invariably terminate fatally for one or other of the disputants.

With extreme difficulty I coaxed the irate soldier of the Empire from the building, and his subsequent remarks ended in the strange, and it would now seem prophetic, declaration: 'You may take it from me, fräulein, what you have seen to-day is one of the beginnings of the greatest war the world will ever see. It will come soon, sooner than people think, and it will change the map of Europe.' It has come within seven months, and with it has come that peril to Austria which the Oberlieutenant foresaw, taking the shape of insurrection, mutiny, wholesale

imprisonments, executions en masse. No. 204.-Vol. IV.

What is the position? At the bidding of their Austrian rulers—who hate, distrust, scorn, and bully them—those Croatian regiments are under orders to slaughter their kinsfolk outside the Austrian dominions. Is it surprising if they have preferred death, as there is good reason for

supposing in many cases that they have?

The regiments wearing the Austro-Hungarian uniform recruited in Croatia, Slavonia, Dalmatia, Bosnia, Herzegovina, and among the Slovenian communities are composed of pure Slavs, who do not and will not speak or understand ε single word of German beyond the necessary words of command. In these regiments instruction must be given in the Serbo-Croatian language. officers are also, generally speaking, Slav. As Slavonic regiments they have been scoffed at by both Austrian and Hungarian regiments, and by their fellow-Slavs in the monarchy as men who deign to wear the oppressor's uniform. They are also derided by their Serb kinsmen as renegades. How often have I not heard Slav-Austrian or Slav-Hungarian conscripts jeered at by Serbo-Croats of both Austria-Hungary and Servia: 'Huh! see these little fools; they are the pet lambs of the enemy; they disgrace their Slav And almost always a quarrel ensues.

In the days of the world's youth, on the plains of Central Asia, the twin tribes Serb and Croat pitched their tents together. When that first great Slavonic camp was struck, and the innumerable Slav clans marched westward into Europe, some going north, some south, the Serbs and

Croats remained together.

In the beginning of the seventh century, when the northern provinces of the eastern Roman Empire were overrun by the Avars, the Byzantine Emperor Heraclius invited into his dominions certain Slavonic tribes who were then camping on the north bank of the Danube, having crossed the Carpathian Mountains. Serbs and Croats accepted his invitation to drive out the Avars and retain the lands then harried by them. The Croats arrived first, to be closely followed by their Servian brethren. The Serbs appropriated the district lying between the river Timok and the Adriatic and Antivari; the Croats established themselves on the north and west. Hence came it that on their conversion to Christianity the Serbs fell under the

[All Rights Reserved.]

OCTOBER 24, 1914.

jurisdiction of Byzantium, the Croats under that of Rome. Hence, too, came it that the Serbs were overpowered by the Turks, while the Croats were drawn under the influence of the Teutons and Magyars. But they remain twin tribes to-day in spite of everything, speaking the same tongue, possessed of the same characteristics, the same ideas. Side by side it has been their lot to endure oppression and scorn. Side by side they have fought bravely to uphold their Slavonic honour. Side by side they have been for centuries hewers of wood and drawers of water for Mussulmans, Teutons, and Magyars. If to-day they are less advanced than many other nations of Europe, we must remember how they have been oppressed. Their faults are the faults of their masters.

When Serb meets Croat to-day they exchange a curious greeting: 'Nada danicha!' Nada in Slavonic means 'hope,' danicha means 'the sunrise!' Nothing has been able to rob either Austrian Slavs or Serbs of their 'Nada danicha,' their hope of the sunrise of S vonic freedom. Does it not seem that the daw... of the Slavonic 'Nada danicha' is already crimsoning the Near East!

If Vienna had realised sooner her imperial mission, if her statesmen had reconciled the movement for Croato-Serb unity with the needs of Austrian patrictism, Austria would not now stand in such terrible risk of imperial dissolution. Instead of doing this, the Dual Monarchy has striven to crush out Slavonic national sentiment within her frontiers. Austria-Hungary has insulted, abused, crushed her Slav subjects, and to-day she stands between the devil and the deep sea—the devil, which is Germany's interested support, and the deep sea of the whole united Slav race.

The dead Franz Ferdinand recognised the necessity of coming to terms with his Slavonic peoples. His idea was to form a Triune Empire in place of the present Dual Monarchy. He wished to make himself not only the ruler but also the friend of his Slav subjects. The one lament in the dominions of the Hapsburgs to-day is, 'Had Franz Ferdinand but lived!' The one regret is that Austrian statesmen were blind enough to ignore Slavonic rights under the Hapsburg Crown; and the greatest hatred is secretly felt for Germany, who has brought about this terrible war.

AN AFFAIR BETWEEN THREE.

PART IV.

IT was the night of the last day of the season, and every man in the camp was prepared to take the down-train on the following morning—that is to say, all except the two who were to remain as camp watchmen. It was also but two days before Christmas, and even in that camp, where there were few women and fewer children, away from all the shopping and bustle of the cities, away from all tworldly intercourse with the exception of the daily mail, there was the fullest spirit of the holiday season. It was the dissolution of the routine of work, and the transformation of every man from a labourer into a capitalist—for but a few days, it is true, but nevertheless a capitalist.

In Jack's cabin were assembled all his crew to take farewell of the season and to discuss the possibilities of being together once more in the spring. Gathered about the stove in the front part of the small building, they laughed and talked in the best of good-humour, conning over their experiences of this and other camps, and laying their individual and collective plans for the Christmas festivities, and laughing at Jack for his decision to remain in the camp through the winter as watchman.

In the back of the cabin, huddled up on his bed in the corner, sat Alvin, as usual his violin in his hands—Mitchell's violin, that from then on was to be his own.

Mitchell, wishing to do all that he could for

the lad, and perhaps wishing to feel that he had left at least one spot of goodwill behind him in a camp, with only his ministrations to the sick or the injured to form a human link in his relationship with all those men, had given him the one possession he held most dear. At the same time he admonished him never to relax in his practice, and never to cease planning for something better and bigger that must come to him in time; for Mitchell had the faith that it would come.

Alvin was silent and downcast that night over the companionship he was to lose—the only person in camp who understood the artistic side of his nature—and his sadness was in turn communicated to his music.

It was an original theme that he used for his self-expression, and so strong became the emotion that gradually the rough visitors lowered their voices to listen. By degrees there seemed to come to the lad the power to express this theme that Mitchell had suggested. It flooded his being with a great new light, so that he forgot the men in the room with him, forgot the limitations of the room itself, forgot the atmosphere, forgot all but the great outdoors with its wondrous procession of seasons marching rhythmically through it; and so he played—played as he had never played before, and as those men would never hear him play again. In a small way they understood the motive,

for it was so much a part of their lives that they sensed the corresponding mystery of it all.

But more than the rest did Jack realise the force of it, and realise, too, that in some way it was due to the lad's emotion of the moment rather than something that had been there before, and he wondered whether he might not be a little selfish in keeping him there to himself. This music had caused Jack vaguely to guess that there might be a greater destiny waiting for Alvin, a destiny that he, Jack, did not understand. He sat in moody silence, pondering a question that would not be forced out of his mind.

Finally Alvin went to bed, reminding Jack that it was long after his own bedtime; but his attention was merely acknowledged by a grunt, and he thought it better to say no more. Some time later Jack got up and left the cabin.

Mitchell was just in the act of packing the last box of his belongings before retiring for the night. It had not been a pleasant evening for him, though his heart had warmed at Alvin's appreciation of his gift, and he had welcomed the call from the superintendent, who went so far as to break his time-worn habit of indifference and ask whether an increase of salary would be an inducement for him to return in the spring. Mitchell was lonely, with that loneliness of a man without a home, without family or friends to brighten his course. He was at sea, and knew not which way to steer his craft. He was clearing his anchorage of the past twelve years (practically his entire manhood) for places strange and unknown. There was but one companion—work —that had been faithful to him and would probably continue with him now; but where was he to set out first? He did not even know what would be the forwarding address for his mail. A thousand times he had thought, if he could only have taken the boy with him; but in his self-absorption he had allowed another man to establish a prior right, and so could not now complain of his lot.

When Jack opened the door Mitchell looked up in surprise, for this was the last man he had expected to see, as he knew that Jack was begging the question of the boy's future. He had guessed it from the avoidance of the other's eyes; but now Jack plunged into that very question.

question.
'Look here, Mite

'Look here, Mitchell, I want to talk to you straight, and I want you to answer me the same way.'

'All right, Jack,' replied the other quietly; 'fire away.'

Jack noticed an unusual quality of friendliness in his voice, and wondered. He continued: 'A while back here you asked the kid if he didn't want to go with you when you left, and study his fiddle so that he could get up to the

top, and the kid wouldn't go because I didn't want him to. Is that right?'

'Quite correct,' said Mitchell.

'But you still think he ought to go, don't you?'

'Yes, I do.'

'Well, so do I, Mitch—so do I,' Jack said, his voice trailing away into the silence of his recollection of a few hours before. Then he resumed: 'If you could have heard him play to-night! I was never quite sure until I heard him play to-night. He told me he wanted to go, told it with that fiddle o' his as plain as he could ha' done with his voice. Yes'—the big man nodded his head slowly—'he ought to go all right; but then what's to become of me, Mitch?'

Mitchell remained silent.

And the other went on: 'It ain't like it used to be, or I wouldn't mind. I've grown to like the kid almost like he was a woman; and if he went, I'd be left here in the camp, or go out for a couple of years until my money was gone, and then have to come back, anyway?' His voice raised the latter part of the sentence into a question.

Mitchell pursed his lips in silent thought for some time, his long fingers drumming on the table; then he looked at Jack fairly, and replied, 'There ought to be some way out of it, Jack. Suppose you had a small place right close to a town, say like Los Angeles, where you could do some farming or something of that nature, while the boy goes into the town for his music and perhaps a little schooling?'

'But they say that land is pretty high down there. Do you reckon my little stack would cover enough to amount to anything?'

'I could let you have a little more if you should need it.'

Jack looked up at the other man quickly, so that he might catch the extent of his meaning. He had felt that he could never understand such a man; but since there had been so close a companionship between him and Alvin, Jack had come to think that perhaps he might not be so distant as he seemed.

'Say, Mitch, what would you say to a partnership deal of some kind?' Jack burst forth suddenly.

Mitchell looked at him with a slow smile creeping to his lips. 'We might figure out something of the kind, Jack, after we've looked

around for a bit.'

'By God!'—Jack's great fist came down on the table with such force that it very nearly drove the legs through the floor—'we'll all start out together in the morning.' His eyes shone with the new idea.

'That suits me, Jack,' replied Mitchell; 'there'll be three of us starting together in the morning.' He held out his hand, and the other grasped it fervently, shaking it violently with all the strength of his arm and shoulder,

until he turned out of the door and hurried through the night towards his own cabin, within which he shook the helpless Alvin into consciousness, and told him the good news.

Mitchell smiled now as he completed his

packing, and wondered the while why big men were ever prone to be slow-witted.

'These loggers are like children!' he mused as he went to sleep.

THE END.

RUSSIAN EPISODES.

By Professor E. H. PARKER.

A SAIL among the Esthonian Islands gives pleasant variety to the more lively junketings of St Petersburg, and the local steamers which ply between Reval, Hapsal, Arensborg, and Riga are not at all uncomfortable, besides being cheap and very fairly equipped gastronomically. First-class passengers must always pay for their dinners in advance, when places are booked; but the rest of the meals are \hat{a} la carte, at any hour of the day. Esthonian is a variety of Finnish, and, though not the same, yet comprehensible to a Finn. On only two of the islands, Worms and Nargen, is Swedish still spoken. Russia has decided to create a new naval station at Nargen, so as to relieve the cramped situation at Reval, where there were at least fifty men-of-war when we visited it. Lettish is spoken at Riga, the main source of which is undoubtedly Slav; but it is also a jumble of Swedish, Finnish, Russian, and other borrowings. Both Esthonian and Lettish newspapers use the German or Gothic letters in printing; and these are also commonly used in street signs, which are always accompanied by Russian and German versions. Except the better classes, few speak either Russian or German well, and a foreigner consequently often finds himself as inarticulate as an Englishman does in Anglesea or in Malta. This confusion of tongues makes it difficult at times to ascertain exact facts about train movements, and the following rather amusing episode will show how we spent half a day in the quest of clarity.

We went to the station at Riga to make precise inquiries how we could best visit the historical city of Pskov without passing a night in the dubious hotels. Every one we addressed in Russian said he only spoke bad German, and every one we addressed in German only spoke bad Russian. At last one friendly adviser pointed to a group of officials, and said, 'The gendarme there will know.' The particular individual of this more or less uniformed group who interested himself in us most was a 'Small Russian' from Kiev, who persisted in talking execrable German. As we persisted (in equally execrable Russian) in trying to nail his volubility down to a precise point, he said, 'Come and have a glass of beer.' With true Russian hospitality of the reckless and excitable type, he plied us with glass after glass of beer, besides lemonade and cakes for the lady of the party, who could not 'toe the line' in good Riga beer. It then appeared that he was not the gendarme, nor a railway official of any kind, but an employé in the Governor's office, who had been seeing a friend off by train; he had the rank of ensign or sub-lieutenant (all our languages and dictionaries failed to settle exactly what rank); his mother was 'in service;' his father (dead) had been a railway employé; and he himself was self-educated. As each of these facts was elicited he got up and shook hands chaleureusement with us, and wanted to order more beer. We thought we really must do something in return for this overwhelming kindness, which, moreover, threatened to last the evening out, so we asked him to supper and a concert entertainment at the Hagensberger Park on the other side of the Dwina. This was to be punctually at eight, and it was clearly arranged that he should meet us at a certain spot in the pleasure-garden, and tell the waiter to secure a table. All this took more time, for Hagensberger was an obstinate obstacle word, as the Russians persist in using the hard g to express the German and our h, and accordingly a good Small Russian can only say Gaggensberger. With further warm protests of fidelity and more handshaking and hand-kissing (I was afraid face-kissing would follow), we at last got away.

Punctually at eight we turned up at the Park, but no Khleb Ivanovitch! 'Khleb' means 'bread,' and sounds like Hlep, with a strong Scots aspirate. During our conversation I had expressed surprise that his parents should have chosen so strange a name for him, but he assured me that it was an exceedingly common Russian personal name. Finally we had dinner or supper alone, having told the waiters to keep a sharp lookout for a Russian gentleman whose name and rank were unknown to us, but who, either alone or with his wife—a point not made clear during our beery and polyglottic discourseappeared to be a tchinovnik of the petty order. Meanwhile a well-dressed, fat old lady of fifty or sixty took a supper-table next to ours, and attracted our attention by the capricious orders she gave to the waiters. At last we were astonished to see her wind up the repast with iced champagne; still further astonished to see her pour out a glass for the waiter, who solemnly and respectfully 'touched glasses,' and then retired to drink it in the pantry; then another waiter; then all the waiters; then two well-

dressed 'buck niggers' with a strong Yankee accent; finally, the managers of the adjoining theatre and the supper-room. All this puzzled us very much, especially as foreign wines are excessively dear in Russia, and she must have paid at least five pounds for her dinner. It became clear as the drinking went on that she was tipsy; she began to weep for her sick husband, the buck niggers meanwhile laughing uproariously, the managers conversing affably, and the waiters gravely accepting their repeated pledges to drink. The mystery was almost as great as that of Bread the son of John's absence.

One intelligent waiter, however, could speak clear German, and he confidentially informed us that she came from the Ministerium, was exceedingly rich, and frequently patronised the Hagensberger 'show.' The two coloured men were humoristen connected with the opérette, and (I suppose, for we did not go beyond the supper-room) did comic banjo 'turns.' Ministerium seemed to mean the Governor's residence, and I began to wonder whether the old lady could be Bread Ivanovitch's wife or mother. I decided to write a note to him and explain that we had faithfully kept our appointment. I asked the scholarly waiter how to say 'Vei, the Governor,' in Russian; this led to his reading and correcting my letter. He explained that Khleb, 'bread,' was absurd; it ought to be Lef, 'a lion;' and then (by a process of nomenclatural laws I could not follow) 'Michailovitch' ought to be added to 'Ivanovitch.' Finally the right good and perfected address appeared-'Lion, the son of John, the son of Michael, native of Kiev, at the Governor's, Riga.' What will happen there I shudder to think, but he had told me he was a reservist or volunteer, and that he might be mobilised that very night to go and fight on behalf of Servia.

Whilst all these things were passing through my brain I saw a man with a white cap looking eagerly about the garden. 'Ha!' I said to myself, 'here he is at last.' I rushed out, followed the officer, and cried out in my best Russian, 'Bread, the son of Ivan, is that you? It is ten o'clock!' The officer turned sharply round and gave me a withering look, but I suppose he simply muttered to himself, 'Only another mad Englishman!' By this time I felt mentally exhausted and thoroughly sick of the whole subject—Bread, Lion, Kiev, and the Ministerium. We had meanwhile supped well and cheaply; we had done our duty to the reservist, and had failed; better luck with our

languages next time.

The approach to Novgorod, coming by steamer in the evening from across Lake Ilmen, is as enchanting a spectacle as the world affords anywhere. It was the near end of twilight, and the moon was just rising above the horizon beyond the brilliantly white monastery of St George, which occupies a strikingly picturesque site on the left bank of the river Volkhovo, about two miles below the ancient city. On the other side of the river, just opposite the monastery, stood out the pretty village whose portentously long name I will spare the reader; in front were the crenellated walls of the sixhundred-year-old Kremlin, the Cathedral, the Archbishop's palace, and the handsome iron bridge connecting the St Sophia part of the town with the business portion, where in the Middle Ages the Germans and the Pskov traders had their factories. In those times Russia was not yet a nation, and the trading republics or guilds of Moscow, Kiev, Vladimir, Pskov, and Novgorod were only beginning to throw off the last traces of the Tartar yoke and to conceive the idea of a real nationality.

I write these lines in a railway waiting-room at Volkhovo town, where we are all beginning to suffer in our own persons the horrors of war. The steamer, after a four hours' voyage, is supposed to catch the half-past six express train for St Petersburg, where we were fondly hoping to spend a pleasant midnight in reading our letters; but on arrival at the station, which is only a few yards above the steamer wharf, we were horrified to hear that on account of the mobilisation no train would arrive until two o'clock in the morning, so we are kicking our heels as best we can in a crowded waiting-room, surrounded by weeping mothers and squalling babies who will not consent to go to sleep on any terms.

Already at Pskov, three days ago, we had observed signs of military movements. On arrival at the salt water and mud baths of Staraya Russa (a fashionable kusort at the southern end of Lake Ilmen) we were still more struck with the display of military activity and popular excitement. At both places people were forming queues in the evenings in order to secure a copy of the St Petersburg newspaper. The six hours' voyage from Staraya Russa, down the river Polist, across Lake Ilmen, and then into the Volkhovo can be performed by luxuriously equipped and exceedingly cheap steamer, which is infinitely preferable to rail. The lake just mentioned looks a mere speck on the huge map of Russia; it will hardly be believed that you are 'out of sight of land' for an hour or so, and that the weather can be (and was that day) so rough that a few passengers felt seasick even on board a twelve-hundred-ton steamer. At Novgorod we put up at Solovyoff's hotel, a quaint old place, where the bed-linen, towels, pillow-cases, &c. have to be specially ordered, and where the aggravating washing-tap is still in use instead of a basin and jug. During the night I heard continuous hurrans in the distance, and instinctively felt it must be reservists or selected troops going off to the frontier on mobilisation. In the morning (1st August) we set out on foot to explore, and were surprised, on crossing the bridge from the trade quarter to the

Cathedral side, to meet so many weeping women. In the open square of St Sophia there were hundreds, if not thousands, of horses assembled; at first I thought it was a horse-fair day, but it turned out that there were groups of officers purchasing remounts from the country-folk, and one woman told me she had already sold four horses, besides sending two of her sons to the war. Both there and here at Volkhovo the war is frequently spoken of as having already broken out between Germany and Russia; Austria-Hungary seems to take a second place in men's minds; the true enemy is instinctively felt to be the Germans; whilst Servia, whatever her faults, is a brother Slav whom the Russians are determined to protect from annihilation at all costs. As the refreshment-room of the little railway station closed at nine o'clock, I thought I would stroll out and buy a few eatables for the dismal night train. Just outside the station I noticed a crowd of ordinary peasants, labourers, and porters standing with their caps off around a man who was holding forth from a box or barrel. So far as my defective Russian would allow me to follow him, he seemed to be preaching the greatness of Holy Russia, the infamous treachery of Germany and Austria, and the immediate necessity for all Slavs to hold together or perish together. At the close of the discourse, to which I also listened bareheaded, the men all hurrahed vigorously in English style, and threw their caps into the air. The women forming an outside fringe either dried up their tears or recommenced weeping, according to the state of their feelings. Then a procession was formed, a hymn of some kind was struck up in perfect tune and harmony, and the men marched through the straggling There was absolutely no rowdyism or horseplay; the people were plainly deeply and solemnly moved; they were perfectly quiet and courteous, and never so much as turned to look at the strolling passenger in their midst. newspapers arriving to-day from the capital give quite a long list of cities where mobilisation is going on, and there seems to be much the same strong national feeling everywhere. Certainly there can be no comparison between the contemptuous indifference shown during the Japanese war and the profound enthusiasm kindled by the hasty and cynical anti-Slav action of Austria, who seems to be universally considered the mere cat's-paw of insincere and menacing Germany. The Vaterland will have all its work cut out for it if it attempts to crush the spirit of the generous Russian nation.

Noticing another steamer moored alongside a wharf on the south side of the bridge, I ascertained that it was the regular passenger-steamer that went down the Volkhovo to Lake Ladoga. She left at seven o'clock, and if we had only been prompt enough we might have travelled by this steamer viá Schlüsselburg to St Petersburg.

arriving some time to-morrow, and escaping this wretched eight hours' wait with inadequate food, air, and light. During the intervals between the processions and preachings I succeeded in buying at the primitive tea-shops, druggists', and groceries of Volkhovo a few sheets of writing-paper, a small electric lamp, some hard-boiled eggs, and a pound or so of mixed biscuits of very fair quality. I may parenthetically remark here that part of my little store consists of a quarter of a pound of marmalad, a sort of dried sugary fruit, and that the Russians make an excellent strawberry and raspberry jam that goes by the name of varenyé, and is equal to our very best. The Germans call it Saft, and it is much used for sweet omelets.

As I approach the end of this article I find I am the only male left in the waiting-room; all the babies are asleep at last; mothers, rich and poor, some still weeping—either for the plight of their babies or the loss of their sons—are snoring all around me. What has become of the men I cannot say. There is no means of drinking, and card-playing is not allowed on Government transport premises. Fortunately I command a window, and no one has yet asked me to close the sly ventilator I have arranged by a cunning manipulation of the double frame.

So little is generally known of the 'generation' of Russia that it should be explained how this Volkhovo River—much bigger than any river in England—is responsible for the modern Empire. The old Slav trading republics were wedged in between rising Sweden, rising Prussia, Poland, and the decaying Greek Empire; they were practically unknown to the rest of the world, and always squabbling together. At last, as the story goes, Novgorod sent word to the Varang (perhaps the same as Frank) Rurik, head of the Rus tribe of Vikings, saying that the republics were broad and fair, but that they never knew how to maintain order. Rurik and his two brothers came, and ever since then (862) the Norman house of Rurik, and indirectly its offshoot the house of Romanoff, have given a name as well as a dynasty to "Rus-sia." It appears to have been centuries before these rude Vikings reached Lake Ladoga through Finland; then a further long time before it was discovered that they could sail up the Volkhovo to Novgorod. Neither they nor the Tartars ever appear to have got as far as Pskov; but in Pskov Cathedral I was shown an ancient picture of (apparently) Ivan III. and the Tartars making a joint attack upon Pskov. Anyway, I have now inspected the general 'lay' of the land, and it became plain how judicious the genius of Peter was when he selected St Petersburg as his capital. The key to the whole situation is how to command the exits and inlets of the lakes. The Volkhovo between the place of that name and Novgorod is a richly cultivated and beautiful river valley.

AN INCOMPLETE TIMON.

By WALTER RICHARDS.

HUGH FENTON sat at his office table surrounded with voluminous papers of the legal variety. He was a conveyancer by profession, and generally acknowledged to have an uncommonly lucrative practice despite the changes and chances affecting that particular branch of law; but this was explained by the envious as due to the fact that he cared for nothing else, and that work was to him what wife and children and hobbies and relaxation, and the joys of life generally, are to other men. Incidentally they admitted that he was a first-rate lawyer and consummate draughtsman. For the rest, he was declared to be as rich as Crossus apart from his profession, as hard as the nether millstone, and about as genial and companionable as the Veiled Prophet.

But just now Fenton was not looking at the formidable abstract open before him, but was leaning back in his chair gazing into vacancy, which as he looked became alive with scenes and persons he had told himself a thousand times were wiped from his memory. He wished, as their insistence grew, that he had not read that

paragraph in the morning paper:

'Rumour was busy in the afternoon with regard to an alleged sensational development in the affairs of the Pioneer Camp Irrigation Syndicate, of which Mr Alfred Brentwood is the managing director. If there is any truth in the report, allegations which seriously affect a wellknown financial firm may be expected to form

the subject of legal proceedings.'

But he had read it, and ever since the name of Brentwood had been dinning itself into his ears and mind. Brentwood! the man who had married Maud Peyton, and by so doing had made life the dreary, bitter thing Fenton had found it! How he hated the man! ostentatious, overbearing, unscrupulous—as his conduct with regard to the marriage had shown—selfish, utterly incapable of care or thought for any one but himself. Though Fenton felt he could never forgive Maud, yet he sometimes almost pitied her yoked to such a brute. And now it seemed, reading between the lines of that paragraph in the 'City Intelligence,' that Nemesis had overtaken his enemy at last. Well, he was glad of it—d—n him! glad if, as was hinted, he should be prosecuted and ruined; gl-- Curse this memory-filled blank before him! Why-when he wanted to gloat and triumph over the thought of Brentwood in the dock, ruined and dishonoured—should the face of Maud Peyton obtrude itself, laughing and bright as in the happy old days; pale and tearful as when he last saw her, and replied with a bitter sneer to her pitiful regret for the grief she was causing him; and the accents of her wailing, earnest cry as he flung from the room, 'Oh Hugh, Hugh! and I so thought you would always be my friend!' ring in his ears?

A knock at the door recalled Fenton to himself. 'Come in,' he said, hastily busying himself

with his papers.
'Mr Westbury would like to see you if you

are disengaged, sir.'

Fenton's first impulse was to refuse, and probably if it had been any one else he would have done so. But Westbury occupied a unique position. As Fenton told himself, with cynical deprecation, he was his one weakness. He had been an old schoolfellow, and forgotten as old schoolfellows often are, till one night, some three years before, Fenton had found him lying, nearly dead with illness and starvation, on a bench in the Park. He had taken care of him, had him nursed back to comparative health, and, when he was well enough, listened to his story. What this was does not matter; the upshot of it all was that Fenton found on his hands a very charming, thoroughbred man, evidently with not long to live, entirely friendless, and absolutely destitute, but with the delusion that he was very wealthy, though temporarily deprived of his property owing to some quite unintelligible legal proceedings. And from that time Westbury had found himself—'thanks to my friend Fenton's legal skill'-in receipt of a moderate weekly income, and Fenton's clerks got accustomed to the frequent visits of a well-dressed, pleasantspoken gentleman, whose evident ill-health and occasional allusions to his 'property' favoured the view, which their master encouraged, that he came in connection with the drawing up of a will of an unusually complicated nature.

'I hope I'm not interrupting you, Fenton?'
'Not a bit, my dear fellow,' with an inward

groan. 'Sit down. How are you feeling to-day?' 'Not up to very much. I'm sometimes afraid, do you know, that I sha'n't last out till the settlement; extraordinary the time the courts take to give a decision, especially as there's no real question at issue!

'I can quite understand your annoyance,' said Fenton gravely; 'but, you see, it's necessary to guard against the possibility of any claim, however unfounded, being made in the future.

'Yes, of course, that is so. I know you are doing your best, old fellow. But what I've come for to-day is to consult you about my will.'

Fenton sighed, with infinite pity for the man before him and just a little for himself; every minute of his time had its quite appreciable value in coin of the realm.

'All right; it's always a prudent thing to do,

though you mustn't let yourself think that it particularly presses with you.—Though, if you had anything to leave, poor old fellow, I should say it ought to be made without a day's delay.' The latter part of his remark was, needless to say, unspoken.

'I don't know. I don't know. Perhaps not.

Anyhow'----

There came another knock at the door, and the

clerk handed a slip of paper to Fenton.

For a moment he said nothing, but sat with his eyes fixed on the paper. When he spoke, it was in a very different tone from that in which he had been conversing with Westbury, a tone of frigid hardness. 'I am engaged at present; but if the lady cares to wait, I will see her in a minute or two.'

'I'll go,' said Westbury. 'I want to make one or two inquiries about an institution I should like to benefit, and will let you have my instructions to-morrow. It's a bit of a responsibility, this possession of wealth.'

'It is,' agreed Fenton. 'By the way, old man, I should be very careful not to breathe a word about your—er—testamentary intentions to a soul except myself. You never can tell what use unscrupulous people might make of any hint of that sort.'

'You're quite right,' Westbury assented, much

to the other's relief.

Fenton had no wish that the poor fellow's monomania should be either a cause of mockery or a source of disappointment. 'Good-bye. Any

time you like to-morrow.'

Westbury slowly left the room, and Fenton noticed with sad foreboding how feeble his movements were. Then he heard the sound of a stumble and an arrested fall, and a woman's voice saying anxiously, 'Let me help you. I do hope you have not hurt yourself.' He heard Westbury thank her in his courteous, old-fashioned manner, with the assurance that he was quite unharmed, and the faltering footsteps seemed indeed a little stronger as they passed out.

Then Fenton drew a long breath as of a man nerving himself for an ordeal; and, ringing the bell, he bade the clerk 'show Mrs Brent-

The next minute the woman whom he had loved with all the fierce intentness of his nature, whom he had thought to make his wife, and whom he had not seen since that day, eight years ago, when with tears and anguish she had told him how another man had won her love, stood before him; stood with grief-wrung lips and trembling, outstretched hands, and terror and pathetic misery, and dumb, well-nigh hopeless entreaty, in the brown eyes that he remembered so joyous and gay and love-lit—or so he had thought.

'Pray sit down, Mrs Brentwood. Pardon the remark, but you do not seem quite—quite the

thing. I'm afraid my poor old friend's fall startled you.'

The cold tone and conventional words, strangely enough, acted as a tonic; her voice when she replied was quite composed, though very low.

'I have not been very well, and perhaps—your friend looked so very ill, I feared it might be serious. But I will explain the object of my visit, which must be a surprise to you; I am almost afraid an—an unpleasing one.'

'A surprise certainly, but the qualification is yours, not mine. In what can I be of service?'

'May I hope I am speaking to—a friend?'
Fenton smiled, sneeringly rather than kindly.
'My dear Mrs Brentwood, "friend" is so very elastic a term as to be meaningless. Pray, therefore, if you prefer it, consider me in that character.'

Maud Brentwood winced with a quick catch of the breath. But, hopeless as it seemed, she would fulfil her self-imposed task. He was making it terribly bitter, but it could not be helped. 'I do prefer it,' she said wistfully, 'or I should not be here; and I am in great trouble.'

She paused a moment, half-hoping that he would help her by some remark; but Fenton merely looked politely concerned and interrogative.

'Do you know the Wintons?' she asked

abruptly.

Fenton raised his eyebrows. 'Oh yes; to use your own expression, we are by way of being friends.'

'Then can you—will you—oh! for pity's sake, say you will—persuade Sir Charles to—to refrain from what he is doing against my husband.'

'I'm afraid you rate my influence, to say nothing of my—amiability, shall we say?—quite impossibly high. But perhaps you will kindly explain.'

Maud half-rose; the icy, unfeeling tone and words convinced her of the utter uselessness of any appeal to this man's sympathy; and yet she knew that once he had loved her, and, as she interpreted the word, it seemed impossible that it should so utterly pass as to leave no slight touch of kindness behind. No, she must not give up.

'It does not seem much use after what you have said. But it is all I can do; and, foolishly, I let myself feel a little hope in coming to you.'

Her hands gave a pitiful, unconscious gesture of despair; and when she spoke again it was in the dreary, half-listless tone of one who feels that the appeal is prejudged against her.

'Things have not been going very well with my husband lately, but he expected to more than recover his position over a scheme called the Pioneer Camp Exploration. He put every shilling he had into it, and persuaded other people to do the same, He and Sir Charles Winton have been interested in another company together; and Sir Charles, who used to be very friendly and intimate with him, now says that my husband had no right to sell that joint interest and put it into the Pioneer, and that it was a—a fraud. My husband says that it was always understood that he was entitled to deal with it, for the benefit of both, at his discretion. But Sir Charles vows he will prosecute, and that means ruin and disgrace for my husband—my kind, good, loving husband.' The long-checked tears came at length, with deep, silent sobs and stifled little moans.

Fenton sat motionless, save for one sharp spasm of his set features when his visitor broke down, and one sudden movement of his hands, as though to stretch them to her. 'And your husband suggested your calling on me?' he asked presently. His voice, though still cold, had lost a little of its hardness.

'My husband! He would sooner have died. He does not dream I have come. It was only my own foolish fancy, remembering what—what I said to you once, and I wanted to try to do something to help him. I am sorry I was so foolish.'

'Do not say that. Thinking as you did, it was a natural thing to do. Is Winton taking immediate proceedings?'

'He says that unless my husband replaces his share of the money by Thursday morning, in the afternoon he will apply for a warrant—as though Fred could find twenty thousand pounds with all these rumours about concerning the Pioneer!'

Well, you have three days, and surely amongst Mr Brentwood's many friends he will have no difficulty in obtaining an advance. I am sorry—really sorry—that it is quite impossible for me to do what you suggest.'

He rose as he spoke. The woman sat motionless for a time, mechanically folding and unfolding a scrap of paper on the table. Then she too rose to go.

'I—am—very sorry. It—it was not easy to make up my mind to come to you; but somehow I had always thought—— And I have hoped and prayed so that my effort might be of some good!' The voice broke a little, but she conquered the weakness. 'I must apologise for taking up your time. Good-bye, Mr Fenton.'

The sad, hopeless eyes were raised to his for a moment; there was no movement on the part of either to shake hands. Fenton murmured a few words of conventional regret and farewell in a voice that did not sound to him quite like his own, and the next minute she was gone.

As the door closed the man who had been treating the woman he had once loved with almost brutal coldness sat down suddenly and wearily in his chair, and the face which leaned upon a rather trembling hand equalled hers in its anguish. Presently he stretched out his

other hand and rested it upon the piece of paper she had toyed with.

'What a brute I was! I wonder whether I hurt her as much as I did myself. And yet—God! how I have longed for some such chance, and—now that it has come—it seems I'm as much a failure as a hater as I was as a lover.'

He sat silent for a while, an angry frown on his face, and his hand still fingering the crumpled paper with a sort of unconscious caress.

'At any rate, I've so far acted up to my later character as to make it pretty plain to—Mrs Brentwood that she need scarcely expect any help from the man she jilted.'

With the grim smile that accompanied the reflection, his reverie came to an end. He rose and dropped the paper into the fire, watching it, with a queer look on his face, as it consumed. Then he returned to the table, wrote a couple of letters, and, ringing for a clerk, directed them to be sent off by messenger.

When Fenton reached his office the next morning he found a letter that had been brought by hand awaiting him. It was from Westbury's landlady, saying that her lodger had been taken very ill the previous evening, and that the doctor said he could not last many hours. He seemed terribly anxious to see Mr Fenton about some business.

'Poor old chap!' mused Fenton; 'it has come sooner than I expected. And I suppose he's worrying about this wretched will, and I shall have to keep up the farce. However, it will ease him and hurt no one, even if it doesn't benefit'——

The phrase on which his thoughts had framed themselves was never finished. Another idea had flashed into his mind, and the look of halfvexed concern on his face changed to a slightly amused smile.

On his way to Westbury's he stopped at a florist's and bought some flowers, which he took to the dying man.

'Who do you think sends you these, old fellow? You remember the lady who was in my outer office yesterday when you nearly fell? Well, she seemed quite concerned about you, especially when I told her you were living by yourself, and this morning she sent these, as a sort of apology, she says, in case she was at all responsible for your stumble, and hoping you are none the worse. What do you think of that?'

'What a beautifully kind thing to do!' came in weak, quavering tones from the shrunken figure propped up against the pillows. 'You must thank her for me, Fenton, and tell her how very touched I am.'

'All right. Poor woman! hers is the sympathy of a very sorrowful heart—"non ignara mali"—you know the old tag! She has troubles enough of her own, and I dare say almost envies you yours. By Jove, old man! you were talking

about deserving objects of charity; you might find many a worse one than Maud Brentwood.

Westbury smiled and feebly pushed toward the lawyer a sheet of paper on which the evening before he had indicated the disposition he thought of making of his 'enormous wealth;' and Fenton, with a dreary sense of the pitifulness of the proceeding, accompanied, when he read what was set against his own name, by a strange aching sensation in the throat which he had not felt since his last great boyhood's grief, busied himself in embodying these, with such modifications as the sick man suggested or agreed to, in testamentary form. The arrival almost simultaneously of the doctor and a clergyman provided the witnesses, and half-an-hour later Fenton left the house, the last will and testament of Hilary Westbury, Esquire, of half-a-dozen imaginary county seats, in his pocket, and in his heart a sore, desolate sorrow such as he had for years persuaded himself he would never feel

Since his interview with Maud Brentwood the previous day Fenton had been making inquiries—quite an easy thing to do effectually even in the shortest time provided one has money and influence to back him-and found that Brentwood was keeping a brave face to the world, pooh-poohing the hints in the Press as an unscrupulous 'bear' dodge, and taking every opportunity of showing himself in public in the character of a wealthy and substantial man. Only, as one of Fenton's informants reported, he did not seem quite in his usual robust health, and sometimes, when off his guard, or, as he thought, unobserved, a harassed, hopeless look would come into his face.

There was to be a semi-charitable social civic function that afternoon, and Brentwood and his wife were expected to be present. Would she be able to nerve herself to attend? Fenton wondered. He hoped so; he wanted to see them together. Maud had called him her 'good, kind, loving hus-The environment would, it is true, not be favourable to much display of feeling; but he rather prided himself as a reader of expression. Anyhow, he would go; knowing and feeling what he did, it was only to be expected, he reminded himself with a grim smile, that he should like to feast his eyes on their distress and their efforts to conceal it.

One of the first persons he saw in the crowded vestibule was Brentwood, loud and cheery and ostentatious as ever. He was waiting for his wife. He heard him say, 'It's not often she ventures into the City; but she's dead keen on this business turning out a success, and you know what that means—eh, Forbes —another cheque from yours obediently. But it is a good thing, so we must see what can be done. Ah, here she is!'

As Brentwood hurried to the entrance Fenton drew a little nearer. There was no mistaking that look in the man's eyes, or the upward glance of hers, questioning, trusting, consoling, or the veiled caress in the conventional removal of her furs; as little as, to the critical watcher, there was the meaning of sighs stifled between smiling lips, of the lines round the man's weary eyes, of the artistic healthy glow on the girl's cheeks, and her ebullient light-heartedness. And watching, now him and then her, when they separated, Fenton realised that one other at least gauged Maud Brentwood's happy gaiety at its true worth. Her husband was laughing and talking in his usual noisy way with a knot of friends; but his eyes followed his wife with an expression at once of pride and yearning tenderness, infinite anguish and self-reproach.

Fenton had seen enough. It was a pity, he reflected with a sort of mocking bitterness, that he could not enjoy the pleasure of seeing these two faces, the husband's and wife's, when, in the privacy of the home that was being shattered over them, they dropped the masks; but even gratified revenge is seldom quite complete-'never the time and the place and the "loathed" one altogether.' And, telling himself that it was a mistake to expect too much in this disappointing world, Fenton returned to his chambers, and found a note with tidings that Westbury had died shortly after he had left that morning.

An hour or so later the Brentwoods returned to what the anticipated auction notices would inevitably have described as their 'palatial residence.' The masks were still retained for the benefit of the servants, but after dinner they were discarded completely enough to have more than satisfied Fenton's recorded wish. Maud was kneeling by her husband's chair, her face buried on his shoulder, her hand holding one of his. Brentwood's face was one of set, hopeless misery, his arm was round his wife, and every now and again he would stroke the pretty girlish head and press it closer to him with a pitiful, The usual desponding futile protectingness. question had received the usual dreary answerdrearier than ever to-day, for one possible source of succour had been tried and had failed. Maud had confessed her visit to Fenton, and the confession, which at any other time would have angered Brentwood, now brought only a fresh wave of pity and admiration and love

There was a knock at the door, and the two hastily assumed conventional attitudes. The servant handed his mistress a letter and a

'If you please, ma'am, the young man said he was to take back an answer.'

'Very well. Ask him to wait in the hall. I will ring when it is ready.'

When the man had left the room Maud

sprang to her husband, holding the letter to him with trembling hand. 'Read, Fred-read!

Oh, it cannot be true; it is too wonderfully beautiful!'

And when Brentwood read the letter he realised the aptness of the epithet.

'143 OLD COURT CHAMBERS.

'DEAR MRS BRENTWOOD,-It is with considerable pleasure that I have to make the following communication. You may remember, when you called on me yesterday, meeting in the clerks' room a gentleman who stumbled, and but for you would have fallen. He was a very old friend of mine, and had that morning been to consult me as to the disposition of very considerable property he intended to leave by will. Your kind action made so great an impression on him that he instructed me to put you down for a bequest of twenty-five thousand pounds, free of legacy-duty, in Westrian Capital Bonds, which, as your husband will tell you, are at present worth a trifle over that sum. Poor Westbury died this morning. I am sole executor, and as I have the bonds (which are bearer bonds) by me, I send them to you at once, thinking that possibly it may be some convenience to you to have them without waiting the usual delay of probate, &c. Please let me have by bearer the enclosed receipt, with undertaking to sign a formal legacy voucher when called upon. I am the more glad to be the medium of this gratifying news, as I found it quite impossible to fall in with the suggestion you made or in any more personal way to further the object you had in view.—Yours faithfully, HUGH FENTON.'

'At any rate, it was really kind and considerate of Mr Fenton to let us have it at once,' said Maud when talking over the 'blessed miracle' a few days later.

'Yes, I'll admit that freely,' answered Brentwood, on whom his imminent danger and subsequent extrication—bringing with it a financial success of which folks talk to this day—had had a wonderfully salutary effect; 'but he needn't have gone out of his way to emphasise his own refusal to help. Fortunately you didn't ask him for money; it is pretty well known that Fenton is about as near as he's rich, and that's saying a very great deal.

It was about a year after this that, at a dinnerparty, Maud found herself sitting next to a medical man whose name had come recently before the public as one of those attending a royal invalid. The conversation turned on monomania, and the doctor was talking interestingly of cases that had come within his own experience.

The odd thing is how entirely, generally speaking, it is literally monomania; in all other

respects the patients are not only sane, but often brilliant. One of the most typical cases I knew was that of a poor fellow who was well-born and well educated—he had taken rather a high degree, I fancy—and at one time very wealthy. He was quite one of the most charming, almost lovable, men I have ever met. Well, in what circumstances I know not, he lost all his money, had a severe illness, and recovered to find himself destitute, but with the fixed impression that he was the possessor of enormous wealth, which, somehow or another, was for the time in Chancery. More fortunate than most, he came across an old friend who made him an allowance and had him looked after. Poor Westfield-no, West—ah, Westbury—yes, that's the name was a doomed man when I first saw him; but, thanks to this friend, his last years of life were quite comfortable. But the delusion grew stronger. I remember I witnessed his will; and, except that he was dying, there was something tragically comic in the spectacle of a man who did not possess one penny-piece gravely bequeathing property to the value of hundreds of thousands.

Maud glanced towards her husband, who with the rest had been listening, and their eyes met. Over the coffee and cigarettes, Brentwood took the seat next the doctor.

'Very interesting case that you were describing, Dr Dryden. Oddly enough, the name Westbury seems familiar to me. Was it about a year ago that he died?'

'Let's see—yes, I should say a year ago last month.'

Brentwood's cigarette seemed to have caught his throat, judging from the rather strained, hesitating voice in which he next spoke.

'And this—this splendid friend—should I be right in guessing that his name was Fenton?'

'Oh, come,' said Dryden, smiling, 'doctors are like confessors, you know-mustn't betray professional confidence, and so on. Still, as you say, he was a splendid friend; it wasn't only the money-for he was a rich man-but the kindness and tactful delicacy. So I won't say "Yes" or "No" to your question, but will just whisper in the strictest confidence—I mean this—that if you guess again, you'll guess wrong.'

It was the next day that Fenton began to realise, when he received a visit from Maud Brentwood, who was accompanied by her husband, that to two people at any rate he stood revealed as a failure, if not a positive fraud, in his adopted rôle of Timon. And on consideration he found the character suggested by Maud, as they bade him good-bye for the present, a much more pleasant and congenial one: 'I knew

you would always be my friend.'

THE FOUNDER OF MODERN NURSING.

To be a good nurse one must be a good woman. FLORENCE NIGHTINGALE.

AMONGST other things which the great war has forced upon our attention is the vast importance of skilled nursing, and the valuable work of the British Red Cross Society has thus been brought prominently to the front. In his admirable *Life of Florence Nightingale*, Sir E. T. Cook makes it clear that this heroic lady, though not the founder of nursing, was the founder of modern nursing, because she made public opinion perceive, and act upon the perception, that nursing was an art, and must be raised to the status of a trained profession. Mr Stephen Paget, F.R.C.S., calls her the reformer of hospital nursing; not only the reformer of nursing, but a leader of women, who raised the art of nursing in this country from a menial employment to an honoured vocation. taught nurses to be ladies, and she brought ladies out of the bondage of idleness to be nurses.

Before the work of Florence Nightingale began to tell on public opinion nursing was looked down upon, ill-paid, and unorganised. At the end of the first half of last century, when she decided to take up nursing, she had friends who made her feel as if she wished to be a kitchen-maid. Wages of nurses were then from fourteen to sixteen pounds a year; there was no uniform dress; and they cooked their own food, which they bought for themselves, and ate their meals in the ward kitchen or scullery. It seems Charles Dickens did not exaggerate much in his picture of Sairey Gamp. Now we have an army of cheerful, healthy, well-trained, well-equipped women.

Florence Nightingale's Notes on Nursing was an epochmaking book, and is indispensable to all who adopt nursing as a calling; her biographer remarks that if it should be out of print it ought to be included in one of the cheaper series of the day, for 'it can never be out of date, and no one who has ever read it has found it dull.' Fortunately it is not out of print, for there is an edition, stamped on the cover with a Red Cross, issued by Messrs Harrison & Sons. Miss Nightingale was in the habit of writing an annual letter or address to the probationer nurses of the Nightingale School at St Thomas's These addresses were usually read aloud by Sir Harry Verney, chairman of the Nightingale Fund, in the presence of the pro-bationers and nurses, and a printed copy or lithographed facsimile was given to each of those present, marked 'for private use only.' A few also were written for the Nightingale nurses serving in Edinburgh. These letters have now been published in a small volume, entitled Florence Nightingale to her Nurses, edited by

Miss Rosalind Nash (Macmillan & Co.). They are simple and direct messages, less full in treatment than the Notes, but strongly emphasising the moral side of the calling.

Mrs Fawcett, in her excellent introduction to Pioneer Work for Women, the autobiography of Elizabeth Blackwell, M.D., the first lady-graduate in medicine, draws an interesting parallel between her and Florence Nightingale. She points out how these women resembled one another in many ways; both had the same sense of vocation and the same strong religious feeling as the base and root of all their work. They had each 'the same intense distaste to the ordinary life of young-ladyhood, wasting time over inane conversation, paying calls, and making baubles which no one wanted; the same feeling that they had got to do what each eventually did do in the way of raising the standard of women's work; the same intense joy and satisfaction in their appointed task.' The one was rich, however, and was born into a family in good position; the other was poor, and had to earn by teaching the money wherewith to get through college. Both shrank from married life as a career.

When Florence Nightingale found that she could not get the requisite training in England, she spent some time at Fliedner's Institute of Protestant Deaconesses at Kaiserswerth, in Germany. She found that the institute was run on the lines of poverty, simplicity, and common-sense, and concluded that nursing could be made a calling for women, and no mere desultory occupation. She had further experience while in charge of a nursing establishment in Harley Street, London. She had visited the hospitals of London, Edinburgh, Dublin, and Paris. Her great opportunity came during the Crimean war, when she was called to become superintendent of the female nurses in the hospitals in the All the world knows how heroically and well she reduced chaos to order, and 'hundreds of brave men attested with their dying breath how nobly Miss Nightingale's selfimposed task was done.' In her position she showed nerve and skill, was gentle, wise, and quiet, and seldom in a bustle or a hurry, though so much depended upon her. The large sum of money subscribed by the British Empire as a tribute to her work was utilised in founding the National Training School for Nurses at St Thomas's Hospital, which was opened in 1860. Miss Nightingale's own plan was to see that nurses should have their technical training in hospitals specially originated for the purpose, and that they should live in a home fit to form their moral life and discipline. Emphasis was laid on the qualities of punctuality, quietness, trustworthiness, personal cleanliness and neatness, and on ward management. A portion of

the sum was set apart for the training of midwives for the poor.

The addresses to nurses we have mentioned as just issued are religious in tone, and at the same time extremely practical. In asking real workers to enter into the immense field of nursing, made more immense by the opening out of London district nursing at the bedsides of the sick poor, Florence Nightingale says: 'A woman who takes a sentimental view of nursing (which she calls ministering, as if she were an angel) is, of course, worse than useless. A woman possessed with the idea that she is making a sacrifice will never do; and a woman who considers any kind of nursing work beneath a nurse will simply be in the way. . . . Nurses' work means downright work, in a cheery, happy, hopeful, friendly spirit. earnest, bright, cheerful woman, without the notion of making sacrifices, &c., perpetually occurring to her mind, is the real nurse; a woman with a healthy, active tone of mind, plenty of work in her, and some enthusiasm, who makes the best of everything, and, above all, does not think herself better than other people.' This is sound, practical good sense.

Again we find her saying that it is not the certificate that makes the nurse or midwife; that no training is of any use unless one can learn to feel and think out things for one's self; and that a nurse must be a missionary, not as a minister or chaplain, but by the influence of her own character. To those who say that medicine is the corrective process she replies that it is no such thing; 'medicine is the surgery of functions.' In a nutshell she gives the foundation laws of health: 'When we obey all God's laws as to cleanliness, fresh air, pure water, good habits, good dwellings, good drains, food, and drink, work and exercise, health is the result; when we disobey, sickness. One hundred and ten thousand lives are needlessly sacrificed every year in this kingdom by our disobedience, and two hundred and twenty thousand people are needlessly sick all the year round.' This was the ideal held up by Florence Nightingale. believed that prevention was better than cure; nursing the well was of as much importance as nursing the sick—the putting of the constitution in such a state that it will have no disease, or that it can recover from disease.

The great war in which we are engaged has stimulated the Red Cross movement, as well as every other form of nursing. Henri Durrant had been an eye-witness of the sufferings of wounded soldiers, without attention, at the battle of Solferino, and, inspired by the work of Florence Nightingale, he did not rest until, at an international conference at Geneva in 1864, the Red Cross idea was formulated. The late Lord Wantage, during the Franco-German war of 1870, formed the National Society for Aid to the Sick and Wounded in War. The Japanese established a Red Cross Society in 1894. By Red Cross

methods the wounded are first treated on the battlefield by the field ambulance, and placed in the field hospital, from which they are conveyed by the Red Cross detachment to the emergency or general hospital. Our base hospital is at Netley, on Southampton Water. A feature of the interest and sympathy awakened at the outbreak of the war was the number of British homes, yachts, and buildings which were at once offered as hospitals; nearly three thousand highly skilled nurses were available for despatch if necessary, and sixty thousand other helpers were forthcoming. Admiralty and the War Office have officially recognised the British Red Cross Society, and agreed that all offers of voluntary assistance made with regard to the sick and wounded should reach them through this organisation. For some years a Red Cross Committee has been in existence in every county in Great Britain, prepared for emergency. The action of the British War Office in 1898 led to the amalgamation of the then existing societies, conferring an official status on the body thus formed, which became the British Red Cross Society, incorporated by Royal Charter in 1905. The society was inaugurated in that year by Queen Alexandra at a meeting held in Buckingham Palace. Five years later the Red Cross Society undertook, at the request of the Government, to work out a scheme of voluntary aid to complete the medical service of the Territorial Force. scheme was introduced, and committees of the Red Cross were formed to raise voluntary aid detachments, constituting the connecting link between the collecting zones and the base hospitals. The members of these detachments have been trained in first-aid, invalid cookery, and sick-room nursing. After the mobilisation of the army and Territorial forces took place, the county directors had to act on the requisition and under the orders of the Army Medical Department, which provides for the casualties of war. The function of the Red Cross Society is to offer such additional comforts and general help as may be considered beyond the scope of the Army and Navy Medical Departments—auxiliary hospital accommodation, auxiliary medical and nursing service, and all the little luxuries and comforts which mean so much to the invalid.

The progress of the war has thrown some strange lights on nursing and hospital treatment. A medical correspondent of the Times, who had visited hospitals in Brussels, noticed what a large number of the Belgians were wounded in the legs, and the many soldiers who had collapsed through sheer exhaustion. The men seemed to have gone on until they dropped; only with actual loss of consciousness did they give in. They seemed at first almost dead; were limp, pale, and cold. After a time their strength returned. Professor Saundby of Birmingham has pointed out how much more quickly the sick and wounded recover by open-air treatment. The then Crown Princess of Prussia, in a letter

to Florence Nightingale, gave an instance of how certain wounded men whose wounds had been doing badly in hospital improved rapidly and recovered after being placed in a garden in a shed which was open on one side, and whose walls

did not reach to the roof. Professor Saundby was of opinion that many buildings offered as emergency hospitals might be utterly unsuitable for the purpose, because lacking in openness to atmospheric influences.

THE WANDERINGS OF PLANTS AND ANIMALS IN THE WONDERLAND OF THE SOUTH SEAS.

By Professor H. A. STRONG.

OF all the 'fairy tales of science,' none is more fascinating than the story of the civilisation of the two beautiful islands lying at the Antipodes under the Southern Cross, christened by the Dutch cartographers after Tasman's discovery in 1642 of the 'unknown Southland.' This land of towering mountains, lakes, and volcanoes received its most inappropriate name from the foggy shoal of the province of Zealand simply because it was supposed to lie near New Holland, just as old Zealand lies near old Holland. The marvel of the history of these delightful islands is the speed with which they have passed from a state of wild nature to one of complete European civilisation within little more than a hundred years. The particular branch of that civilisation to be dealt with in this article is the gift made by the Old World to New Zealand of its fauna and flora, which have in the space of three generations utterly transformed the stock of living things in the Dominion.

The extraordinary fact, hardly realised by most of us, is that a country so remarkably suited by nature for the support of every description of animal life should have been almost as destitute of indigenous animals as the moon. At present not merely do these islands abound in all the animals known to our own country; but others, such as various kinds of deer liberated by the Acclimatisation Society, have been added to the list of fauna. There was, indeed, one animal found in New Zealand by Captain Cook on his arrival in 1769—a small, dark-brown rat called the kiore. This animal is supposed to have been introduced into the islands by the Maoris on their arrival from one of the islands in the South Sea; but it is gradually disappearing before the imported brown rat, just as the British black rat is disappearing before its Norwegian congener. The kiere, like other animals of the rat tribe, at uncertain times appears in vast numbers, starting none knows from whence, and going to no known goal, but evidently prompted by some mysterious instinct of nature. The same peculiarity has been remarked in the Norwegian lemmings; and the sudden appearance of the plague of voles in the neighbourhood of Dumfries a few years ago, and their equally sudden disappearance, will be remembered by many. Some years ago a countless swarm of

these little creatures appeared on the west coast of the Middle Island. They travelled southward along the shore for a distance of more than one hundred and fifty miles, pushing forward with restless energy, as though impelled by some mysterious agency. Many died by the way, and the moving host was exposed to fierce attacks by the imported brown rats-against which we are constantly warned-evidently bent on extirpating their weaker relatives in possession. These strange creatures continued to move in endless procession for many months, when they disappeared suddenly and mysteriously; nor did any one discover whither they betook themselves. The most remarkable fact regarding this huge migration is that the animals forming it consisted solely of males, not a single female having been found among the whole number. It would be interesting to learn from naturalists whether a similar fact has been noticed in the case of the migration of other animals of the rat kind, such as the hamsters or lemmings.

Reptiles, again, are conspicuous by their absence from New Zealand. Snakes, which form such a disagreeable element in the fauns of Australia, are unknown, and it is one of the amusements of the New Zealanders to observe their Australian visitors while walking through the scrub; for the latter have unconsciously acquired the habit of tapping the ground before them with a stick to scare away any possible pests of this description. This class of reptiles is represented by a few little lizards and the weird tuatara, known by sight to visitors to the reptile-house in the Zoological Gardens, London. This creature is a kind of iguana about a foot in length, and is found only on a few rocky islets on the coast of the North Island. The extraordinary characteristic of the tuatara is its capacity for perfect rest and its apparent power of existing without food or water. It may be kept in a glass case for months or even for years, and even the lack of air does not seem to affect its tranquil stoicism.

On the other hand, the bird-life of New Zealand is full of interest, and the native specimens are both numerous and beautiful. The gigantic moa, the largest specimen of the Dinornis, has indeed become extinct, but its remains have been found in such quantities as

to prove that at one time it was exceedingly common, and the museums in New Zealand contain many fine specimens of the skeletons and feathers of the bird. It was a wingless creature, standing some fifteen feet high. It had huge and powerful legs, and apparently habitually swallowed numerous pebbles to aid its digestion. Some of the older Maoris are ready to declare that in the days of their youth they have seen and even hunted these monstrous birds, and every now and then a paragraph appears in the Press asserting that a settler has caught sight of some solitary survivor of the race of moas. But scientists shake their heads, and declare that the bird has not existed since a remote antiquity. There are, however, in New Zealand three specimens of the moa kind, though they merely represent their giant congener in petto. There are two varieties of the kiwi and the weks or woodhen. The kiwi is well known to visitors to our museums; it is a true apteryx, or wingless bird. It is found only in solitary places on the west coast, and is believed to be rapidly diminishing in numbers. The weka, on the contrary, is very common throughout the New Zealand bush, and is well known to all who have camped out there; for it is an extraordinarily inquisitive bird, and this characteristic is so strong in its nature as to overcome its timidity, so that it will even enter the tent of a traveller, take stock of him and his surroundings, and steal what may suit its taste.

There are several kinds of indigenous parrots, of which the most singular is the kea or mountain parrot. In the old days, when its natural food was plentiful, this parrot used to subsist, like ordinary birds of its kind, on berries and fruit; but as these have been rendered scarce by the spread of stock, it has developed a most singular carnivorous propensity. It has made the discovery that the most delicate morsel to suit its taste is the kidney fat of the sheep, and since the time of this discovery it has become one of the pests of the flockmasters; it swoops down upon any unfortunate animal that it may find isolated, and tears away the wool, skin, and fat with its powerful beak, which it inserts into the kidneys of the sheep, leaving the animal to The kea is now becoming rarer, die in agony. since its breeding haunts have been discovered by the settlers; but its change of diet seems a striking instance of adaptability to environment.

The tui, or parson-bird, resembles a large starling. On its breast is a tuft of snow-white curled feathers, thought by the settlers to resemble the bands worn by clergymen; it is strictly preserved by law, is easily tamed, and learns to speak like a starling.

There are many other birds indigenous to New Zealand, some affording sport, others interesting for the singularity of their plumage or their habits, such as the wood-pigeon, the paradise duck, and the blue heron. Suffice it here to

say that New Zealand is as rich in bird-life as it is poor in its stock of native animals; and ornithologists will find a full description of all the birds in the Dominion in Sir W. Buller's Birds of New Zealand, a masterpiece of natural history. It must be remarked that British birds have been imported, and have increased enormously in numbers, so that the music of the songsters to which we are accustomed is more frequently heard than that of the native birds, which are mostly nocturnal in their habits. It is also noteworthy that the imported birds seem to diminish the numbers of the indigenous birds, even as the presence of the white man seems to tend to the disappearance of the natives of the countries in which he settles.

Fortunately for its inhabitants there is very little insect life in New Zealand. Sand-flies are troublesome, especially on the west coast; but at one time there were no wasps, hornets, or bees in the Dominion. We are taught to regard our common housefly as an enemy to be ruthlessly exterminated as a vehicle of infection; but this is not the view of the New Zealanders, who made the discovery that the British housefly, though a small and insignificant insect, possesses the virtue and the pluck of engaging with the large native bluebottle, which is considered a pest from its habit of blowing fresh meat and rendering it uneatable. It is said that a settler was much surprised on meeting a neighbour carrying a large bottle containing British houseflies, and bountifully distributing the insects pro bono publico as he rode home.

The housefly was introduced by accident rather than by design; but there is one instance of insect acclimatisation which has been of the utmost benefit to the colonists, and has, indeed, been the instrument of creating a new industry in the Dominion. This insect is the ordinary humble or bumble bee. Before the introduction of this beautiful insect there was no possibility of growing red clover, because there was no indigenous insect to fertilise the flower. As it is, red clover is one of the main products of New Zealand, and it has been stated that the introduction of this insect has been worth a million sterling to the Dominion.

But possibly the most singular creature that exists in New Zealand is the aweto, a vegetable caterpillar (Hipialis virescens). Much discussion has lately turned on the question whether it is possible for organic matter to arise from inorganic matter. However this may be, the case of the aweto seems to prove that a caterpiller may turn into a vegetable, as it habitually does in the wonderland beneath the Southern Cross. It remains an ordinary caterpillar until it is fullgrown; but then a miraculous change comes over it. The spore of a vegetable fungus, Sphæria Robertsii, fixes on the neck of the caterpillar, takes root there, and grows into its body, filling it exactly, and not altering its shape in any

degree. As soon as the spore has ceased growing both it and the caterpillar die; and the substantial result of this singular process is that a wooden caterpillar is left, with a wooden spore standing up in its neck. Specimens of these wooden caterpillars may be seen in several of our museums, and they are very common in New Zealand. The life history of this vegetable caterpillar sounds like a chapter of natural history composed by Baron Munchausen. It may well tax the credulity of the sceptical; but, as the wag said, 'it is none the less true for being a fact.'

All the animals known to civilisation which have been acclimatised in New Zealand have prospered and multiplied exceedingly, and that Dominion is probably at present the most favourable for sportsmen of all our overseas possessions. Captain Cook put some pigs ashore, and these have bred till their numbers are countless; they form the staple food of the Maoris, and are an excellent quarry for hunters of game. They have reverted to the type of wild swine, have assumed huge bristles, and the old boars are armed with huge tusks. Wild goats, also probably introduced by Captain Cook, swarm in the mountains. Red and fallow deer, and some species of Indian deer, have been turned out in places, and are rapidly increasing in numbers. Rabbits, as we all know, have become a perfect pest, and stoats and weasels have been imported to keep them down; though the complaint is that the stoats and weasels prefer to raid the fowl-yard when occasion offers. Grouse have been introduced, but have proved a failure, presumably because they cannot exist without the Scots heather. But the beautiful Californian quail, with its perky crest, has multiplied exceedingly, and has even made its way into the gardens and parks of the cities. The black swan of Australia has thriven so well that it hardly seems to have been an importation.

The rivers and lakes abound with trout, which grow to an almost incredible size; indeed, both Australia and New Zealand are becoming the happiest of hunting-grounds for the fly-fisher. It is no exaggeration to say that a skilled angler may expect to catch on Lake Taupo five times as many trout as he might hope to catch on Lochleven, and many of the fish weigh as much as ten pounds. As an instance of how new conditions change old habits, it may be mentioned that the trout in these lands lying under the Southern Cross actually imitate the salmon in taking freely to salt water, and their taste and flavour is thereby improved; but for some mysterious reason the salmon which have been imported have never been seen after once going down to the sea.

It is perhaps worth while to add that the New Zealand Year-Book, in comparing the climate of Great Britain with that of other countries, states that the average sunshine in

our country ranges from one thousand two hundred to one thousand six hundred hours per year. The average in Napier and Nelson was no less than two thousand five hundred and one hours and two thousand four hundred and sixty-seven hours respectively.

It may not be inopportune to add that recent explorers and pioneers of civilisation have discovered an extraordinarily numerous fauna in the Northern Territory of Australia, recently taken over from South Australia by the Federal Government. This vast region is equal in area to France, Germany, Italy, Holland, Belgium, and Switzerland combined, and contains at present not more than from two thousand to five thousand inhabitants. It is perhaps not generally known that wild buffaloes abound in the north-eastern part of the country, and that there are a few hunters who make their livelihood by shooting them for their horns and skins. The carcass is usually left on the ground and wasted. It seems a pity that no attempt on a large scale has been made to domesticate these animals. They are the descendants of the water buffalo of Timor, and were introduced from that island when the British Government in the 'twenties founded some military settlements on the north coast of Australia. They have multiplied and spread, and are now seen occasionally in Queensland. Herds of wild ponies are also common. Game is very plentiful. Black-and-white geese, native companions, jaberoo, spoonbill, ibis, and spur-wing plover are among the birds which offer food and sport to the tourist. Turtle and dugong are found on the coast, the latter animal resembling a porpoise, and its flesh resembling pork. Oysters are found in boundless quantities. The great problem now exercising the intellects of Australian statesmen is how to get this rich tropical territory populated by white settlers, as they have determined not to allow others to settle in their continent. Should, however, such a huge territory remain unoccupied, the Australians are not unreasonably apprehensive that some neighbouring Power may deem that it could put the region to better use than the present owners have done.

REMINISCENCE.

WHEN evening comes and fragrant fields grow wet With silver largesse of the falling dew, My thought, like some wild alien bird, flies yet Back to the tropic sunsets and to you. The English lanes, for all their loveliness Of starry hedge-flowers where the bees have swung. Lack the mysterious gloom, the magic stress Of phantom branches to which fire-flies clung.

For I remember how the swift night came Beyond the heat-haze: suddenly the moon Rose golden from the phosphorescent sea, The native drums would beat and torches flame, The champak-scented air made reason swoon: Then silence—and a hushed expectancy.

C. FARMAR.

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, Yesterday.

THE dawn is breaking upon a new age, in which life may be calm and peaceful, happy and beautiful. It may be better to live. Yesterday it was as if the soul of tormented man was passing through a long night of crushing torture, shaking terrors, black hours of thunder and shrieking, with the Furies abroad, like a veritable pandemonium of devilry. The storm will pass. The sun will rise in a clear sky, and there will be the singing of birds, the crooning of gentle breezes through the trees, the laughing prattle of children safe in happy The world is to make a new beginning. Civilisation, unarmed and unafraid, is to come to its own. It even seems that all the eras, all the ages of the long and uneven past, have but led to the new time that is now to start. It is true; we must believe it, and try fully to realise the quality and the possibilities of a new life that is ahead. Optimism can lead to no danger now if we are true to ourselves and to the ideals that will be presented to us, and it is a good tonic when for so long past the human mind has been oppressed. For its justification and the absolute belief in the excellence and splendour and glorious possibilities of this new life we need but one basis at the beginning of the argument, one simple postulate, and that is the defeat of our enemies in the war, and with it the utter annihilation of German militarism. As a postulate, that is sound, and may be taken with confidence, because the converse is unthink-It is from this postulate we assume mere existence, and with existence the rest follows. Germany, as we have known it, will cease. Even now it is only beginning to be dimly realised what an oppressing and unhealthy effect Kaiserism has had upon the life of the world for a generation past, how it has strangled action and even thought, blighted ideals, and brought about such a hideous waste and folly in the maintenance of militarism as may cause this age to be looked back upon by those who are born hereafter as one of amazing stupidity.

* * *

We have come to the end of it, and now is the time for a new beginning. Mankind will welcome that beginning as the most magnificent No. 205.—Vol. IV.

opportunity it has known, the most promising and irresistible. Individuals constantly yearn for the good excuse and the helpful circumstance to make a sudden end of an old bad system of life and start afresh. The Old World will make one There has been a vast cataclysm, great forces have been drawn together with a common object and ambition, an essential cleansing of the world, and there is such a general upheaval in all countries and systems and in every class of society as makes the new beginning inevitable and the circumstances most insistent upon it. The great change must unavoidably be for health and good and happiness; it cannot be otherwise. We may look upon the time that is coming as a-renaissance of the world. Life is more complex now than it was at the time of the great Renaissance of art and letters in the fifteenth century, but beauty will be added to it, just as was the case then. For all the fancy prices that millionaires pay for pictures, art now stands for much less in the life and joy of the community than it did then, and in comparison with the people of that age we have no feeling for beauty. The senses of people have become clogged with vulgarity, ideas of machinery, and coarse materialism. It is a hard thing for a man to possess the biggest motor-car in his parish and to be a true lover of art. Yet it is easy to buy the work of an old master and be a prig. For all that, we shall in the new life feel in our souls much of that quick, uplifting spirit of the great Renaissance.

* * *

There may be something like a throw-back in our ideas and tastes. We may hold to what we know; but there may be a less feverish pursuit of the still unknown, if for no other reason than that much of this pursuit in the past has been stimulated by consideration of armies and war, and often enough has been financed by their authorities. Science has been the servant of Bellona. What has science given to the world as we know it? Many good things. Also it has given us modern Germany, which is so infinitely inferior in all matters of the spirit to the Germany of a hundred years ago, when the great musicians lived and made their compositions; it has rendered possible, as OCTOBER 31, 1914. [All Rights Reserved.]

nothing else could have done, the greatest and bloodiest war that the world has ever known, or, as we think, will ever know, with all its mines and torpedoes, and submarines and aircraft; and in place of belief in the highest things it has given us a gross and utter materialism. After the terrific cleansing process through which our minds will have passed, in contriteness we shall realise there are better things in life than electricity and petrol, better joys than to travel fast and to eat expensively, and that a danger that has not been suspected lurks in the old doctrine that to save time is to lengthen life. In the aggregate millions and millions of hours are saved every day in London, as compared with thirty or forty years ago, by the use of petrol and electricity; but life is not lengthened thereby-much the reverse surely -nor are the joys and satisfaction of living increased.

* * *

But not quite by considerations of the mere negative can we come to understand the joys of the future life on earth that are coming to Britons, and to some of those who are their friends, as the result of this war that, in the highest sense of the good of the world and all humanity, is assuredly not being fought in vain. Great as is the price to be paid, Britain will get full value for its money and blood, and we who have not now full lengths of life to lead shall have the value. Of all the human emotions there is none so deeply satisfying as that of pride; not the vulgar pride that comes from exhibition, from meretricious display, from mere possessions, or even from title and family, but the deep and soulful pride of conscious worth and great achievement. It is the pride of glory. The Briton, as such, will have such an overwhelming pride after this war as no man of any other country or empire has ever had in the past. He will have fought, indeed, not merely for the good of himself; but he, disinterestedly, will have fought to save the world, and will have saved it. He will have accomplished the greatest good ever done since earth was placed among the planets. He will have set forth, for the admiration and wonder of every generation that shall follow, how his might, created by his right, was displayed in a dazzling magnitude. It had been said, and there were some fears-not without cause—that the great British Empire was experiencing the difficulties of its size and its variety, and that a decline was imminent. But at this time of crisis-decline indeed! How the blood of generations of Britons yet unborn will leap in their veins when they read of the way in which Indians with love and loyalty came to our aid; how the men of South Africa, who had been angry with us once before, sprang to their guns at the first sign that the Empire was in danger; how from Canada and Australia,

from New Zealand and from every little colony of this motherland, the children hurried to give their money and their lives for what was best in all the world; and how even nations that were not concerned with the cause of quarrel looked on in grand admiration and sympathy, with hands twitching to grasp their swords. Never, they will know, was Britain so great as then, when, in humble piety and truth, it could be said she was fighting not for herself but for the Creator of the threatened world. What a privilege to be a Briton of this glorious, this matchless period! Destiny has given to the Britons alive in 1914 an imperishable distinction, and one which will endure for their time and ever after. It was a great thing to be a Briton of the rousing times of Elizabeth, great again to have been British when Napoleon was overthrown; but the Briton of the present period is now and for ever supreme among all races. The pride of his worth and achievement is enhanced by his new burning patriotism. Too often British patriotism has been quiescent. It needs to burn continually for Britain to be herself; and now the nation has been knit, and it is all aflame throughout the Empire. From that love of country, openly and exultingly confessed, great deeds will flow. Love is the strongest and most uplifting emotion of the human being; no power can equal it. It is the divine spark in man that makes him superior to all other things that live, or seem to live. One who does not and cannot love can do little that is worth the doing; and there are two forms of love that are inspiring beyond all others, one being this great love of country. So from her strengthened patriotism, and the pride of it, shall Britain ascend. Glowing pride! In the great days of the Roman Empire it was a glorious thing to be a citizen of Rome. Every Roman felt the better then for his Empire and his share in it. In every moment of his life he felt the dignity and the superiority of his citizenship. 'Civis Romanus sum !' And in our New Renaissance, when we and our friends have made not only great empires for ourselves, but have saved the civilisation that has taken thousands of years of life to build, and have refined it nearly to perfection, shall it not be a splendid thing to say, 'Civis Britannicus sum / I am one of the Britons who helped to save the world for life and beauty'?

But pride is not enough for life; dignity and consciousness of worth will not establish a New Renaissance. This war has other good work to do For ages past war has been regarded as a great essential to the improvement and strengthening of the human race. The principle of the survival of the fittest has brought about this view. Ever since man began there have been wars. By many of them the human race has unquestionably

improved; but it is not clear—far from it that, when once a certain state of efficiency. has been achieved, institutions and advantages have been established, and reason has been cultivated, wars cannot with great benefit be replaced by other forms of contest less savage. indeed, is now as absurd as it is terrible. will not be tolerated in the future as it has been in the past, and the old arguments in favour of it will not be heard. Listen to General von Bernhardi, the priest of German militarism who encouraged his nation to the fight in which she falls: 'This desire for peace has rendered most civilised nations anæmic, and marks a decay of spirit and political courage such as has often been shown by a race of Epigoni. "It has always been," H. von Treitschke tells us, "the weary, spiritless, and exhausted ages which have played with the dream of perpetual peace." . . This aspiration is directly antagonistic to the great universal laws which rule all life. War is a biological necessity of the first importance, a regulative element in the life of mankind which cannot be dispensed with, since without it an unhealthy development will follow, which excludes every advancement of the race, and therefore all real civilisation. "War is the father of all things," said Heraclitus of Ephesus.' This apostle of the bloody doctrine that Might is Right clearly makes it an axiom in his philosophy that man is like the brutes, and that the same laws of progress apply to both, that the human has no superiority in instincts and tendencies to the serpents and the beasts. It is an axiom that may serve the Prussian, but it will not do for others, and even the Prussian will progress with it no more. But yet it is true that in the past war has been a great cleanser, and the greatest of wars will be a splendid purifier. It will make of Germany a man among nations, a good, honest, cleanliving, and right-thinking man. In time perhaps the Germans will be able to look other nations in the face again. Beyond doubt the war will yield a vast enlightenment to willing, struggling Russia. There is proof already that it has strengthened morally such a doubtful breed as the Servians, whose record hitherto has not been a pleasant one to contemplate. But if in the past one has been inclined to think the Balkan peoples rough and primitive and even barbarous, we grant to them now that they may wear the lily for their emblem by comparison with the Huns of Germany, who have made us sick of the mention of 'science' and 'culture' for what they have seemed to signify in them. Belgium is exalted among nations for its heroism; never can its glory be dimmed; a great king and a great people live in that land. Our sister France, the fairest country of the world, the people in whom the refinement of civilisation has been carried to its noblest and most perfect achievement, comes fully to her own, and with a light

and happy heart, rid of painful shackles, will go on with a great work for humanity.

For the last consideration, come home to the dear homeland that we love so much. Great as Britain has been, she will advance now to an overpowering greatness that is beyond all present imagination, and her wealth and prosperity and happiness will increase enormously. But it is not of the spoil and the coming riches that Britain needs most to think when the parchments of peace are signed in Berlin. If it were, then this would not have been a war for humanity at all. It would be nothing to us if we gained the whole world and lost our own soul. war will improve the British people. nation we have needed some attention. may have been over-rich, and may have fallen into ways of carelessness. Our thoughts have dipped a little from their normal height, our standards have become a little shaken, and there has been some confusion. In some ways we have become narrow-minded, and have overlooked the greater things in national life while we have laboured in promoting the importance of trifles. Think of the mad, the ridiculous state into which our parliamentary system has fallen through excesses of the party system. Only when at war, when by threat this wasteful, foolish conglomeration of parties all dissolved and left an efficient unity, did we fully realise the folly of it all. The party way is desirable for good government by supplying criticism and regulating control, but much of what we have had in recent years has been merely peevish hindrance and destruction. The excess of party system, as it was carried on up to the time when Germany and Austria began their fatal conspiracy against mankind, vanished at the announcement of the war; and will it ever come to life again? If not, that will be something won. After the war shall there not be a better regard in general for the forces of the spirit as against the forces of materialism, seeing the sad pass to which the latter have brought us? In the dark hours at the beginning of the conflict men were heard, in their agony, to say that if the Allies, fighting for the good of the world, lost the war, it would no longer be possible to believe in Providence. Then is not the converse true, and shall there not be a new and better belief, perhaps a saner and less conventional, in the Controller of the universe? We shall realise the joy of a simpler and more real life, not meaning that we need impose harsh restrictions upon ourselves. We shall perceive that previously we had wandered too far from our base in ideals, and that it were well to return to some of the care and thoughtfulness of Victorian times. If in some respects those times were smug and priggish, they had fine virtues, and perhaps the conscience of Britain was then more fully awake and active, and set at its right adjustment, than it was after-

wards until the beginning of the present war. Many vulgarities have crept into our ways of living, and the unity of the nation and its hardship should remove them. Shortly before the war began a host gave a dinner-party of such magnificence that it was reported that it cost him forty pounds for each of his guests. About the same time I read this in a newspaper: 'It was reported at the meeting of the Reading Insurance Committee to-day that in the case of one local family six of the children slept in one bed—three at the head and three at the foot. Three of these children were suffering from consumption, as also was the father.' This kind of thing should not be tolerated any more in the richest and greatest country in the world, the one that has helped to save humanity.

* * *

Tastes and standards in our forms of entertainment have gone awry. Real literature and real music and real drama have been badly neglected to the advantage of the merest shoddy. Has it not often been the case that after a great and cleansing war there has been a grand revival of the best in these matters, coming from chastened hearts and purified souls? Here in the past there has often been pointed out the badness of the gate-money system in games, and the evils to which it had led, cricket and football as good sports having been spoiled. A sad exposure came at the beginning of the war when, having to choose between the service of patriotism and the games with the sixpences of gate-money, large bodies of the supporters of such games and one of their high governing authorities held to the system, and are now condemned. Shall we not remember now what was the last great interest and enthusiasm that England had, according to its leading newspapers, just before the war began? What strange subject was being given great attention in those journals, being most seriously discussed? Prize-fighting! In simple boxing, as between two men who box for the love of the thing, there is sport and manhood to be displayed. It does no harm; it may do good; it is fit to see. But this new prize-fighting, supported by leading newspapers, is not like that, and is not even half so good as the fighting of the days of Tom Sayers. These modern pugilists will fight only when sums of from one to six or seven thousand pounds are guaranteed them, and when the loser is sometimes assured of more moneygain than the victor. Sport! And the acknowledged champion of such a sport is a black man who at the time when I write is living in London and giving exhibitions at music halls, receiving more in fees in a week than would serve to keep for a year a family made fatherless by this war. This kind of thing will not do for

our New Renaissance. Right on the eve of this war, when the country was lending itself to the prize-fighting craze, some priests were being lauded for their superior broad-mindedness because they consented to be the officials at these combats. Pictures of such priests, with commending words, were published. They were represented as being better than other priests. In the New Renaissance which follows this war the Churches will have better work to do. And the women of England were being called to these fights, and they went, even in thousands, as never before had they done. Some leading journals noted the fact with great approval; they gave them the utmost encouragement Those women were represented as being better for what they did. Women of prominence were invited to write to the newspapers their impressions of such fights, and this is how one of them wrote: 'The fight is over! Wells has won' I have indistinct recollections of standing up and shouting my delight. It seems all too splendid. I feel as though I knew all the sensations of those women who threw their jewels into the ring. It was England winning, and all the hopes of England winning still. . . . No doubtful decision on points, but with one of those blows that make him still the greatest boxer we have. I sat there trembling with fear lest in those ten seconds Bell should rise again. No one could hear the count of them. The whole building was shouting just what I felt, and when they had passed I can only say that my delight was too great.' And yet it is still true that the hand that rocks the cradle rules the world—so very true. There is an expression that women once would use about one of their sex, which they employ less in these times, I think. Alluding to their friend, they would say, 'She is such a nice little woman!' This is a triplet of three very plain, simple, and somewhat indefinite words; but has it ever occurred to you that together they stand for a very distinct type of woman, that they mean quite exactly one particular kind and no other, and that their application to a large proportion of women would at once strike you as incongruous and absurd! You know the woman that they mean—one who is soft and tender, innocent and gentle, affectionate and trusting, no doubt intensely feminine, divinely womanish. As you think of her you think of children too, and of the beauty of life. The type was commoner in the Victorian times than now. Yet we have seen since the war began that the heart of the British woman is still great. The instincts of the men and women of our race are as good as ever, but there may have been a little carelessness. It will have gone when the guns of Europe are silent once again.

CONCERNING KIÁU-CHAU.

By W. F. BATTEN.

T is more than a little disconcerting to any one who knows Tsing-tau—otherwise Kiáu-chau -to read telegrams stating that it is to be bombarded by the twelve-inch guns of the Japanese fleet. But the comments in the Press on 'the danger of exposing the Jap's war-vessels to the fire of the heavy guns of this strongly fortified place' are entirely superfluous; for the danger to the Japanese fleet from the heavy guns of the forts built on the circle of hills, from five to six hundred feet high, which surround Kiau-chau is purely imaginary, the simple reason being that the forts are unfinished and the heavy guns non est; though doubtless they have done their best to remedy, as far as possible, this state of affairs since war was declared. Then the garrison, which is supposed to number between seven and eight thousand men, really consisted of only about five thousand German marines, with a few companies of drilled Chinese, at the time when war broke out; and it is doubtful whether the German reservists will succeed in reaching the town from other parts of China. But supposing there were seven thousand troops in the place, they would be utterly inadequate for a successful defence. This is because Kiau-chau, like our own Wei-hai-wei (a little farther north), needs for defence to have the hills surrounding it strongly held by some twenty-five thousand troops. Therefore, if either Japan or Great Britain, or both combined with France, intend to capture 'the German Hongkong,' it should be done by establishing a close blockade—that is, through starvation—not bombardment; and it now looks as if this were the course the Japanese intend to take. With regard to the bombardment of this handsome town, we wonder whether the financial and commercial world at home wishes to hear of eight hundred and fifty-pound shells charged with high explosives being dropped on the premises of British merchant princes like Messrs Jardine, Matheson, and Company, or those of the Hong-kong and Shanghai Bank, the great banking corporation which in past years, when working hand in hand with our Foreign Office, was ever the sturdiest supporter of British financial and commercial interests in China. Nor would these eight hundred and fifty pound intruders be any better appreciated by Messrs Butterfield & Swire and other well-known British firms established in Kiáu-chau. However, the many English families who in the heat of summer go to the handsome Grand Hotel, the Strand, or the Central, in the fine foreign quarter of the settlement, in order to let their delicate little ones get the benefit of Kiáu-chau's excellent climate, and to enjoy its sandy beach, all left at the approach of trouble. Moreover, it would be almost as

great a pity to hand over this handsome, thriving, and up-to-date town to the maladministration, corruption, and dry-rot that still distinguish mandarindom as it would be to allow it to be demolished by shell-fire. Far better would it be to restore it to China nominally, in order to save mandarindom's face, while actually allowing it to remain a foreign settlement somewhat resembling Shanghai, but administered by the Allies instead of by Germany. The influence of the 'mailed fist' in China is an evil thing, which has always been used to injure British interests and undermine British prestige in the Far East. Its methods with Chinese officialdom were threats or bribes; with the British, unfair competition backed by heavy subsidies and underhand intrigues. Through these methods alone has it succeeded in running British shipping out of Chinese ports, and squeezing British firms out of their trade with China.

When, in the 'seventies, the writer visited Tsing-tau it was merely a poverty-stricken little fishing-village, and so it remained till the end of 1897, when the ramshackle German fleet of those days was enabled—owing to the permission given by our Government to use British coaling stations—to crawl into the peaceful harbour of Kiáu-chau, and, under the pretext of avenging the murder of two German missionaries, to seize it and the adjoining country. Eventually the Chinese Government was compelled to grant a ninety-nine years' lease of one hundred and seventeen square miles of territory nominally, but in reality of a zone of thirty-two miles from the shore of the bay; and this brought seventy thousand Chinese under German rule. The right to construct a railway to Chinan-fu, the capital of the province of Shan-tung, had also to be conceded. This province, which is the Yorkshire of China, has a fine climate and a population of forty millions, who eat meat and vegetables The men can instead of the usual fish and rice. be trained to be fine soldiers, as King Edward's regiment of Chinese Guards testified, and also good seamen and marines. Shan-tung, China's finest province, was undoubtedly earmarked for German absorption by peaceful penetration, or otherwise, in the future. Moreover, Kiáu-chau could be made almost a second Port Arthur, and doubtless would have been had the financial position in Germany permitted. This would have enabled the 'mailed fist' to overawe Peking, which is only three hundred and fifty miles distant; hence the Chinese Government's desire that we should retain Wei-hai-wei. The Germans intended also to connect their local railway with the main Lu-Han Peking-Hankow line.

The bay of Kiáu-chau, though only about a mile and three-quarters wide at the entrance, has an area of one hundred and fifty square miles, and is, indeed, so large that the land at its head can only be dimly seen from the entrance. The harbour varies in depth, but there is safe anchorage within it for ships of any size; and there is a large, though at present undeveloped, supply of good bunker coal within easy reach. When the war began it sheltered thirteen German warships, as well as an Austrian cruiser. The most powerful of the German vessels were the Scharnhorst and the Gneisenau armoured cruisers. There were also the Nuremberg and Leipzig fast cruisers, and the gunboats Itis, Jaguar, and Suchs, with two large destroyers, and small craft of negligible value.

The wonderful transformation the Germans have effected in the harbour has extended to the surrounding country, where the bare, rocky, granite hills surrounding the port have been covered with trees by careful afforestation. at one time poorly cultivated valleys between these and the coast are now very fertile tracts, producing fine crops of wheat, maize, millet, and barley. Last year the new German railway to the provincial capital carried over a million and a quarter passengers, with about nine hundred thousand tons of goods. The important works so long carried on in connection with the harbour are now completed. The new sixteen-thousandton floating dock is capable of taking vessels up to four hundred and fifty feet in length, and there are three moles which can berth twenty ships. The water-supply is pure and abundant, and the electric lighting, like the drainage arrangements, is quite up to date. There are many fine buildings, including a well-equipped observatory. It is estimated that the German Government has spent nearly twelve millions sterling upon the

The present total of Germany's trade with China-nearly four millions per annum-when compared with that of the British, does not present the true perspective in relation to the future, and it is the future in China that is going to count. Hence the German commercial community's persistent efforts, always backed and controlled by the German Government, to secure a dominant position against the time when China's economic resources will be much more fully developed. The district immediately surrounding Kiáu-chau is rich in mineral and metalliferous deposits.

Besides the 'Central,' the 'Strand,' and the

new 'Grand,' there are other very handsome hotels in the foreign residential quarter, which has been very well designed and handsomely laid out. Prince Henry of Prussia cut the first sod of the Shan-tung Railway in 1899, and within three years after one million two hundred and thirty thousand passengers and eight hundred and fifty-two thousand tons of goods were carried. In 1912 the Shan-tung Mining Company obtained nearly six million tons of coal of a quality very suitable for steamers' bunkers, the demand being in excess of the present supply. Soap, albumen, and hat factories, and breweries, are run on up-to-date lines; and Kiáu-chau has obtained a virtual monopoly of the straw-braid industry. There are ample educational facilities, technical and German High Schools, as well as good Chinese ones, being maintained by the Govern-

Though Kiáu-chau was declared a free port in 1899, by a very favourable arrangement (for Germany) with China a branch of the Imperial Maritime Customs was established there in 1906 for the collection of duties on goods coming out of, or going into, the interior, in accordance with the general treaty tariff; but 20 per cent. of the duties so collected must be paid over to the

It should be clearly understood that if Great Britain is to profit financially and commercially by the destruction of the ill-gotten German military sphere of influence in China, and British commercial enterprise is to be secured on a permanent and unassailable footing, our traders must take a leaf out of the German book. They should be represented by managers or agents who can talk to the Chinese without interpreters, and they must supply goods suitable to local demands. Commercial firms should, as far as possible, combine, and British banks and financial syndicates support British enterprise only. Our Board of Trade is now adopting a quite new policy, and will whole-heartedly support such If, therefore, the coming opportunity is turned to good account, the influence of British capital should enable British firms to secure contracts for new railways, mining operations, and engineering works generally. Here, too, there will be no danger from such Japanese competition as our traders will have to face; whilst the removal of the heavy and illegitimate pressure of the 'mailed fist' will entirely change the situa-The prospect of a great future lies before British enterprise in China through these changes.

A SCOTTISH DUEL OF LAST CENTURY.

By WM. A. MILLAR.

in our social manners and customs are well

HE changes that a hundred years have brought | seek to settle private differences as compared with those which obtained in this country as exemplified in the methods by which men now | late as the eighteenth, and even the earlier part

of the nineteenth, century. Political contention then could hardly fail in having a piquancy of its own when it carried with it the possibility that one might be waited upon by 'the friend' of one's antagonist, with a polite request to 'give satisfaction' in the approved mode; and no doubt in those days many a sober citizen found a certain complacency in recalling his earlier and more ardent years, when he too had 'pinked his man in Beauty's quarrel.' Even the traditional canniness of the Scot and the sobering and pacific influences of the years were not proof against the practice; for in the encounter now recalled, which took place on Tuesday, 26th March 1822, near the quiet village of Auchtertool, in Fifeshire, the combatants were both men in the prime of lifethey had been born in the same year, 1775 -and were members of families connected with the county, and well known throughout Scotland.

One was Sir Alexander Boswell, Bart. of Auchinleck, Ayrshire, a Writer to the Signet, and a poet and antiquary of some distinction in his day; the eldest son, too, of James Boswell, the biographer of Johnson, and a cousin of Claude Irvine Boswell of Balmuto, advocate, who became a Lord of Session under the title Lord Balmuto. Sir Alexander was a man of lively imagination, and possessed of a considerable fund of humour, who sang his own songs with great spirit and effect. Some of his songs, such as 'Jenny's Bawbee' and 'Jenny Dang the Weaver,' had acquired a wide popularity even in his lifetime, and were almost as familiar as those of Burns. He had a printing-press of his own at Auchinleck, and in 1803 he published a small volume, Songs, chiefly in the Scottish Dialect, bearing the inscription, 'Nulla venenato litera mixta joco.' It would have been well for him if all his verses had been animated by the spirit of that motto. His opponent was James Stuart, Esquire of Dunearn, who seems to have divided his time and attention pretty evenly between his duties as a lawyer in Edinburgh—he held the honourable office of Clerk to the Signet-and his concerns as an agriculturist on his Fifeshire estates. Mr Stuart was closely connected with many noble Scottish families-Moray, Reay, Melville, and the Erskines of Cardross; and it is noteworthy that Boswell and he were relatives, and had at one time been on friendly terms.

The casus belli was one common enough a hundred years ago. Stuart was an extreme Whig; and Boswell, an ardent Tory, had written some 'political squibs,' as he called them, first to The Beacon, which was published in Edinburgh, and afterwards to a Glasgow newspaper called The Sentinel In these were contained many violent attacks upon Mr Stuart; in particular, certain charges of personal cowardice, which were both unprovoked and undeserved. The head and

front of the offending was what was written in one of the papers, entitled:

Whig Song.

Supposed to have been written by one of the Jameses, extainly not by King James the First or King James the Fifth, but probably by one of the House of Stuart.

Tune: 'Sheriffmuir.'

There's some say that they're Whigs,
And some say that we're Whigs,
And some say there's nae Whigs ava, man,
But ae thing I'm sure,
A paltry Whig do-er [lawyer or agent]
'S the Whig that out-whiggifies a', man.
Chorus.

There's stot-feeding Stuart,
Kent for that cow-art,
How glegly he kicks ony ba', man;
And Gibson, lang chiel, man,
Whase height might serve weel, man,
To read his ain name on a wa', man.
Chorus.

Your knights o' the pen, man,
Are a' gentlemen, man,
Ilk body's a limb o' the law, man;
Tacks, bonds, precognitions,
Bills, wills, and petitions,
And aught but a trigger some draw, man.
Chorus.

This song, and certain other writings which appeared in *The Sentinel*, were published anonymously; but Mr Stuart, incensed by these attacks, went to Glasgow and contrived to secure possession of the original documents. Till then he had had no suspicion as to their authorship, and was accordingly greatly taken aback to find that they were in the handwriting of Sir Alexander Boswell, and that some of them were actually signed by that gentleman, and bore the postmark of Mauchline, near which was Sir Alexander's county seat of Auchinleck.

Mr Stuart immediately—on Monday the 25th of March—repaired to Edinburgh. Failing explanation or apology, a meeting was inevitable, and he sought out a friend, Lord Rosslyn, to undertake matters for him.

Lord Rosslyn, at Mr Stuart's request, had a meeting with Sir Alexander, which took place in the Waterloo Tavern; recounted what Mr Stuart had learned; and told him with great civility that as there was a very strong presumption that the papers had been written by Sir Alexander, Mr Stuart considered that he was entitled to ask whether he were really the author. Lord Rosslyn performed his part tactfully, and, as was Mr Stuart's wish, with every desire to avoid the appearance of offence or aggression. He assured Sir Alexander that if he could say that he was not the author of the papers, or had not sent them to the newspapers, such a denial on his part would be conclusive against any evidence that might be forthcoming. Sir Alexander, to whom this visit had not been unexpected, remarked that it was a matter of great delicacy. He left the room, and returned accompanied by

the Hon. John Douglas of Lockerbie, a friend of his own and a brother of the Marquis of Queensberry. Lord Rosslyn repeated his question, impressing on the others that it appeared to be justified by the strong presumption as to the authorship of the documents. Boswell desired to discuss matters in private with his friend. Lord Rosslyn left the room; and when he was called back he found Mr Douglas alone. gentleman stated that he could not advise his friend to give any answer to Lord Rosslyn's question; that Mr Stuart, who was in possession of the facts on which that question was based, must exercise his own judgment; and that, if the unfortunate business were to proceed farther, two conditions were indispensable—that there should be no meeting for fourteen days at the soonest, for Sir Alexander proposed to execute some settlements which, for their validity, would require his attendance at kirk and market, and that any meeting arranged should be on the Continent. To these conditions Lord Rosslyn indicated that Mr Stuart would agree.

Sir Alexander had evidently made up his mind to offer no apology, and the challenge being inevitable, Lord Rosslyn returned to his friend to apprise him of what had passed. Within half-an-hour Lord Rosslyn called again on Mr Douglas to confirm that Mr Stuart was agreeable to Sir Alexander's conditions, and it was then arranged that matters should be finally adjusted between the parties in London, Calais being spoken of as a safe and convenient rendezvous for the Lord Rosslyn had hardly parted from Mr Douglas when Sir Alexander returned to tell Mr Douglas that he had been to consult his friend Lord Meadowbank on the subject of the place to be chosen for the encounter. Lord Meadowbank, one of the Judges of the Court of Session, had advised that there was no necessity to go to the Continent, or even to England; that, indeed, Sir Alexander was as secure in Scotland as anywhere else, and that 'the Lord Advocate was as safe as the Grand Jury.' Sir Alexander had hoped to reach Mr Douglas's house with this opinion before Lord Rosslyn left, but the Earl had gone. Mr Douglas hurried round to his house, to learn that he had already set off for Newhaven ferry on his way home to Dysart House in Fifeshire.

Thither Mr Douglas followed him, and overtook him on the pier. Considerable differences emerged in the conversation that ensued. Lord Rosslyn objected to any change being made in the arrangements, as being highly inconvenient and embarrassing, the more so that Mr Stuart was to go to London that night, and might even then be already gone. Mr Douglas asked the Earl to return to Edinburgh with him to see what could be done; but Lord Rosslyn refused. He was convinced that their return together, coupled with their meeting in the morning, might excite observation and suspicion, and he accordingly

embarked on the ferry-boat and continued on his journey to Fife.

Before parting with Lord Rosslyn, Mr Douglas had obtained the Earl's consent to his calling on Mr Stuart to see whether the rendezvous could be changed. Mr Douglas returned to the city and at once called. Mr Stuart had no objection to the meeting being in Scotland, though he indicated that he wished that any arrangements might be made not directly with himself, but through Lord Rosslyn. By this time the evening was drawing on. Mr Douglas saw Sir Alexander, who reported that in the afternoon he had seen his man of business about his will, and that the settlement might be completed within a couple of days instead of a fortnight, as Sir Alexander had at first supposed.

There is the strongest evidence that after this visit from Mr Douglas, Sir Alexander went round to a dinner-party with the 'Author of Waverley' at his house in Castle Street, and was the merriest and gayest of the high-spirited company

gathered round Sir Walter's table!

In the meantime, between nine and ten o'clock, Mr Douglas returned to tell Mr Stuart of the latest suggestion for the meeting. Mr Stuart said it was not right that he should have any communication on matters of the kind, and told Mr Douglas he had a friend in the house, a Mr James Brougham, who was accordingly sent for. This gentleman—a brother of Lord Brougham undertook to communicate by express to Lord Rosslyn Mr Douglas's proposal that the meeting should take place in two or three days, and that Berwick-on-Tweed was suggested, so that parties might meet on either side of the Border as they thought most prudent. Mr Douglas then bade both Brougham and Stuart good-night. would have thought that by that hour, and after the excitement and exertions of the day, he would wish only to get home and to bed. But, like Sir Alexander, he did not allow these events to interrupt his social engagements or inclinations, for he went straight to a party at the Royal Hotel! About two in the morning the waiter came to him to say that some one wished to speak to him downstairs. This was Mr Brougham, with news, startling and disconcerting indeed.

About midnight, and, as it afterwards appeared, at the instigation of friends of Sir Alexander Boswell—though entirely outwith that gentleman's knowledge and against his wishes—the parties, Sir Alexander and Mr Stuart, had been waited upon by sheriff-officers, and brought before the sheriff, who had bound them both over to keep the peace! The sheriff's jurisdiction and injunction applied only to the city and county of Edinburgh, but it was apparent that the intentions of the parties were already being noised abroad. Therefore there was need for the most urgent haste. To postpone the meeting now for two or three days was out of all question if further interference

from the authorities was to be avoided. Mr Brougham accordingly urged that the meeting should take place that very morning, and as early as possible, say ten o'clock. Mr Douglas agreed, provided Sir Alexander had no objection. He immediately set off to find out.

Sir Alexander nau gone to roused the family, and got the baronet up. He Sir Alexander had gone to bed. Mr Douglas was short, and Mr Douglas hastened back to Mr Brougham. Lord Rosslyn, he said, must be present, seeing it was with him that the negotiations had been conducted, and they must all go over to Fife, as that would be the easiest way to get at Lord Rosslyn. Auchtertool would be a

convenient meeting-place.

There was no more sleep that night for any of the actors in the little drama that was so soon to have so tragic an ending. Brougham had resolved on the necessity of his going personally to Dysart to explain to Lord Rosslyn the new developments that had arisen. He arranged with Mr Douglas about pistols. Lord Rosslyn, he knew, had a pair. He would bring both, and Sir Alexander was welcome to one of them. straightway saw Mr Stuart, advised him of all that had been arranged, and left post-haste for Dysart. Mr Stuart wrote some letters, one to his wife and the other to his friend Mr Gibson, with particular instructions as to its delivery. He then called, a little before five in the morning, on another friend, Mr Liston, a surgeon in Edinburgh, telling him he wished him 'to go into the country' with him.

They got a carriage and set off for Fife. It was only when they arrived at the other side of the water that Mr Stuart told the doctor what was on foot, and by that time Dr Liston had guessed his purpose. In the course of the conversation which followed, Mr Stuart said he had no animosity to Sir Alexander Boswell, who was a relative of his. He indicated that he apprehended danger to himself, and referred to another duel which had recently been fought, and in which one of the parties was wounded in a toe. 'I hope,' he added, 'that this encounter will be no worse.'

On the way to Auchtertool, Mr Stuart called at his residence at Hillside, taking Dr Liston with him. There he was engaged for some time among his papers. He made his will and wrote out a memorandum, which he handed to Dr Liston, saying, 'Read that in case I should be hit.' How certainly he anticipated danger to himself, and in what spirit he entered upon the encounter, may be gathered from the text of that memorandum, which was in the following terms:

'If I am hit, and it is wrong to take me to Edinburgh, I wish, if not risking too much, to be taken to Hillside, where everything is comfortable, and where I shall recover far sooner than anywhere else.

'If my senses remain, and I am not moribund, send as fast as possible for my wife with all due caution. She is, of all her family, that one who would the least wish me to live with a dishonoured name.

'I have a desire to be overbled. J. S.

'HILLSIDE, Tuesday morning, March 26.'

The two then continued their journey. have Dr Liston's statement that Mr Stuart was quite cool and collected on his way to Auchtertool.

In the meanwhile Sir Alexander Boswell also had completed some arrangements at his home in Edinburgh, got a chaise, called on his medical man, one Dr George Wood, and with him and Mr Douglas in the carriage, set out for Queensferry shortly after five in the morning. On the way matters were explained to Dr Wood, who, like Dr Liston, was ignorant of the particulars of the affair; and all three agreed that, in the circumstances, Sir Alexander was in duty bound to receive Mr Stuart's fire if Mr Stuart came there that morning. It is clear that to these friends Sir Alexander Boswell admitted that he was the author of the song.

They had breakfast at North Queensferry, through which village Mr Stuart and Dr Liston had passed only shortly before; and, on their continuing the journey, Sir Alexander asked Mr Douglas, as a friend, what advice he would give him as to firing. Mr Douglas replied that Sir Alexander was the best judge of that, and that he should consult his own feelings. Alexander thereupon remarked that he had no ill-will toward Mr Stuart, or any wish to put his life in jeopardy, although in an unhappy moment he had done him an injury. 'No,' he repeated, 'I bear him no ill-will; and I am, therefore,

determined to fire in the air.

Sir Alexander Boswell and his party reached Auchtertool at ten minutes to ten o'clock, Mr Stuart and Dr Liston's carriage arriving from Hillside about twenty minutes later. Rosslyn and Mr Brougham had reached the neighbourhood first. Mr Brougham had got to Dysart House shortly after eight o'clock, and hurriedly explained all that had passed since the Earl left Edinburgh on the previous afternoon. They set out for Auchtertool without delay, and, against the chance of Mr Stuart not having been able at the early hour to provide in Edinburgh for the attendance of a surgeon, arranged on the way for Dr Johnstone of Kirkcaldy accompanying them. Mr Douglas, leaving his party at Auchtertool, walked on toward Kirkcaldy, and met Lord Rosslyn about three-quarters of a mile from the village, just beyond the Baidlin toll-bar. He told him that Sir Alexander Boswell and Mr Stuart were at Auchtertool; but it was thought that Lord Rosslyn might be recognised there, and it was agreed that he should wait where he was while Mr Douglas went back for the others.

Mr Douglas, therefore, did so, and returned

shortly afterwards with Sir Alexander Boswell and Dr Wood. In the carriage on the way Sir Alexander said, 'Now, gentlemen, I beg you to remark that it is my final determination to fire in the air.'

Mr Douglas got down to join Lord Rosslyn. These two set off across the field on Balbarton Farm to the northward of the road to choose a secluded and suitable piece of ground. The carriage drove on for another hundred yards, and stopped at a gate. The carriage with Mr Stuart and Dr Liston had arrived and drawn up on the roadway too. Lord Rosslyn pointed out to Mr Douglas a convenient spot, which no doubt he had occupied himself prospecting while he was waiting for the others to come up; and asked Mr Douglas to go with him to the top of a little hill not far off to have a look at it. Mr Douglas did so, agreed that it was a very suitable place, and waved his hand to Sir Alexander and the others to come toward the spot where they were. That was a sort of hollow dell with a high bank on one side. There Lord Rosslyn and Mr Douglas measured off the distance, each taking twelve long paces. There was some trifling difference in the measurement, and it was agreed to take the longer.

Lord Rosslyn produced the powder, the balls, and the pistols, and these were loaded by himself and Mr Douglas, the latter sitting and the Earl standing up. Each wished the other to give the fateful signal; but ultimately Mr Douglas put that part of the proceedings upon Lord Rosslyn.

The seconds then conducted the principals to their respective stations. Mr Douglas asked Sir Alexander whether he was willing yet to give way in any respect. Sir Alexander replied that he did not see the least possibility of it. He repeated that he intended to fire into the air, and Mr Douglas enjoined, 'Take care to make your fire in the air as distinct as possible. I hope there will be no difficulty then in bringing the matter to a conclusion without further firing. I think you should fire at the bank.' Mr Douglas was satisfied that the matter would stop there, because in his opinion that would be the best apology that could be made. No doubt Sir Alexander was of the same view. At the same time, it was impossible that Mr Douglas could communicate to the other side Sir Alexander's intention to fire wide. None the less, Mr Douglas felt that his knowledge of that purpose imposed on him a certain responsibility which he was unwilling to bear alone. He accordingly spoke to Dr Wood about the possibility of giving some hint to the other side. 'I have no doubt,' he added, 'that no hint should be given.' Dr Wood agreed that he was right. Mr Douglas even mentioned the matter to Sir Alexander, who told him decidedly not to give any hint whatever. 'It would,' he said, 'be placing the other party in a most awkward situation.' Such a hint would, of course, have amounted to an intimation that it was Sir Alexander's desire not to fight, and precluded all possibility of a meeting.

In the meanwhile Mr Stuart and Lord Rosslyn, too, were anxiously considering the situation, even on the stroke of the twelfth hour. Mr Stuart asked the Earl if it was not fit that he (Mr Stuart) should make a bow to Sir Alexander expressive of a wish to be reconciled. Lord Rosslyn answered that he thought that perfectly right. Mr Stuart advanced toward his antagonist for that purpose, and made to raise his hand in salute. But, unfortunately, just at that moment Sir Alexander had turned toward his station, and was walking away from his opponent, and the last opportunity for a reconciliation had gone.

The medical men had been asked to wait at the entrance to the dell, which they did, with the exception of Dr Wood, who thought that he ought to be nearer the parties; and he had accordingly taken up a position somewhat nearer to Sir Alexander. The doctors agreed to turn their backs on the scene, and turn round again immediately after the firing. Mr Brougham had remained on the little hill near, in charge of Lord Rosslyn's horse. Each of the parties took up his station and received his pistol from his second. Mr Stuart at that moment said to Lord Rosslyn, 'I think I ought not to take aim.' Lord Rosslyn agreed, and as a final caution desired Mr Stuart to present his side and not his front to the fire. The seconds drew off together on one side, just at the foot of the bank. Everything was in readiness. Lord Rosslyn called out in rapid succession the words, 'Present! Fire!' Two shots rang out, one hard on the other, and Sir Alexander Boswell immediately fell to the ground.

What passed at that tragic moment and immediately afterwards may be best described in the words of the eye-witnesses. At the trial of Mr Stuart which succeeded these events, Lord Rosslyn-who had kept his eye on Mr Stuart during the encounter-told what he saw. 'When I uttered the words, "Present! Fire!" Mr Stuart raised his arm and fired almost instantaneously. There was a small difference between the shots. Sir Alexander Boswell's came last, but so close on the other as to be scarcely distinguishable. Every possible assistance was afforded to Sir Alexander, who was surrounded by the medical attendants, and I believe by Mr Brougham. Mr Stuart advanced with great anxiety toward Sir Alexander, but did not speak; nor do I think he had any proper opportunity of doing so. When I heard that Sir Alexander had sustained a serious wound I advised Mr Stuart to go away, which he did. Sir Alexander was then removed to Balmuto, all of us assisting. There was no time lost. I bore a considerable hand in carrying him to Balmuto, and Mr Wood and Mr Liston also went there.'

Mr Douglas's story corroborates that account, and adds some other details: 'At the encounter

my eye was more on Mr Stuart than on Sir Alexander Boswell. I felt satisfied that there was no great chance of Mr Stuart falling, Sir Alexander's determination having been not to fire at Mr Stuart. Therefore I kept my eye upon him. I observed Mr Stuart raise his pistol deliberately. He did it very steadily, but I did not see the direction of the pistol. I saw it brought firmly up, and of course I then felt a little nervous. They fired, and I saw Sir Alexander fall. I heard two distinct shots. immediately ran to Sir Alexander, and inquired if he were wounded. The surgeons, too, were instantly with him. I do not think Mr Stuart left his place, at least not much from where he stood; but I did not observe him much or look much at him. After the medical persons examined the wound, Dr Wood told me he was afraid it was mortal. I went toward Mr Stuart, and told him he had better go off directly. When Sir Alexander's wound was probed and examined, he turned round to me and said he was very much afraid that he had not made his fire in the air appear so decided as he could have wished. That was the only observation he made. There was no dressing on the ground. I borrowed Lord Rosslyn's horse to inform the family at Balmuto. On returning from the house I met them carrying him on a door. They had collected some people on the way, who had assisted in carrying him.'

There were some patches of snow still unmelted on the side of the road, and on the way Sir Alexander once or twice asked for a little snow to be put into his mouth to allay his thirst. When the party reached the house Sir Alexander was deadly pale, but calm and collected; and he said, with a sad smile, to his host, 'This is a shabby way of paying you a visit, Lord Balmuto.' Dr Wood's verdict was, alas! soon to be realised. The bullet had entered the lower part of Sir Alexander's neck, shattered his collar-bone, and struck the spine, all below where it hit being paralysed. About midnight the doctor asked how he felt, and he instantly replied, 'I feel a live head fastened to a dead body.' Shortly after he sank into a stupor, and died in the afternoon of the next day.

The trial which followed these events, three months later, and in which Mr Stuart was indicted on a charge of murder, aroused great interest throughout the country. It was presided over by Lord Justice-Clerk Boyle, the other judges being Lords Hermand, Succoth, Gillies, and Pitmilly. Lord Meadowbank did not attend, for the reason that, as mentioned, it was he who had been consulted by Sir Alexander as to having the duel in Scotland. The prosecution was in the hands of Sir William Rae, the Lord Advocate, Mr James Wedderburn, the Solicitor-General, and Advocates-Depute Duncan M'Neill and Robert Dundas. Mr Stuart, who pleaded 'Not guilty' to the charge, was repre-

sented by no fewer than seven counsel, including Mr Francis Jeffrey, Mr James Moncrieff, and Mr Henry Cockburn. One striking feature of the evidence was the varied and weighty testimony of numerous witnesses not only to the peaceableness of Mr Stuart's disposition, but to his constancy and courage. These witnesses were all gentlemen well known in public life, many of them being strongly opposed to Mr Stuart in politics.

Mr Stuart's friend Mr Gibson, the 'lang chiel' referred to in the song, told in the witness-box how, a few hours after the duel, Mr Stuart called on him in Edinburgh, and of the affecting scene which took place. 'Mr Stuart ran into a corner of the room, covered his face with his hands, and burst into tears. He was in the most complete agony of mind. . . . He said he had taken no aim; he wished to God he had taken an aim, for then he was certain he would have missed Sir Alexander.'

The Lord Advocate made little comment on the evidence, which, in a short speech, he left with the jury for their consideration. Jeffrey, on the other hand, dwelt at length on the absence of malicious intention on Mr Stuart's part, reviewed a series of previous Scotch trials which had arisen from similar circumstances, and quoted a number of authorities in support of the principle and practice of duelling. first of these, it is of interest to note, was a very considerable extract from 'a work universally known, and which will carry down the name of the father of Sir Alexander Boswell to the latest periods in the annals of English literature—the memoirs of his illustrious friend Dr Johnson, a man certainly of the sternest morality and most profound sense of religion, who joined to both these high and severe attributes perhaps the most vigorous understanding that was ever brought to the consideration of any moral question.' In a notable and powerful speech, Mr Jeffrey urged that his client's mind had been free from every spark of malignity, vindictiveness, or rancour; that he acted in the matter from motives totally unconnected with personal animosity; and that he ought now to be considered, not as having committed a great crime, but as having fallen under a great calamity.

Without retiring, the jury, after a moment's consultation, found the panel, as the accused was called, 'Not guilty,' and Mr Stuart was thus honourably acquitted.

Not many, surely, who read the story of this tragic and sorry encounter between two honest, spirited, and amiable gentlemen will wish for a revival of the practice and tradition of which, in different degrees, they were both the victims. This was not quite the last duel that was fought in Scotland; but, as a result of the widespread attention attracted by the circumstances of the affair, the subsequent trial, and the eminence of

the parties in society and public life, the practice of duelling was undoubtedly hastened forward toward the final stages of discredit in public opinion. It may be said that the report of the

pistols, as they cracked out on the quiet air of that spring morning two-and-ninety years ago, sounded the knell of a ruthless custom in the social history of our country.

KUSTARNY.

IT is safe to say that there is no other national industry so wonderful, so vital and paramountly necessary, but so little known outside the country of its origin, as kustarny. Yet kustarny deals most intimately with the real life of some twelve million workers, and is one of the marvels of the vast empire of the Czar. It gives expression not only to the conditions ruling their existence, but to the artistic culture of the mighty nation to which they belong. The word itself means 'peasant industries,' as distinct from capitalist enterprises, and had its origin ten centuries ago, when the history of the Russian

Empire was yet to be written.

Owing to the severity of the winter the peasants of Russia are compelled to abandon agricultural work for five to seven months in the year, according to the region, and are thus cast upon their own meagre resources for occupation during their enforced leisure. It was in these circumstances that kustarny originated. The natural resourcefulness of the Russian turned him to what is now a series of home manufactures, which at this day produce some of the most rare and exquisite wares to be found throughout the two worlds. So phenomenally important have these peasant handicrafts become in the life of the nation that the Russian Government not only provides raw material through District Kustarny Centres, but undertakes to purchase the goods and push the sale of them abroad, collecting the finished products from the innumerable villages and distributing the payment for them; doing, in short, everything to stimulate this peculiarly indigenous industry.

The jewellery and bric-à-brac work of the kustari are particularly beautiful. About Russian jewellery, both in design and workmanship, there is a certain indefinable charm found in no other European or American manufacture; it is more like a combination of the best European and best Eastern artistry blended in subtle harmony. The finest of it is produced by the peasants, who are remarkably clever jewellers, executing the most intricate work with a finish and beauty so perfect as to be almost beyond comprehension, especially when the conditions under which they turn out the exquisite wares are taken into consideration. Their necklets, rings, bracelets, and other articles

are almost incomparable.

Bronze-work, to which the Czar has given much favour, is the winter product of a small section of the peasants, who, in addition to being unusually skilful craftsmen, have made a special study of the subjects. Their casts of insects, animals, plant life, human subjects, and others are strikingly handsome.

What is certain to become as costly a craze for collectors as Japanese and Chinese lacquer-ware is the loukoutin work of the kustari. This particular art was created hundreds of years ago by a peasant family named Loukoutin, from whom it derives its name. The model is first enamelled in various designs and colours, and then baked in an oven at a high temperature. A subsequent finishing process produces this indescribably beautiful enamel-work. Pieces of the original loukoutin ware, which is very scarce, now bring more than their weight in gold. The Russian connoisseur is no fool.

The kustari utilise the Ural precious stones to great advantage, making skilful use of their singular beauty and brilliance in the setting. The malachite variety are especially popular on account of its extreme lustre. The peasant-jewellers show surprising art in fashioning single stones into minute but exquisite carvings of such animals as dogs, horses, elephants, sheep, &c., many of which fetch fabulous sums among the French and Russian collectors. Other stones are finished and polished in the usual manner, and find their way into the leading markets on the Continent and the near East.

Those of the *kustari* who devote their weary winter to casting life-studies in metal produce work which can stand alongside that of the finest atelier, and challenges criticism successfully. In cast-iron, the peasants' artistry and fine workmanship in such rough material seems almost in-

credible.

Perhaps, however, the articles for personal adornment manufactured by the peasants out of white-metal are the most astonishing. designs are very characteristic of Old Russian craftsmanship, and are wrought under very primitive circumstances, which make their beauty and perfection of finish all the more surprising. The conditions under which the kustari work are anything but conducive to the attainment of artistic perfection. Almost all the work, including jewellery, metal-work, wonderful horn goods, linen and woven materials, wood-carvings and toys, and tchinar (wooden goods), embroidery and lace, is done in little rooms lighted by one small window, through which the light of the winter day struggles with an effort, and often in midwinter there is but three hours of daylight. When the darkness gathers the room is lighted

by a small oil-lamp, or if the family is very poor—and it usually is—by means of a piece of wood dipped in oil. By the indifferent radiance of either of these, the peasants create their masterpieces which have called forth the enthusiastic admiration of world-known connoisseurs.

It would seem that the extraordinary skill of the *kustari* is inherited in increasing measure by each succeeding line of descendants, many families having specialised in a particular manu-

facture for generations unnumbered. It is difficult to explain in any other way the singularly rich quality of the work, especially as it is executed with rather primitive appliances and tools. What is most noteworthy in these days of spiritless designs and mechanical work is that in the products of the kustari—the agricultural clodhoppers of Russia—there is an individual spirit, a peculiar mystic design, which gives life and vigour and freshness to them.

THE MONTH: SCIENCE AND ARTS.

SCIENCE IN WAR.

ALTHOUGH ostensibly the terrible conflict being waged upon the Continent is a contest for supremacy between masses of soldiers, the results being governed by physical endurance and stamina of the opposing armies to a very pronounced degree, in reality it is a battle between the forces of science. The scientist in one form or another is revealed at every turn. Many theories are being submitted to the stern and frightful test of practical application, and the outcome will be interesting. In the first instance, there is the scientific method of mobilisation, followed by the arts of tactics and strategy in massing the soldiers and making the moves in the grim game of war. Then there is the science of feeding the millions of protagonists, together with the methods for preparing the dietetic elements so that the fighting-men may be kept in the pink of condition. The small firearms represent science in another guise, because this is the first big war in which the automatic rifle, the self-loader, high explosive powders, high velocities, and the penetrating as well as stopping properties of the respective bullets have been tested. The quick-firers and machine-guns, light artillery, range-finders, heavy howitzers, siege-guns, and fortifications are also being submitted to supreme ordeals. Dense versus extended formations as applied to the movement of troops in the fighting line, as well as methods of entrenchment and protection, are being tested severely. Shells of infinite variety, in conjunction with high explosives, are being used for the first time. After the battle is over, science is represented in another and a humane form. Practical surgery of what may be termed first-aid is rendered upon the battlefield to reduce the mortality and extent of incapacity arising from rifle and artillery fire, while that terrible scourge of war, disease, is being fought in a manner such as has never been known before. It is doubtful whether epidemics, such as typhoid and dysentery, ever will succeed in obtaining a firm hold in this campaign, thanks to the elaborate hygienic methods which are being practised. Transportation, both by rail

and road, is undergoing severe trials, motor traction being especially in evidence, inasmuch as the damage wrought to the railways renders movement thereby very slow and uncertain. So far as communications upon the battlefield are concerned—the extent of the fighting line ranges up to three hundred miles—telegraph, telephone, and wireless are being utilised. The aeroplane and airship are in use for the first time, and many interesting theories are being disproved or substantiated. Upon the sea the results of lyddite, mélinite, and other devastating and asphyxiating high explosives are being carefully studied, as well as the destructive effects of the shells. Naval tactics, as practised by the different combatants, are brought into violent competition. The steam-turbine in its application to warfare is upon its trial; the resistant power of the latest developments in armour-plate construction, the submarine, and the torpedo are likewise under searching investigation. human element in reality is a somewhat minor factor-soldiers and sailors are merely pawns in the game, although they have important duties to fulfil, and are called upon to handle the many wonderful instruments which have been devised to consummate destruction. But, after all is said and done, victory will be dependent to a very vital degree upon the forces of science, and the knowledge of applying them to the best advantage.

REGAINING LOST INDUSTRIES.

The German has ever been regarded as a wonderfully successful copyist. In the history of invention the Teuton does not play an important rôle, but in the commercialisation of an invention he has led the world, the initiative and enterprise of the American notwithstanding. Many a new industry has been created in these islands; but it has been strangled by competition inaugurated across the North Sea, and in many instances powerful monopolies have been established in the country with which we are at war. One of the most telling instances of this capacity to profit at Britain's expense is in connection with the aniline dye industry. The import of Perkin's momentous discovery was instantly

realised by the Teuton, and within the space of a few years the whole industry virtually passed to that country. In fact, the same may be said of the whole of applied chemistry; the Germans by diligent research outdistanced the rest of the world. This fact was revealed very strikingly upon the outbreak of war. Many chemicals rapidly rose in price, the increase in some instances representing 500 per cent. A large number of British industries which had come to depend entirely upon German sources of chemical-supply were in danger of being paralysed. Fortunately, however, Government intervention and commercial enterprise relieved the situation very materially; but, seeing that tremendous leeway has to be made up, considerable time must elapse before Britain attains the pre-war level which prevailed in Germany. In some instances the arts of manufactures have been lost to this country. The revival of these industries must be undertaken without delay, in order that the British firms may be in a position to cope with the enormous economic expansion which is inevitable upon the conclusion of hostilities.

PRESERVING HOME FRUITS.

'Husband the resources of the country' has become a topical saying, and in connection with fruit its urgency has a peculiar value. The fruit harvest of these islands this year has been abnormally heavy, and the housewife has devoted more attention to the preservation of the fruits. Manufacturing enterprise has extended considerable assistance in this direction, the main idea being to assist the housewife in her frugal work, so that the risk of failure may be reduced to the minimum. A new preserving-jar has recently appeared upon the market, the sealing device of which is interesting. The seal comprises three parts—an indiarubber band, a zinc ring, and a glass cap, the arrangement being that no metal is brought into contact with the contents, so that any chemical action, such as may arise from the acids of the fruit coming into contact with the metal, is eliminated. The jar is charged with sound fruit, which must not be over-ripe, and which must not be crushed into the vessel. Cold water is poured into the jar to cover the fruit; the filled jars are then placed in a saucepan containing cold water, sufficient water being used to immerse the jars to the shoulders, and they are isolated from one another by a cloth. The indiarubber ring is set in position, and the glass cap is adjusted by partially screwing home the zinc ring which holds the cap firmly in place. The fruit is sterilised by slow boiling. When the jar is removed from the saucepan the zinc ring is screwed tightly on, and the vessel, with its contents, is left to cool, after which it is stored in a cool dark place. The process is extremely simple and effective. Fruit preserved in this manner will keep indefinitely, and ptomaine poisoning is absolutely impossible; while, last but not least, the jars are inexpensive, and may be used over and over again.

'T.N.T.'

The widespread damage wrought by the submarine mine during the present war has become the subject of considerable comment. missile has always been regarded as deadly, but hitherto it has been considerably overrated. In the Russo-Japanese war the destruction wrought by the mine was comparatively negligible, only one battleship, the Petropavlovsk sinking almost immediately after striking the lurking danger. In this instance, however, it was the circumstance of the mine exploding in proximity to the warship's magazine, and thereby detonating, which was responsible for the swift disaster. The reason why the German mines have been so destructive is because a new explosive Hitherto wet gun-cotton has been is used. employed for this service; but in the present war the mine is charged with what is colloquially known as 'T.N.T.' The full name of this explosive-which is far more powerful than wet gun-cotton—is trinitrotoluene, generally abbreviated in Germany to 'trotyl.' This explosive is of comparatively recent origin, and is very safe to handle, since it can only be fired by means of a detonator. If ignited in the open air it will burn away like paper, while a rifle-bullet fired into a charge will fail to cause an explosion. A fulminate of mercury detonator is necessary to demonstrate its tremendous destructive effects. One outstanding quality of this explosive is that its effects are felt over a much greater area than is the case with gun-cotton. The manner in which vessels have been blown to pieces by coming in contact with the floating German mines offers sufficient testimony upon this point. The powers of this explosive are well known in Britain, and there is no doubt it has been adopted by our services. 'T.N.T.,' however, is not the most powerful explosive known, because there are several others which are infinitely more destructive, notably picric acid; but it is the danger attending the handling of these agents which rules them out of general practice.

A NEW ANÆSTHETIC.

Experiments are being carried out with a new anæsthetic which is a combination of urea with alcohol, and which is known as urethane. It is administered by means of a hypodermic syringe; and, according to the results which are now being obtained, it is extremely effective. Upon administration the subject sinks into a state of drowsiness, which develops into unconsciousness. The complete insensibility to pain which results enables any operation to be carried out with perfect security, because consciousness is lost for several hours. One great advantage accruing from the use of this drug is that under proper application heart failure, such as sometimes attends the

use of chloroform, is unknown; but an overdose is fatal, because it arrests respiration. The vigilant surgeon, however, should be able to detect signs of breathing difficulties, and act accordingly; whereas in the case of drugs affecting the heart directly it is difficult to detect that the patient is in extremis. Urethane has the advantage that sickness does not occur from its use; so the risk of stitches and ligatures being broken from retching does not occur. Inversely there is one great drawback—the prolonged period of insensibility. So far, it has not been found possible to reduce the unconscious lapse to less than five hours, which is a serious defect; but, on the other hand, some practitioners who have used the new drug say that this defect is more than counterbalanced by the many advantages which it possesses.

POWER FROM RAIN.

Energy is wasted in every direction, although during the past two or three years considerable ingenuity has been manifested in efforts to turn natural resources to account. Thus the sun's rays are being harnessed to furnish steam for pumping operations in Egypt and other tropical countries; the wind is utilised for pumping and for the generation of electricity; but so far no one has attempted to make profitable use of the rainfall, although a tremendous amount of energy is thereby running to waste. A correspondent in an American journal has recently pointed out what we are losing through our failure to make use of the rainfall. The district in which that observer resides was visited by a severe rainstorm, the fall of water aggregating 4.17 inches in ten hours over an area of ten square miles. He estimated the height of the rainclouds to be five thousand feet, and on that basis some six thousand million pounds of water fell during the ten hours, representing fifteen million horse-power-hours. The correspondent estimates that if this energy were harnessed, four thousand arc lamps in the city streets could be kept alit therewith for four hundred and twenty-five days. If one rainstorm would furnish such an enormous amount of energy, what would be available if we were able to turn the whole rainfall to account? At all events, the foregoing interesting computation conveys a graphic idea concerning the enormous energy at work in nature.

A SOLDERING POWDER.

The use of resin and solder in tin and other metallic operations appears to have been completely superseded. For some years liquid specialities for this work have been on the market, and have met with conspicuous success. The one objection to these liquids is their liability to spill unless care is observed in handling them. To overcome this defect a soldering powder has been introduced which can be used with brass, zinc, iron, tinplate, &c. The powder has only to be dissolved in cold water, when it

is ready for use. The proportion of powder varies according to the metal to be soldered, but in this respect there is considerable latitude; it is convenient and clean to handle, and doubtless will come into very general use.

A SIMPLE TIE-FRAME.

The popularity of the double collar shows no sign of diminution; but every one is cognisant of the difficulty experienced in tying the sailor-knot. The tie fails to slide easily round the collar, and to remove this inconvenience a combined stud and tie frame has been devised. The frame slips into the stud in the usual manner, and then lies flat upon the shank. The tie is previously knotted upon the frame, so that one has only to slip the latter into position upon the stud, thus facilitating dressing, neither the collar nor tie being soiled in the process. Moreover, the tie is kept firmly in the desired position.

ECONOMICAL RIFLE PRACTICE.

Thousands of pounds are spent annually on the ammunition used by recruits in rifle practice and by enthusiastic amateurs in the art of marksmanship. The pleasure to be derived from the possession of a rifle is often considerably diminished by the expenditure involved. For this reason the electrical device recently patented by Mr W. G. Paterson of Glasgow should meet with ready acceptance by all marksmen, whether civil or military. The invention reduces the cost of target practice at short range to an infinitesmal amount, while still allowing every shot fired to count towards proficiency. It consists of an ingenious arrangement of electric battery and incandescent lamp, inserted in the magazine chamber of the rifle, which, when the trigger is pulled, projects a spot of light on to the target. As the ray of light travels through the barrel of the rifle it indicates exactly which part of the target the bullet would have struck, thus enabling the marksman or his instructor to perceive instantaneously the result of the shot. The invention is especially suited for revolver and miniature rifle practice, for which the cost works out at about a farthing per thousand shots. Mr Paterson has not overlooked the toy rifle, which will be in great demand this Christmas. Parents who were apprehensive of the air-gun will now be able to place in the hands of their children a toy which, though harmless, will enable them to acquire steadiness of hand and eye. The inventor is also the proprietor of a unique cinema-target which he intends developing in conjunction with the above.

THREE MILLION YEARS OLD.

The New York *Outlook* records that an important discovery has been made in New Mexico by members of the staff of the American Museum of Natural History, New York City. This discovery is that of the complete skeleton of a

mammal. President Osborn, of the museum, says of it: 'The mastodon is like a thing of yesterday compared with it.' The mammal in question is the ectoconus. It lived about three million years ago! In fact, according to Dr Osborn, it is thousands of years older than any other mammal skeleton discovered up to the present time. This skeleton will take its place as one of the museum's most treasured possessions. It was discovered in a stratum not much above that in which the remains of the dinosaur of the reptilian period was found. This would indicate that the ectoconus followed shortly after the close of the reptilian period. It thus fills out a very little known period in the world's history. Judging by its skeleton, the ectoconus somewhat resembled the wolf in size and contour; it was peculiar to the North American continent, and was of a type no longer existing. The skeleton was discovered about two thousand feet below the surface of the earth; this was also interesting, for remains of the next existing mammals have in the past been found at about twelve hundred feet below the surface. latest discovery was made in an arid region. Scientists believe, however, that when the ectoconus lived the region was traversed by a stream in size and shape somewhat like the Orinoco. This is by no means the only item in the season's record for the experts. western Nebraska, where an American museum party has been at work, the bottom of an old stream was exposed through the use of nitroglycerine, and here skeletons were discovered of the moropus—an animal larger than the rhino —and also specimens of the pigmy rhino. They existed during a period half-way between that of the mastodon and the ectoconus.

CHINA MOVES.

Dr G. E. Morrison, the well-known Times correspondent in China, gave an important address before the London Chamber of Commerce, which was meant to correct a widespread notion that a large part of that country is at present in a state of anarchy, and drifting to perdition under the régime of an autocratic dictator of unbridled ambition. This view was in conflict The diffiwith all evidence available to him. culties are fewer now than at any time since the revolution; while the handmaids of civilisation —railways, steamers, and telegraphs—are being extended. Industrial development is also far more promising than at any former time. Dr Morrison considered the amended Chinese constitution truly republican, based as it is on American and Japanese models, in conformity with the historical development of European constitutional government; and it seemed well adapted to the people, and well fitted to prepare them to evolve from the rigid autocracy of the past. Another authority, the Rev. Frederick Brown, of Tientsin, author of Chinese Dayspring

after Thirty Years, believes the country has now passed the dangerous stage. The causes of discontent he sets down as greatly owing to the incorrigible dishonesty of the official class on the one hand, and on the other the inability of the Government to control the plunder-lust of the brigands who compose nine-tenths of the army. Yet another writer says that the worst malady of China arises from the universal struggle for office and power which is waged about the President's yamen as fiercely as it was about the Dragon Throne. The Rev. John Ross, D.D., who has written to recommend the excellent work done by the Christian Literature Society of China, rather confirms these views. He points out that the flowing tide of reform is at the flood since the overthrow of the corrupt Manchu dynasty. Full freedom of religion is now granted, there are sixty Christians in various positions in the republican Government, education is making rapid strides, while students are coming to Western lands, to return as doctors, lawyers, or preachers. This Christian Literature Society, which has circulated millions of copies of more than three hundred different books and pamphlets throughout the country, has made a profound impression on the literati of China, who are the real rulers of the land. When this class is moved the country follows. The Chinese reverence for literature is shown by their collecting printed waste-paper in the streets to burn it, lest it should be defiled. Much of the information in the books and pamphlets has also been disseminated through the newspaper press. A newspaper in Manchuria which printed articles on Mohammedanism was willing to follow these up with a series embracing Christian material. One viceroy has stated that the reforms now being introduced into China are largely due to the society's publications. The work has been done on a sum of less than four thousand pounds a year, which the society has sometimes difficulty in securing.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

LIGHTS.

FROM this low hill I watch the twilight stealing
Upon the far-off city, and the gray
Deepen to dark, the bravery of day—
Her builded towers and pinnacles—concealing.
Earth fades to heaven; and stars with kindred
feeling

Earth fades to heaven; and stars with kindred feeling
Commingle with the lowlier array
Of earthly lights; ranked in the darkness they
Seem angel hosts in adoration kneeling.

As creeps the dark, so in the wake of Time Death; nor may might and majesty withstand The obliterating shadow of his hand.

Time fades to night eterne; but the sublime Spirits of earth and heaven, a starry band, Burn before God in their immortal prime.

THOMAS SHARP.

THE JUNGLE CAT.

By F. ST MARS.

CHAPTER I.

PREDERICK CHAUS (otherwise Baby-Face Chaus, or the Jungle Cat, according to whether you were his friend or his enemy) stood staring mildly—this was as near gloominess as he ever permitted himself to show-with his big, innocent, child-like blue eyes down upon the silent street. It was inhabited by one cat, which fled before the footsteps of a special constable. And he was wondering at the perversity of things which permitted him, the greatest living professional hunter and trapper of wild beasts of his day, to be stranded in a great city at war. Also, he was wondering whether the letter he had written to the high official who, he understood, was in charge of these things, offering himself for a special type of scout, for which he would be peculiarly fitted, was likely to bear any fruit.

Now, as a type of intrepid big-game hunter and trapper of fierce beasts, Baby-Face Chaus—half English, half Welsh by birth—could not do other than strike the most casual observer with anything but a smile of incredulity. His round, soft, clean-shaven face; his large, mild, babyblue eyes; his slight self; his thin, delicate hands; his small feet and wrists and ankles; and his shy and innocent manner, were things you simply could not get away from. They stuck in your mind's eye and made you laugh at the bare idea. Most people did more than laugh; they said he was a soft and harmless sort of fool. Chaus himself seldom laughed; he merely smiled; and men said he could not cry. His outlook upon all the world appeared to be one of permanent bashful, unsuspecting wonder. An innocent among ye taking notes in very truth.

Baby-Face Chaus was still wondering—and mentally wandering—at the window, when one of those discreet-looking, dark, clean-shaven men, with bowler hat and black tail-coat and umbrella all complete, who have special Government messenger written all over them, came up the street, stopped, and knocked at the front-door.

Baby-Face watched him; then, crossing the room, took down the little grinning bronze devil who lived atop of the mounted elephant's foot on the mantelpiece, and turned him round three times for luck. 'An answer to my application

for special service,' quoth he, and next instant his housekeeper entered the room with a letter.

Chaus broke the seal, took out a sheet of paper, stared at it, turned it over, stared at it again, shook out from the envelope a visiting-card and a Government railway pass, regarded the paper again, and, 'Mrs Langstone,' quoth he, 'my fishing-kit, please. I shall be away for a day or two.'

Then he took one of his own visiting-cards, wrote on it the one word, 'Right,' put it in an envelope, sealed it, and handed it to his house-keeper, a tiny, gray mouse of a woman. 'The answer,' said he, and the woman left the room.

Baby-Face picked up the paper, and slowly squeezed his chin with his left hand; it was a habit he had.

'Tigers. Harantsworth. Go and kill them. Report result as per enclosed card,' he read, and that was all. No signature, no address, nothing. And it must be admitted, I think, that no man ever started upon a stranger commission with stranger instructions.

Baby-Face looked up Harantsworth on the map, and found that it lay up at the top of one of those lost harbours on the coast of Southshire that shall be nameless. Then he put on a pair of rubber top-boots which strapped round the calf, slipped his trousers neatly down over them so that they looked merely like a pair of ordinary patent-leather boots, put on a Burberry coat and hat, and, going to a locked cupboard, took out a rifle-case.

At this moment Mrs Langstone entered the room, carrying a partly filled fishing-bag and an empty fishing-rod case, and a cup of coffee and Baby-Face took from the Plasmon biscuits. rifle-case the stock of a magazine rifle and slipped it into the fishing-bag, and next the lean barrel of a magazine rifle, which he slid into the empty fishing-rod cover, and strapped all up snug. From the cupboard he then fetched a belt already filled with rifle-cartridges, and strapped it on Then he consumed his under his waistcoat. refreshment and counted out for Mrs Langstone —silent as a mouse, too, but I take it she had got beyond surprises years ago-some money to go on with, and ten minutes from the receipt of

No. 206.-Vol. IV.

[All Rights Reserved.]

NOVEMBER 7, 1914.

his mysterious instructions left the house. And that was Baby-Face Chaus all over.

Harantsworth appeared to be a small town with red-tiled roofs and its feet in the water. It was owned, apparently, entirely by children and starlings, and three dogs that slept in the sun on the pavement and wouldn't get out of the way. An old man lurking in the dark behind the counter of a boot-repairing shop said that the Army and Territorials and Navy between them had taken the rest.

This much Baby-Face Chaus noted before he entered one of the fourteen inns, and invited the proprietor to drink with him while he fed.

'Fish?' grunted the landlord. 'Lor' bless ye! there ain't none. Nor won't be till this war's

ever. All the fishin' fleet's laid up, so they says.'
'Not that sort,' Baby-Face smiled. 'Fish here—to be caught—in the harbour. I'm sent down here to recruit'-

'Ho, you hare, hare you? Then it's no good your a-comin' 'ere, 'cause there ain't none left to recruit.

'Not men. (Won't you take another with me, landlord?) To recruit my strength; and I reekon, after the roar of guns, fishing is about the most peaceful.'

'So 'twould be if there was any to take ye

out in a boat, but I doubt if there be.'

'How about along shore?'

'Oh, you might get one or two that way when tide's up, but 'tain't fishin'. But, as you've come for rest like, that don't matter.'

'No,' said Baby-Face pensively. 'That, as you say, doesn't matter. How about working along eastward?'

'Um! Well, yes; but there's Tarling Manor

'bout a mile along would stop ye.'

'How stop me?'

'There's a great 'igh wall there runs down to the beach, 'cause Mr Oving, what rents th' place, goes in for what they calls "climatising" animals.

"Oh!' murmured Baby-Face Chaus, and stared with wide blue eyes. 'What sort of animals?

Tigers?'

'Gawd an' Mr Oving, they knows. I don't,' protested the landlord. 'Nobody ain't never been in there. They daren't. Mad game I

The round pink-and-ivory outlines of Freddie Chaus's face stood out like the painting of the face of a child against the old oak of the door as he bent low over his bread and cheese. His long eyelashes flickered ever so slightly, while he quietly answered, 'They do, you know. There are one or two landed proprietors about England who acclimatise foreign creatures, or try to—ostriches, zebras, beavers, kangaroos, European bison, American wapiti deer, and the like; and I believe there is, or was, one chap who kept a lion or two walking about loose.

How long has your Mr Oving been at this gahobby, may I ask?'

'Since about ten months afore this 'ere war begun.'

'Ah! Foreigners?'

'Dunno. None o' us 'as seen 'im much. Scientific sort o' gent 'oo keeps 'isself much to 'isself; though they do say as 'e 'as a lot o' gen'lemen friends-professors, they looks likedown to see 'im at times. Very generous 'e is to the people like-very generous indeed, I'm sure. There 'd be many as 'u'd miss 'im if 'e ever left.'

'Really?' Baby-Face Chaus was finishing his meal at speed. He was thinking about his orders, and was sorry for the poor people of Harantsworth who would miss the studious, retiring Mr Oving and his ''climatised' beasts.

Down an old, old lane-Puck's Lane, they called it-flanked with towering cliffs of elmtrees where the rooks cawed, and, for a little space, by the wall of a garden as old as Old England; by forgotten cow-yards awash in high grass; by hawthorns, where the mistle-thrushes quarrelled gratingly among the berries, and a great, gaunt, brown rat foraged in the ditch; past caves under branches through which shone glimpses of sun and of fields; along a tunnel of hedges that had not seen a chopper for many years, went Baby-Face Chaus to where the lane folded down on the pebbles of the shore of the harbour, and the shallow tide spoke at his feet in whispers.

There was sunshine here, and all the land was given over to wide, bright horizons and the fullness of air; the larks sang gaily in the marshy fields, the feathery tamarisks waved all along the sea-bank as far as the eye could reach, whilst here and there, far across the smoked-glass water, a red-tiled house sat down low on the shore, as if it were in Holland. A heron cra-anked, and redshanks whistled dolefully. Tyo ! tyo ! the lost-soul wail of a wandering curlew and the whimper of a wild duck's wings combined together to complete the illusion.

But Baby-Face Chaus, though he was-strange thing-gifted with something of the artistic temperament, had no illusions. His gentle gaze wandered over the church spires, the tall chimneys, the gasometers, the giant cranes of the great dockyard town, visible dimly in bluegray haze far to the east; over the bald, bold hills, fort-capped and frowning, to the north; over the still waters to the surf-fringed harbourbar to the south; and over all the mixture of white-sided sea-wall, whale-backed mud-bank, green-yellow marshes, and smudged lone waters to the west. His powerful prism glasses revealed, at the mouth of the harbour, khaki dots that moved and were Territorial guards, but near him for miles was nothing human alive at all. He might have been on the west coast of Ireland, instead of within eight miles of a big Royal Naval dockyard town, by the loneliness of the place.

'Yes,' said Baby-Face to himself, 'guarded to the south, guarded to the north, and guarded all round; but never a pair of eyes to look here. It'd be hard to get in, but once in, a-

and I'm here for tigers, anyway.'

His glasses took within their range a spiked wall running down to the beach and well out into the water, and Baby-Face Chaus removed himself to that wall quietly, keeping as much as possible in the shelter of the tamarisks, and treading with care. He found it a high wall, too high to climb, too far out into the water to wade round, spiked atop, running away back over the long, bent, whispering, coarse grasses, away behind the hedges, and broken only by one door close at hand—one little iron door sunk deep in the wall, that showed no signs of opening to anything short of dynamite.

Baby-Face pursed his lips with the pout of an unpleased child, and sat down on the sea side of the seabank, the tamarisk-hedge behind, and behind the tamarisks the door in the wall, and stared out at the wheeling silver gulls far over the diamond-spangled water. He lit a cigarette, and seemed to have forgotten time completely.

Even the ghostly swish of boots in long dry grass is plainly audible at a little distance in that silent, flat, marshy land, but Baby-Face had needed no grass hint to tell him that some one was coming. Before ever the sound was audible he had vanished, quick and silent as a cat, among the twining, snake-like stems of the tamarisks, having been warned, by a whistling redshank, a single lone peewit, and a complaining snipe, of the passage of some human across the marshes. And he lay flat and motionless as any average stone, hidden past all finding.

The human proved to be a man, a big one, in a lounge suit, with a flat, smooth face, tow hair, and the eyes of a fish. He was a fine specimen to look at as regards size. And Baby-Face was kicking himself with irritation that he could not remember for the moment where he had seen that man before. Then he did. The man had shaved Chaus at the Great Southern Railway Company's terminus in London four

hours before.

The man went straight to the little iron door, opened it with a key, passed in, and banged it to vigorously after him with a deep and heavy clang that startled a hare—that had been crouched all the time in the grass watching, no doubt, first Baby-Face Chaus, then the manso that it fled like a fawn streak into the sunbathed landscape.

As for Baby-Face Chaus, he stared at the uncompromising door with lips pouting more than ever; and then, in a second, he was on his feet, crouching, tense, motionless—no longer Baby-Face, but quite obviously Jungle Catwatching the door with alert eyes.

Then he crept forward. There was no swish of grass at his movement. There wouldn't be.

A man who earns his living by shooting and capturing all the fiercest beasts of this earth cannot afford to walk like a 'copper' before indiarubber shoes came in. He examined the door. He listened outside of it, one hand in his jacketpocket-in case. But no sound greeted him save the trickle of the lark's song overhead and some distant clamour among the wheeling gulls.

Then he pushed the door, and it gaveto his touch. It was open. It was not locked. Being one of those doors that lock automatically on being shut, it had—as you may have noticed they will do sometimes if slammed to with great force-jarred open, or rebounded if you like, too quickly for the lock to catch, by reason of the force with which it was swung shut. And

Baby-face Chaus peered in.

I am sure I don't pretend to know what he expected to see-fields and sun, most likely, on the other side of the wall, the same as on his side. So he did; but he could not have had much time to note it, for he nearly fell into a deep concrete ditch which ran along the inside base of the wall as far as he could see, to where it disappeared among some distant trees. And crowning the top of the other side of the concrete ditch for its whole length was a row of bars that looked as if they were strong enough to keep in-anything.

At Chaus's feet dangled a rope-ladder down into the ditch—it was still moving slightlyand about twenty yards along the ditch to his right, but on the other side, he discerned a door, a little door, of iron also, let into the solid concrete, and leading apparently into the bowels

of the earth.

The innocent wide orbs of Baby-Face noted all these things in one instant, comprehensive glance, before he let himself down the ropeladder—verily spider never negotiated web more silently-into the ditch, and, creeping up to the door (how he blessed those rubber boots of his that made no sound!), gave it a gentle push.

Whatever might be said about the mechanism of the lock of the other door, rusted probably from lack of use, there could be no doubt about this one. It had worked perfectly, and the door was fast shut. Beyond it, somewhere along there, into the bowels of the earth it was to be presumed, the man had gone. There was no sight or sign of him anywhere else.

You picture to yourself this slim, gentleseeming enigma, Chaus, standing there in the two inches or so of water that had collected at the bottom of the ditch, pouting like a naughty kid at the door that would not let him see what was inside, but you may find some difficulty in realising at first the risk he knew by then he

must be running in being there at all.

Next he retraced his steps, and carefully placed the first door precisely as he had found Then, starting to run as far up as he could on the slope of the ditch, he raced across the

bottom, up the far side as high as his momentum carried him, and sprang upward, just managing to clutch the bottom of one bar with his extended left hand in the leap. To fling up the other hand, get a hold, pull himself up, and straighten with his toes between the bars on the top of the concrete was the work of a moment.

The rest was not so easy. But Baby-Face Chaus the resourceful had expected bars and spikes, and had taken the precaution to relieve his friend the landlord of a few corks for fishingfloats. Pulling himself up to the top of the bars—really this slim man was as deceptive about strength as in all else, for he worked with apparent ease-he stuck a cork on the top of each of four spiked bars, cast his coat on top of the corks, and climbed over. Thence to behind the cover of the nearest bush he slid, snake-fashion, and paused to see whether anything happened.

Nothing did happen, however. Except for where he could see the opposite far wall marching parallel with its fellow back from the beach, the land between appeared much the same as the scene outside-straw-coloured, harsh, foot-long grass; a straggling tamarisk-hedge along the sea-bank; still, rushy pools hither and yon; tropically green patches, where the snipe probed in winter here and there; little clumps of old twisted and dwarfed berry-trees, their heads permanently bowed from the south-west, standing knee-deep in tangled bramble at wide intervals; and the light and the silence and the freedom

of that wonderful soft, pure air over all.

But Baby-Face had been looking for beasts in the process of being acclimatised; the concrete ditch, bars, and high wall, taken together, seemed to say they were no lambs, and he saw none. He remembered his orders, however, and was taking no chances. He quietly and swiftly put his rifle together and charged the magazine. Then he stole to the tamarisk-hedge bordering the shore, and crept along on the sea side, where he could not be seen except from the water. He was just prospecting-looking, if you like, everywhere for hint or sign of tigers, which his orders had told him he would find at Harantsworth, and his instinct told him he would find

Here, by Jove! Baby-Face had not gone two hundred yards, when, with uplifted foot, literally 'twixt stride and stride, he stopped dead, and stood like a bull at gaze. His big blue eyes, wide open and surprised, were staring down at the muddy, narrow strip of sand left at the bottom of the beach by the tide, which had turned and was beginning to fall. And well might he stare, for there, bang in the glare of the westering sun, deep in the mud, were the footprints of a large and heavy beast, and they had been so recently made that the water was still oozing into them. Take the impressions of your own-or your maiden aunt's-cat's feet, and magnify them in imagination many times, and you get the footprints that Baby-Face Chaus saw there before him in the mud at that place. It was an uncanny thing to stand there all alone in such a spot, and stare at those 'pugs' of a large, fierce animal that might even then be watching him, unseen, from some deep cover.

It was true that he was very close to many of those sights and sounds which we have come to call civilisation. A main-line of railway ran only a mile to the north, such few people as could might be walking on an esplanade along the shores of the English Channel not three miles south of him, and less than eight miles to the west throbbed and clanged and hooted and roared and whistled one of the greatest dockyard towns of the kingdom. Yet for all that he might shout himself hoarse without the faintest hope of a single soul hearing him, and his body might lie there half a week, and not be found by anything more encouraging than the gulls and the rooks and the little shore crabs

of the tide.

But Baby-Face Chaus smiled—as I live, the fellow smiled—and his personality took on that air of masterly suppressed energy that you will see envisage a great pianist when he sits down to a piano, a born author or poet when he takes up the pen, or a champion rifle-shot when his cheek cuddles down to the stock of his rifle. In a word, Baby-Face Chaus was now at his profession, the work for which, it would seem, he must have been born, and in seconds he became a changed being.

(Continued on page 788.)

THE CAPTURE OF GERMAN TRADE.

N all warfare, whether military or commercial, to achieve success it is necessary for the attacking side to learn all it can about the position and methods of its opponents; otherwise it stands a chance of defeat through moving in wrong directions or with inappropriate weapons. The present attempt on the part of British merchants and manufacturers to capture a great part of the German foreign trade has been

wisely and strenuously initiated; but, judging from what has been published, it is extremely doubtful whether sufficient account has been taken of German commercial practices and methods, for unless these are to a large extent followed or improved upon it is much to be feared that the business abstracted from Germany during the war will go back to her again afterwards. It seems to the writer that by indicating a few of the principal variations in English and German trade methods a better understanding of the position may be brought about.

Perhaps the most vital differences in these methods relate to the working of the respective industrial joint-stock companies. In Britain nearly every important manufacturing company has from a quarter to a third of its capital represented by watered stock—that is, stock issued for intangible assets, such as goodwill, commissions, profits on flotation, and so onwhereas in a German company there is no such thing as watered stock, its nominal capital being invariably the actual capital. If in the course of business a German company buys out a competing concern, and has to pay for intangible assets, these do not appear in the balance-sheet, but are wiped off at the earliest possible moment, and indeed are commonly cleared at once out of undeclared profits, an item which is not usual in British companies, but is carefully conserved in every strong German company. Then in Germany company reserves are free from taxation, whereas in Britain they are not. In Germany companies are controlled by the managers (known there as Direktoren), and not by the Council of Administration, which is the body corresponding to the British board of directors. In a large company the managers not only attend to all the operative business, but also fix the dividends, apportion the reserve, and in fact arrange the whole balance-sheet. Council of Administration, who are usually the largest shareholders, find the capital, and may be consulted as to important matters of policy; but their office is in reality little more than nominal. The managers of a company as a rule own no shares whatever in it, and are paid mostly by results, receiving small regular salaries, and dividing a share of the profits; but their total remuneration is often enormous. From three thousand pounds to ten thousand pounds a year is not considered out of the way for departmental managers in a large company; while there are several concerns in which the principal managers receive from ten thousand to twenty-five thousand pounds each yearly.

In the preparation of a balance-sheet the managers of a German company are usually extremely conservative. In an important concern about a third only of the net profits is paid in dividends, the rest being used to wipe off the cost of plant and in building up the reserve, which is often equal to the whole paid-up share capital. It is the great strength acquired by this practice that has enabled German companies to take large contracts right out of the hands of their British competitors. When, as is not uncommonly the case, a German company is so strong that it can pay its regular dividends for a whole decade without making a shilling further profit during that time, one can under-

stand how it can sometimes cut out its British trade opponents. It can offer practically unlimited credit, and, further, it can if necessary find the capital for the work which it is to accomplish. When the Victoria Falls Power Company wanted a million or two for its great undertaking, a German company came forward and offered not only to carry out the work and to guarantee its successful running, but also to guarantee a debenture issue with which to pay the cost. No British company was strong enough to do this, and the Victoria Falls Company was unfortunately compelled to hand over the contract to Berlin. Through their astonishing financial solidity some of the great German companies are enabled in a way to force contracts. They send round travelling inspectors to report upon mining and manufacturing concerns of other countries, and when they find that new machinery might be advantageously erected, they offer to supply the machinery and to guarantee a particular saving Thus one of these companies in running cost. will say to a coal or factory owner, 'Your running plant is costing you twenty thousand pounds a year. If you will allow us to erect a new plant at a cost of twenty thousand pounds, we will undertake to save you six thousand a year in running charges, and you need pay us nothing till the new plant has been running for twelve months, and you satisfy yourselves that the saving in cost is as stated. If things do not turn out as we expect, we will remove our plant and re-erect your own at our expense.' Perchance the coal or factory owner is a little over-conservative, and politely intimates that he cannot find the money for new plant. Then comes the answer, 'We will find it for you at 5 per cent., so that the whole cost of the new plant will be repaid to you in four years out of saving in the running costs.' Of course such a company finds out the position of the coal or factory owner before making the proposal; but the point to be noted is that this kind of business is only carried on by German

In many of the manufacturing industries the complications arising from variations in cost of labour, freights, materials used, &c. are so numerous that it is difficult to arrive at the respective advantages or disadvantages to which German and British manufacturers are subjected; but in the vast engineering industries these can be pretty fairly gauged, though they work out differently according to the respective tariffs and customs. The leading German manufacturers in iron and steel, basing the statement on years of experience, assert that, in competition with Britain, the engineering industries of Germany are handicapped to the extent of 6 per cent. on their costs through the duties on partly manufactured material, while the lower wages paid to their workmen are balanced by the

reater efficiency of the British mechanic.* When competing for British business, the Germans try to equalise this handicap by rendering it unnecessary for the buyer to employ a consulting engineer. It is customary for a German firm to engage its own specialists, who make plans and specifications for the machinery required, while in Britain these are commonly prepared by the purchaser or his consulting engineer. The German firm guarantees everything to the user of the plant, who is advised to save the consulting engineer's fee, which is nearly equal to the extra cost to the German firm arising from the duty. In the case of competition for contracts in a neutral country, the German balances his handicap by giving extended credit or directly financing the user, by undertaking delivery in shorter time, by lower freights due to bounties or special arrangements with shipping companies, and other ways, not the least important of which is the sacrifice of home consumers to foreign interests. Moreover, the German is always ready to cut prices very low for a first order when he sees a possibility of future business. It should be noted that the user of machinery in Germany is not worse off than his British confrère in ordering plant, notwithstanding that he has to pay the manufacturer an extra sum to represent the duty, because there are no middlemen's charges to account for. In Germany there are no consulting engineers, or secret commissions, or lawyer's charges, all contracts being drawn up by the principals. is the custom for foreign contractors tendering for British work to add $2\frac{1}{2}$ per cent. to the cost estimates for secret commissions, Britain being regarded, next to Russia and Italy, as the most notorious of the leading countries for these illicit demands.

Much of the German trade expansion is due to their system of commercial spying, which has been developed to a degree hardly dreamed of by British manufacturers. This spying has a triple object: first, the securing of trade; secondly, the acquisition of knowledge relating to new appliances and methods; and, thirdly, the obtaining of good men for German business houses and factories. The most powerful of German spying agents are the consuls. German consul is not only a Government reporter on general trade matters, but he is also a special representative of each section of German trade. He makes it his business to know the doings of every factory and merchant of any consequence in his district. He has spies or acquaintances wherever a large business is done, and he knows what is used, and how much of it, in every mine, factory, or workshop within his range. If, in one of these places, any machinery or appliance of a kind that Germany can supply shows signs of wear, the consul knows it as soon as the proprietors, and on the day after he is informed of the fact it is also known in every factory of importance in Germany which it may concern, the news distributing agency being the Government in Berlin. The consul does not spare the telegraph wires, and he is furnished with the most comprehensive code that the imagination can conceive. He can telegraph the size, shape, and precise details of every appliance and of many complicated machines, German manufacturers being commonly as well instructed by his reports as if they had plans in front of them. An instance of this consular work which came under the notice of the writer may be given. The manager of an Italian mine was considering the advisability of employing an iron railwaytruck of a slightly different pattern from those he had in use, and one day he made a rough sketch of what he wanted, and left it on his table. By some means unknown to the manager, the nearest German consul, whose office was thirty miles away, obtained particulars of the sketch, and telegraphed them to Berlin, with the result that in a week's time the manager received from five towns in Germany offers to supply the trucks, while three commercial travellers called at the mine on the subject, one of them bringing with him a model truck of the precise pattern required, and offering to carry out the whole order, whatever it was, in three weeks. The mine manager told the writer that a British manufacturer before tendering would want a complete plan supplied him, and would probably take a week or two to put in his offer, while he would require two or three months in which to do the work. The German consul is, in fact, a restless commercial agent whose life is spent in helping German firms to secure orders. On the other hand, the British consul is usually a polite and sagacious representative of the Foreign Office, who keeps his chief supplied with trade statistics, writes an annual report on the general commerce of the district, and looks after the interests of British travellers. A courteous, pleasant, broadly educated man as a rule, and very necessary, but a different man altogether from his German confrère. It would scarcely do to substitute a consul of the German type for a man of the average British type; but in many places a purely commercial man might be appointed to act under the consul, and so help to balance the advantages of the German official.

Another beneficial influence possessed by the Teuton trader is the extended power of the German Ambassador. There are several countries in Europe where foreign traders, and particularly local branches of foreign houses, are continually coming into contact with the Government or the administration, mostly about matters of taxation, tariff charges, difficulties with local officials, and

^{*} In connection with this matter it is interesting to note that according to the publicly expressed opinion of German experts, where physical strength is applied in their workshops, three men have now to be employed where two sufficed a quarter of a century ago, the average physique of the German workman having so much deteriorated.

so on; and unless a strong stand is taken by the traders they are half-worried out of their lives, and often driven from the country through ceaseless extortion. The only official to whom one can appeal in these cases is the Ambassador or other national representative; but owing to the regulations governing the conduct of British Ambassadors, it is practically impossible for the British trader or manufacturer to obtain redress for his grievances, whereas no such disability attends the authority of the German Minister. Let us suppose that a British and a German trader have each received an extortionate or blackmailing claim from an official of one of the countries referred to. They both indignantly repudiate the claim; but finding their protests of no avail, they appeal to their respective Ambassadors. The British Ambassador, on receipt of the particulars from his countryman, writes an acknowledgment and promises to look into the matter. He does so, and a week later informs the trader that he has examined the papers, and is laying the complaint before the Foreign Secretary in London. A further two or three weeks pass, and the complainant receives notice that representations on the subject at issue have been made to the Foreign Minister of the Government concerned. Another fortnight goes by, and the trader is then informed that an inspector from the department involved has been instructed to inquire into the matter. Then there are interviews and correspondence, with the invariable result that nothing at all is done, and meanwhile the unfortunate trader has been compelled to meet the demand, or part of it, to prevent some disastrous interference with his business. Now, in the case of the German, the Ambassador has power to act without consulting his Foreign Office, and, on finding the complaint of the trader just, he informs the Government to which he is accredited that unless the irregular claim is withdrawn within twenty-four hours some very dire consequences will ensue; and it may be taken as a thing assured that before the British trader has received his first letter from his Ambassador the German trader has satisfactorily overcome his trouble. The practical effect of the different systems can hardly be overestimated. In Italy alone, of the hundreds of British firms that have tried to establish permanent agencies there, quite 95 per cent. have had to withdraw, while there is hardly an instance of a German house closing an Italian branch. From this it is scarcely surprising that while the Italian trade in German goods has progressed enormously, that in British goods has done little more than stand still, and this notwithstanding that the Britisher is, and always has been, very much more popular in Italy than the German.

The great German manufacturer is peculiar in that while he professes to regard his fellow-countrymen as supreme in every branch of industry, he yet never allows this prejudice

to run up against his business interests, for he is an adept at spying out good men, and has no hesitation in engaging them whether they be British, French, Russian, Scandinavian, or Chinese. Let a great work be in progress anywhere in Europe, or for the matter of that in America or Asia, and there will come along an official from a German manufactory to find out what new processes or appliances, if any, are being used, and what men of exceptional ability are employed who might possibly be induced to go to Berlin or Essen or elsewhere in Germany, or to a branch of a German house abroad. In this way the German houses pick up young men of all nations. Their inspectors attend university lectures in the search for brilliant scientists to enter their laboratories, and examine books in all languages on the subjects which concern them, in the hope of finding able specialists who might guide them in new developments of their business. In fact, they leave no stone unturned, and spare no expense, to secure the best brains for their purposes. What British manufacturer would hear a single university lecture by a young man of twenty-five years, and then offer him five times his professional salary to move into his workshops? Yet that was done by a Frankfort firm. And where is the British manufacturer who, after reading a treatise, would go to the author and say, 'We will give you five thousand pounds a year to walk through our laboratory every morning, watch the work in progress, and see if there is anything you can suggest'? Yet this was done by a Berlin firm, and the offerwhich was accepted—was to a foreigner. Of course British manufacturers have their own way of finding the men they require, and they certainly never lack good men; but some of the principal German houses not only seek the men they know they require, but take possession of exceptional brains in the sure and certain hope that they can turn these brains to uses not yet perhaps even contemplated.

Although Britain loses much through the want of more general scientific education, this defect is responsible only in a small degree for the way in which she lags behind Germany in the application of scientific discoveries to commercial purposes. As a matter of fact, very few inventions of importance are made in Germany, notwithstanding the rapid advance there of education in the sciences. The German mind is critical rather than originative. It hesitates to get away from grooves, but it examines these grooves and turns them inside-out and outsidein to an extent beyond the imagination of commercial scientists of other countries. The result is that an extraordinary store of knowledge is acquired in every department of industrial science, which is immediately brought to bear when a new groove is cut out by an enterprising Briton, Frenchman, or American. The case of the aniline dyes is well known. Though a British discovery, Germany secured practically the whole world's business in them. The application of metallic oxides to the improvement of gas and electric lighting, an Austrian discovery, was immediately appropriated and improved upon by the Germans, who have now almost a monopoly of the business. The same result would have followed in the case of wireless telegraphy had not political considerations crept in to confine certain systems to different countries, though Britain, Austria, and Italy were alone concerned in the foundation of this great departure. The many discoveries of minor importance in the application of electricity to chemical processes, nearly all of them of British or French origin, have mostly been appropriated in Germany, as with the British inventions relating to the application of magnetism to the separation of metallic ores, and numbers of improvements in electric-power plants. the most astonishing instance of German enterprise in this way is in respect to turbine engines. In one year after the first British turbines were built, two German companies spent no less than a quarter of a million sterling in trying to improve upon the British system, and within a couple of years were supplying British firms with new models.

It will be seen from what has been stated that there are many more matters to be considered by British manufacturers in competing with

the trade of Germany than mere questions of individual energy, adaptation of business practices to suit foreign buyers, and so on. Broad principles of finance, international organisation, and political administration must be dealt with if the favourable opportunity to secure German trade, or some of it, which now seems to be presented, is to be firmly seized. The movement must be characterised by large, liberal ideas, while there must be freedom from the daily consideration of immediate profits, and the eternal sacrifice of brilliant conceptions on the altar of the commission agent. We cannot expect manufacturers and retailers to come together suddenly and overthrow the huge system of middle profits which draws to Britain so many German commercial travellers, and has been the indirect cause of the building up at the expense of this country of quite 25 per cent. of the German soft goods trade. We cannot at present expect a British manufacturer to look with equanimity, whatever the result, upon the prospect of remunerating expert commercial travellers with five or six thousand pounds a year, and an allowance of four or five pounds a day for expenses; nor can we in a week or two inaugurate a system of mutual help between banker and trader. But we can at least look deep into the causes of German trade expansion, and examine our foundations before attempting structural

THE ALARUM.

By THEODORA WILSON WILSON.

CHAPTER I.

'COME now, mother!' said Paul persuasively,
'confess that you sit alone in this delightful room brooding over your son's shortcomings
until— Well, you don't think it was my
fault that I was born with an artistic temperament, and that I simply cannot play the ordinary
routine kind of game?'

'How you were born, Paul, was certainly not

your fault,' said Mrs Marsland quietly.

But her son interposed by laying his hand affectionately on her knee. 'Then why be so tragic, mother beloved? What has gone so dreadfully wrong? It is my luck that Uncle John's money has set me free to develop along individual and artistic lines, and why shouldn't I take advantage of my liberty?'

'You must be your own judge of that;' and his mother looked at him with a deprecating smile. For weeks Mrs Marsland had been nerving herself for this talk with her idolised son; and though she was finding her strength quite unequal to the strain, she managed to add pluckily enough, 'Only, don't you think it is time that you stopped sheltering yourself from painful and uncomfortable things by escaping

under a kind of—of temperamental cover? I have always hoped that you might turn out to be one of the strong men on whom the world expects to lean.'

Paul laughed a little ruefully. 'Mothers shouldn't hug secret ambitions to their bosoms,' he answered, trying to speak lightly. 'However, don't quite give me up. If only Mary'—

A quiver shot through his mother's nervous frame, and from the depth of sunken sockets her usually soft violet eyes shone with a strange passion. 'Don't say what you were going to say!' she exclaimed.

His mother's manner shook Paul uncomfortably, and he objected to feeling uncomfortable. It was as the breath of life to him to live in an atmosphere of continual approbation, and he determined to strangle off the stupid conversation.

'My darling mother, you know that you ought

not to excite yourself.'

'Excite myself!' She flushed and gave wey to a curiously bitter laugh. How well she understood her son's motive, even through the very solicitude in his voice! Yet she continued in a restrained, intense tone, 'I wish to speak to you, Paul, about some one whom you scarcely remember, but whom I cannot forget.'

'Yes, mother,' Paul managed to respond.

'Your father also gloried in his artistic temperament, and he also said, twenty-eight years ago, "If only Mary!" I was young and strong in those days, and was entering the wide world with open arms and generous beliefs. I was keen with ambition to serve my generation, and cut at the roots of unnecessary suffering; and, yes, I think I had the faith as a grain of mustard-seed which removes mountains. Then it was that I met your father. I loved him. He seemed to me to be the fulfilment of my highest womanly ideals. He wooed me with the passion of his wonderful eyes, and with the very tones of his musical voice. I married him, and it was only afterwards that—we hurt each other. I do not blame your father. He simply did not understand. He loved me artistically, if you will; but when I wished to translate idealism into hard everyday effort he said that I shattered it.

'That is all I can tell you. He died, as you know, and my health failed. But as you grew up I hoped that you would take up the work I had missed doing. Our beloved Empire needs young blood, young ideas, young faith in an eternally young God, and '---

'Mother dearest,' interrupted Paul with a tender anxiety, 'you are overtiring yourself! I ought never to have let you get into this tiresome conversation. Though I cannot be all you have expected, still I truly think that if Mary Duncan and I'-

'Paul!' she faltered. Then, gripping her strength together, she went on feverishly: 'I know Mary so well! I know that she is one of those women all awake to the influences of this modern world, who has, nevertheless, the courage to see visions and dream dreamsdreams of real substantial blessings which she herself may actually help to bring down; and even for your happiness I should not like another woman to be disappointed!'

'I see, mother!' His tone grew suddenly icy. 'Don't speak to me like that!' she exclaimed shrinkingly. 'If only you knew the effort it is to me to go against your smallest wish!'

'No possible good can come to either of us by prolonging this conversation, mother,' he said with attempted calmness. 'I am glad that at last I so thoroughly understand your opinion of me.'

'Paul!' she called after him.

But he strode away.

CHAPTER II.

SHALL ask her, all the same,' said Paul to himself, as his motor turned at last into Curzon Street. 'It is really time that I absolutely insist upon mother having bright

companionship of some kind. She is growing positively morbid.'

Thus he sought to throw aside his intolerable sense of mortification. Surely any son about to make the great venture of his life ought to have been supported by his own mother's unbounded love and sympathy! Paul felt himself very badly used indeed.

The Duchess was one of those women upon whom societies depend for giving 'At Homes,' in order to entice the leisured and snobbish classes, by means of rich viands and a stately entourage, to give a few minutes' consideration to the needs of the Great Outside. Her Grace knew well enough why her invitations were accepted, and why desponding secretaries implored her assistance; yet she good-naturedly submitted to the yoke, and spared no pains to make her functions a success.

Paul frankly hated such affairs, and he was only going on this occasion because he hoped that after the lecture he would have the chance of taking Mary Duncan down to supper.

Evidently he was late, for a solitary and wellpowdered footman offered him a programme, and informed him that her Grace was already in the chair.

Paul walked up the marble staircase, nodded to one or two men he knew who were loafing on the landing, and then took his place against a folding-door and looked into the gorgeous ballroom, in which a well-dressed crowd were penalising themselves and their clothes on canebottomed chairs.

The lecturer was a broad-shouldered, bluntspoken man, who was declaiming with enthusiasm on behalf of the Society for the Prevention of Cruelty to Children.

The lecturer did not interest Paul in the least; but he craned his neck that he might examine the audience.

Yes, she was there. She was sitting a little to one side, and he was able to examine her exquisite profile, and satisfy himself with the turn of her slender white neck. Her whitegloved fingers were clasped tightly together in her lap, her eyes were fixed on the speaker, and her lips only just met. Paul did not much care how long the speechifying lasted so long as he could watch unseen.

Yet it was soon over. The Duchess took care never to outtire her butterfly social reformers. She closed the meeting with a few happy words of pleading, and then the silver salver made its way about amongst the

Paul relieved himself of a five-pound note; and, considering that he had done his duty, he took advantage of the general movement to press into the room.

'I hope I may have the pleasure of taking you down to supper, Miss Duncan?' he asked as he gained her side.

'Ah, then you did come!' she said with a happy flush.

'Of course!' he replied emphatically.

Was his mother right? Had Mary the power of seeing visions? At any rate, as she looked at him with a curious intentness he could not flatter himself that she was seeing him at all.

'I am so glad that you heard him. It is so

terrible, isn't it?'

'Yes, oh-very! Things are a beastly shame in this world-often!' he said awkwardly.

'It seems so horrible of us to let such things happen day after day, year after year, and to children who have deserved nothing but good!'

'You have not tortured or ill-treated children?'

he said quickly.

'No; but I haven't cared enough even to find out what every true woman ought to know,' she

said earnestly.

Overpowered by what she had heard, Mary somehow expected a sympathetic response from her companion. Was she disappointed? At least she allowed him to find her a quiet corner within a window veranda, away from the general rush.

'And now, what may I get you, Miss Duncan?'

he asked eagerly.

'Oh, coffee—a sandwich—anything; it doesn't

He rushed away, and presently returned with a footman whom he had beguiled into special attendance.

'It is delightful here, I must confess,' she said with a contented sigh; 'to get away from the scrimmage, I mean,' she added, as she noted the flush that deepened in her companion's face.

'I am glad you think so,' he said somewhat

lamely.

'And I must not stay long,' she went on decidedly. 'I want to get hold of the secretary of the society. I wonder if he could find any use for me. It would be so glorious really to know things, and to do real work.'

'Of course, if you wish to see the secretary I can find him for you,' he said reluctantly. 'Only'

'Only?' she repeated.

'I should hate for you to go slumming and witnessing in law-courts, and running up against all kinds of nastinesses!' He spoke more dictatorially than he knew. It was exasperating to be shunted aside by a mere secretary of a society.

She answered him with a little rippling laugh. 'Yourself as usual, Mr Marsland. Deeply sorry to put you to the pain of hating anything I may feel it my duty to do. Indeed, I forgot that it is dangerous and unkind to disturb the delicate bloom of artistic souls.'

She looked at him so comically that he was forced to respond to her raillery with a smile.

'You may mock, Miss Duncan,' he retorted; 'but you are not cut out for-for all that kind of thing.

'Too vague!' she answered. 'Mr Marsland, really you are frantically behind the times! Didn't you know that woman has waked from her sleep? Didn't you know that she has already cleared her eyes and forgotten her dreams? Didn't you know that her soul is quivering at what she has seen, and that she is nerving herself to welcome any pain, so that she may help to "sort" the world? Forgive the expression! It is not my fault that I was born north of Inverness.'

'So long as you were born anywhere' began with so ominous a seriousness that she interrupted him adroitly.

'Oh, look—through those doors! Our darling Duchess is giving us ices! May I be greedy?

Paul could not but notice the smart doubling of his quarry; yet he became radiant once more. This was the delightful Highland Mary who had returned to him, in place of the solemn-browed Miss Duncan, keen on societies and their intolerable secretaries.

He secured the ice, and for the next few minutes was rewarded with that light chaffing conversation in which Mary was always so entrancing, and in which he was most at home. Yet he knew that time was galloping. moment she might rise to go to her friends; so again he broke in with an intonation hardly necessary for his very commonplace request: 'You will allow me to motor you home, Miss Duncan ? '

'It is very good of you,' she answered; 'but I am not going home to-night. I am staying a Aunt Fraser's.

'Then may I motor you there?'

'Oh no, thank you. I am walking. The house is only five minutes away, as you know.

'Then may I not walk with you for five minutes?'

'I ought to make such a privilege depend upon whether you can find the secretary for me first,' she said as lightly as she could. Her woman's wit gave her a sudden stab of warning. and she rose.

The sound of a Brahms Rapsodie was being cruelly overpowered by the roar of the gossiping crowd, and the electric light from beyond shone out as radiant background for her darkly waving hair.

'Why make bargains? Sit down again, please!' He jerked out the command with so rude a passion that she, aware of the publicity of the position, sat down promptly, devoutly hoping that nothing tiresome was going to happen.
'I am so dreadfully afraid the secretary will

escape before

'Hang the secretary!' exclaimed Paul, and he took a low seat behind her. 'I beg your pardon. Miss Duncan,' he stammered, trying in vain to hide his agitation.

'Please, don't,' she said softly, looking at him with anxiety. But her very voice and look

stimulated him to blunder forward.

'Don't what? Don't tell you that I love you, Mary? Am I always to be put off, whenever I demand to tell you what I have a right to tell you? Oh, I know I am just a stupid fool, and all that sort of thing; but if you will only take me on I will go into life as if it were worth living! I will seek out all the best this world can offer, and share it with you always, if you will give me the right.'

This was not in the least the kind of offer Paul had meant to make; but at any rate the words were out, and he did not know how white he had gone, as he leaned over toward her.

Mary sank lower in her chair. She was no common flirt, keen to capture so that she might have the pride of dismissing with mockery. Whatever her feelings—and, to her consternation, she was finding that they were not quite what she expected—she struggled after self-control, so that she might say what she felt she must say without hurting him more than she need.

'I am so dreadfully sorry that you have said all this, Mr Marsland,' she said in a tremulous tone that nearly drove him frantic. 'I—that is—I am not going to pretend that I have not thought that—— No; please, let me finish!' as he tried to interrupt her by taking her hand. 'But you know perfectly well that we could never live happily together. We want different things out of life.'

'How?' He must get some word in before

anything irrevocable stunned him.

'I have tried to explain to you,' she said more steadily. 'I have heard the alarum, and I cannot sleep again. If we were married we should

only hurt each other all the time.'

'Not if we loved each other! Not if—though that is impossible—you loved me as I love you! Mary dearest, be my wife! How can you know how much I love you, and how I would serve you?' Somehow he got possession of her hand, and his touch so thrilled her that she feared he must know it. A doubt clutched her heart. Why might she not give this beautiful, alluring boy his way?

'Mr Marsland, you have no right'-

'Be my wife, Mary!' he breathed into her ear.

But, recovering herself, she drew her hand away with a resolution he was forced to respect. 'I cannot! I must live a whole woman's life. I cannot turn traitor to myself.'

'And you think that I'--- he began bitterly.

'I think that — that you have not yet awakened!'

'Beg pardon, sir.'

'Yes?' Paul rounded on the friendly footman, furious at the interruption. 'Some one is wanting you, sir, on the telephone.'

'Couldn't you take the message?'

'It is the doctor from Teddington, sir. He wishes to speak to you. You are wanted at home at once, sir.'

'All right! All right!' he said hurriedly. 'Tell the doctor I will come.'

'Our family doctor on the usual fidget about my mother,' he said, as he turned toward her again. 'I must go; but just one word, Mary.'

But she rose indignantly, and a passionate light shone in her dark eyes. 'Mr Marsland,' she exclaimed in an incredulous voice, 'your mother needs you, and you wait to speak to me!'

The astonished reproach cut him intolerably, and he leaped to his feet. 'I beg your pardon,' he said in a voice of strained bitterness. 'Any excuse is enough, I suppose. I shall not even, I regret to say, have time to go in search of the secretary.'

Another moment, and Mary Duncan was

alone.

CHAPTER III.

OF course Paul knew that he had behaved rudely and unjustifiably. Twice this day he had felt the rein, and now a mingled sense of remorse and mortification drove him forward as uncontrolledly as when, as a child, he had fought and screamed and kicked the instant the world went against him. He had his motor called, and, thrusting his chauffeur aside, he took the wheel.

Teddington was a good hour's run, and he drove with a reckless skill out along the brilliant streets, on through the nearer suburbs, reaching the belt of model dwellings which stretched between him and the villages which were just beginning to dream of the coming of the London builder. His chauffeur sat silent and patient. He was used to the strange freaks of moodiness which overtook his master. As they reached the quieter lanes the going became terrific.

'We are far beyond the limit, sir,' said the chauffeur once. But his master vouchsafed no reply. 'Paul! Paul!' said a voice in his ear. He put on the brake until the car groaned, and the chauffeur gripped his hands together.

Paul turned. The back-seat was empty. 'Fool!' he ejaculated. He drove faster than ever, spurred forward by a monstrous anxiety which he scorned. He reached the old Manor House, and swished up the drive.

The house was gay with light. As he entered the hall the doctor met him.

Paul's flushed face went deadly white; a sense of suffocation rose in his throat. 'It isn't true?' he cried wildly.

'I am afraid it is, Paul,' said the old doctor.

(Continued on page 795.)

SOME IMPRESSIONS AND RECOLLECTIONS OF SMYRNA.

FROM the ruined Byzantine castle on Mount Pagus, five hundred feet above Smyrna quay, the eye ranges over the city and gulf, and out into the Ægean. All who look from this old Acropolis may see and understand the changes wrought in those parts by the Balkan war. In the west the summit of Mount St Elias, in Chios, shows over the saddle of the Ionian peninsula. In the north-west blue Mitylene reaches out across the mouth of the gulf. Both islands have passed from Turkish sovereignty; and from Smyrna, as it is said, one may now see Greece. They cover the outer approaches to the harbour; and yet even more is involved than this. Of Smyrna's three hundred thousand inhabitants more than half are of It is this fact, you gather, which Greek blood. provides the change in ownership of Chios and Mitylene with a background of special interest.

An English visitor, however, is likely to find more than the dreams of Greek chauvinists in his thoughts when on Mount Pagus. He looks over Homer's own land. The authentic Meles should be within eyeshot; a stream of the name, claiming the honour, is only five minutes' scramble down the back of the hill. Little more than a stone's-throw from the castle are remains of the old Greek stadium and theatre; and close to the stadium is the tomb of St Polycarp. The castle, too, has seen Crusaders, and Timur himself, to say nothing of others, in

hostility before its walls.

Of closer interest, perhaps, is the part that Smyrna fills in the early story of English commerce. During the era of fighting merchant ships it was a place much resorted to by them. Adventures on some of the earlier Smyrna voyages are chronicled for all time in Hakluyt's histories. To the Levant Company of London, which so long bore the whole cost of the British Embassy at Constantinople and of the British consular service in Turkey, Smyrna was the chief port in their El Dorado. What with corsairs, and fat profits, and intercourse with the East, 'The Levant' and 'The Smyrna Voyage' once were glamorous phrases in English ears.

Also worthy of recollection is the early English colony in Smyrna, the outcome of the trade. Foreign communities, tenacious of their footing and nationality, have flourished in the city for more than three centuries. They were wealthy and influential long before the present Greek predominance began. One of the earliest, and the most important of them all, was our own. No doubt it was mainly ourselves and the Dutch who earned for the place its contemptuous Turkish designation of Giaour Izmir (Infidel Smyrna).

It is curious to observe how quickly this little English colony provided itself with familiar English institutions. It soon had a place of

worship and a parson—a chaplain, as he was called. A list of chaplains who have served the community hangs in the English church at the Point, and the names, as you see to your surprise, go back to the early years of the seventeenth century. More unexpected is the English tavern that presently appeared. It came later than the church and chaplain, but

in good time, and it prospered long.

There is a quaint old book, Travels in Several Parts of Asia, by Alexander Drummond, at one time the British consul at Aleppo, which throws some light on the Smyrna English of a hundred and seventy years ago. Alexander was a younger brother of George Drummond, six times Lord Provost of Edinburgh, and died in the Scottish capital in 1769. The author contentedly records that on December 4, 1744, he 'landed at Smyrna in time enough to dine at the British tavern.' The house was to his liking, and he lodged there, as he says, notwithstanding offers of private hospitality. Owing to the filthiness of the streets, he could discover 'not one foot of ground which might be used for a walk.' But there were compensating pleasures. 'The English and Dutch gentlemen,' he adds, 'are therefore compelled to cards in the evening and the cheerful glass after supper as their chief amusements.'

Drummond was a Freemason; and, finding no lodge in Smyrna, he promptly established one. 'All the members are gentlemen of amiable characters,' he writes. 'I am not a little vain at being the father of such a flock.' He celebrated the birth of the lodge, 'The Drummond Kilwinning, from Greenock,' in verse, of which four lines seem to show an inner cause for his pride:

But now Britannia's gen'rous sons A glorious lodge have rais'd, Near the fam'd banks where Meles runs, And Homer's cattle graz'd.

The foreign colonies have left their mark on Smyrna. The air of prosperity, the two miles of stone-walled quay, the large warehouses, the lines of two railway companies, all give a Western impression. One of these lines, the Smyrna-Aidin, is the best and most comfortable in Turkey. It is British owned and managed, and that, no doubt, is why the English stranger finds himself oddly familiar with its stations and trains and customs. After being much the foreigner on the Constantinople-Bagdad Railway, he now can turn the tables, and he does so instinctively. His carriage may be filled with figures more or less Oriental, and camels may look over the closed gates of level-crossings; but his recurring idea is that they have to do with an Earl's Court exhibition and the Zoological Gardens.

There was a Frank, or foreign, quarter in Smyrna, now long gone from its earlier purpose. But Frank Street, at once the Strand and Oxford

Street of the city, preserves the memory. It is crooked, narrow, and without pavements, and thronged with a traffic of surprising contrasts. You jump aside to clear a dashing pair-horse carriage or a hooting motor-car, and are run down by a donkey with a wild boar across its back. As you look in at a fashionable shop-window, a noiseless shadow flits over the glass, and you find yourself jostled by passing camels. A little farther, and a peasant carrying live sucking-pigs in his arms fastens on you as a likely buyer you, of all people! as you think. And behind him come blue-robed ulemas, and Greek ladies, and an English governess with dark-eyed children. The crowded bazaars of Aleppo are more gorgeously Oriental, and Galata Bridge shows a greater diversity of races; but the pageant of Frank Street has a quality and interest of its own.

From the confinement of the Frank quarter most of the wealthy foreign families removed in time to villages a few miles out. A century ago they were at Seid Keuey; now they favour Burnabat and Buja, but chiefly Burnabat. It is a place of gardens and fine houses, with golf-links, a club, an English church, and suchlike things proper to a community which is largely English. Burnabat is famed for its hospitality. Land in Smyrna in the morning, and the chances are that the same day you will go on to Burnabat.

Since the earliest days of the foreign colonies the neighbourhood of Smyrna has been notable for brigands. Alexander Drummond found the foreigners keeping close to their quarter owing to the recent murder of one of their number by banditti. Residents of Burnabat and Buja still live under the shadow of brigandage. Within the past four or five years there have been attempts at kidnapping, with shooting and killing, in Burnabat. It is little more than two years since the most famous outlaw known to Smyrna was hunted down and shot. Tales of brigandage are, in fact, part of the entertainment provided for you at Burnabat.

In Smyrna itself, however, brigands of the outskirts seem far away. At lunch on the Marina, with a 'Dover sole' (as the waiter has called it) and the latest London newspaper before you, possible brigandage counts for no more than a possible railway accident. And if you drop in at Coste's tea-rooms, where, they tell you, all the Smyrna English may be seen between three and six o'clock, brigands become still more remote. Many of the faces are English, the chatter rising from the oak tables is English, and before the doors is a line of waiting motorcars and carriages. Yet within an hour's easy drive you might certainly run some risk of being robbed, or shot, or even held for ransom if known to be worth it.

THE ROAD: ITS PARAMOUNT IMPORTANCE.

By the Right Hon. Sir J. H. A. MACDONALD, K.C.B., LL.D.

What we want, my Lords, is Roads, roads, roads!

DUKE OF WELLINGTON.

THE nations of Europe are now, to the number of seven, engaged in a war such as has never been seen in the history of the world. The number of the troops engaged and the extent of front occupied by the contending forces exceed anything that has been witnessed in ancient or modern days. For the first time war-transit by road is being conducted to a very great degree by mechanical power, and such power is being used not only for conveyance of stores, but also for moving artillery and machineguns, serving Generals and their staffs by carrying them rapidly throughout the extent of their command, conveying orders and dispatches, and making rapid reconnoitring attacks by armoured vehicles, in all of which services great speed can be used without failure or serious limitation of endurance, such as necessarily attaches to a service in which no other accessory power is available except that of animals. This war will, therefore, teach many lessons on the subject of the road. For warfare on any extended scale roads are essential, and more so than ever in the twentieth century. Upon the sufficiency of the roads, and their ability to withstand the

attack of heavy traffic without becoming unfit for efficient use, the success of a campaign may in great measure depend. We know how nearly the bad state of the roads jeopardised the arrival of Blücher in time to clinch matters at Waterloo, the whole of a long day being necessary for an eleven miles' march. It is told of the great Duke of Wellington, when a debate took place on the first Kafir war in Africa, that he summed up what was necessary, in addition to welltrained and well-armed troops, by saying, 'What we want, my Lords, is Roads! roads! roads!' To his mind, roads were essential to the conduct of war, so that the troops and their arms might be used to the best advantage. More than ever to-day, when power-vehicles will be employed in all but cavalry work, is it indispensably necessary that national attention should be freely given to the road problem, so that our country should not be put to disadvantage, if war comes within its borders, because its roads are insufficient in number and deficient in quality.

It may now be laid down without risk of intelligent contradiction that if the country is to be well served by its roads, these must' be capable of carrying a very different traffic, both in bulk and character, from that of the latter half of the last century, when the use of the road was comparatively trifling, because all distance locomotion by heavy vehicles had been diverted from the road to the railway. In consequence of this old roads deteriorated, and were repaired on the cheap, and new roads were flimsily constructed. It is now practically admitted on all hands that road construction and maintenance, neglected for half a century, are once more of paramount importance, and that it is a matter of public necessity that the roads shall be made fit to bear the traffic which passes over them, traffic which tends every day to increase in volume as regards all classes of vehicles, and in mileage as regards the distance per day which each vehicle accomplishes. The carriage which used to jog along for its fifteen or twenty miles is now replaced by the car, which can traverse three or four times that distance in the same time and be still fit for further work. professional man who travelled daily by train to and from business now runs in and out in the same time, or even more quickly, by car or motor-cycle. The farmer who sent his crops, his fruit, and his vegetables over long distances to the market town can now have them conveyed direct from farm to market more quickly and in better condition, and with less injury, than when loaded and unloaded six times, and knocked about in shunting from and to The vans of the town tradesman which sidings. went ten or twelve miles into the country daily to deliver goods now go twice or even three times that distance, out and in, each day. The road tourist thinks nothing of a journey of one hundred and fifty or two hundred miles in one day. All this development has taken place in little more than a decade, and that there will be a great increase of all classes of road traffic for some time nobody can doubt; while in war on land efficient roads will be a sine quâ non, in view of the strain of heavy traffic of guns and munitions of war. War is no longer a leisurely conducted affair; Von Clausewitz's caustic saying, that 'standing still and doing nothing is quite plainly the normal condition of an army in the midst of war, acting the exception,' is no longer a true reproach to those who conduct campaigns. Speed is the aim, and the measure of speed is the quality of the road.

The road being now of paramount national interest, a step was taken in furtherance of that interest when the Imperial Road Board was appointed a few years ago, to which was committed the proceeds of the petrol-tax and the auto-vehicle licenses, bringing in more than a million sterling at first, and the amount steadily increasing from year to year.

Everywhere throughout the land more powervehicles are being put upon the road in each season, and a corresponding diminution of animaldrawn traffic is taking place. The extent to

which this is so appears not to be fully appreciated by many. It is still quite common to hear motor traffic spoken of as something exceptional, and as an intrusion upon general traffic. power-vehicle is still looked upon by many of the public and by not a few local road-authorities as an interloper, to which no consideration need be given except by way of complaint and objurgation. People who think so and speak so will have to awake, whether they like it or not, to the fact that motor traffic has in great degree become, and will in greater degree become, the traffic of the road, and that animal haulage must recede into the position of being the exception, and that a negligible exception, where formerly it was the rule. A few statistics will be found convincing by all but those who fall into the category of the man persuaded against his will, who is 'of the same opinion still.' The figures may be interesting. Observations recently made in London bring out most remarkable results. A test recently taken at the top of Haymarket, where the vehicles must pass in both directions through a driving-space of only forty-six feet in width, the time of the test being one hour, between 7.30 P.M. and 8.30 P.M., brought out the following result:

PASSENGER VEHICLES.
Motor. Horse.
1750 17

In country districts it is much the same. Five days' observation in Perthshire gave this result:

Motor. Horse.

A test taken of cabs only, in Pall Mall, counting up to 600 of those mechanically driven, resulted thus:

CABS.
Motor. Horse.
600 4

Of the horsed cabs, two were four-wheelers and two were hansoms.

In the case of the commercial vehicle, the progress has not been so rapid. It was not to be expected that it would be in the same ratio. The merchant using animal haulage has to think twice and thrice before making the change. It is hazardous for him to experiment, as it is the rich only who use vehicles for convenience and pleasure that can do so without financial risk. The outlay in purchasing vehicles which represent both the horse and the wagon is necessarily great, and unless the trader is able to assure himself that he can have his work done more economically, more conveniently, and more rapidly, without increasing the percentage of cost of carriage, he naturally hesitates to make a change. There is a reasonable inclination, before making the plunge, to wait and see how the adventurous who first make the change come out of the venture. But while such considerations have been 'canny' and prudent, it is becoming more manifest month by month that conviction has come to the commercial community that the adoption of power-haulage is a prudent and wise step, consistent with economy, advantageous in time-saving, making extension of deliveries more easy, and in more ways than one bringing about an increase of business. No one who observes can fail to see that the number of power-vehicles carrying goods has been rapidly increasing, and continues to increase day by day. Observations taken in London show that from one-third to one-half of the commercial vehicles upon the street, in the busy thoroughfares round Trafalgar Square, are now driven by mechanical power. Tests on recent occasions brought out:

COMMERCIAL	VEHICLES.
Horse.	Motor
92	54
66	33
120	71
91	57
30	24
17	18
30	22
446	279

But perhaps it may be said that London is not a fair criterion for the country generally. Here is a test taken when driving to Woking:

Horse. Motor.

It must be understood that the figures both of fast vehicles and commercial vehicles vary up and down, and the statistics given may be held to be the most favourable to the power-vehicle. But an average of tests brings out that, in the case of the fast vehicles, the percentage of animaldrawn traffic is certainly not more than two or at most three, and in the case of the commercial vehicles the power-driven are certainly not less than a third, and often are nearer one-half. Thus fast horse-vehicles are now a negligible quantity, and the progress in the adoption of mechanical power in the case of the commercial vehicle makes it plain that it too will in a very short time be the dominant factor in the traffic. In the case of trade vehicles, the removal of horses for war service will cause many people to turn to powertraction; therefore it is the power-vehicle that has to be considered, and must be considered, when the question is: How are the roads to be made fit for their purpose in such circumstances?

It is satisfactory to know that it is in this country that the greatest advance has been made in the ascertainment of the best mode of road construction and road maintenance. It is possible now in many places to drive for many miles in the driest weather without there being any raising of dust. This in itself is a thing of great advantage in the direction of comfort to the road user and roadside dweller, of prevention of deterioration of goods, and of maintenance of public health. But these, however satisfactory, may be called side-advantages only. If a road is dustless it is not only satisfactory in these respects, but its condition testifies in an un-

answerable manner to the fact that it is not a road that materially deteriorates under traffic. Its dustlessness is a proof that the surface is not crumbling away, but remains practically intact and therefore impenetrable to water. Water is the most deadly enemy that the road has to encounter if once it can penetrate below the surface. While the roads which are exhibiting this efficiency were at the time of construction to a certain extent experimental, the period during which they have stood the test of trafficalready equal to from two to four years in many cases—has enabled the road engineer to gain further experience and by experiment to work out improvement, so that it can now be said with confidence that the formula for a durable, dustless, and economical road surface has been attained.

In former days the destruction of roads was caused by the penetration of water into the roadcrust in wet weather, and, in the case of very dry weather following, by the failure of the stones used in making it to hold their positions without moving, and so loosening the body of the roadcrust, and producing fatal disintegration. It was supposed by most people that the wear of the road was at the immediate surface only, whereas the actual injury caused by traffic not only affected the surface, but destroyed the entire road-crust by causing movement of the stones in it far down below the surface. Examination showed that blows of the hoofs of the heavy carthorse and of wheels wherever the surface was uneven, resulting in motion far down in the crust, caused the sharply broken stones which had been laid down to move, and by chafing one against another to become loose in their seats more and more, until they resembled potatoes, from their angles being rubbed off. The road thus ceased to have any cohesion, so that the surface could not remain even, every horse or vehicle squeezing mud up in wet weather, and picking or pressing the stones out of their seats in dry weather. And this disintegration, being irregular in its effect at the surface, caused depressions in which water could lie. Every one knows what is the state of an ordinary road shaded by trees for many days after a fall of rain.

All this is, as regards the making or renewing of road surfaces or the construction of new roads, a thing of the past. Investigation and experiment have made it certain that a road can be constructed at a reasonable cost which will be impervious to water, will keep its surface unbroken for a long time, and which at any point where it shows signs of giving way can be made perfect by patching, without the Scriptural result of the new making the rent worse, as the quality of the patch and its surroundings will be practically the same. The lower crust of the modern road can be made so compact by the use of a well-proportioned binding material of ascertained quality that the mass is held firm, and cannot

disintegrate by its pieces being moved and made to chafe one another, so as to remove the sharply angled surfaces and reduce the crust to a noncohering layer of rounded pieces. Also, it can be so made that water will not penetrate as it does into a road the only binding material of which is dirt. A stretch of such road, after being under traffic for two years or more, will be found with every stone still in the exact position in which it was fixed at first laying; and so tenaciously are the stones held by the well-chosen binding material that if a block cut out of a road is broken in two, it will be found that the stones are so firmly fixed that where the split comes opposite them they break across, leaving one half fixed in each of the two pieces of the specimen of crust. No stronger testimony could be given to the excellence of the crust than this real evidence of the firm grip of the binder.

But another improvement has been developed. Just as a carpet placed on a floor prevents vibration and deadens sound, so in the case of important roads in city or country combinations of bitumen with other materials are now used to put, as it were, a resilient carpet on the top of the resisting road-crust, with the effect not only of lightening the blows of the traffic and so protecting the material below, but also of diminishing noise, saving wear and tear of vehicles, their frames, their tires, and their springs, and giving a greater mileage per gallon of petrol than can be the case if the road at the surface is rigid and in measure uneven, as it must be when the crust is exposed to the direct stroke of traffic of all classes of vehicles. Such a superimposed surfacing acts exactly as does a carpet in a room. It is slightly depressed where pressure comes on it; but when left alone, or when pressure comes on the carpet close to the depression, the depressed part rises again into position. A good turf is just an outdoor carpet. The foot of man or horse depresses it, and thus it is relieved from hard going; the turf rises again, either by being pressed down at a point close to the former depression or by being left untouched, and by its elasticity rising once more to the level. The bituminous carpet which can now be put upon a road acts as the elastic turf does on a lawn; it yields, although of course in a slighter degree than the turf, and recovers, and so violence tending to destroy the weight-bearing crust is warded off. More durability is thus given to the body of the road, and an impervious surface is maintained. It remains to be proved by time whether it will be economically efficient; but there is good reason to hope that roads covered with such a carpet, proportioned in its thickness to the character of the traffic on the particular road, will last and remain in good order for a much longer period than has ever been the case hitherto, provided only that it is sufficiently inspected, and any incipient injury is dealt with at once. The repair of the road carpet is easy, and if properly done gives as good and smooth a surface as ever.

With such good prospect before the community, there is one other matter which calls for legislative intervention. The burden of road construction and maintenance falls in the most uneven and unfair manner upon many localities. There must be good roads provided between the great centres of population, and as matters at present stand the burden of doing this is in many cases most unjust to many districts. Such a road as that between Glasgow and Carlisle, or that between Carlisle and Preston, ought to be made and maintained in the best manner. But to put such a burden for many miles upon low-rented pastoral subjects such as are found for miles on either side of Beattock Summit or Shap is most inequitable. Main roads such as these, and all other roads which can be classed as main roads, should be matters of Imperial concern, so that the burden of construction and maintenance shall not fall oppressively upon poor localities. It is satisfactory to know that a move in this direction is being made. The Road Board is engaged in obtaining statistics of traffic, with a view to classifying roads and formulating a better system by which the road burden may be more equitably distributed than at present. When s proper classification is provided, so that the roads which ought to be of first-class construction are scheduled, there is no reason to doubt that the engineer will be able to give a specification for road construction which will make it certain that the main road of the future will be a dustless, mudless, smooth, and durable way, and that the cost spread over a period of years will not be greater than, if so great as, has now to be encountered to keep up a road passably good, but inefficient to a considerable degree in the qualities of a truly sound and efficient road. This must be made a matter of State duty, so that the burden may not fall unfairly, and that the work may be done with equal efficiency throughout. It is 'a consummation devoutly to be wished.'

Meanwhile the assurance can be confidently given that the production of the dustless, smooth, and efficient road has passed from the experimental to the practical stage. It is for the legislature to give the impetus to its realisation in fact.

THE MASTER-SEEKER.

THE seed, impatient of th' authentic hour, Yearns for the Sun to find its secret flower.

Prison'd in marble, Galatea stands Breathlessly waiting her Pygmalion's hands.

And language, yet a wordy rabble-throng, Craves for a Keats to track its hidden song.

So does my bosom wistfully await
The Lord of Love who is predestinate
To win from out my heart th' elusive elf
Which I can ne'er discover for myself.
G. S. LAYARD.

EDUCATION AND FOREIGN METHODS.

By Sir Thomas Barclay, Author of Problems of International Practice and Diplomacy.

THERE is no field of public and private activity which commands such an array of theories or such a variety of experimental practice as education. Nor is there any subject which has a greater fascination for those who get beyond the elementary stage of carrying out the orders of others, every teacher being in himself a standard of comparison for the testing of his subsequent experience.

When, with the Mosely Educational Commission, I visited Chicago in the autumn of 1903, I spent an evening with the distinguished professor of pedagogy John Dewey, discussing the objects of education as they presented themselves in the

United States.

To Professor Dewey the desirable object of statecraft in regard to education seemed to be to keep it in such a state of flexibility that it would at all times reflect in the individual teacher the highest developments of the life of the society of which the school forms the intellectual, industrial, and moral nursery. The school, in other words, appeared to him as a place in which a child can obtain initiation into the ways of obtaining and doing the best and most satisfying work of the community for which he or she is fitted. School work should, therefore, be directed to providing the child with the means of developing the qualities of mind, body, and character which enable him or her to contribute his or her maximum, whatever it be, to the common happiness and prosperity.

Looked at in the mass, says Professor Welton (a Leeds authority on education), education may be said to be an effort by the community to impose its culture on the growing generation. Change in culture ideals means change in the specific form of the goal of education. sequently educative efforts must be capable of readjustment. This does not mean that the educator ought to try to give effect to all the current views of life, the average view at any moment being necessarily below the best. Education, in any case, says Professor Welton, can never be a mere passive watching of the development of the young mind. The educator studies the original endowment of the child and the early stages in the development of the child's innate nature in order that he may wisely and successfully employ appropriate means to direct further development, and to accelerate its progress toward a more rational, complete, and worthy life, and not that he may the more skilfully give facilities to the child to drift about on the unregulated currents of caprice.

Thus education presupposes an external influence, not the mere removal of obstructions to development, though it cannot disregard the right of the individual to follow a line of development in accordance with his own or the

parental view of his abilities.

Meanwhile, in the United States, in Germany, in France, and in this country, statesmen, clergy, and parents are pitted against each other, representing different points of view between the extremes of external State direction and individual independence, and as yet they seem only agreed upon one point-namely, the universal provision of a certain amount of literary education; all must be able to read, write, and reckon, and these are the chief acquirements that the average child at the present day, at any rate in the United Kingdom, carries away with it from the elementary school. In fact, it is rather in spite of than in conjunction with these contending influences that the educator gets a chance at all. Curiously enough, in Germany the headmasters of elementary schools seem to enjoy greater independence than in some other I have visited large Bürgerschulen in south Germany, in which, following out Professor Dewey's requirement of flexibility, headmasters are constantly adapting the school to its surroundings and circumstances, not only influencing the development of growing generations, but through them exercising a physical and moral influence on the parents, thus bringing the whole community within the orbit of the school, and drawing them into ever closer relationship with one another.

That nations on the subject of education can learn from each other requires no demonstration for those who venture beyond the national frontiers. The Mosely Commission to the United States has had such an effect on English educationists that, in some respects, we have now shot ahead of the Americans; and one of the party, Sir Robert Blair, now the chief education officer

No. 207.-Vol. IV.

[All Rights Reserved.]

NOVEMBER 14, 1914.

within the jurisdiction of the London County Council, is carrying out experiments which American educationists are watching closely, and which may yet make London a model centre of education.

The reports published under the successive direction of Vice-Chancellor Sadler and Dr Heath by the Board of Education are a mine of valuable information; and among those who have been engaged in the work of preparing them several of the more enthusiastic votaries of the subject have set about investigation for their own unofficial enlightenment. Among these is that indefatigable searcher, Mr Cloudesley Brereton, whose book, Studies in Foreign Education,* is the more immediate occasion of this article. One may say of Mr Brereton that what he does not know about education at home and abroad is 'not worth knowing.' In his book he compares French and English secondary schools, and deals with French infant and rural education, and with French physical and moral and university education, contrasting them with the German scholastic system and methods, and gives a bird's-eye view of American education.

American education has an accessory object to which nothing in this country corresponds. In the United States the belief in the schools is best illustrated, says Mr Brereton, by the thorough fashion in which the American school 'takes the child of the stranger within her gates, whether German or Hungarian, Norwegian or Italian, and transforms him heart and soul into a real American citizen. While nearly all European states are troubled by racial difficulties and dissensions, the common school has saved the United States from one of the thorniest of problems in the whole world' (p. 295). I saw the truth of this myself. In the work of Americanising the foreigner, the immigrant families of Northern races, however, co-operate with a keen appreciation of the assimilation. They even Americanise their names: Koch becomes Cook, Nielson becomes Nelson, Schuster becomes Shuster, Cohen becomes Cowan, and so on.

American educationists, again, convinced of the justice and expediency of a policy which is closely connected with the ultimate ideals of American democracy, apply themselves to satisfy the growing demand for bringing the school into closer touch with the after-career of the pupil. 'The American schools have so far sturdily maintained the paramount necessity of laying a firm basis of general education, and refused to sacrifice the education of the citizen to the training of the workers' (p. 300). This has not prevented them, in technical education, from introducing specialisation, and that of a very high order; but they have carefully kept it till the end of the pupil's career. 'There is none

of the smattering of technical instruction in immature pupils which has had such an unhappy vogue in England.'

'In commercial education,' Mr Brereton remarks, 'they have, strangely enough, done less than what has been effected in some European states. The reason for this is that hitherto they have been content to secure for themselves the home market. With the present growth of their foreign trade they will soon feel the need of raising a special army of well-trained commercial travellers, thoroughly versed in modern languages, while their future captains of industry will also require to be more highly educated, not in the practice but in the theory of business, or economics, as it is called. Most of the so-called business colleges are rather devoted to the teaching for actual practice and the lower arts of commerce; but once the Americans realise the need for a greater number of higher institutions, they are sure speedily to supply the missing article. In no country is the distance between cup and lip shorter than in America. The difference between the average Englishman of to-day and the typical American seems to be that the Englishman has to grumble over a deficiency till he has talked himself over into supplying it. With the American a want has often only to be noticed to be at once met and remedied.'

In the report of the Mosely Commission I dealt more particularly with this question of commercial education. Mr Brereton does not seem to have visited a special secondary school for commercial education which had recently been started at New York by the education authority when I was there (autumn of 1903). Owing to the American spirit described in the above extract, I have no doubt its then showcomings have since been made good.

French and German education Mr Brereton treats as offering our educationists more accessible models for comparison. Both are in a state of active evolution, and have problems to solve which are closely akin to our own. Yet both have methods and ideals as different as are the characters, social organisation, and physical and geographical conditions of the countries and

peoples concerned.

As regards elementary education, it is so necessarily conditioned by its surroundings that we can only hope that in this country the example of Germany will be followed in giving careful attention to administrative skill and character in the selection of headmasters, and in leaving the greatest possible latitude to them in the management—material, moral, and educational—of the schools. It is these highly competent and respected headmasters of primary schools who have made and are making modern Germany. I commend the German tendency in this respect to the attention of Mr Brereton and other advanced English educationists.

^{*} Studies in Foreign Education, with Special Reference to English Problems (Harrap & Co., London, 1913).

On secondary education, which has always been a more congenial study than elementary schools to English educationists, those engaged in it belonging to the travelling and scholarly class, Mr Brereton's book is full of illuminating passages. The main ideal of German education, he remarks, is erudition; that of French education, culture. I am disposed to take a somewhat different view as regards the German ideal, and think Mr Brereton should confine his statement of it to the Gymnasien. But here again I am inclined to consider what Mr Brereton calls erudition merely as a method, the ultimate aim being thoroughness and precision in the mental equipment of the lettered class. Apart from these Gymnasien, there are a variety of different schools of a secondary character intended to meet the different requirements of the German middle class. What Mr Brereton misses in the highest class of secondary schools (no doubt he refers to the Gymnasien) is philosophic training, 'which more than anything else tends to develop the individual into a conscious and coherent being.' Coming, he says, at a period of storm and stress, during which youth is putting away childish things and becoming manhood, it serves, if properly utilised, not merely as the very crown of school studies, but also as an initiation into the problems of life and conduct. The German school authorities themselves, a short time ago, became alarmed at the absence of such a training, and it was made the principal subject for discussion at the Headmasters' Conference for 1902. The conference reported not only in favour of definite philosophical training, but also in favour of giving the whole of the teaching in the higher classes a more philosophical cast. Whether this recommendation has been followed out Mr Brereton does not say; but as I heard the same complaint in Germany only recently, I doubt whether any progress in the direction desired has yet been achieved in practice.

The French lycée has long and deliberately supplied what the German headmasters wished to see introduced into the Gymnasien. 'French education,' explains Mr Brereton, 'may be roughly divided into two parts, one of which ends with the first part of the baccalauréat or leaving examination, formerly called la rhétorique, the other ending with the part still known as la philosophie. Both these parts indicate the aims of the courses of study to which they apply.'

Oddly enough, while Mr Brereton is urging us to follow a French model in the above particulars, French educationists are endeavouring to introduce into the lycées the spirit of accuracy and concentration which is the essential outcome of the German training in the Gymnasium, the making of capable and truthseeking, if not always philosophic or generous or even courteous, minds. The combination of gracefulness of expression with strength of

thinking is devoutly to be wished; but it obviously implies an alloy of metals which, however precious, do not always amalgamate.

The French distinguish between éducation and instruction. I am not sure that we do not gain by the linguistic poverty which forbids our making the distinction. As regards éducation, the nearest English equivalent of which is training of character, we have little or nothing to learn from either the Germans or the French. Educationists in both Germany and France, in fact, are seeking to implant in their schools British methods of character-training. The French in particular, as Mr Brereton says, are steadily moving in the direction of encouragement of freedom, self-reliance, and personal initiative; and he warns us that, while we may well copy the high pitch of efficiency to which the French have brought the teaching profession, and the honourable status to which they have raised it, we must avoid any movement tending to make teachers mere purveyors of knowledge or to divorce them from active participation in the larger life of the school which the French call éducation.

When, however, we come to the development of the intelligence, we may find much that we can freely admire and imitate in the French system of teaching.

'When a French university professor,' says Mr Brereton, 'is shown an English paper with ten or twelve questions (say in history), he is lost in astonishment at the number of questions; but when he is told that they are all to be answered in three hours he is dumfounded. The number of questions to be attempted in the lycée for a three hours' composition, or in the university for a six hours' paper, would be one or two. One can only explain to him that the English method treats intelligences much as sponges. It attempts to discover those which can retain the greatest quantity of the facts or theories they have absorbed. To which our Frenchman rejoins, "But where does the composition come in, the act of presenting one's subject in the clearest form and in the most suitable language?" One can only point out the fact that it doesn't come in, except in a subordinate way, for the simple reason that the English examinee writes from the point of view of one who writes for a critic who knows already what he ought to say, and only wants to verify his remarks, whereas the French candidate writes from the point of view of one who wants to explain to the ordinary person what he has to say, and so naturally puts his case with the utmost care' (p. 283).

If one of the weaknesses of the English is imperfection in the method of expression, and the French cultivate the art of expression as a direct object of education, ought this not to be a ground for encouraging the study of French? If so, how does this, in general education, affect

the study of German? 'Which language,' asks Mr Brereton, 'is likely to afford the better linguistic, logical, æsthetic, and literary training? Is it German, with its glorious lyrical poetry, its almost boundless vocabulary, its Gothic-like architecture, with cathedral-like sentences branching into a mass of clauses, a veritable cluster of side chapels, recalling at once the might, majesty, and awe of its archetype, the primeval Hercynian forest-forest that, alas! the ordinary student does not see because of the trees, as he struggles with its sesquipedalian compounds and its apparently interminable sentences, its involved and complicated style, that happily shows signs of a movement towards a greater simplification of expression, yet is still involved in the toils of its own verbosity? Or is it not rather French, with its poetry in which the overwhelming sense of form almost cramps and stunts the emotions, with its far less copious vocabulary because of the admirable way in which its contents have been catalogued and cross-referenced, with a prose style that combines the classical architecture of pure line with the warm colouring of modern sentiment, recalling in its directness and solidity the road and bridge building talents of the Romans, while its good taste, moderation, and refinement represent a genuine infiltration from the best epochs of Greek culture? Lucid and logical, appealing alike to the æsthetic and literary sense, what finer instrument of mental discipline is there outside the classical world?' (p. 288).

Even as a preparation for the study of Latin he holds there can be no comparison between German and French. The Germans, as between English and French, have recognised this in all their so-called reform schools, in which the study of a modern language is made the stepping-stone to the study of Latin; 'though, had they adopted the argument of the Philoteutons over here,

they would not have hesitated to select English, as the connection between German and French is far more remote than between English and German. French is also the one modern language that is obligatory in their "unreformed" classical schools. Again, in their non-classical schools they begin with French and not with English. The truth is, they realise that French is really an indispensable factor in general culture.

I think Mr Brereton's arguments, worked out fully, would favour learning both French and German just as in Norway, where the secondary pupils, with two years' interval between beginning them, take both English and German. I am myself heretic enough to think that a child learns English best by learning a foreign language, and that if we substituted the teaching of foreign languages for the teaching of English we should not only get better results, but make a useful addition to the child's capabilities in after-life.

Nor would I confine the teaching of foreign languages to secondary schools, but would begin the learning of French throughout the primary schools at twelve years of age. This would mean that our elementary teachers would have to know something of the French language, and an excellent thing it would be for them as well. By an exchange of primary teachers a beginning at any rate might be made, and this would serve the further purpose of giving some of our primary teachers that experience of foreign methods which even the Americans, advanced as they are in educational theory and practice, consider necessary in order to keep their teachers abreast of modern educational progress. It seems in any case desirable that our educational authorities should afford primary teachers opportunities of comparison which at present neither their holidays at a season when foreign schools are also closed nor their salaries permit them to enjoy by their unsupported efforts.

THE JUNGLE CAT.

CHAPTER II.

So motionless did Chaus 'freeze' that a big, spotless old ruffian of a herring gull, beating up along the shore on the hunt for stranded loot, did not see him. The bird came straight toward him, high up over the tamarisks, its long, thin wings beating their shallow halfbeat steadily. Frederick Chaus's eyes never left it. He knew his game, this sphinx of a man. And quite suddenly the bird swerved. At fifty yards it flung up and round, with a quickly uttered Check! check! check. and started to fly and beat and swerve and curve rapidly above that one spot, and—

'Thanks, old chap!' muttered Baby-Face Chaus. 'You make a very passable scout;' and he moved—as a man might move who is

walking on the glass roof of a conservatory—along the muddy sand, till he was level with the spot where the bird had checked and was now wheeling with its querulous alarm note, scolding something.

From the water's edge up the pebble beach Chaus crept in wonderful silence, only to be appreciated by those who have tried to do the same, to the top of the seabank, and, on hands and knees, peered through the tamarisks.

A less experienced man would have scanned the grassy waste ahead, and looked too high; but that was not Chaus. He glanced down first to the marshy ditch at the bottom of the seabank, and stiffened from head to heel. He was looking straight into the inscrutable, unblinking, indescribably fierce yellow eyes of a full-grown male tiger. Wide-whiskered, frilled, heavy-jowled, loose-bellied, bow-legged, with great head thrown up, the massive brute stood there in the wet, staring up at him with fierce, insolent, malevolent intensity, motionless as a statue in red sandstone.

For perhaps as long as it takes a man to inhale a long breath and let it out again slowly, those two, man and beast, remained thus motionless as the chalk-clumps around, eye meeting eye; but it was the beast who lowered his gaze first.

And Baby-Face Chaus's rifle was at his shoulder. Goodness knows how he managed it. He certainly never appeared to have moved an inch. Probably, though, he had been moving all the time, lifting his weapon slowly, slowly, incalculably cautiously, so slowly as even to deceive the beast; and you can take my word for it that wants some doing. But Baby-Face knew—and you can watch a cat with a mouse next time you see one to prove it—that the slightest observed movement on his part in that minute or two might mean disaster. It is the way of all the cats.

Slowly he aimed, it seemed, but very quickly really. The trigger was squeezed, not pressed, and—Heaven help the man! there was the click of the released striker, and no report. The snap of the striker, and just a gentle little snake-like hiss; nothing more. Ye gods—a misfire!

But whatever might be said about the failure of the rifle in that supreme moment, there was no doubt in the actions of the tiger. Even as the *click-clack* as Chaus jerked back and forward the bolt startled the wheeling gull, the great beast hurled himself up the slope with that unmistakable 'shattering roar' which always heralds a charge.

Up went the rifle again, snap went the striker, a second time devoid of the report that should have been one with it—oh, help! another misfire!—and, quick as light, Baby-Face leapt aside. Came a crash and splintering of riven tamarisk-boughs, a shower of the fleshy-leaved sprays, a stench of hot, carrion-scented breath, and Baby-Face Chaus was standing up, ejecting the empty cartridge-case, and coolly looking down over his shoulder to where the tiger, in the last wild, awful flurry of death, was threshing and rolling on the muddy sand below.

In a few seconds the big striped body was still, the massive head dropped with a choked, tremendous growl, the long banded tail gave two or three terrific whacks on the mud, and all was still.

'Let me see,' chuckled Baby-Face Chaus, bending over the beautiful tawny striped body, and staring with wondering, gentle eyes of innocent amazement. 'Lungs. Heart. Spine. Um! Not so rotten for a quick snap-shot. Now we will proceed.' And he did.

But unless you happen to be up in these matters you may not be aware that there is such a thing as a report-silencer on the market, a little light metal cylinder which you screw on the muzzle of your rifle, and which smothers the report, turning it into a harmless hiss. One of those Chaus had on his rifle. It explained the apparent missire. Under certain conditions—conditions like the present, for instance—he found that the contrivance came in useful.

Baby-Face Chaus, however, was not a man to lose time in gloating over victories. He took them as mistakes, not gifts, of fate, and was suspicious that they might be a trap. Thus you never caught him napping, or anything else than, as it were, under arms. Never was there a man so constantly prepared for trouble, so ever-expectant of attack.

In seven minutes, moving always from cover to cover—be it no more than a fold in the ground—he was far out across the rough lands of Tarling Manor, and it would have taken a very sharp eye indeed to detect him or follow his movements when detected.

The tracks of another tiger—the right third claw missing, had this one—he found behind a bush under a little tree loaded well with red berries among which the thrushes and blackbirds feasted riotously. The beast had evidently made a regular basking-ground of this place, for the grass was all beaten down and worn off, and there were bones; and the tiger itself he sighted almost immediately after, as he rounded the bush.

The beast was standing right out in the open with its back to him, watching, with extreme intentness, something invisible that moved in the short grass ahead of it. The impression was as if the brute were observing a ghost, for the grass was very short just here, and there was nothing, absolutely nothing, to be seen, even through Chaus's powerful prismatic binoculars.

Nor was that all, however, for another tiger, just ahead of the first, was trotting up and down a line also invisible, watching, like the first, the same something that you couldn't see, but whose movements it followed, at times growing so excited that it broke into a trot. It was exactly as if the animal were in a cage, and was pacing up and down against the bars, watching the keeper moving about with its meat; only there were no bars, and nothing at all that one could see to check it or for it to watch.

Baby-Face Chaus stepped back to cover, aimed swiftly, and squeezed the trigger. There was no report, only that odd, uncanny little hiss as before; but the nearest tiger to him turned a complete somersault, and lay where it fell on its back, paws stuck out stiffly at all angles to heaven, as rigid as if it had been dead a whole day.

day.
'Brain,' snapped Baby-Face mechanically, as if he were used to making beautiful 'bull's eyes'

like that every day, while he jerked another car-

tridge up from the magazine.

The second tiger had whipped round quick as a snake, and was standing erect, glaring first at its dead companion, then at the bush which sheltered the shooter, and Baby-Face's bullet got it fair in the neck, and it fell as if the life had been snapped off from it as one snaps out an electric light. As a matter of fact it was not dead, though. Chaus knew that. Big beasts hit in the neck are usually paralysed like that, and it only needed the second bullet-which came almost at once-right through the head to slay the fine beast before ever it came round from the effects of the first shot. And from first to last neither tigers nor rifle uttered a It was an uncanny and ghostly proceedsound. ing, and the precision with which it was carried out by that shy, gentle-seeming, baby-faced man made it none the less so.

Now it was characteristic of Baby-Face Chaus that when he moved he moved swiftly, amazingly swiftly. One glance at the two striped heaps on the ground told him all he wanted to know about them, for that was part of his trade. It told him nothing that he wanted to know about what they had been looking at. He crept forward with a ready rifle. His tread made no sound, and his shadow, long in the grass behind

him, frightened only field-mice.

Past the first tiger he went-lying as if it held the weight of all heaven on its rigid outstretched paws-and on to the second-superb in its strength even in death-and on, one stride. Then he stopped, swayed forward with almost overbalanced momentum, recovered with difficulty, and opened his eyes very wide indeed. He was on the brink of another concrete trench, deeper than that he had crossed before, and covered-'blinded' would be correct-as to its top with wire, on which light twigs and grass were laid. It was too wide for a tiger to jump over, and if he did he would be stopped by the wire fence on the other side, and if he jumped down he would be held prisoner by the strong wire fence which guarded, as has been said, that Evidently, thought Chaus, this was a hint taken from the New York Zoo. But he did jump down, or slid rather, and then-and then he stopped short, half-sitting, with a gasp of sheer stupefaction.

He found himself looking at a big sunken chamber, as it were the concrete basin of an empty artificial lake, roofed as to its top with wire, on which grass and stuff lay to mask its identity from above, and surmounted with a strong wire fence close to its wall. At the far end, away from Chaus, the outer wall, swinging inwards, crossed it. There were wide iron rolling doors there, and the concrete floor was continued under them. To his right, about twenty yards off, was a little iron door, now half-open, which evidently communicated with an under-

ground passage, leading to the door in the wall by the shore through which the German had entered.

But it was none of these things that astounded Baby-Face Chaus. It was the things which occupied the floor of the space itself that fetched him up all standing, so to speak. 'One, two, three, four, five—five aeroplanes, and—and I was sent to kill tigers, too,' whispered Baby-Face Chaus. And he was right there. Five aeroplanes there were in that place—army aeroplanes, not B.E.'s, but such as they use in—Germany, shall we say! Five very fine and powerful aeroplanes, monoplanes—not British—there in that place, where you couldn't see them if you flew over them, and where the tigers would have taken jolly good care you shouldn't see them, any other way.

Then Baby-Face Chaus climbed silently over the wire. This was the most risky part of the whole proceedings perhaps, because to do so he had to show himself very openly, and ran the chance of getting caught like a cat up a clothesprop. He accomplished it, however, and crouched among the wheels and the 'tails'—listening.

The place was as still and echoing in its hollow silence as an empty church. But still Baby-Face Chaus waited 'frozen,' listening. 'Where,' he was wondering, 'is that blamed German hairdresser?'

But there was only the twitter of a meadowpipit on the parapet without, and the hum of the south-west breeze which nearly always blows in that land, through the wire above. Only that, and nothing else. And——

'Ach, my tear vriend! und 'ow vill you have

your hair cut, eh?'

Baby-Face Chaus had straightened a little, and was moving to examine the sliding-doors by which the avions could be taken outside, free of the tiger-guard, when the voice fetched him round as if some one had stuck a knife between his ribs. He found himself staring almost point-blank into the neat ring of a Browning automatic pistol-muzzle, with half the face of the German hairdresser-man staring overtop.

'Ho,' said Baby-Face coolly, his eyebrows crawling nearly up to the top of his forehead, above his amazingly big, baby-blue eyes, 'it's you, is it?' And he regarded the man wonderingly, half-reproachfully, altogether innocently, as a child would say, 'Oh uncle! how could

you?

'You're a tead man if you moof,' replied the

face above the pistol-muzzle harshly.

'And you're another, anyhow,' snapped Chaus—every inch the Jungle Cat in a flash—falling flat with such amazing suddenness that the bullet from the German's pistol, fired as he moved, passed clean over him.

He never had time to fire another, that spy man, not ever another shot from an automatic. He was dead before he could release and press the trigger a second time, hit neatly through the heart with a '75 grain bullet from the Jungle Cat's Webly-Scott '32 automatic pistol, which had simply gone off from a mysterious somewhere about his person, almost as he reached the ground. It was a wonderful exhibition of quick thought, instant action, and fine shooting.

'Aeroplanes, aeroplanes, and every one of 'em with her bombs in all ready. That bounder seems to have been putting 'em in now. And petrol-tanks all full. Evidently the merry little picnic was timed to take place very shortly,' mumbled Baby-Face, popping from body to body of the big, silent flying-machines, after having relieved the corpse of the late hairdresser of his weapon. 'What a game, eh! What a game!'

He was right. What a game this plot revealed! For it was evident on the face of it that, since aeroplanes could not fly into the country and be of any use at the end of the journey, aeroplanes right in our midst—and these had probably been here since a long time before the declaration of war—could do much harm.

Even supposing the men in the forts saw them at once, and did not mistake them for British machines, which, rising, as they would, so close, the soldiers were almost certain to do, they were so near the big dockyard town and its forts—only five miles in a straight line, in fact—and would take so few seconds in getting there at top speed, that it was more than likely two or three of them would be able to drop all their bombs before being hit or driven off; and just think what that would mean—damage incalculable!

Baby-Face knew that the sound of these shots might be calculated to bring some one upon the scene mighty quick, and he was faced with the responsible alternative of putting the avions at once out of action with bullets or of fighting for them intact. He chose the latter course, because he conceived that five extra aeroplanes, with bombs, petrol, and hangar complete, would be a very welcome acquisition to our army.

Wherefore, when the sound of running shod feet sounded on the concrete without, he promptly flattened himself against the great iron sliding-doors. And this, you will admit, was a strategic position, since any one looking through them would have to come half in and show himself at a disadvantage before he could see Baby-Face.

Very slowly the doors rolled back about six inches, and in the tense, aching silence that followed he was aware—rather by intuition than any other form of knowledge—that some one was peeping in and scanning the situation.

For perhaps three minutes nothing more happened, and the suspense became like a taut wire in his head that must snap. It was awful!

Then a nose, a black moustache, and a chin appeared. A head followed very, very cautiously. The head looked straight in front of itself first, then turned and looked along the inside of the

doors to the right, where Baby-Face was not; then turned again quickly, and looked along the inside of the big doors to the left, where Baby-Face was. And at the same instant the head gave a start, and made to draw back, but stopped.

This was natural, because it had felt the cold impression of the Webly automatic's muzzle against its temple, and heard a voice whisper in its ear, very softly, almost lovingly, 'Keep still.'

And it was still-very still.

Then—well, nothing further happened. The head just kept where it was, and the pistolmuzzle just kept where it was, and that was all; while the silence grew, and grew, and the strain with it, till you could have seen great beads of cold sweat breaking out upon the head's forehead and running down to its nose. As for Baby-Face Chaus, he might have been turned into a wooden post in that instant, for all the further signs of life he gave. But he was not a post. Oh no, he was listening with all the intentness he could summon to help his preternaturally sharp ears; for he had no means of telling whether the owner of the head was alone, or whether he had friends behind him. Naturally Baby-Face Chaus had no wish to entertain those friends, if there were any, just at that time. But he knew that if there were any friends they would be certain to betray their presence sooner or later. It was only a question of time and waiting. And the sound came at last.

There was a shuffle without; then an impatient whisper through the narrow opening between the big doors, 'Vat is wrong, Max?'

'Silence, or this'll blow your head off!' The words were barely breathed by Baby-Face into the ear of the head, but it heard them.

'Mein Gott' it muttered, and then again, 'Mein Gott' and you could hear the rasp of dry lips being moistened with a dry tongue.

Evidently the speaker without heard only the last, but not Chaus's words, for there came the sounds of hurried whispering without, and more shuffling of feet. Then, 'Max, what is de madder?'

The Webly-Scott automatic's muzzle screwed itself a little more against the temple of the head, and, 'If your friends try to open the doors any farther, say your prayers,' whispered Baby-Face again.

And the head shivered visibly.

Came then more whispering without, and a new voice joined in. Evidently there were at least two of them outside, and by the same token Baby-Face's position began to look precarious.

Meanwhile the seconds ticked on—you could hear them doing it plainly from the watch in Chaus's waistcoat-pocket, so still everything was—and the face began to turn a clammy gray.

'Max,' came the whisper from outside again, 'we will open de door—yes. Somedings is wrong gone. We know id.'

The '32 automatic gave a nudge, and-'Every-'No, no!' gasped the head aloud. dings is all right. For the luf of Gott do not

moof now!

Followed silence, broken only by the impatient shuffling of feet. Once Chaus caught a glimpse of a nose trying to peer in over the head, but it

could see nothing.

As for Baby-Face, the sweat was beginning to trickle and trickle all down his back, and he felt his hair sit up and creep all under his soft tweed He knew this mad position could not endure much longer. It was enough to make him shout out, if only to break the intolerable agony of the tense strain. Yet for the life of him he could not see how to end it. He might blow the brains of the head out, and chance what followed; he might fire at one of the aeroplanes, and chance hitting a bomb and blowing the whole bag of tricks, himself included, into Tophet; or he might do a bolt for the little door leading to the subterranean passage on the other side, andprobably get nicely riddled in the process. Something must be done. They could not keep here like that for ever; besides, both he and the head would go mad in the meantime.

Then suddenly it was all over. Without warning, or preparation of any kind, there came from outside a short, sharp challenge, 'Hands

up, there!'

Followed a volley of German curses, a scuffle, the bark of a Browning pistol-shot, the butting crack of a rifle, a ghastly yell, and-silence.

Then the orderly tread of shod feet rang on the concrete without, the doors rolled back, and, 'Good perishin' 'eavens above! Look at 'ere, sir!' gasped the amazed voice of a corporal, at the head of half-a-dozen khaki-clad figures, with rifles and fixed bayonets, who dashed in, and halted, with mouths and eyes wide open, staring at the scene, with Baby-Face Chaus, his weapon still glued to the head of his bowed and livid prisoner, in the foreground.

An officer pushed through, stared, choked, and

was dumb.

'If,' begged Baby-Face Chaus wearily, 'you'll have the goodness to take over this prisoner I shall be much obliged.' Then he stepped forward and saluted, handing his orders and the card to the officer. 'I've carried out my orders, sir,' said he, 'and should like to report to name on card, as requested.'

'And that's me,' laughed the officer. 'We heard the firing, and I received telephonic instructions to give you support if necessary. But what

about the tigers?'

'I've got them too, sir.'

'How many?' 'Only three.'

'Only three! Good Lord, man, you speak as if you shot wild beasts every day before breakfast for a pastime!'

'Not a pastime, sir,' corrected Baby-Face ietly. 'For a living.'

quietly.

'Yus,' echoed the corporal in a stage whisper, 'an' give 'im little white wings, an' a bow an' arrer, an' strip 'im, an' 'e 'd fly away as a bloomin' Cupid. 'Eaven 'elp us judge our fellow-men, says I.'

THE END.

OLD SCOTTISH PROPHECIES.

By JAMES FERGUSON, K.C.

PART I.

THE history of Scotland owes not a little of its charm to the graphic and picturesque sayings, often embodied in an easily remembered rhyme or couplet, associated with national events, prominent families, and particular localities. The most remarkable of these are the predictions known to have been fulfilled in some cases soon after they were uttered, and in others hundreds of years afterwards, which, whether they be in all cases truly prophetic or not, nevertheless remain as a romantic and arresting record of the facts to which they relate. The most famous of the seers into futurity was Thomas the Rhymer, the Knight of Ercildoune, near where the Leader joins the Tweed, who lived shortly before the outbreak of the troubles caused by a disputed succession and the attempted enforcement of English supremacy. Gifted alike with the vision of a poet and the judgment of a reflecting statesman, he foresaw only too clearly the evils

threatening his country, and was fortunate in receiving the mysterious summons to another world when 'the white hart and hind paced side by side,' before they actually came to pass. So great was his fame that it is probable that as many a Covenanting parish of the west country would be indignant at the suggestion that 'the occupant of the grave under its gray stone fell by any meaner hand than that of Claverhouse himself,' so the anticipations of lesser and later prophets have been attributed to the outstanding name of 'the Rhymer.' In the far north a similar pre-eminence belongs to 'the Brahan seer;' but there were minor prophets and wise women such as the Witch of Glengairn and the Lady of Lawers.

The Border country from which the Rhymer came was also the region which had some seven centuries before produced the great poet and prophet of the Britons of Strathclyde, the famous

Merlin, who after the death of his friends fled deranged from the slaughter of Ardderydd into the depths of the Caledonian forest. mediæval writers confused the Welsh Merlin or Myrddin Emrys with the northern Myrddin Wilt or Merlinus Sylvestris; but both were historical characters, and both gifted with 'the vision and the faculty divine' of the prophet and the poet. As Professor Veitch observes, 'Of the prophecies attributed to Merlin one at least may be regarded as having a certain and never-failing fulfilment. Speaking of the wild scenery amid which his later days were passed, "Lady," said the bard, "the flesh upon me shall be rotten before a month shall have passed, but my spirit will not be wanting to all those who shall come here." A long and numerous following have drawn their inspiration from the Scottish Borderland, and it is no mean succession of poesy which counts as its most conspicuous names Merlin of the Woods, True Thomas of Ercildoune, and the Wizard of the North, Sir Walter Scott.

Of the national predictions the first and most famous is that relating to the Lia Fail or Stone of Destiny, on which the old Scottish monarchs were crowned at Scone, which was carried off by Edward the First of England, and which rests to-day under the Coronation Chair in Westminster Abbey. Tradition affirms it to have been the stone on which Jacob slept at Bethel; to have been taken on the captivity of the Jews, by the prophet Jeremiah, with a princess of the Royal House of Judea, to Egypt, and thence to Ireland, where the refugee princess married an Irish monarch; and to have been brought over by Fergus, her descendant, the first of the Scottish kings:

Ne fallat fatum, Scoti, quocunque locatum Invenient lapidem, regnare tenentur ibidem.

The national triumph of Bannockburn was darkly foretold by the Rhymer in the lines:

The burn o' breid Sall rin fu' reid;

and the disaster which heralded the procession of woes was predicted by his statement to the Earl of March in 1285, that 'before next day at noon such a tempest should blow as Scotland had not felt for many years before.' This proved too true when the news came that Alexander the Third, the last of 'the Kings of Peace,' lay dead with his charger under Kinghorn cliff.

An Englishman who accompanied the Duke of Somerset's army to Scotland in 1548 records the prediction fulfilled two centuries later when the Highlanders under Prince Charles broke the battalions of Sir John Cope at Prestonpans:

Between Seton and the sea. Mony a man that day shall dee.

Another prophecy is said to have foretold the fatal field of Flodden; though there is some reason for the opinion that it rather represented

the belief of the Scots that their king was not slain, but would return:

Our Scottish king shall come full keen,
The red lion beareth he;
A feddered arrow sharp I ween
Shall make him wink and war to see.
Out of the field he shall be led
When he is bloody, and wo for blood;
Yet to his men then shall he say,
'For Goddis love turn you again,
And give yon Southern folks a fray.
Why should I live, the right is mine,
My dule is not to die this day?'

The fall of the eldest son of the Earl of Angus and his brother, Sir William Douglas of Glenbervie, in the same battle was also foretold, the stars and heart being the arms of the House of Douglas:

The sternes three that day shall die, That bears the harte in silver sheen.

And another almost as disastrous a day for Scotland, when 'in the fallow fields of Inveresk the dead bodies lay as thick as a man may note cattle grazing in a full plenished pasture:'

At Pinkie Cleuch there shall be spilt Much gentle blood that day; There shall the bear lose the gylte, And the eagle bear it away.

The Regent Morton is himself said to have quoted a prediction attributed to Merlin, when committed to the custody of Stewart, Earl of Arran, before his execution:

In the mouth of Arran a seleouth [wonder] shall fall, Two bloody hearts shall be taken with a false traine, And derfly dung down without any dome.

The Union of the Crowns was trebly prophesied:

When Tweed and Powsail meet at Merlin's grave, Scotland and England shall one monarch have.

In the year of James's accession to the English throne there was an unusually high flood, and the waters of the two streams did join at the traditionary grave of Merlin. Another prediction seems to have been originally directed to the return of the Regent Albany from France, who landed at Aberlady 'with hempen bridle and horse of tree;' but it was most gratifying to Scottish pride:

However it happen for to fall
The lion shall be lord of all,
The French wife shall bear the son
Shall wield all Britain to the sea;
And of the Bruce's blood shall come
As near as in the ninth degree.

The third, attributed to the Rhymer, ran:

On the waterfa' and the watershed,
When is seen the nest of the ring-tailed gled,
The lands of the north sall a' be free,
And ae king rule owre kingdoms three.

Of prophecies associated with particular families there are many instances, mostly attributed to Thomas the Rhymer. From his own district come the sad reflection on his own race:

The hare shall kittle on my hearthstane, And there never will be a Laird o' Learmont again;

the weird on a neighbouring family:

Vengeance, vengeance, when and where, Upon the house of Cowdenknowes now and evermair:

and the comforting assurance, which still holds

Tide, tide, whate'er betyde, There'll aye be Haigs o' Bemersyde.

But, strangely enough, distant Aberdeenshire provides a remarkable number of the Rhymer's soothsayings.' Looking down on the gray ruins of the Abbey of Deer, founded by a Comyn, Earl of Buchan, in 1216, is the slope of Aikey Brae, where Edward Bruce inflicted the last defeat on the mighty house which at one time numbered three earls and thirty belted knights, and on which there was a cairn called 'Cummin's Craig,' where an Earl of Buchan is said to have lost his life by a fall from his horse when hunting. 'The prediction goes,' says an old local chronicler, that this earl, quho lived under King Alexander the Third, had called Thomas the Rhymer by the name of Thomas the Lyar, to show how much he slighted his predictions, whereupon that famous fortune-teller denounced his impending fate to him in these words,' which, it is added, were all fulfilled literally:

Though Thomas the Lyar thou callest me, A sooth tale I shall tell to thee. By Aiky side thy horse shall ride, He shall stumble and thou shalt fa', Thy neckbane shall break in twa, And manure all thy kin and thee And, maugre all thy kin and thee, Thy own belt thy bier shall be.

It is said that in some excavations in the ruins of the abbey a skeleton was found, with the remains of a belt, lying in the most honoured

place of sepulture.

At Fyvie, where there was a castle in the Rhymer's days—for Edward the First slept there in 1296—the tradition is that True Thomas was kept waiting outside the castle yett in cold and rain, and pronounced the malediction:

Fyvyin's riggs and towers Hapless shall your mesdames be, When ye shall ha'e within your methes Frae harryit kirklands stanes three, Ane in Preston's tower, Ane in my lady's bower, And ane beneath the water yett, And it ye shall never get.

The potency of the spell has been indicated by the rarity of a direct descent from father to son, and the succession of families who have held the magnifica et amæna arx of Fyvie.

A similar prediction is associated with the old castle of Towie, where for generations the owner never saw his eldest son come of age:

Towie-Barclay o' the glen, Happy to the maids but never to the men.

Near the mouth of the river Ugie is the site

of an old castle probably existing in the Rhymer's time, and a little farther up the river are the remains of the lordly residence of the Keiths, Earls-Marischal. To either the prophecy is applicable:

Inverugie by the sea, Lordless shall thy lands be; And underneath thy ha' hearthstane The tod shall bring her bairnies hame.

It is said that a picnic-party once started a vixen from the ruins of the later castle. On a field near by there stood for long a stone called 'Tammas Stane,' which was removed in 1763. The weird ran:

As lang's this stane stands on this craft The name of Keith shall be alaft; But when this stane begins to fa The name o' Keith shall wear awa'.

The removal succeeded by a few years the death of Field-Marshal Keith on the field of Hochkirchen, and shortly preceded that of his brother, the last Earl-Marischal.

Another prediction, said to have been fulfilled in the year of Prestonpans, attached to the old castle of the Turings of Foveran near the mouth of the Ythan:

When Turing's tower falls to the land, Gladsmuir then is near at hand; When Turing's tower falls to the sea, Gladsmuir next year shall be.

Gight, the seat of that turbulent branch of the Gordons whose heiress was the mother of Lord Byron, has three predictions, all realised in comparatively recent times:

When the heron leaves the tree The Laird o' Gight shall landless be.

On the marriage of Catherine Gordon to the poet's father, the occupants of a heronry close to the castle migrated in a body to the woods of Haddo House, and the 'rigs soon followed.' 'Unrivalled in its quaint obliquity' is the second:

Twa men sat down on Ythan brae, The ane did to the ither say, 'An' what sic men may the Gordons o' Gight ha'e been?

The third is still more remarkable for its literal verification:

At Gight three men a violent death shall dee, An' then the lands o' Gight shall lie in lea.

In 1791 Lord Haddo, who resided there, was killed by a fall from his horse on 'the Green of Gight.' Shortly after a servant on the home farm met his death in a similar manner; and when the buildings were being unroofed prior to the whole land being laid down in grass, one of those engaged in the work commented on the failure of the prediction, but in a few hours an accident occurred, and the scoffer himself made up the fatal tale.

To the old seat of the Bairds of Auchmedden

at Pennan attached the saying :

While there is a Baird in Auchmedden There shall be an eagle in the crags of Pennan.

On the sale by the original owners to the Earl of Aberdeen the eagles disappeared. On the marriage of Lord Haddo to Miss Baird they returned, but again disappeared on the succession of the Honourable William Gordon. In 1854 the estate was purchased by Mr Robert Baird of the Lanarkshire family, when one eagle returned to the rocks, but was killed or driven away by the men of the coastguard.

More encouraging is the couplet upon the family of Lord Saltoun, which has two versions:

When there's ne'er a Cock o' the North, You'll find a Fraser in Philorth,

and

While a cock craws in the North, There'll be a Fraser in Philorth.

In one sense the prediction may be said to have been fulfilled when the last Duke of Gordon died in 1836, in another it stands good as long as an heir remains to inherit the honours of the Marquisate of Huntly, and in a third it promises practical immortality to a race.

Perhaps the most beautiful of all is the prophecy associated with the Hays, Earls of Erroll, whether relating to Slains in Buchan or to

their ancient seat in Perthshire:

When the mistletoe bats on Erroll's aik,
And the aik stands fast,
The Hays shall flourish and their good gray hawk
Shall nocht flinch before the blast.
But when the root of the aik decays,

And the mistletoe dwines on its withered branch, The grass shall grow on Erroll's hearthstane, And the corbie roup in the falcon's nest.

The falcon which flew round the lands of Erroll after the fierce fight of Luncarty is the crest, and the mistletoe the badge, of the gallant Hays.

The fortunes of the lands and fine ruins of Tolquhon in Formartine, were indicated in:

Granton, Granton, or Tolquhon, When one ill's aff, anither's on; And peace to ye will never be Till the hands of the Gordons get ye.

The county of Ayr has its own saying illustrative of the vicissitudes of families:

Sundrum shall sink, Auchincruive shall fa', And the name of Cathcart Shall in time wear awa'.

The fame of the Rhymer extended beyond the Highland line. If Border tradition maintains that he waits with Arthur in Eildon Hill the summons to reappear, the West Highland tradition asserts that he is still in Dunbuck Hill (near Dumbarton, a spot within the territory of the Britons of Strathclyde), and that of the Hebrides affirms that he rests in Tom-na-heurich Hill, near Inverness:

When the hosts of Tom-na-heurich come, Who should rise first but Thomas?

True Thomas is believed to be as a spirit regularly attending markets on the search for horses possessing certain characteristics. When his complement is made up he will become visible, and terrible events will occur:

When Thomas comes with his horses, The day of spoils will be on the Clyde; Nine thousand good men will be slain, And a new king will be set on the throne.

Other anticipations also ascribed to the Rhymer are: 'The South Sea will come upon the North Sea;' 'Scotland will be in white bands, and a lump of gold will be at the bottom of every glen.' The first was fulfilled by the construction of the Caledonian Canal, and the second by the making of roads and the increase in the number of good houses.

(Continued on page 811.)

THE ALARUM.

CHAPTER IV.

PAUL had been about a month in Fotherdale, where he had found a lonely lodging with an old retired shepherd, Jim Walker, and his granddaughter Agnes. He had been down the valley to the village of Gargill to buy postage-stamps and tobacco, and he was now tramping slowly up the dale on this hot June afternoon.

The day was perfect, and the wild fell road wound its leisurely lime-white way ever gently upward toward the head of the dale.

At first the valley was wide, and on each side of the unfenced road there stretched grassy wastes, vivid with gorse and sunlit bracken, or strewn with black boulders, lichen-patterned.

Down by the beck to his left the sun-dew lurked in the cozy bottom, and the cotton-grass hung motionless amongst the reeds; while now and again cropping geese added a quaint touch to the scene.

Above, on the higher ground, brilliant patches of sentinel foxgloves swept the dale with broad colour, and wild roses tangled themselves amongst the hazels and junipers; while, as the dale narrowed and the fells heightened, the early bell-heather adorned the crags in bold, conspicuous tufts.

To his right a reedy ditch skirted the way, gently beautiful with forget-me-nots, crisp ferns, and many a tender little plant which loved to dwell in secret; while, above and beyond, the magnificent blue of a festival heaven framed the whole prospect adorably.

The head of Fotherdale was but four miles from the village, yet Paul walked wearily.

Why had he come on this fool's quest, expecting that the glamour of the north would soothe his soul? His soul refused to be soothed, and even though earth and sky cried aloud for admiration, Paul cursed the sunlight and prayed for cloudy oblivion. A blow had had the audacity to fall upon him which for once he was quite unable to parry. A burden had been forced upon him which he could not unload, shift his shoulders as he might. So he passed through successive and recurring conditions of remorse, indignation, and self-pity.

That he had loved his mother passionately was undeniably true, and now that she was gone there came times of anguish when he felt he could lay himself down and shriek aloud for the need of her. Yet it was becoming intolerably clear to him that he had accepted her life's devotion as the merest matter of right, and had refused her the one reward after which she had craved. Yet so insidious had the self-viewing of his own interesting personality become that even as he kissed the beloved face for the last time he perceived himself in action, and appreciated the moving power which such a picture might make as a study in pain.

It was only as he entered the privacy of his mother's boudoir, and went through the daily contents of the post-bag, that the knife cut so acutely that he began to forget to notice that he was bleeding. What a stupendous life of social service his delicate mother had managed to live! In the letters which showered upon him, and in the examination of her bureau, hundreds of kind acts and thoughtful schemes

for effective good lay revealed.

Reality was rising to struggle with mere chimera. One frail womanly prop had dropped, broken to earth. Was he, her son, to refuse

his shoulder?

Perhaps it was to think out this question that Paul escaped from his would-be friends and his painful surroundings, and left his address privately with his solicitor. Or it may be that he wished to realise what it meant to him that the one letter for which he craved, and which might have shot a ray of hope through the gloom, had failed to come.

He, Paul, the all-conquering boy, had been beaten back by something beyond himself, against which all his life's weapons fell blunted. 'Oh,' he murmured to the glaring heavens:

What shall I be at fifty, Should nature keep me alive, If I find the world so bitter When I am but twenty-five?'

Even if 'everything' was his own fault, surely-

surely Mary might have written!

He turned suddenly at the sound of the smart click of hoofs behind him. The dale doctor, in his shabby trap, was rounding a bend of the road. A word to his beast, and the pace dropped to a walk as he came alongside of Paul.

'Good - afternoon,' he remarked sociably. Grand weather!'

'Very,' agreed Paul. He continued his walk, as did the doctor's horse.

'I fancy you are the artist who has come to picture our beauty for the benefit of a credulous outside world,' said the doctor. 'You fellows are fond of invading us in summer, when we are sleepy and sublime.'

There was an irresistible something in Dr Brock's manner which forced Paul to throw aside mere convention. Besides, he was thankful to have some kind of interruption to his thoughts. A month of himself had been a monstrous strain.

'Too sleepy and sublime,' he answered with a short laugh. 'I can find no inspiration.'

'Ah!' commented the doctor. He had gained a full view of the artist, and noticed how young he was, also the traces of strain about the eyes, the set of the soft lips, the black tie, and the drooped shoulders.

Dr Brock was an undeveloped city specialist lost in a dale, and he knew it. 'Climb up with me for a change, and see some of that harmless drollery termed the medical profession,' he said with a certain dictatorialness, as he brought his

horse to a standstill.

'Thanks,' said Paul simply; and he climbed up beside the doctor and pulled the worn old

apron across his knees.

'Gee up, David!' remarked the doctor to his horse. 'We are a noble profession, aren't we. David? We've said it so often that at last we have been taken at our word. Keep a dog for seven-and-sixpence and a doctor for-Come up! What are you stumbling for? Tired of feeding on banana-skins and rotten turnips, and sleeping on sawdust?-Come, young man! Give me something fresh to think about. are all asleep here-no intellectual life, no go, no push, no public spirit, no one reads, nothing but snobbery and gossip. We spend two hundred pounds a year on our foxhounds, and can't afford a district nurse; so my wife does the nursing, which suits our dale "nearness" admirably.' The doctor was only letting off his chatter in order that he might find some point of contact with his guest. 'Then why do you stay?' asked Paul.

'My dear fellow, explain to me how I can get away! When once you are in general practice, in general practice you may stay until they carry you feet foremost along the nearest corpse road! Started this ambitious career on my legs, rose to a bicycle, scrapped it and bought Jerry ten years ago; and he laid his whip lightly on his horse's broad back. 'Changed his name recently to David for public reasons—honour to whom honour is due-that sort of thing, you know. And now I have a car in my stable. My wife is cleaning it up to-day. People fancy a doctor can't count their pulse-beats nowadays

unless he comes in a car. But David for a road like this;' and they swung round sharply to the right, up a steep track that led across a pass between the fells. 'David in the trap, or David between my legs—there's no car ever built that can beat David! But tell me what they are all doing in London. Remind me that some one is awake.'

Paul gave a short laugh. 'The season is drawing to a close, and they will all soon be dispersing to calm their nerves.'

'He is hit over something pretty badly,' thought the doctor. Aloud he said, 'Well, we grow nerves even here! I'm just going over into Riddingdale to see a young man who has "slipped his mind." We have a trick in the dales of "slipping our minds;" so be warned! That's generous of me, for it's one of the most paying jobs I have—a guinea down for signing the certificate. You are staying with the Walkers, aren't you?'

'Yes.'

'You've been there about a month. Oh, I know everything. No, as a matter of fact, I don't, though; and perhaps you can help me. Have you happened to come across the Dowthwaites of Dale Head Farm?'

'I know the farm-picturesque old place.'

'And there's a picturesque kind of story going about it, too,' mocked the doctor. 'Dowthwaite is a widower, and his sister housekeeps for him. He has a little girl, and it is being said that he, or more likely she, ill-treats her. Haven't been able to make an excuse to find out yet. healthy a place Dale Head. They say it takes a doctor to kill 'em up there! But if you happen to see anything or hear anything while you are "happening round" to paint your picturesque farm-well, you might just let me know. I'm a magistrate. That's all wrong, too. No doctor, squire, or parson ought to be a magistrate in the country. Prejudiced, and know too much in confidence! We want a stipendiary badly about here. Tell your great men in London when you go back.'

A grim smile crossed Paul's face, and a curious sensation of wonder gripped him. 'I must try

to remember,' he said.

'And surely Agnes talks? She never lets me get a word in edgewise when David and I call for a pail of water and a pot of tea.'

'Miss Walker certainly talks,' Paul admitted; 'but she hasn't happened to mention the Dow-

thwaites.'

'Then you just lead her up to the subject, and do a bit of private detectiving! Always get practice in anything you can—never know how useful it may come in. Oh, and I might warn you that it is said that this Dowthwaite wants Agnes for his second wife; but I doubt if she'll be such a fool. Still, women are fools!'

So the doctor conversed until at last they reached a wild, man-forsaken-looking group of

blue stone buildings, and David pulled up outside a rickety five-barred gate.

The doctor handed the reins to his companion, and jumped down into a sticky puddle, pushed open the gate, and disappeared round the corner. Paul was left alone with David and a very suspicious-looking dog.

'Well,' said the doctor on his return to his seat, 'and have you decided how soon you would "slip your mind" if you were condemned for all

your days to live up here?'

'I shouldn't fancy it,' admitted Paul.

'No; and if I were you I'd clear off home to pleasanter company than any you'll find here.' So the doctor at last struck in his forcing remark.

'I have no home,' said Paul sharply. 'My

mother is dead.'

Dr Brock made no kind of reply for a long stretch of road. Then he said quietly, 'One's mother only dies once. Then one discovers that other people's mothers also die, and that life hurts, and was meant to hurt, to show what we poor fools are made of.' He did not apparently expect any reply, for he stroked David across the back as he remarked, 'Hurry up, my dear fellow! Remember I want some supper before I go to the village concert to sing my only song.'

CHAPTER V.

WELL, and how many pictures o' thy bonny face has t'artist painted, Miss Walker?' asked Dick Dowthwaite, with an attempted gallantry, as he leaned over the little wicket-gate which shut off the shepherd's garden from the rough fell.

'And what's that to thee, Mr Dowthwaite?' asked Agnes. 'Jealous, happen?' And her blue eyes sparkled as brightly as her knitting-

needles.

He stared at her dourly, then said in a low, rough voice, 'Thoo'd best have a care, Agnes Walker! Women's tongues get going over fast for health.'

'And, begging your pardon'—and Agnes dropped a curtsy—'women's tongues don't go no faster than men's lips when there 's a pint-pot within an inch or two o''em. That hand o' thine, Mr Dowthwaite, will soon be getting that doddery, it won't be safe for thy sister to let thee out alone wi'a wood-chopper.' She smiled sublimely at her angered victim, and rested the long gray stocking on the rough stone fence.

'If thoo was a man, my lass!'

'Pity but what I was,' she mocked; 'and then there'd be no need for thee to come courtin'!'

The man's attitude might have warned Agnes that she was playing with thunder; but she was tired of this courtship, and was reckless in her ways.

'Then this is t'last chance,' he began sullenly.
'Chance! And sic a chance!' she laughed.
'As if I hadn't telt thee by t'teens o' scores that

I'll have nowt to do wi' widowers! When I wed I'll manage to get myself a fresh un! Thee don't fret thyself, Mr Dowthwaite.'

'Thoo's changed thy tune gaily since t'artist

landed!' he sneered.

'So that's t'latest!' mocked the girl; yet her cheek flushed, and she went on hurriedly, 'There's nobbut one thing as would ever have made me look aside at thee, that's if ever I'd so much as given tha a thought.'

'And that?'

'Thy daughter Janie! If ever a poor li'le lass led a dog's life, it's Janie!'

'My daughter is none o' thy business!' he snarled, still unable to tear himself away.

'No; seemingly I've lost my chance to make it my business! But think on, Mr Dowthwaite; there's a deal o' talk started in t'dale, and for t' love o' God see to it that you poor lass isn't done to death between thee and thy skinflint sister.'

The girl's face suddenly lost all its mockery, and a keen look of womanly tenderness rose in its place. For an instant the man wavered, halfcontrolled by the new influence; but she spoiled her effect, unfortunately, by allowing the sneer to come.

'Agnes Walker, this is t'last!' he shouted furiously. 'I've stood thy impudence till I'm fair sickened. Even I isn't altogether a fool, and it doesn't need a man as can look through a stone wall to see t' road thoo's going! But think on, my lass! London gentlemen don't make wives o' shepherds' granddaughters.'

An angry light flamed up in the girl's face. Fet out!' she cried fiercely. 'And if thoo shows thysel' near this fence again I'll get my grandfather to smash in thy ugly face for tha!

So think on as I've telt thoo!'

CHAPTER VI.

HERE was a delightful path tracking the bed of a fell beck, comparatively cool in the hottest sunshine, owing to the shade of straggling hazels, rowans, and birches; and on the following morning Paul took this track, with the idea of gaining the fell heights for a long tramp.

'Please, may I go with you, just a li'le bit of

t'road?'

Paul looked behind him, considerably startled at the sound of the soft, pleading voice. He saw a slightly built child of perhaps seven gazing up into his face with large, solemn black eyes.

'Why, certainly, little lass,' he said kindly, laying his hand rather heavily on her shoulder.

'Oh!' She gave so irrepressible a cry that Paul drew back.

'Why, did I hurt you?'

The child tightened her teeth over her underlip for an instant, and then said steadily, 'Naa!'

'That's a lie,' thought Paul. 'I wonder why

she told it.' His interest was aroused. must obviously be the child from the farm, about whom the doctor was anxious. He had not given the doctor's suggestion another thought, and had certainly no intention of worrying himself with dale complications; still, it was difficult to ignore the appeal of that thin, distressed face.

Indeed, the child, after looking furtively round, as though to make sure that no one was following her, took hold of his hand, and he found himself walking along beside her.

'You are lame, little one,' he said presently, as he noticed that she was trying to hide a

limp.

'Oh naa, I isn't!' she said. 'Do you like t'dale ?'

'It is very beautiful,' he replied.

'But what is t' world like outside, right away over yonder?' and she pointed to a wild mass of fell which enclosed the dale from the south and all that the south might mean. 'Folks say you come from London. Do you, sir?'

'Yes.'

'It's terr'ble bonny in London, isn't it?' she asked wistfully.

'Not nearly so bonny as it is here.'

She looked at him increduously, and shock her head. 'Will you be going back to London some day?'

'Why, yes, I suppose so.'

'Then'—he found her clinging to him with both hands—'will you take me with you?

The quick outbreak of passion was so astonishing that Paul stood silent for an instant; then he said in a low, soothing voice, 'My dear little girl, I do not even know your name.'
'Whisht!' she cried. She darted from him

like some wild thing, with naked and noiseless

feet, into the coppice to the right.

Then it was that Paul became conscious that some one was whistling a tune behind him. He looked round, and saw a man, whom he recognised as Farmer Dowthwaite, striding along. with a heavy ash stick in his hand.

'Ah, Mr Marsland, is it?' he said, with a curious mocking intonation, which Paul did not in the least understand. 'Have you happened

to see my li'le lass along this road?

'Have you a daughter, Mr Dowthwaite?'

'Ay; and she's a limb—a regular limb, if ever there was one. She's tooken herself off somewheres, and her aunt Martha worrits whenever she's out o' her sight. Janie's a thin lass, with coal-black eyes and a deal o' yellow hair.'

'I'll look out,' said Paul frankly. 'If I see her, do you wish me to tell her to go home?'

'Tell her that her aunt is waiting for her, and that the longer she bides the more worrity her aunt Martha will be. Our Janie will understand.

'Right you are,' said Paul. He was thankful

to note that the farmer plunged leftward, and crossed the beck by means of a rude plank.

'So I have broken in upon tragedy!' he thought. He pursued his walk, thinking intently, not of himself this time, but of a little child. 'Mary would have known what to do!' he ejaculated, as he gained the open fell and took in a deep breath, fragrant of sun-heated

But the only answer was the swish of a light wind across the summer-dried grasses.

CHAPTER VII.

INTIL that night Paul had not particularly noticed a handsomely bound Bible that lay on his chest of drawers in front of a case of stuffed birds.

Since the days when his mother had diligently taught him, he had almost completely neglected the Book, but to-night something induced him to open it. He knew his way about it as a blind man might be able to finger a raised chart; but of the visions and vistas of glory waiting for those who have eyes to see, he knew nothing.

'And He took a child, and set him in the midst of them: and when He had taken him in His arms, He said to them, Whosoever shall receive one of such children in My name, receiveth Me; and whosoever receiveth Me, receiveth not Me, but Him that sent Me.

That was enough. Paul remembered one sunny day in the old garden, when his mother had explained to him that the old language meant that the Master pressed the child to his breast. Yet until this moment he had never perceived that the way to God lay directly through a little child and an all-sacrificing Saviour.

Again the intolerable lonely longing after his mother overwhelmed him. Weakness was it? There are some weaknesses more honourable than strength.

He blew out the candle, and lay down with wide-open eyes, staring into the strange, moonlit room. A remembrance came to him of how, long ago, he, a passionate child, had fought with his mother all through one miserable day, and how at last she had come to him in the moonlight, and for one moment he had thought she was an angel from heaven, and in his excitement he had cried out repentantly, 'I will be good! I will be good!'

His mother had taken him in her arms and kissed him, and then laid herself down on his bed, and softly sung to him-something about a silly little lamb that had wandered from its mother's side—until he fell asleep.

'My God!' fell from the grown man's lips,

Pity my simplicity. Suffer me to come to Thee!'

Paul closed his eyes, and in the darkness the Vision came to him.

CHAPTER VIII.

NEXT morning Paul took a walk in the direction of Dale Head Farm, and as he drew near he was pleased to notice that Janie was just in front of him. She was carrying a heavy pail of water up from the spring. 'Let me help you,' he said kindly.
'Naa.' But her face went crimson, and she

whispered, 'When are you off to London, sir?'

'Soon,' he answered.

She gave a haunting sigh, and said quietly, 'I'll just have to bear it till then.'

The point to be discovered was what she meant by 'it.' For reply, however, Paul merely forced the pail out of her hand. She struck at him impotently, and followed, expostulating.

'Janie!' came a strident voice.

Paul saw a square-set, hard-featured woman of forty advancing across the yard.

'Here is your water, madam,' said Paul, raising his hat. 'I had quite a fight to get hold of it.'

'You shouldn't have,' sobbed the child. 'Mr Marsland from Walker's?' the woman queried.

He smiled assent.

'Then you see what a limb she is!'

'Yes, I see. Rather a delicate limb, though, I am afraid, Miss Dowthwaite,' said Paul meaningly.

Miss Dowthwaite glanced at him suspiciously.

'She ails nowt!' she snapped.

With a reassuring smile to his small friend, Paul passed on, for he had no excuse for lingering. Yet when he had gone a few hundred yards, something impelled him to retrace his He strolled back, and went up a little knoll from which he had a full view of the

upper windows of the house.

Surely that was the shrick of a child? He paused, breathless. All was still. No; a He could window was shut down violently. see a woman's face for an instant. He paused irresolutely. An Englishman hates to intermeddle, and perhaps he was altogether mistaken. His thoughts flew to a certain duchess's overheated ballroom, and words which at the time had made no impression returned to him: 'The difficulty in a case of cruelty often arises because neighbours refuse to act, even though they know that suffering is going on. The public should feel it a solemn duty to report suspicious circumstances direct to the head-office of the society. It is a crime for any grown-up person to hesitate to rescue a little child from moral danger or bodily torture.

Paul repassed the farm, and took a walk down to the village. The doctor and his wife were both out, so he telegraphed a long message to his solicitor. As he came out of the little postoffice a curious smile played about his mouth. 'After all, it is I who have applied to the secretary,' he thought.

(Continued on page 802.)

THE COST OF RADIUM.

By G. BASIL BARHAM, A.M. Inst. E.E.

THE most extensive discovery of pitchblende which has yet been made has just taken place in India, and it is certain to have a far-reaching effect on the cost of radium. Pitchblende is a mineral which is one of the most important sources of the metal uranium and its compounds, and it is from these radium is obtained.

For some time past a mica-mine has been worked in the Singar district of Gaya, India, and a short time ago a large number of tourmaline crystals were found there. Near these were traces of uranium, a metal resembling nickel in appearance, with certain compounds, principally uranium ochre, so called by reason of its pronounced yellow colour. These were associated with triplite, and as the pits were deepened nodules of pitchblende were found. Systematic working was then undertaken, and a large amount of pitchblende was found in the mine. Nodules of fair size were frequent, and it was not long before a nugget weighing thirty-six pounds was turned up.

A gentleman visiting in the district was shown a large black-and-yellow nodule of pitch-blende, and was informed as to its radio-active properties. Sceptical regarding these, he tried a number of experiments, such as photographing objects of small size by its means, and, convinced, he wrote to one of the local papers. By a curious coincidence, the report of Mr Burton, a geologist, who had been sent to inquire by the Government of India into the pitchblende working, was issued almost immediately afterwards, and one is consequently able to judge as to the extent and importance of the find.

Mr Burton's report is to the effect that the pitchblende occurs in a pegmatite which has a maximum width of forty yards, and is exposed for some three hundred and fifty yards along the side of a cliff. There are a number of muscovite schists caught up in the main body of the pegmatite, and at the juncture occurs the greatest quantity of the mineral. At the time Mr Burton's report was compiled some four hundredweight in all of pitchblende had been found, but the nodules have been come across more frequently later, and the total weight now raised is said to be almost nine hundredweight. Recently a nugget, weighing fifty-six pounds, of practically pure pitchblende was dug out, and the area on which prospecting work has been carried out has yielded several indications of the presence of more of the uranium compounds. In fact, the prospecting has now entered the commercial stage, and a syndicate has been formed to work the deposits. As an initial step, they have obtained an exclusive concession for mining over a considerable part of the country under the Rajah of Gaya. The Government of India, through the Lieutenant-General of Bihar, is watching the development with interest; and to show the extent to which the plans of the syndicate have matured, it may be mentioned that they are already making inquiries as to the suitability of pneumatic drills for the work, having learned that hand-drilling by native labour is erratic and unreliable.

The experiments carried out by the holidaymaker are of interest as showing the strong radio-activity of the ore now being found. The value of the mineral depends on its uranium, and consequently its radio-active content; and it is interesting to note that the rough tests mentioned have been supplemented by others of a more scientific character. As a result, it has been definitely proved that the Singar ore is richer in radium than that found in any other locality. Up to the present the richest has been the Joachimsthal pitchblende, which gave 55 per cent. of U_3O_8 ; but the new find contains over 83 per cent. of that valuable uranium compound. In hydrated radium bromide the Gaya ore gives, roughly speaking, the same as the Joachimsthal product-namely, about three hundred milligrams per metric ton.

As regards the effect of the new discovery on the price of radium, it may be assumed that those who at present regulate the supply of this remarkable curative agent are aware of the mining, and have taken steps to meet, so far as they are able, the competition which they probably will have to face in the near future. At any rate, it does not seem likely that there will be any immediate drop in price.

At the same time, the new field is so extensive, as well as so incredibly rich, that it does not seem possible that the present high prices can hold for long. As soon as the syndicate gets to work supplying the market there is certain to be a fall. Radium will be comparatively plentiful, and hospitals and similar institutions will in all probability be able to obtain at a cost of a few hundred pounds supplies for which they are now being asked to pay thousands.

BRIGHT STAR.

SHINE on, bright star; thy lovely radiance pour On earth that sleeps! Regardless of the store Of heavenly beauty that surrounds her way, She travels on through night to meet the day.

Shine on, thou glory of a blameless life,
To guide a pilgrim wearied with the strife
"Twixt truth and error, as he goes his way
Through sin and sorrow to celestial day.

COAL AND WAR.

By ROLAND H. BRIGGS.

WE are convinced that coal is our only reliable source of power, and that there is no real substitute.' In these words the Royal Commission on Coal-Supplies (1905) conclude their remarks on the possibilities of sources of power, other than coal, which can be utilised now or in the future.

It is a matter of paramount importance that the nation should understand the international aspects of the coal question, since it is far too vital to be left entirely in the hands of those who are obtaining monetary profit from the coaltrade.

At the present time we are allied to one nation whose coal-supplies are likely to be exhausted during the lifetime of the present generation, and, co-operating with it, we are at war with a nation whose coal-supply was given by one authority in 1912 as sufficient for one thousand three hundred years. It is only natural, then, that at such a crisis as the present thoughtful minds should turn to the time when British coalfields will have been denuded, and Germany and Austria will be the only two European countries left with rich coalfields.

Some authorities have estimated that in one hundred and fifty years the coal available in this country will be exhausted, unless some of the very deep seams can be worked, or the operations of the miner carried on farther underneath the sea than has ever yet been attempted. Even if this estimate of one hundred and fifty to two hundred years is a very pessimistic one, it must be taken into account as a possibility; and whether the length of time which our coal will last be one century or six, it is at the present time being steadily reduced by 25 per cent. by the export of a quarter of our production every

It is reasonable to assume that the present Armageddon will end the great wars of the present generation, and perhaps of the next. But what is the position of our grandchildren and our great-grandchildren to be? Are we, for the sake of present profit, to leave to posterity the barren heritage of a coalless land? Do we care so little about the future of our great Empire that we will allow the heart of it to be

robbed, beyond the needs of present necessity, of the 'only reliable source of power'? Great masters of commerce in Hamburg have said that if Germany loses in the present war she will not recover for three generations. Are we to leave our descendants, then, to the thankless task of competing with future Teutonic hosts at a disadvantage with regard to the sinews of industry and the mainspring of war? How can we hope that they can retain their place in commerce if they have to import their coal from other parts of the Empire, or even to buy this all-important commodity from alien races? We must not close our eyes to the fact that the resurrection of Germany and her possible desire for revenge is not the only menace which the future holds for the Empire. There are problems which we cannot fathom in the future of the Slavonic race and in the awakening of the East, and it behoves us to leave our country at least as well prepared as possible for the perils of the unknown.

The question which we have to answer is: Are we to continue to allow coal to be exported from these islands without let or hindrance, or are we to hold back all, or at least that part which is destined solely for the use of foreign nations or foreign ships?

That there are strong arguments both for stopping and continuing the coal export trade cannot be doubted. The commission already referred to states in another part of the report: 'The witnesses generally were of opinion that the maintenance of a large export coal-trade is of supreme importance to the country, and essential to the prosperity of the coal-producing districts.' This is because the export trade is said to regularise the coal industry, and owing to the increased output to enable the British public to be supplied at a lower cost than would otherwise be charged. It is also claimed that, owing to the importance of coal as cargo for outward-bound ships, any diminution of our export trade in coal would result in a corresponding increase in freight charges for imported goods. Another contention of those who believe that the export of coal is of advantage to this country is that a great part of the coal sent from Britain across the seas is used for replenishing

No. 208.—Vol. IV.

[All Rights Reserved.]

November 21, 1914.

the bunkers of British ships on distant voyages, some of them so protracted that the vessels can carry only a fraction of the fuel necessary for the whole voyage, and must take on additional supplies two or three times on both the outward and the return journey.

It seems to be possible that on the careful examination of these three points a way might be found to modify the existing freedom allowed to exporters, and thereby lengthen the time during which coal will be available in these islands, without materially damaging the coal or shipping trades, or seriously increasing the

cost of coal to the British consumer.

In addition to the coal-trade, there are many great industries which have to arrange their supplies to suit the fluctuations of seasonable requirements, and the commodities which some of them make are just as susceptible to deterioration through long storage as coal itself. But by the adaptation of their prices to the requirements of the seasons, taking a little less when times are quiet and a little more when trade is brisk, by the perfection of their advertising and commercial systems, by the completeness of their organisation and the up-to-dateness of their plant, they are enabled to regularise their profits, their output, and the conditions Why, then, of the labour which they employ. should it be impossible for the coal-trade to do the same?

The value of cheap imports to our country is obvious; but should the contention that the reduction of the export of coal will increase the cost of import freights be passed without a challenge? The value of cheap imports to a country may be great, but surely the value to the countries from which these imports come is far greater. For instance, the seaports of north Germany took from us in 1911 no less than nine and a half million tons of coal. this great export to an enemy's country was in future entirely stopped, can we imagine for a moment that the German manufacturer would allow his valuable exports to be jeopardised by a fractional increase of freight charges? Surely we know that he would willingly pay this extra cost himself rather than permit any hindrance to the sale of his commodities in this country.

Then there is the question of the coaling of British ships abroad. The large number of British coaling stations all over the world which derive their whole supplies from Great Britain are of incalculable value to the mercantile marine

throughout the two hemispheres, and it has been pointed out with pride that no steamship from Germany or the Baltic, from the Netherlands or Belgium, or from the northern or Mediterranean ports of France can reach India or China or Japan without British coal. But is it to our national advantage that the vessels of competitive nations should be assisted on their way? Should not our unequalled network of coal-supplies be reserved rather for replenishing the bunkers of those vessels which fly the British flag, or at least the flag of a nation which is bound to us by treaty?

Reviewing the whole situation, then, from the data at our disposal, we can in imagination picture the future, and then form our conclusions as to the correct procedure for the present time. Although the authentic statistics are very insufficient, the opinions of experts very contradictory, and the deductions of geologists very speculative, it seems fairly clear that the time is not far distant when Great Britain, Germany, and Austria will be the only three European countries with any adequate home supply of coal. Seeing that the great iron and steel industries, and nearly every other branch of manufacture, depend entirely on coal, it is abundantly clear that France, whose supplies will soon be exhausted, and Russia, whose coal is very limited in amount, widely scattered, and poor in quality, will have to import largely or fall behind in the race for commercial supremacy. The East is well supplied with coal, and the West has incalculable quantities; but which nation is to remain the Centre of the World, the Hub of the Universe? Is it still to be Great Britain, as it may be if we will but husband our coal, or a new and revivified Germano-Austrian Empire, smarting under her past defeat, and determined to obtain the ascendancy, now that her most dangerous rival, Great Britain, is handicapped by the necessity of importing fuel-supplies? It is not perhaps necessary entirely to curtail the export of coal; it is not even certain that a coal export tax, such as that of 1901, is a useful measure; but it is certain that we should consider most carefully every aspect of this many-sided question before allowing the vast export trade to foreign and antagonistic countries and to their ships, or agreeing to the finding of the 1905 commission that 'there seems no present necessity to restrict artificially the export of coal in order to conserve it for our home supply.'

THE ALARUM.

CHAPTER IX.

NEXT day was Sunday, and Paul, having discovered through skilled conversation

tom to drive down to afternoon church, and then stay to tea with friends in the village, with Agnes that it was the Dowthwaites' cus- | decided that it was his artistic duty to

make a sketch of Dale Head Farm during their absence.

He worked diligently for half-an-hour, keeping a sharp lookout in case he should catch some glimpse of his small friend; but presently losing patience, he decided that a bolder plan must be ventured upon, cost what it might. He strode up to the farm-house door and knocked. was no kind of response, and he knocked again louder; then tried the door. It was locked.

'Where can the child be?' His determination grew. He wandered round the farm, followed by a slinking collie. Every window appeared to be fastened on the inside, and he appreciated that he had no right whatever to force an entrance. He paused undecidedly. What real proof had he? He listened intently as he stood toward the back of the house. At first he could hear nothing save a babbling brook behind him and the fidgeting of some cows in an outhouse. And then! Was that a moan of distress? It seemed to come from a window above him, which looked over a low outbuilding. If only he had a ladder! Again a cry-more distressful, he thought.

He dragged up a heavy chopping-block, and, gaining a foothold in the roughly mortared wall, he ascended to the ridge of the outhouse and scrambled along it to the window. It was fastened, and the blind was drawn.

He tapped at the pane. A child's shriek of

horror was the only answer.

'It is all right, Janie!' he called. 'It is only me, the artist from Mr Walker's. Can you undo the window?'

'I can't! She 's tied me.' 'All right! I'll manage.'

He examined the window, and by cutting at the woodwork and slipping his knife between the sashes he was able to thrust aside the catch. Yet all the time he was working, a terror-stricken voice was imploring him to leave things alone.

'She'll kill me! She'll kill me! You don't know what my aunt Martha will do to

me!

'Nonsense, Janie! Don't you worry. I am taking all risks,' he called out reassuringly

At last he pushed up the sash and dragged back the blind. Then he looked.

He saw an almost naked child, strapped by her hands to a high bedpost in such a position that her poor little toes alone touched the ground. Another instant, and Paul smashed in the windowframe and pushed his body into the room.

The child watched him wildly, her frame Seizing her quivering and her eyes dilating. round the waist, he raised her slightly, then slashed through the strap. Having released her, he laid her icy, shivering body on the bed. She rolled over, away from him, and moaned.

'Janie, little girl, tell me all about it!' and he

bent over her.

'Oh, go away!' she sobbed. 'Now you've

spoilt it all! Now she'll never let me see you again-never! She strapped me up today because I ran after you! Oh!' She pressed her hand to her left hip. Then she shivered violently.

He looked hastily round to find some clothes, but there were none to be seen; so he put his own warm coat about her, wrapped her in a blanket, and carried her, still protesting, down-

'Don't worry, Janie child!' he said soothingly; 'your aunt shall never have you again never!

He found his way to the kitchen, raked up the dying cinders, piled on the peats, found the bellows, and blew up the biggest fire the child had ever seen. Amazedly she watched him; yet his wilful power brought her a strange sense of rest and confidence. Her eyes closed. He searched round and found some whisky; and having diluted it, he roused her and put it to her lips. Then he proceeded to warm some milk. He had never been so domestic since his school-fagging days.

Janie sipped the milk languidly, and tried to smile at him; but her face flushed, and again her eyes closed. She gripped her hands together

and mosned restlessly.

'Fever!' he muttered. 'Now for it!'

The doors were both locked, and the windows were narrow lattices; but with the screwdriver on his knife he took off the lock. Then he raised the sleeping child in his arms, and leaving the house, he uttered a fervent, 'Thank Godwhatever comes of this!'

He carried the child about half a mile along the dale, and then turned straight up to his own lodgings. Janie would be safe with Agnes, while he went off to give information to the doctor and the police.

As Agnes was sitting with folded hands at the cottage door, thinking it was about time she dressed to go to the Primitive Methodist Chapel, she saw a sight that brought her to her feet. She was hurrying out with an exclamation, but Paul silenced her by placing his finger on his lips and pointing to his burden.

'Hush!' he said softly; 'this child has been half-murdered, and I have brought her

to you.'

'Dowthwaite's lass!' Agnes whispered, drawing aside the blanket. 'So this is t'latest! Poor li'le lamb! You did right to fetch heryou did for sure.'

Janie made an attempt to free herself from Paul's arms, and uttered some half-delirious

'I am afraid she is in a fever,' he said. Then, seeing the shepherd at his door, he added, 'I hope you don't object to my bringing this child here, Mr Walker? I've just broken into the farm, and found her strapped to a bed'-

'Object!' interrupted the shepherd. He was

in his Sunday black clothes, clean-shaven and spruce-looking, a picture of anxious benevolence. -'Agnes, my lass, thee get t'li'le un into bed, and do t' best as ever thoo can for her! Happen t' Lord Himself has delivered the child into our

'This way, Mr Marsland!' said Agnes, readily

enough.

'I believe I am hurting her all the time,' Paul said as he laid her down on Agnes's bed. 'Perhaps you would be good enough to examine her and report.'

When Agnes joined her grandfather and Paul, her whole face was quivering with emotion.

'Oh grandfather! It's like as if there couldn't be a God in heaven!'

'Nay, nay now, lass! What's t'good of

getting upset?'

'I isn't upset!' she affirmed stoutly. 'Only, if thoo'd seen her poor thin shoulders fair caked with scars, and her left hip—there's an abscess

I could get my hand into, very near!'
Paul's lips tightened. He panted to be gone.
'Thank you, Miss Walker!' he said, impul-

sively holding out his hand to her. 'We must

see this matter through.'

'Yes, sir!' said Agnes, colouring deeply.

Now all this had taken Paul longer than he expected; and as he walked rapidly down the rough path that led into the main road through the dale, the sun was colouring the sky overhead and tinting the fell-sides gloriously. He was just striking into the main road, when, looking up toward Dale Head, he saw the farmer and his sister hurrying along toward him.

Paul instinctively straightened his shoulders. If there was to be a row, he had better tackle it

at once.

Miss Dowthwaite's face was drawn and white. and perhaps his sudden appearance threw her off her guard. At any rate, she began to scream hysterically, 'Dick! Dick! He's here!'

'Yes, I am here, certainly, Miss Dowthwaite!' called Paul, advancing toward her. membered uncomfortably that he had left his walking-stick in the farmyard, when he had

climbed up to the window.

But the farmer was only too eager to share his sister's excitement. 'Ah, it's you, is it-- scoundrel! You scum of Londonyou'--- and he shot forth a torrent of language unutterable, while his sister, growing alarmed, held his arm.

'I am in a hurry, Mr Dowthwaite,' said Paul coolly; 'but if there is anything you wish to explain, I'-

'Explain! Can you explain this?' and the

farmer flourished Paul's own stick threateningly. 'Ah, that is my stick! I left it when I rescued

your daughter from a torturing death.'

'Where is she, the impudent hussy?' cried Miss Dowthwaite, still anxiously grabbing hold of her brother.

'Where your cruelty will never again reach her, Miss Dowthwaite!' said Paul solemnly.

The woman uttered a scream. dead?

'Ask the police that!' said Paul curtly. Then he turned from them and strode away, scarcely noticing the curses the farmer shouted after

For the next quarter of a mile down the dale the road was skirted on each side by copsewood. and it struck Paul that, considering he must return that day after dark, it would be as well if he cut himself a stout stick. He had secured a good one, and was just pausing to trim it, when he was startled by a sudden yell.

'Here's your cursed stick! Take it!'

He was conscious of a violent blow on the back of his head; then he knew no more.

CHAPTER X.

MARY had never written; but she had suffered intensely. It hurt her to think that the indolent, irresponsible Paul, whom she knew so well, had wholly disappeared, and had probably turned sober and unnatural through pain.

How was life really looking to Mary, now that the subtle charm of Paul's presence and admiration was withdrawn? What a rank prig

he must have thought her!

If she had meant to write, she ought to have written at once, on the occasion of his mother's death. Now it was too late. So, to solace herself, Mary had approached the Society for the Prevention of Cruelty to Children, and had offered her services freely to the committee.

Therefore it happened that, late one Saturday evening, she received an urgent message from the society's secretary. He was in a difficulty, owing to the holidays of several of the staff, and wished her to go off at once to Westmorland to make certain inquiries. The informant of the case did not wish to be known at present, but full instructions were enclosed.

The message thrilled her. Certainly she would

On reaching the nearest station on the main line, she found that there were no local Sunday trains; but she managed to engage a motor with a somewhat rough mechanic as chauffeur, who knew the district well. Though she had had a full month's strenuous experience in active work. this was her first independent effort, and she found herself humiliatingly nervous. Over and over again during the journey she had marvelled that she had had the sheer cheek to push herself into such work.

'What a prig I was that night!' she groaned. 'Poor Paul! If only I knew what has happened to him!' But her nervousness made her anxious not to waste any time in making the real plunge,

and she decided that before showing herself in

Gargill she would call at the farm.

'Do I know Dale Head?' said the chauffeur. 'I know every turn of t'road up Fotherdale. Dowthwaites has lived there for a deal of generations. He's a widower. Lives with his sister, who reckons she'll get t'farm when Dick has killed himself with drink!'

The evening had already closed in, and the road was dark as they entered the copsewood. The man drew up suddenly.

'What is it?' asked Mary nervously.

'There's summut on t'road! A drunken feller likely! Stay where you are, miss. I'll soon shift him!'

But this was easier said than done.

'Foul play o' some sort!' exclaimed the chauffeur. 'He's insensible!' and he took one

of the lamps from the car.

Mary stepped from the car, determined to prove herself equal to any task, and stooped to look. She saw Paul lying there, his head resting in a pool of blood. She pressed her hand to her forehead. No lady inspector must faint at the sight of a little blood.

The chauffeur opened the man's coat and shirt, and laid a hand on his heart. 'He's alive!'

'Can't we get him into the car? Can't we get him to a doctor?' she cried.

'We must stop this bleeding.'
'Of course!' Mary was qualified in simple ambulance work, yet she had not thought of it. So now she did what she could, skilfully enough, and presently they were rewarded by a groan from their patient. 'He is coming round!' cried the girl, struggling to keep her excitement within bounds.

The chauffeur put his arm under Paul's shoulder. 'All right, my lad!' he said familiarly. 'You're all right. Try to pull yourself together. We've a car here.

'Car! Where is he?'

'Who?'

'Dowthwaite-police-doctor.'

'Whisht!' said the man. 'You keep yourself quiet now.—If you'll just lift from this side, mum, happen we can get him on his legs.'

With an effort they managed it, and Paul rose

giddily, leaning hard on both of them.

'You'd best sit aside of him, mum,' said the chauffeur. 'Folk never knows what may happen after such-like doings. And I'll mind my own job.' And away they dashed, ignoring all speedlimits.

'We want the police!' said Paul, struggling to free himself from the rug so tightly wrapped

round him.

'Hush! We are going to the police; but you must not speak,' said the girl softly yet decidedly.

Paul tried to stare round at the speaker. Then he sank back, wholly bewildered, and closed his eyes.

The car drove straight to the doctor's, and Paul was brought inside.

Luckily Dr Brock was at home, and he received his patient with a grim professional calm.

'I have been sent down by the Society for the Prevention of Cruelty to Children to report on a case,' Mary explained in reply to the doctor's inquiring glance. 'Some one has sent us some information. I wonder whether this accident has anything to do with it.

'Probably enough,' said the doctor, remembering with some misgiving the hint he had given the young artist. 'Ah, here is my wife.

Now we are all right!'

(Continued on page 821.)

SUGAR POSITION. THE

By F. I. SCARD, F.L.C.

WHILE there is every prospect of the supply of other food products to Great Britain being maintained, the effect of the war on the import of sugar is likely to be serious. The sugar crops of the world in 1913-14 amount to about 18,570,000 tons, 9,670,000 tons of which are cane sugars and 8,900,000 tons beet sugars. Of the beet-sugar supply the continent of Europe provides 8,250,000 tons and the United States 650,000 tons. The cane-sugar supply is spread over a much greater area. Louisiana and Texas furnish 268,337 tons, Mexico and Central America 152,000 tons, Demerara 90,000 tons, Surinam 13,000 tons, Peru 225,000 tons, while the crops of Argentina and Brazil are 225,000 tons and 200,000 tons respectively. In the West Indies, the British colonies of Trinidad, Barbados, Jamaica, Antigua, St Kitts, St Lucia,

and St Vincent export 101,000 tons. Rico produces 325,000 tons. The Cuban crop has amounted to 2,550,000 tons, a big item in the world's production; the republics of San Domingo and Hayti have shipped 110,000 tons, the French islands Martinique and Guadeloupe 81,000 tons, and the Danish island of St Croix 7500 tons. In the East, the crop of British India has amounted to 2,260,000 tons, of Java to 1,345,000 tons; while the Japanese island of Formosa has contributed 190,000 tons, and the Philippines 195,000 tons. Sugar is manufactured in China; but no figures are available, and that country imports instead of exporting sugar. The Australian production of cane sugar has reached 225,000 tons, while the Fijian Islands export 100,000 tons. The Hawaiian Islands have produced 525,000 tons.

does not grow much sugar, the crops of Natal and of Mozambique having been 146,000 tons, whilst those of the neighbouring islands of Mauritius and Réunion are credited with 290,000 tons. Spain contributes the small quantity of 13,000 tons.

Under normal circumstances the direction of the supplies of sugar is fixed by the geographical and tariff considerations. Thus, by reason of its tariff-which protects Hawaiian, Porto Rican, and Philippine 'sugar, as well as its own cane and beet production, at the same time giving preferential treatment to Cuban sugar-the sugar of all these islands is attracted to the United States. Java, Mauritius, and Fiji naturally supply Eastern and Antipodean markets, notably India (which requires about 800,000 tons of sugar over and above its own production), China, Malaya, Queensland, and the Cape, where the home production is also insufficient in amount to meet the internal requirements. Tariff as well as geographical considerations cause Mozambique sugars to go to the Transvaal and Portugal, while the sugar of the French sugar colonies, Réunion, Guadeloupe, and Martinique go to the protected markets of France. In like manner, the Formosan sugar is ear-marked for Japan. Canada gives preferential treatment to British-produced sugar, and thus attracts the sugar from the British West Indies on the one side of the North American continent, and from Fiji and Mauritius on the other; the balance of its requirements being mostly derived from San Domingo and Cuba in the Caribbean, and Java in the Eastern seas. Brazil exports but little sugar, which comes to this country; and the same may be said of Argentina. Peruvian and Mexican sugar finds its way mostly to Britain, while the Central American states also make most of their small exports to this side.

So much for cane sugar and North American beet sugar. The balance of the world's supply is made up of 8,250,000 tons of Continental beet sugar. The bulk of the surplus, over home consumption, comes to this country, as might be expected, and amounted in 1913 to 1,596,000 tons. A certain quantity, about 50,000 tons, goes to British India. Russia exports to Finland, Persia, and overland to the East somewhere about 175,000 tons. Germany and Austria-Hungary export about 400,000 tons to the Mediterranean, Switzerland, Egypt, Italy, and other countries not mentioned, only a few thousand tons (about 3000 tons in 1913) coming to the United Kingdom.

As regards the Russian exports, there is no reason to suppose that these will not continue during the war, but they may be taken as negligible quantities. The exports of the other countries now at war will certainly cease, and the consuming countries outside of Russia, Germany, and Austria-Hungary are now confronted with a shortage of something like 2,000,000 tons per annum. To meet this shortage the cane-pro-

ducing countries will be drawn upon for supplies which, in spite of increasing production, they will be unable to furnish immediately.

Great Britain last year consumed nearly 2,000,000 tons of sugar, 80 per cent. of which came from the Continent. We are, therefore, specially hard hit as regards sugar-supply, and labour under the further disadvantage of having to obtain sugar from such countries as Cuba, which is bound to the United States by ties of tariff, or from Java, with high freight charges. If the sugar is obtained under these adverse conditions it will have to be paid for heavily. The commandeering of the whole of the British West Indian, Mauritian, and Fijian sugar would

only provide 550,000 tons.

As a means of meeting the situation, the Government has secured a quantity of sugar for immediate and prospective delivery up to the end of March to the extent, it is said, of 900,000 As the visible stocks in the United Kingdom at the time of the outbreak of the war were 100,000 tons over those of the corresponding period of last year, it may be said that from these two sources 1,000,000 tons will be available up to the end of March, dating from the time of the outbreak of the war. are also sugars from private sources which will help to swell this figure. The Government purchase consisted of sugar from British Guiana, Mauritius, Cuba, Java, and the American refiners. It may be said, therefore, that the wants of the United Kingdom are fairly, although not fully, provided for up to the end of March; with much-reduced consumption proportionately What the future will be depends upon the duration of the war. In any circumstances, however, 2,000,000 tons of the world's supply of the next six months' sugar will not be available, and this deficiency will have to be met by diminished consumption, if not here, in other consuming countries.

There is another important point in connection with the sugar-supply of the British Isles, and that is the ability of the refiners to work up the raw sugars, if it is possible to obtain them in necessary quantity. Last year the refiners provided 700,000 tons of sugar, considerably less than half the total consumption. Will they be able at once to increase their output so as to meet consumers' requirements when the raw portions of the above sugars come in in considerable quantities? If not, there will be a deficiency of grocery sugar. It fortunately happens, however, that in recent years cane-sugar plantations have been able to turn out white crystals without the sugar having to pass through a separate refining stage. These sugars, available for direct consumption, can be obtained from Java and Mauritius, while the well-known Demerara crystals of the

West Indies will still be available.

Although Great Britain has been in a tight place as regards sugar, the position might have been much worse. Had not bounty-fed sugar been countervailed in the pre-Brussels Convention days by India and the United States, and had not the Brussels Convention put an end to Continental bounties, the state of things would have been disastrous. German and Austrian beet sugar would have captured all those markets not protected by anti-bounty tariffs, the British West Indian sugar industry would have ceased to exist, Java could not have been able to develop its sugar industry to the great extent it has done, while it is certain

that the Mauritian planter could not have stood the unequalled competition. In fact, the canesugar production of the world could not have developed as it has done. Now there is cane sugar available, although in insufficient quantities, and the further stimulus given by the war to the world's cane-sugar production should, if the war lasts long enough, make up the deficiency, and thus relieve Great Britain from the peril of having to depend upon Germany and Austria for so much of its sugar-supply.

ROMANCE.

By A. J. DAWSON, Author of The Message, &c.

WALTER EDWARD PERKINS was practically brought up in the counting-house of Messrs Arncliffe, Worthington, & Sons, shipbrokers, of Leadenhall Street, London, E.C. At all events, the young Mr Worthington of 1874 took thirteen-year-old Perkins into the office more than thirty-eight years ago, to oblige his next-door neighbour in Streatham, whose brother was the clergyman of the parish in which young Perkins's father had just been buried.

Perkins—our Perkins—was born in the State of New Jersey, his father being an American citizen, and his mother English. His mother survived his father no more than three or four years.

Thirty-eight years, you know, is quite a long time. It made Walter Perkins fifty-one on his last birthday. And winter and summer, spring and autumn, all the days of all those years (with the exception of Sundays and one fortnight in August each year), were spent by Walter Perkins in Messrs Arncliffe, Worthington, & Sons' counting-house in Leadenhall Street. Just cast your mind's eye back and consider what these years, or all you can remember of them, have meant for you: the variety, the travel, the experience, the different kinds of life you have savoured. Well, Walter Perkins spent them all in Leadenhall Street.

There is quite a general impression abroad, I fancy, that twentieth-century civilisation in cities like London and New York has for ever abolished mystery; that we all know about each other nowadays; and, in short, that Romance is dead. It is a pity that Romance should have died, say the sentimental; but all agree in thinking it good that the ancient clouds of mystery, gloom, and ignorance should have been dispelled; that everything is open and above-board in our modern life; that nothing is hidden any more; and that, for better or for worse, we now know all there is to be known about each other, and that nothing can possibly escape the searchlights of our newspapers.

Rubbish! There never was a more utterly baseless illusion. Not only is Romance not dead,

but mystery remains—mystery as impenetrable as ever it was in the Middle Ages.

The levelling of slums, the opening up of broad thoroughfares, the introduction of light everywhere, universal education and improved police methods, telegraph, telephone, tape-machine, 'tuppenny' tubes, aviation—these things are all of the surface, and make no sort of difference to the eternal mysteries of human life, save, perhaps, to complicate them somewhat, and make still more marvellously intricate their subtle convolutions, their amazing coincidental interrelations.

The routine of the city worker's life may be You will be hopelessly as prosaic as you like. wrong if you assume that the man himself must necessarily be prosaic because of that. It is in the inner springs of human life that mystery survives, strong and impenetrable as ever it was in the history of mankind. And as for the glaring light of our twentieth-century civilisation, it merely serves to accentuate the hidden mystery and romance of modern life, by defining more sharply than ever the division between our mere outward appearance and the securely masked inner being which is you, which is me, which is the man or the woman sitting next us in the train. Your ignorance of me, and mine of you, is monumental—greater perhaps than it ever was in what we foolishly call the age of romance, because men and women were so much less subtle then, and the hours of what might be called psychological deshabille, when the mask was lowered, or half-lowered, were so much more frequent.

Here, at all events, in this matter of Walter Edward Perkins, is a statement of fact about a City man who has been regarded by his intimates as one of the most prosaic and commonplace persons living, a creature of whom it would be said that any sort of connection between himself and mystery or romance would be merely unthinkable. As well think of mystery in relation to the postman who delivers your letters in the morning, or the clerk who takes down your replies in shorthand. Well, all-unknown to

you, there is probably a deal of mystery in the lives of each of those seemingly commonplace functionaries.

From the beginning of 1892 onward Walter Perkins made his home in Alma Terrace, Balaclava Street, which is a small, mean side-street off Stamford Hill. That is 'N.,' you know, though merging into South Tottenham. may conceivably have passed the superior end of Balaclava Street, if you have ever happened to motor out north-eastward, making for Epping, the Cambridge Road, and the country beyond. Even Walter Perkins had motored past it, if

you come to that—in a bus. It was rather a weak move, that settling in Alma Terrace. (Perhaps you know some of these Alma terraces and villas. They were mostly built round about 1854-56.) Mrs Pocock. who acquired the tenement there which subsequently sheltered Walter Perkins, was some sort of a connection by marriage through the family of Perkins's dead mother. When he accepted her proposal that he should become her lodger, he regarded her as the nearest approach to a relative he would ever be likely to know; and so he became her lodger partly from a sort of sense of duty. Had he not done so, it is possible that he might one day have married, and been—cured, shall we say? But, as Mrs Pocock's lodger in Alma Terrace, he retired very much within his own shell during the hours he spent outside Leadenhall Street, and that, of course, meant the very antithesis of a cure.

The impression one formed of Walter Perkins in Leadenhall Street, in the train between Stamford Hill and Liverpool Street, in the ABC shop where he was wont to take his exiguous midday meal, and other such-like places-was that he was a singularly colourless person. You never could have said what colour his eyes or hair were, or what sort of clothes he wore. He was very much all of a piece; office furniture, you might have said, in cynical mood; or, in another mood, 'Just a very ordinary and typical member of the pale battalions.' You never heard him raise his voice; and it was merely inconceivable that he should swear. How little one knows!

Walter Perkins's everyday expression had that mild, gentle kind of amiability which one associates with sheep and rabbits. His nutriment might have been foolscap, his tipple some emasculated form of skim-milk and soda, you had guessed. Men never apologised, and women but seldom, when they trod on Perkins's toes in the crowded suburban trains; and he had a way of taking up less room in a bus than any ordinary mortal, and of conveying the suggestion that he rather owed the public an apology for requiring any space at all.

You must figure him, then, in his monotonous little treadmill of a life, apologetically tripping from Stamford Hill to Leadenhall Street and back each day; a kindly, unobtrusive, little man, verging upon baldness, hard to identify, impossible really to describe, completely submerged in the complex machinery of commercial London; never seen at all in the London that you know, west of Trafalgar Square; and one who, both in the counting-house and in Alma Terrace, was invariably 'put upon,' just so often as ever his rights might happen to stand in the way of anybody else's convenience.

There were youngsters in Messrs Arncliffe, Worthington, & Sons' office who had not been born when Perkins entered the service, and who now were drawing double his pay. There was not enough ego in his cosmos, and barely enough aggressiveness for the mere maintenance of life in the twentieth century, you would have said. And if you had been told that Walter Perkins carried within him the soul of a Viking, that his heart swelled at times, on his mill round between Alma Terrace and Leadenhall Street, till it was as large as that of the bravest man in London town-as large as Frobisher's, Drake's, Raleigh's, Nelson's-you would have said, 'What a quaint idea! What! that queer, little man? Why, he never heard of a Viking, and the sound of a sword rattling in its scabbard would make his knees knock together!

'Queer thing about you, Perk,' said one of the oldest among his juniors at the office not long since; 'but I don't believe you've ever had a hobby of any sort. Never even look at the football news, do you, Perk?'

'Well, no, now you mention it; I don't much think I ever do,' admitted Perkins, in his self-

deprecatory little way.

'Mistake that, you know, Perk. 'Tisn't good for a man, you know. I mean to say, you ought to take an interest in something, you know, for the sake of your health. Now, I'm a member of the debating society and the Southern Union Cycling Club. Then there's my stamp collection, and the garden, and the dog; and, of course, I follow the sport of the day, and-er-politics, you know; and-Oh, there's lots of things, you know. You ought to do something, Perk. If a man is a man, he needs hobbies of some sort nowadays to keep him fit and robust-fighting trim, you know, and—er—all that sorter thing. Whereas you—well, you rather let yourself go, don't you? Tend to get rather old-maidish, don't you think! You know what I mean?'

And Perkins mildly admitted, as much by the movement of his bent shoulders and barely visible eyebrows as by anything he said, that he feared there might be a good deal in what his young friend suggested. Not even under the spur of such provocation was it conceivable that Walter Perkins should, for an instant, lift one little corner of his mask, or give the smallest hint of the nature and preoccupations of the real

man within him. And so, in more or less kindly and wholly contemptuous fashion, all his associates had naturally dropped into the habit of labelling Perkins in their minds as belonging to the human door-mat sub-species. And they never doubted that they knew him. There was so little to know, they would have told you, in poor old Perk.

As a fact, he stood alone among the staff of Messrs Arncliffe, Worthington, & Sons; quite alone. He belonged to the elect. He stood as much apart from them as though he had been President of the United States of America; differentiated from them by the fundamental fact that his life was dominated by a passion—had always been dominated by a master-passion. The round men saw him meekly tread was not his life at all, but a tiresome, incidental feature of it to which he never grew accustomed, of which he never for one single day became even moderately tolerant. He loathed and despised it, utterly and always. He hated every detail of his daily round in the city with a hatred which was violent and integral. But mere negative hatred was not the passion that dominated his life. That was intensely active. The passion of the clerk's life was his love of adventure.

Remember, he had spent the whole of those thirty-eight years, bar Sundays and the annual holiday, in Leadenhall Street and his mean lodging. The farthest point he had ever reached—one never-to-be-forgotten holiday—was Boulogne. He knew Epping Forest rather well; and in copses there, when nobody was within sight or hearing, on Saturday nights and early Sabbath mornings, odd sounds and spoken words had issued from his thin lips. Once, greatly daring, he had passed an entire summer night among the bracken there, and, as a consequence, had spent many days in bed with a devastating feverish cold.

But his real life was lived in his dingy bedsitting-room in Alma Terrace, when the key had been turned in the lock of its flimsy, Swedish-made door. Here the real Walter Perkins had quite a little library of several hundred volumes, nearly all good, and quite all, without exception, records of adventurous travel, of harrowing escapes, bloody fighting, piracy, exploration, and deeds of daring in remote places. Authentic records, mark you. Perkins never stooped to mere highly coloured, blood-and-thunder makebelieve. His knowledge of the Spanish Main was sound and far-reaching. He was something of an authority—though no man guessed it upon the Californian and Australian gold-rushes. His collection was specially good as touching African, South American, and Australian exploration, and piracy, both east and west. He was curiously familiar with the names of mountains, rivers, and trails in Arctic and sub-Arctic Mexico and Peru were favourite America. hunting-grounds of his.

In his whole collection there was but one work of fiction, and that was modern. It was The Wrecker, by Stevenson and Lloyd Osbourne. There was one passage in this volume which had never failed to furnish him with the same thrill as that he had experienced when reading it for the first time. It follows Carthew's discovery of the nature of the charge, the murder charge, against his new friend Wicks, the cabman who had driven him to 'The Currency Lass.' Here is the simple passage which so thrilled Walter Perkins: 'Carthew breathed long; he had a strange, half-pleasurable sense of wading deeper in the tide of life. "Well," said he, "you were going on to say?"'

'Ah!' Perkins would sigh, as he read it for the hundredth time. . . . "Half-pleasurable sense of wading deeper . . . wading deeper." . . . Yes. "Half-pleasurable!" Yes.

And back The Wrecker would go to its place on his shelves, while Perkins opened for perusal the particular book of the day, whatever that might be—say The Adventures and Discoveries of Captain John Smith, 1579-1631, or Morgan's History of Algiers, or Hakluyt, or Prescott, or The Adventures of Thomas Pellow of Penryn.

It was a pity he had no hobby, said his well-meaning critic at the office. How it would have startled the man to see Perkins bending, enthralled, over his maps and books; to guess how his fellow-clerk thought, and moved, and dreamed, and had his real being among the thunder of big seas; upon white, sun-scorched beaches fringed by palms; in the midst of track-less prairies, deep jungles, rugged mountains, remote cafions, with explorers, filibusters, half-savage pirates for his sole companions!

I suppose the true pity was that Perkins had no real life in the workaday world; that it was only the tyrannous annoyance of daily interruption that made him conscious of any existence outside the shadowy confines of his despotic passion. A pity that he had no hobby! Stampcollecting, or the debating society, belike! Lovers have been known to go without food for their mistress's sake. Walter Perkins went without life itself, for thirty-eight long years, out of singlehearted devotion to the passionate interest which absorbed him, and had absorbed him, mind you, from his twelfth year. He lived largely in Leadenhall Street, or spent his days there, anyhow. Yes. But the only thing he was really conscious of in the City of London was London Bridge, where you may sniff authentic odours from oversea ports, and see cargo handled that has come direct from sun-washed wharves on the far side of

You must not suppose, however, that Perkins's life was without hope or plan; on the contrary, he had had one definite master-aim before him throughout each one of those thirty-eight years. This fixed aim was to win clear of the cramped routine of his City life and all that went with it,

and to plunge waist-deep into the life of oversea adventure; to experience in his own person that 'half-pleasurable sense of wading deeper,' mention of which in Stevenson's book stirred him so profoundly. For this he lived and suffered the daily round which he so infinitely loathed.

Long ago, in the dim 'seventies or the scarcely less remote 'eighties, he had made up his mind that the essential key to his ultimate goal was the sum of five hundred pounds. The figure became fixed by the merest accident—the mention of that sum in a musty, old calf-bound record of early nineteenth-century adventure, which Perkins had picked up for fourpence on a bookstell

But once fixed, the idea never varied in his mind. At one period he had mildly gambled for it in Hamburg lotteries and the like, seeking, desperately, to hasten the day of his release. Later he grew more methodical, and his progress, however slow, was sure. But obstacles and interruptions were numerous. The death of Mrs Pocock's daughter added a full year to Perkins's sentence. Furtive indulgences in his sole form of dissipation—the purchase of travel books and such incidents as his illness after a wild night in Epping Forest years ago, had tacked on a considerable number of months. But Fate was kindly to him in one matter; he was never conscious of his own personal appearance, and recked nothing of his middle-aged baldness. his own mind, he was rather a coarse, gross-living, swashbuckling type of person; heavy-handed, brawny, and robust as an ox. His language, too, was often truculent to the verge of obscenity; only it never was spoken aloud. As he minced between station and office he often felt the chafe of heavy sea-boots between his knees.

The finger of destiny moved for Walter Perkins on the 7th day of August 1912. On that day the order for his release was presented to him across the polished counter of a City bank. He walked out into the street on that damp August morning a freed man, the key to the whole world of adventure, in the shape of a paper token representing five hundred pounds, in his pocket.

And then came eight mortal weeks of agonising indecision, of humiliating vacillation, of racking doubts and aguish fits of alternate tropic heats and lamentable gray chills, in which his fifty-first birthday, like a crooked little finger of warning, kept pertinaciously asserting itself among the storm-rent clouds, the heroic background of this little clerk's mind.

A score of times he left Alma Terrace in the morning bent upon finally cutting the painter in Leadenhall Street that very day; his little speech to the manager was letter-perfect in his mind; his very words and gestures of farewell all arranged; his exit covered down to the last brave nod of his gray-fringed head to the messenger-boy in the vestibule. As he thought it out, among his books and maps, he had always to

face surprise and a hint of mild reproach from those to whom his ultimatum was delivered. But they all understood, in the end; and he, the adventurer, passed out grandly to the business of

preparing his kit for far travel.

And then came the all-too-familiar atmosphere of the office itself, and the precise detail of ordered routine would take him by the throat as his thin arms were passed into the sleeves of his office-coat, and shake him remorselessly into acquiescence for the moment in that daily round by the light of which his real life's project melted away into cloudy nothingness—a thing whose quivering, shrinking nakedness it was impossible to discover there in Leadenhall Street. The fifty-first birthday, and the cruelly long succession of years behind it, with menacing severity, bade him remember the conditions of his servitude and be Perhaps the most painful feature of this painful period of indecision was the fact that, for the first time in almost four decades, the clerk found himself cut off from his books and maps. Their spell was broken. He could not even open them, so shaken was he.

On the morning of the 8th of October—a Tuesday—Perkins was missing from his accustomed place at the counting-house in Leadenhall Street. All day his stool remained unoccupied. That night Mrs Pocock left the front-door at Alma Terrace unbolted till half-past twelve, then bolted it and went to bed, greatly wondering

over the absence of her lodger.

You may recall something of the Balkan troubles of 1912. During the last week of During the last week of October a private letter reached the editor of a London journal from a correspondent then in Adrianople. The last paragraph of that letter read as follows: 'A rum thing happened yesterday, but of course nobody took any notice of it in the general scramble. A Bulgarian officer told me about it, and gave me the scrap of paper enclosed herewith. It appears that among a batch of dead and dying Turks they found a man who was apparently English, and certainly a civilian. Whether or not he had any valuables on him I can't say. None were handed over by the fellows who found him. He was dying when they came upon him-shot through the lungsand couldn't speak. But he had a pencil and this scrap of paper, and apparently he scribbled on it just these two words: "Wading deeper." Queer, wasn't it? They brought me also a piece cut from the neck of his shirt with the name W. E. Perkins on it in marking-ink. might be a romance behind this. One never knows. But as for the two words on the paper, I suppose that was simply delirium—just a question of temperature. But who was Perkins, and how came he there with those Turks?'

Tuesday the 8th of October was the day upon which Montenegro declared war against Turkey. True enough, 'one never knows.' And so, at the

last of it, Walter Perkins did experience that 'half-pleasurable sense of wading deeper.' But how much did any living creature guess of the terrific struggle going on in that little clerk's mind between the 7th of August and the 8th of October? What of his pilgrimage across Europe?

And people talk about all the mystery and romance having been crowded out of life by our twentieth - century civilisation! Mystery and romance! Why, you can't get away from them. Your next-door neighbour's household is compact of them.

OLD SCOTTISH PROPHECIES.

PART II.

TO the Lady of Lawers are credited the prediction, made at a time when the House of Taymouth was rich in sons, that an old white horse will yet take the last Breadalbane Campbells across Tyndrum Cairn; the prophecy that when the red cairn on Ben Lawers fell the Church of Lawers would split, fulfilled by the cairn erected by the sappers falling in the year of the Disruption; and the foretelling:

A mill will be on every streamlet,
A plough in every hand,
The two sides of Loch Tay in kail gardens;
The sheep's skull will make the plough useless,
And the goose's feathers drive their memories from

The most famous of the seers of the Northern Highlands was Coinneach Odhar (Dun Kenneth), the Brahan seer. He was born in the early years of the seventeenth century, and tradition says that he fell a victim after the Restoration to the rage of a jealous woman, being burnt as a wizard at Chanonry Point by order of the Countess of Seaforth, to whose importunities he had foolishly yielded, and revealed how the earl was at the time employed at Paris. The earl arrived at home on the day of the execution; but, though his horse fell dead under him, he reached Chanonry just too late to avert the tragedy. The prophecies attributed to him related to all sorts and conditions of people, and the foresight and the fulfilment of many of them have been most remarkable. The following may be given as among the most interesting:

'The day will come when English mares with hempen bridles [full-rigged ships] shall be led round the back of Tom-na-heurich'—fulfilled in the making of the Caledonian Canal. 'The day will come when there will be a road through the hills of Ross-shire from sea to sea, and a bridge upon every stream.' 'When two poor teachers shall come across the seas, who will revolutionise the religion of the land, and nine bridges shall span the river Ness, the Highlands will be overrun by ministers without grace and women without shame.' Curiously enough, it was observed that the ninth bridge over the Ness was commenced in the year in which Scotland was visited by the American revivalists, Moody and Sankey; but the militant suffragette did not appear till a generation later. 'The ancient proprietors of the soil shall give place to strange merchant proprietors, and the whole Highlands will become one huge deer-forest.'

'The day will come when the Mackenzies will lose all their possessions in Lochalsh, after which they will fall into the hands of an Englishman who shall be distinguished by great liberality to his people and lavish expenditure of money. He will have one son and two daughters, and after his death the property will revert to the Mathesons, its original possessors, who will build a castle at Dunoin-a-Dubh at Balmacara.' This has been absolutely fulfilled except, as yet, as to the site of the castle.

'Oh Drummossie! thy bleak moor shall, ere many generations have passed away, be stained with the best blood of the Highlands. Glad am I that I shall not see that day, for it will be a fearful period. Heads will be lopped off by the score, and no mercy will be shown or quarter given on either side.' The prediction was only too faithfully fulfilled in the battle of Culloden.

'The day will come when the Lewsmen shall go forth with their boats to battle, but they will be turned back by the jaw-bone of an animal smaller than an ass.' Fulfilled in 1745, when the Lewsmen came over to join Prince Charles, but were turned back by Lord Seaforth, who signalled from the shore with a sheep's jaw-bone in his hand.

Remarkable is the prediction as to the mineralwells of Strathpeffer. 'Uninviting and disagreeable as it now is, with its thick crusted surface and unpleasant smell, the day will come when it shall be under lock and key, and crowds of pleasure and health seekers shall be seen thronging its portals.'

'The day will come when fire and water shall run in streams through all the streets and lanes of Inverness.' 'The day will come when long strings of carriages without horses shall run between Dingwall and Inverness, and, more wonderful still, between Dingwall and the Isle of Skye.'

Most remarkable of all was the prophecy as to the fate of the House of Seaforth. The seer after his sentence predicted that ere many generations had passed the line would end in sorrow; that there would be a chief, the last of his House, both deaf and dumb, the father of four fair sons, all of whom he should follow to the

grave; that the remains of his possessions should be inherited by a white-headed lassie from the East, who would kill her sister; and that, as a sign that these things were coming to pass, there should be four great lairds in the days of the last deaf-and-dumb Seaforth—Gairloch, Chisholm, Grant, and Raasay—of whom one shall be bucktoothed, another hare-lipped, another half-witted, and the fourth a stammerer. The last Earl of Seaforth lost his four sons, he was deaf and dumb in his later years, his elder daughter returned to succeed him as a young widow from India, and a carriage accident at Brahan Castle, when she was driving, resulted in the death of her younger sister.

Among other Highland prophecies is the one that 'the Farquharsons shall flourish to the tenth generation,' said to correspond curiously with the curse invoked upon the name by the mother of Lamont of Inverey, hanged by them on a large pine near Mar Lodge bridge for siding with the Clan Chattan of Badenoch in their raids upon Huntly's lands in Mar, when she predicted in a Gaelic verse that that pine should flourish when there was not a Farquharson left

in Strathdee.

The prophecies relating to particular localities are numerous and interesting. The oldest are perhaps those relating to Iona, attributed to Columba himself:

In Iona of my heart, Iona of my love,
Instead of the voice of monks shall be lowing of
cattle;
But ere the world come to an end
Iona shall be as it was.

Another ran: 'Till Argyll be king, Iona will be as she was.'

With the remains of the old church and kirkyard of Deer in Buchan, said to be older than the Cistercian Abbey of 1216, is associated the tradition that the church was originally being erected on the slope of Biffie, but that each morning the builders found their work cast down; and, a watch being kept, a supernatural voice was heard repeating:

> It is not here, it is not here, That ye sall big the Kirk o' Deer; But on Tap Tillerie, Where many a corp shall after lie.

To the Rhymer is ascribed the darksome 'freit' hanging over a place in Berwickshire:

At Three-burn Grange in after day
There shall be a lang and bloody fray;
When a three-thumbed wight by the reins shall
hald
Three kings' horses baith stout an' bauld;

And the three burns three days will rin Wi' the blude o' the slain that fa' therein.

The general melancholy character of his anticipations is maintained by:

> Atween Craik Cross and Eildon Tree Is a' the safety there shall be;

and the rhyme about the old bridge of Dee which so impressed the youthful mind of Lord Byron that he would never ride over it on horseback:

Brig o' Balgownie, though heich be your wa', With a wife's ae son and a mear's ae foal Doun shall ye fa.

More cheerful is the commendation of a spring in Cruden on the site of the last conflict with the Danes, near to the modern resort of Cruden Bay:

> St Olave's well low by the sea, Where pest or plague shall never be.

Still unfulfilled and uninterpreted is the distich about the bare hill of Mormond:

When Mormond Hill is clad in reid Den Callie burn shall rin wi' bleed, An' gin the saut rise 'been the meal Believe nae mair in Tammas' tale.

The operations of nature are recorded in reference to Locharmoss, Dumfriesshire, in:

First a wudd, and syne a sea, Now a moss, and aye will be.

The good folks of the Scottish capital may plume themselves on:

York was, London is, and Edinburgh will be The biggest and the bonniest o' a' the three;

but their satisfaction is kept within chastened limits by:

Musselburgh was a burgh When Edinburgh was nane, And Musselburgh'll be a burgh When Edinburgh's gane.

The old county town of Forfar and its neighbour on the South Esk are supported against the residential burgh on the same river and the growing city on the Tay by:

Bonnie Munross will be a moss,
Dundee will be dung doun;
Forfar will be Forfar still,
And Brechin a braw burrow toun.

The inevitable fate of the kirk and kirkyard on the swift and changeable Dumfriesshire stream is affirmed in:

Let spades and shools do what they may, Dryfe shall take Dryfesdale kirk away.

A Gaelic saying predicts:

Great Tay of the waves Shall sweep Perth bare.

A Forfarshire one declares:

When the yowes o' Gowrie come to land The day o' judgment's near at hand.

And that mysterious mound the Bass of Inverurie is practically assured against destruction in the lines:

When Dee and Don shall rin in one, And Tweed shall rin in Tay, The bonnie water o' Urie Shall bear the Bass away. The sands of Forvie, on the Buchan coast, covering a buried parish, of which there was an old rental in the charter-room at Slains, witness to this day to the curse of an abducted heiress:

If ever maiden's malisoune
Did licht upon dry land,
Let nocht be found on Furvey's haughs
But thistill, bent, and sand.

Of general and more than purely local character, no prediction is more remarkable than the forecast of the run on grouse-moors and deerforests of the Cailleach Braithreach, the Thunderbolt Carline, a famous witch of Glengairn:

If the children of the Gael but knew the value Of the egg of the fowl and of the crop of the heath,

The fowl would be dearer than the cow, And the glen would be dearer than the strath.

Another saying attributed to the Rhymer has perhaps an application even to the airy visions of Welsh politicians who angle for votes with pictures of a paradise when the wilds of Dirriemore and Assynt shall blossom like the rose:

The waters sall wax, the woods sall wane, Hill and moss sall be a' ta'en in, But the bannock'll ne'er be the braider.

CASTEIL HUISTEAN.

By LADY NAPIER OF MAGDALA.

'HALLO, Hugh! Welcome back to Clubland. Where in the world have you been all these months? You don't look as if your holiday had agreed with you, old chap. By the way, I was so very sorry to see poor Darcy's death in the papers. Did you not go off somewhere together this summer?' said Jack Dampier to another member who had just come into the club.

'We did, indeed,' said the latter; 'and I only wish that I had never agreed to the accursed plan.'

'Oh,' said the first speaker, 'I am sorry. I dare say you would rather not talk about it. I know how fond you were of poor Darcy.'

'I won't talk about it here, Jack; but if you will come over to my rooms I will tell you about it. It will be rather a relief to talk to a sensible fellow like yourself; but it is not a thing I could bear to go into with most people.'

The two men adjourned to Hugh Johnstone's rooms, and settled themselves down into his shabby but comfortable arm-chairs for a talk,

and lighted their pipes.

'Well,' said Hugh, blowing an immense cloud of blue smoke, 'Darcy persuaded me to join him in a small sailing-boat this summer. We were both pretty good on the sea, he especially. He knew about navigation, tides, and so on. We were to work the boat ourselves, with a lad for odd jobs. We were to cruise about the west coast of Scotland and the Hebrides—perhaps get out to St Kilda; and we meant to have a real good time. Darcy was a bit of an antiquary, and wanted to poke about some of the old keeps and dens and earth-houses on the coast and in some of the islands. He could talk Gaelic. He had been brought up in those parts, and loved them and the people. His mother had married a small laird, en secondes noces, when Harry was a small child, you know. He had run wild all his early days, barefoot and hatless. He could swim like a seal, and knew every bird, beast, and fish, so to speak, in those parts. His stepfather was devoted to him, and his mother was one of those lazy, placid women who let everything slide that gives them trouble; and she never troubled her head about her wild little scamp of a boy.

'Their small property was very remote, only to be got at by means of an occasional steamer and the rattle-trap mail-gig. The people were very primitive and behind the times; steeped, too, in the weirdest superstitions—apparitions, warnings, fire-balls, lights, witches, and what Second-sight was common among them, and the most curious tales were told of visions. and that sort of thing. Darcy was a very bad subject for such a bringing-up. Extremely imaginative and nervous, though as brave as a lion, he was most receptive to influences from outside, and with a strange morbidity unusual in a healthy young lad. It was ruinous for him: and he was never sent to school—tutors at home. and that sort of thing. I have known him He was a most lovable always, you know. creature, quite irresponsible and flighty, but of the warmest and most generous nature. He would give you the coat off his back if you asked for it, dear old fellow.'

Johnstone paused a moment.

'He had, unfortunately, just enough money to obviate any necessity for work of any kind, and could follow up any whim or fancy that beset him for the moment. He had a most unhealthy obsession and craving for the occult and supernatural, which he indulged to the uttermost. He attended spiritualistic séances, and was positively avid about these matters; and he went to all sorts of haunted houses ghost-hunting.'

'Did he have any success?' asked Dampier.

The other man smiled incredulously. 'I don't know. He told me one or two curious tales; but I am afraid they went in at one ear and out at the other. I always tried to get him off these topics. I hate them myself, and think them poisonous; and to my mind they affected his

health. He grew to have such an odd, strained look—always as if he were listening for something; it made one quite jumpy. I was very glad when he suggested the sailing trip. I thought it would get him away from his beastly seances and the hypnotising charlatans he had got mixed up with. So, to cut a long story

short, we started off.

"We joined our little craft at Oban. It was a smart, comfortable little boat, and looked like a good sea-boat, with plenty of beam. Just ourselves and a strong lad from Skye. The weather and the scenery were too lovely for any power of description except, perhaps, William Black's. Those parts can be like a very dream of heaven; but, my word, it can be like the other thing too when it comes on to blow—and blows all round the compass! I forget if you know the west, Dampier—the "isles of the sea," and all about them?"

The other man shook his head. 'No; I go to a beastly ugly and unromantic part of Scotland, as a rule—east coast and thereabouts. One gets so groovy as one gets on, and I have a string of houses about there where I bestow my company year after year. Grouse, partridges, and then on to the haunt of the fell destroyer of the mangel-wurzel, the

wicked pheasant.'

'Well, the west, besides its beauty, is full of legendary lore; and Darcy seemed to be very happy at first, and we had a lovely time cruising about among the islands on summer seas, shooting, photographing, sea-fishing. It was an ideal life, and Darcy was beginning to look ever so much better. Unfortunately, he insisted on calling for letters at some out-of-the-way hole where there was a post-office, and then a change came over him. He grew absent-minded and distrait, and the horrid listening look came into his face again. His eyes were clouded and full of trouble.

'I thought it best to take no notice. He never said anything as to the contents of his letters. I prayed for a stiff breeze—even for half a gale—which would give us something to do, and keep his mind and body employed. Anything rather than this brooding. The breeze came, sure enough, pretty stiff; but it soon died down again. It was a perfectly marvellous summer for these parts—seas of glass and limpid turquoise skies.

'During one flat, calm day we were rolling about on the long Atlantic swell, and Darcy got out his letters again and pored over them. After a time he put them in his pocket, and appeared to be lost in thought; then he rose and came up to

me.

"Hugh," he said, "I want you to do something for me, and help me. You know I am a member of the Searchlight Association. We try to verify the supernatural occurrences that are supposed to happen in certain places. There's a ruined

keep or castle in these parts that I want to visit. The vision, or whatever you call it, recurs at intervals, and only at certain stages of the moon, when the rays penetrate and light up the room where the scene took place, the rays shining through a certain window. Strangely enough, this happens only once in every eighteen years. I suppose some astronomer could explain it; I cannot. The vision is a terrible one. The castle is locked, but I can get at the key; and the room in which the thing takes place is quite sound, the only sound room in the building-doors, ceiling, windows, all intact. To-morrow night will be the date upon which the vision recurs. Will you come with me? We will leave the boat here, and walk across the hill. The castle stands on a promontory, and looks sheer down into the sea."

"Yes, I will come, all right," I said. "But you had much better give up all that rot, Harry; it leads to nothing, and it is doing you harm, old chap. Let us run up to Skye and join the herring-fleet in the Minch instead. There will be a spanking breeze to-morrow, or I am much

mistaken."

'He looked very much put out. "No," he said, "I will not give this thing up. It interests me desperately, and I am going. If you won't come I must go alone. The thing has been kept a dead secret by the people it concerns—the people who own the keep and the land—but of course it has leaked out in various and garbled forms. The fact remains, however, that the owners gave up living in the castle, and allowed it to fall into ruin. They never come near the place, and the ground is always let, and shot over from the little inn. Will you see me through it, Hugh? We must go to-morrow. It is a goodish walk from here. We will take sandwiches and a flask."

"Of course I will see you through it, Harry," I said. "We shall have a beastly uncomfortable

night, if we have nothing else."

"Yes, I can promise you that," he said with

a grin.

'The castle, or what remained of it, stood on a sort of promontory. It looked like a huge jagged tooth in the moonlight. It was built close to the edge of a precipice, as were so many of the old keeps and castles of those times. The seas lashed the black rocks two hundred feet below. The scene was inexpressibly wild and imposing.

¹The full moon was sailing serenely through the deep blue of the sky. The sea moaned and roared on the rocks below, a heron shrieked, and

an owl hooted hard by.

'Darcy pulled out his watch. "Come, let us get in," he said. He ran up the stone steps to the iron-clamped door and unlocked it. How he had got hold of the key I don't know. A stone stair was built into the thickness of the wall, and wound upward. Some of the steps were

missing, and there were great gaps in the masonry. "Come on," said Darcy. "There is the door of the room. The steps are all right."

'He pushed open a door that opened on to the stair. It was an immense room, long-shaped, with a vaulted ceiling. It had two windowsone at the side of the room, the other at the end at right angles with it, looking straight out to sea. It was very dark, the squares of the windows showing up blue in the surrounding gloom. Darcy struck a match. There was a catch on the door which prevented its being opened from outside, and he fastened it securely.

"We must sit on the floor," he said. "It is quite dry, and we can sit with our backs to the wall. Go to sleep, old chap; I will keep watch. Of course there may be nothing at all; but let

us keep quiet."

"By all means, let us give them every chance,"

I said sourly.

'We had had a long walk over very rough ground, and I thought regretfully of the cosy cabin in the yacht, and the bowl of good steaming broth and the glass of roaring-hot toddy

before turning in.

'A dead silence ensued. I could hear the tick of the watch in my pocket. Darcy sat close to me, with his knees drawn up, his chin resting on his clasped hands. Suddenly he put out his hand and touched me, and pointed silently. The moon's rays had caught the side of the window that looked out to sea in a faint silver line. The line slowly broadened until at length the rays poured into the room, which became flooded

with a cold, unearthly light.

'A volume of icy air, laden with a faintly fetid odour, rushed through the open doorway, the door having opened noiselessly. Darcy had closed it securely, you will remember. The form of a woman clasping a babe to her breast, her face as the face of the dead, her hair loose and streaming, rushed through the open door and came toward us. She was followed by the huge figure of a man dressed in a sort of coat of mail—a man with a face I can never forget. The hate of hell was on it, passion indescribable. He overtook the woman and grasped her shoulder. She turned. The agony of a lost soul was in her dead face, her glassy eyes. She seemed to clasp the babe closer to her bosom. The fiendish man tore it out of her grasp with iron strength, strode to the window overlooking the sea, and hurled the child into space. A shriek so fearful, so despairing, that I can never quite get it out of

my head, rent the air. Then all was still, and save for Harry Darcy and myself the room was

Johnstone wiped his forehead. 'My dear fellow,' he said, 'this thing has made a mark

on my life.'

'I believe you,' said his friend sympa-

thetically.

'Darcy was sitting as though carved in stone,' continued Johnstone. 'I shook him. For a horrid moment I thought he was dead; but at length I was able to rouse him. He began shaking like an aspen. Strong shudders ran through his frame. "Come," I said. "For Heaven's sake, pull yourself together, and let us get away from this hellish place. Dear old fellow, do try."

'I don't know how I got him back to the boat. The awful shuddering fits came over him again and again, and several times he had to sit down. We were hours on the way. At last I had him on board, and undressed, and into his bunk, where he lay like one dead. The lad and I sailed the boat back to Oban, where I got a

room for poor Darcy at an hotel.

'He never rightly recovered. The chill, or whatever it was, settled on his lungs, and he

died of pneumonia.

"We have looked into hell, Hugh," he said before he died, holding my hand. "I had better have left these things alone."

'It is all very well, Dampier, laughing at ghost stories and apparitions, and I have laughed long and loudly; but never again. Explain to me, if you can, this thing which Darcy and I both

saw. Both, mind you!'
'I cannot,' said Dampier. 'There is so much, after all, that we cannot explain. The idea occurs to one that it may be part of the man's punishment in the other world that he should be obliged to return at intervals and re-enact his wicked deed, and hear again that woman's shriek. The poor sinning woman must also bear her part. Of course, she was a sinning woman. Did you get hold of the story?'

'Yes, after an infinity of trouble. I gathered that the man-fiend was owner of the castle, and had been at what they called "the wars" in those days, returning unexpectedly, to find his fair but frail wife unfaithful to him. Something to that effect. Good-night, old chap. This is,

of course, only between ourselves.'

'Of course. Good-night.'

A PROMISING CATTLE FOOD.

SOME years ago the British farmer drew nearly the whole of his supplies of cottonnearly the whole of his supplies of cottoncake from Egypt; but as the attention of the growers in our great Eastern Empire became drawn to this state of things, Indian cotton-cake

was put on the market, and is now very largely used. Once again the East has proved a vast source of supply for cattle food; and the soya bean, which is not so well known as it might be by the home agriculturalist, is being imported into this country from Korea, China, and Japan in ever-increasing quantities. There was a conspicuous exhibit of the soya, soy, or soja bean in the Korean section of the Anglo-Japanese Exhibition some time ago; but few of those who saw the heaps of yellow grains, round like dried peas, but of a deeper colour and perfectly smooth, could imagine that in a short space of time this comparatively unknown food would be poured into this country by the hundred thousand tons.

The soya bean makes a particularly nourishing cake; and in the countries where it is so largely grown it is held in such estimation that it is used as an article of human food, being ground into a coarse flour and made into cakes or broth. The plant is indigenous to those countries, and appears to have been used for centuries as a food for cattle as well as for mankind. It is exceptionally rich in nitrogen, and is highly fattening. The finest grade is known as the Sakura, which is imported from Dalny; but this is almost equalled in fineness and richness by the Hankow bean from Shanghai and the bean grown at Harbin near Vladivostock. The soya beans which are being grown as a hay and forage as well as a seed crop in the United States are of a brown or black colour, and a green variety is far from uncommon.

As a green forage soya is admirable, and the hay formed is fragrant and nourishing. Cattle seem to prefer it to ordinary meadow hay, and eat it with avidity. It is not known with any certainty what the effect would be of feeding animals in this country entirely on soya; possibly the food might prove too fattening. But in the Far East the cattle have no other food in many districts, and that they thrive on it will be evident to any one who has seen the fine herds which are raised in the western plains of Korea.

When it is ground into meal by the farmer himself the whole of the oil content is left in the soya, and the cattle get the full benefit of its great fattening properties. Much bought meal has the whole or a part of the oil removed, and consequently forms flesh rather than fat. Soya-cake has a considerable amount of the natural oil removed; and, in view of the high prices which vegetable oils are commanding at present for soap-making and margarine-making purposes, the cost of soya cake and meal should before long be very reasonable.

It is interesting to recall the tests that were made some little time ago as to the value of soyacake as a cattle food. The tests were comparative, a number of animals being fed on soya and a number on decorticated cotton-cake. Sufficient time was allowed to make the tests of value, as they occupied twelve weeks in all. The results showed that the two cakes were equal as regards milk production, whilst from a flesh and fat forming standpoint the soya gave the better

results of the two. It is perhaps somewhat unfortunate that there was a certain diffidence existing in the minds of those who undertook the tests, as they were not certain what effect the use of soya would have on the cattle. Consequently they allowed only a very small amount, the cattle being fed principally on hay, straw, and roots. The daily supply of cake was four pounds per animal, mixed with an equal weight of good oats.

The soya beans themselves have an average albuminoid content of 40 per cent., and of oil about 18 per cent. The soya-cake sold in this country has an oil content of only about 6 per cent., which compares unfavourably with the 13 per cent. of oil in decorticated cotton-cake. In albuminoids soya-cake has the advantage, containing 44½ per cent. as against about 40 per cent.; and the carbohydrates are about equal, being 25 per cent. of the whole with the soya and 243 per cent. with the cotton cake. The woody fibre content is approximately the same in the two cakes, as also is the ash. There is more moisture in the soya than in the cotton cake, the percentage in the former being $13\frac{1}{3}$ as against 107 per cent. in the latter. At the price at which it is quoted, soya-cake should prove a cheap food; whilst soya beans themselves, ground into meal, might with advantage be employed as a fattening agent.

DEATH OR LIFE.

Is it to live—to join the quest for pleasure,

To seek each day some fresh, untried delight,

To have few calls upon our time and leisure,

To hurry here and there for some new sight?

Is it to live—to turn away from sorrow,

To have enough while others feel deep need,

To rest to-day and not to toil to-morrow,

To seek the good of self by act and deed?

Is it not rather dying hour by hour—
The slow paralysis of heart and mind,
The sure decay of talents and of power,
The deepening darkness of those growing blind?

Do they not live who spend themselves for others, Who rise up early and who late take rest; Who daily toil to aid their poorer brothers, Are they not drinking deeply of life's best?

Do they not live who fight and battle ever Against the forces of disease and pain? Can any joy compare with the keen pleasure Of those who make the blind to see again?

'Tis true such life means daily self-denial,
Not rest and peace, but toil and ceaseless strife;
But 'tis alone by conflict and by trial
Men gain the fullest and most perfect life.
FRANCES A. MANKS.

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, Yesterday.

KIND thinkers suggest that as a touch of evil may be discovered in the best of us, it is possible that something of good may be found in the worst; and, again, the benevolent have proposed that there is reason for the exercise of compassion toward those who are numbered among the extremely wicked. At the present time the Kaiser may be produced as a most interesting case for the test of these sentiments. Let us now dismiss from consideration the first couple of these propositions on the good ground that we cannot be sufficiently dispassionate to reach a fair judgment. It is easier and better to take in hand the one remaining, and consider whether in any respect whatever this strangely exalted Prussian is entitled to a particle of sympathy from those who take the broadest and most philosophical view of human affairs and the progress of the world; whether, in the simple expression, we might be 'sorry for him.' Be not too hasty with an angry answer, No. We may select as an interesting line of experiment the subject of his ideals as expressed or indicated by himself, and see to what it leads. In the long run of the world, thoughts count for more than acts. In the same way, we should judge more exactly of a man by his ideals rather than by his commissions, being careful that we perceive precisely his own view of the ideals and his action toward them. Then let us look at the Kaiser's, see what is his attitude toward them, and how he progresses toward attainment. We may learn something of interest about Wilhelm in the process, and perhaps come to a new decision regarding him. One thing certain is that he is most desperately anxious he personally should stand exalted in the eyes It is not that he wishes posterity of posterity. should admire him, feel its heart warmed toward him for the good that he had done to the world, or hold a simple admiration for what might be vaguely described as his greatness. would be satisfied, and more than that, if posterity should be awe-stricken at the contemplation of him, as he has discovered with interest and attention the people for more than fifteen hundred years have been awe-stricken at the contemplation of Attila. He has been looking through the books of history, and there No. 209.-Vol. IV.

are two characters in them that have evidently seized his erratic imagination. Distorted to his own fancy, they have been set in his mind as ideals. In each case he has misunderstood, and his own quality is too gross for the purpose that he has. All his life he has been acting, and has come to feel himself the finest imperial eagle that has ever flown, when there are many sparrows in Britain and France that are in thought and capacity much finer birds. It is in that idea of Wilhelm as a mere actor, a shameless poseur, that we get a good explanation of his ideals and his attitude toward them. I remember the first time I ever saw the Kaiser that thought impressed itself in a flash upon me. It was a cold, gray winter morning many years ago, and I had been standing with a crowd of others at a vantage-point in Hyde Park for a long time waiting for a solemn procession to come along. Presently it came, with muffled music moaning. It was the funeral procession of Queen Victoria; and not the bier of the illustrious dead, not the most remarkable gathering of kings and princes moving there in that sad line, demanded and gained the attention more than Wilhelm in a fine martial attitude on a snow-white horse that was meant to be most conspicuous. I remember the white horse in that procession when I nearly forget the personal display of the Emperor and the cold look in his eyes that, like the ends of his moustache, were faced towards the sky while the band wailed out the eerie notes of Chopin's Marche Funèbre. He said to himself at night that he had created a great impression at the greatest funeral there had ever been; we may be sure that he said

Wilhelm tired of peace manœuvres. His declared alliance with the powers of Heaven did not seem to be employed with sufficient advantage. The Hohenzollerns of the past sent their spirits to his dreams, and jangled sword music in his ears. It must have been then that he determined on the parts he would play, and made the same sad error that poor Dan Leno made when, in utter sincerity, he concluded that he had been meant for higher things than to be a jester, and particularly that he was meant to play the part of Hamlet. Poor Dan did play Hamlet once at the November 28, 1914.

end of all. Wilhelm, thinking of the Hohenzollerns, of Europe and the world, of destiny and posterity, of himself and his acting, and also of God, looked diligently around the great characters in the amazing drama of history, and he seems to have settled upon two of them as well within his scope and suited to his particular talents. They were Attila and Napoleon. These became his ideal parts. In this selection there was a horrid incongruity through misunderstanding, for Napoleon was not in the least like Attila, any more than Wilhelm was or ever could be like Napoleon, whom he did so much wish to resemble—which was a reason why he rode on a milk-white horse. Yet the two parts appealed to the Prussian for study, along with reflections of Nietzsche and Treitschke, perhaps because it seemed that in what he failed in Napoleon he could make up for by Attila. For all the devastation that he worked, there was a great grandeur in the character of Napoleon. He was a man. The ruin he caused was only an incident. He did not make its accomplishment his object; it was a necessary means to his end. He was one of the three greatest soldiers that the world has ever known. He was chivalrous, loved the campaign and the strategy, the smoke of battles, and his soldiers were as his brothers. There is no other grandeur in military history, or in the contentions of nations, than the whole-hearted fervent applause of the French soldiers for their great and glorious leader. Napoleon coveted power; his ambition soared too high. He would be a king among kings, and he wanted the cheers of his soldiers, and by might he would gain his ends, but he had no lust for mere carnage.

* * *

The Kaiser may have agreed with himself, and wisely, that there were some things in the part of Napoleon to which he could not well attain. There were those subtle touches of greatness, that loftiness of spirit, even the human gentleness that often came to the surface in Napoleon. Then, too, the times are hardly suited to the Napoleonic method. Thoughts have expanded, space has become contracted, science and machinery have made enormous multiplications; and, if not greater and finer, everything in these times must be at least bigger than it ever was before, so that, proportionately, to equal Napoleon and challenge him with posterity, which was the Prussian actor's desire, all records in war, to use the common phrase, must be broken. Waterloo was fought within the space of a few fields, and in a day. To gain the same effect of awe with the people of to-day and with posterity, it would be necessary to have a long succession of greater Waterloos, and to use countries for the battlefields instead of farms. In the development of this appalling idea of destruction the study of the character of Attila became of great service. Napoleon had a most splendid imagination. Wilhelm has none, and therein Attils suited him, because the king of the Huns had little or none either, and he too desired to devastate the world, and did it. What Attils lacked in imagination he made up in sheer barbarity. To butcher, to devastate, to horrify, to break every law of God and man—that was Attils. Wilhelm clearly liked the part.

The way in which he has attempted consciously in his acting something of the grand natural military manner of Napoleon is pathetic. We know how Napoleon rode along the line of his troops on his white horse, and how they would cheer him until they almost fainted with exhaustion of emotion; how he would go among their tents at night; with what honest fervour he would address them. There was spontaneous expression in those days. Now Wilhelm was lately present at the battle of Nancy, or rather was in a safe place near to it, with the most wonderful and enormous protections to his habitation, when he had been led to think that his troops would gain a victory, and there would be an opportunity for a fine soldierly and imperial display on his part. So he gathered ten thousand cavalry in parade dress about him, and he was astride his own white horse, intending when the victory was achieved to make a most brilliant entry as the conqueror into the capital of French Lorraine. But suddenly the Germans retreated, and Wilhelm had to turn his back on Nancy. He was disappointed of his glory. And about this time he took to appearing unawares in the barracks at night, silently watching the men in the well-known attitude of Napoleon. Once when the moon shone in a clear sky over the German camp, and the guns in the distance at Verdun were booming in the night, the Kaiser went to one of the regiments and made a long speech. The singing of the National Anthem brought the proceedings to a close. You remember how Napoleon raised his brethren; and we have lived to read how Wilhelm sent a telegram to the Crown Princess informing her that his son and her husband, magnificently assisted by God, had won a battle-which he had not-and on Sedan Day at Coblenz, a day of vast disappointment to the Germans because there was no new Sedan, Wilhelm embraced this young scoundrel, who has stolen from French castles like a common thief, as 'Invincible Hero,' and presented him to the population as 'Restorer of peace in the world.' After an action Napoleon would walk down the ranks of the regiments. He knew in what wars each one had served him, and he would stop before the oldest soldiers. To one of them, it was said, he would recall, with a word and a familiar cares. the Battle of the Pyramids, to another Marengo, and to others Austerlitz, Jena, and Friedland, and the veteran, who believed he had been recognised by his emperor, glowed with pride

among his younger comrades, who envied him. But he attended to the young soldiers also, asked them questions, whether their wages had been paid, whether their captains looked after them, and would look himself into their haversacks. He would stop in the centre of a regiment, demand the names of the most worthy, and when the names were given would have them called out before him, would question them upon their careers and experiences, and would there and then promote them to the rank of officer, seeing they got their rank immediately and in his presence, and would himself instruct them in the way in which they were to receive it. And as the Comte de Sigur said, 'It is in this way that Napoleon makes them love war, glory, and himself.' He was just; he was generous; he rewarded merit. He said once, 'I raised many thousands of Italians who fought with a courage equal to that of the French, and who did not desert me in danger. the cause? I abolished flogging. Instead of the lash I introduced the stimulus of honour. Whatever debases a man cannot be serviceable. What sense of honour can a man have who is flogged before his comrades? When a soldier has been debased by stripes he cares little for his own reputation or the honour of his country.' He said to an officer, 'Write to Corporal Bernandot, of the 13th Regiment of the line, that he is not to drink any more, and behave better. It seems that the cross was given him because he is a brave man. But it must not be taken from him because he is too fond of wine. him realise, however, that he is wrong in putting himself into such a condition as to disgrace the decoration he wears.' But the stories illustrating Napoleon's fine standards and the greatness of his soul are too many for a day's thought. He was not religious, of course, but yet he could respect religion, and he was certainly spiritual. A man of his imagination could be no materialist. He said, 'In spite of all the iniquities and frauds of teachers of religion, who are eternally preaching that their kingdom is not of this world, and yet seize everything which they can lay their hands upon, from the time that I arrived at the head of their Government I did everything in my power to re-establish religion. Man has need of something supernatural. It is better for him to seek it in religion than in Mademoiselle de Normand'—this lady being a fortune-teller in Paris. You remember that one night, when he was aboard one of his ships in Egyptian waters, there was a discussion on deck among his officers after dinner as to the existence of a God, and Napoleon, joining in, held his hand toward the heavens and asked, 'Can you tell me, gentlemen, who made all these?' We recall that in 1807 designs for a new coinage in Italy were submitted to him with the motto, 'Napoleone protegge l'Italia,' and he wrote on the margin: 'This is most unsuitable;

the word proposed in place of "God protect" is most indecent.' Wilhelm would not quite understand that, or what Napoleon meant when he wrote to his Minister of Marine saying: 'I dispense you from comparing me to God. The phrase is so singular and irreverent that I wish you to believe that you did not reflect upon what you were writing.' That was Napoleon.

* * *

Let us now, with apologies to the spirit of the mighty Corsican, compare two proclamations to armies, one of Napoleon and the other of Wilhelm. Napoleon would talk to his men of valour, of courage, of the greatness of France, and of their coming conquests. Glory and hope always. Departing for Egypt, he cried to them, 'Soldiers! you have made war in mountains, plains, and cities. It remains to make it on the The Roman legions, whom you have often imitated but not yet equalled, combated Carthage by turns on the seas and on the plains of Zama. Victory never deserted their standards, because they never ceased to be brave, patient, and united. Soldiers! the eyes of Europe are upon you. You have great destinies to accomplish, battles to fight, dangers and fatigues to overcome. You are about to do more than you yet have done for the prosperity of your country, the happiness of men, and for your own glory.' And this at the present time is the proclamation to his eastern army of Wilhelm, whose soldiers are pushed on by their officers from behind, and who are described by them as just being food for the guns: 'Remember who you are. The Holy Spirit has descended upon me, because I am the Emperor of the Germans. I am the instrument of the Most High. I am His sword, His representative. Woe and death to those who resist my will! Woe and death to those who do not believe in my mission! Woe and death to cowards! Let all enemies of the Germans perish! God demands their destruction, God who through me commands you to fulfil His will.' By this time we can well understand how the Prussian felt that the part of the Napoleon was too rich for him to play before posterity. Something grosser, more barbaric, was needed. In these days we live on the past far more than we may suspect. There is scarcely such a thing as modern architecture; we copy the styles of ages gone, or leave the buildings plain. For our designs in wares, in ornaments, in everything in which the spirit of man is given to the beautifying of things, we go to the ancient models and make selections from them. All our novelties are raked up from the past. So Wilhelm, going on his great tour, dug into recesses of the history of horrors of the past, and with what delight it must have been he came upon Attila! So then he made a speech to his troops going to China: 'When you come into contact with the enemy, strike him

down. Quarter is not to be given. Prisoners are not to be made. Whoever falls into your hands is into your hands delivered. Just as, a thousand years ago, the Huns, under their king Attila, made themselves a name which still appears imposing in tradition, so may the German name be known. The blessing of the Lord be with you. Give proof of your courage, and the Divine blessing will be attached to your colours.' Even in the sickliness and ghastliness of such utterances one can begin to suspect that what Wilhelm is most in need of is a sense of humour, and that idea, once started, leaps.

* * *

Attila had it. The king of the Huns was a magnificent monster. There was not a method of barbarism he did not practise for the advantage he could gain from it. Yet even he had some human qualities. He was upon occasion a good host to ambassadors. The historians tell us that he was not inaccessible to pity, as the Germans have been in Belgium, and that his suppliant enemies might confide in the assurance of peace or pardon; while he was considered by his subjects as a just and indulgent master. And he spared Rome. In the appalling blackness of the Attilan traditions there are some specks of light. Attila declared no alliance with God. He merely admitted he was the Scourge of God. A repulsive little beast he was, exhibiting 'the deformity of a modern Calmuck, a large head, a swarthy complexion, small deepseated eyes, a flat nose, a few hairs in the place of a beard, broad shoulders, and a short square body, of nervous strength, though of a dispro-portioned form.' He had a haughty step and demeanour, expressing his consciousness of his own superiority, and he had a way of fiercely rolling his eyes, as if he wished to enjoy the terror which he inspired. When a man does this you may suspect him of a sense of humour, whatever may be his barbarities. As we inquire fully into the history of Attila, the suspicions are confirmed. Shall there be no smiles at the true story of the affair of himself and the Princess Augusta, and how the king did much use it to his advantage? Attila, coming to exercise sovereignty, had a large number of wives, scores of them, and he could have had as many more as he pleased from among his own and conquered people. But, strange to say, there was one Roman lady of supreme distinction who wanted him for a husband, and there the romance begins. Honoria was the sister of the Roman emperor Valentinian, and was educated in the palace of Ravenna. It was felt that her marriage might be a matter of danger to the State, and therefore, to secure her celibacy, she was given the title of Augusta, by which she took rank above the highest subjects and was beyond their matrimonial reach. But Honoria at sixteen was a full-blooded girl; she fretted in this state, and

presently fell in love with her chamberlain, as the result of which she was sent away to a state of seclusion at Constantinople. After many years of solitary pining she became desperate, and formed a strange plan. She had heard all about Attila and his barbarities—also his power-but had never seen him. There was everything in him to arouse feelings of abhorrence in her, but for that she did not care. She wanted freedom. So she contrived to send a messenger to Attila with a ring as the pledge of her affection, and besought him to claim her as his wife to whom he had been secretly betrothed. But at that time the Hun did not like the idea, disdained it, and collected more wives from other sources. Yet when afterwards he became more and more ambitious, an idea occurred to him. He wished to quarrel with the Romans, and he had here the excuse. He demanded his bride! The Roman Emperor was amazed at the situation revealed, sent a firm refusal, and Honoria was forcibly married to a person of no account, and then shut up for life in a prison somewhere in Italy. As the Romans would not give Attila his bride, he made war. And when this war was done and peace prevailed, and the time came when Attila desired another war, he again asked the Romans for his bride, and threatened to punish them for wronging her if they did not yield at once. They did not yield, and so Attila went to war again. He always knew they would not yield. Some time later he would be once more troubled by the grievous wrongs being borne by his beloved Honoria whom he had never seen, and, the Romans refusing again, unsheathed was the sword of Attila. And when at last, at the supplication of Pope Leo and the Roman senators, he spared Rome and consented to go away across the Alps, he said he would come back again if the wrongs of Honoria remained unredressed. Is it not impossible to doubt that the Hun was smilingeven if only inwardly and to himself—when he gave this last threat forth? With what grim but magnificent humour were those demands for poor Honoria made! Of its kind this story, so little known and told, is matchless, and he who caused it, though the uttermost barbarian, had that sense of humour which to-day is not possessed by his imperial imitator. Attila went away; he married yet another bright young girl named Ildico, and after too much freedom at the table on his wedding-night, he died before the morning broke. Is there not more good human colour in the character of Attila than in that of Wilhelm? Granted that the latter equals in barbarous disposition, he fails in comparison with the Hun in this want of the sense of humour. This may seem a strange fault to find with Wilhelm, for in war there is little enough indeed of humour; but a sense of it, a realisation of the grotesque, might have saved an emperor of sensitive mind. If Wilhelm

could realise the pitifulness of his failures in the characters of both Napoleon and Attila! He can approach distantly to neither. His ideals elude him. He has misunderstood. One who

should know he made mistakes, and that he failed; but shrinks from the judgment of posterity that he was a fool—anything but that. It gives the uttermost terror to his death. And plays in public might not fear that posterity | for that some may be sorry for the Kaiser now.

THE ALARUM.

CHAPTER XI.

IF the child lives through the night, we may get her round,' said the doctor as he stood by the bedside.

'I have told Miss Walker that I will stay the night,' said Mary. 'I know something of

'That's right! That's all to the good! shocking case; and some of us have been horribly to blame to let such a thing go on under our very noses! It's a bad business all ways. That young artist is a bit delirious, and my wife has her hands full with him, so I must get back. But he'll get round all right.'

'You think so?' Mary controlled her voice

admirably.

'Yes, I think so. But as for those scoun-Now I have seen the child, I'll have a word with the constable downstairs.

So the doctor and magistrate signed a warrant for the arrest of Dick Dowthwaite and his sister

without further delay.

All that long night Mary and Agnes watched for the life of the child, and the old grandfather kept up the fire below, and smoked hard to keep himself awake.

In such a watch it was impossible but that the women should be drawn to one another. intervals Agnes poured out her anxiety, and incidentally revealed her admiration for the injured 'He's such a gentleman!' she said. 'Oh! I can't abide not to know how he is.'

'He is having the best of care,' said Mary

soothingly.

'Ay, happen! But what if Dick Dowthwaite had murdered him?' Agnes whispered excitedly.

'Hush, hush!' said Mary. 'We have no

right to accuse until we know.

'Oh, we're not so particular in t'dale. Besides, I do know. And it's all along of me! Dick's that spiteful; and, you see, he wanted to marry me, and he thought that—that Mr Marsland had cut him out.'

'Oh, and has he?' asked Mary slowly.

Agnes went rosy-red, then gave a pathetic 'He has, and he hasn't. Since I little smile. set eyes on Mr Marsland I could never bring myself to a fellow like Dick. Of course I would have him in a minute if I could get him; but I'm not a fool, and I know well enough that he means nothing by his pleasant words. Still, pleasant words is pleasant words, and when they stop-you miss 'em.'

Yes,' said Mary.

'But, of course, he'll wed his princess yet,'

added Agnes with a brave resignation.

Then the little patient needed attention, and Mary was glad that the whispered conversation

As the morning brightened, the hard-pressed doctor was again walking up the steep path to the cottage.

'A strong cup of tea, Agnes, there's a good

And how is she?

'Miss Duncan thinks she's mending, sir.'

'Hope she's right. If she is, it will be a mercy for some people which they don't deserve.' 'You've got 'em fast?' asked the shepherd.

The doctor gave a rueful laugh. 'Given us the slip so far. Cleared out last night with nothing but their skins and their money-bags. But we'll get 'em yet, the old scoundrels!'

'And Mr Marsland?' asked the shepherd.

'Oh'—and the doctor gave Agnes a familiar nod-'he's only a youngster, with a head as hard as a bit of your own bluestone, Walker. he'll obey orders, he'll do. But these lads get pig-headed at times. But, for heaven's sake! see to that kettle before I go upstairs. Even a doctor is only flesh and blood; my second night out of bed, and forty-eight solid hours since I took a deep breath.'

CHAPTER XII.

PAUL was having a dull time; for, save for one visit from a police-officer, Mrs Brock wouldn't let a soul go near him. During the afternoon he lay behind drawn blinds in a curious state of languor, trying to recall the happenings of the night before. Presently, to his relief, the doctor entered, and, looking at him narrowly, Dr Brock guessed that his patient was worrying his brain over the incidents connected with the accident.

'That lady must be a rare plucked one,' he said. 'She may have saved two people's necks on two counts, so far as I can judge. A committee member of the N.S.P.C.C., if you know what that spells?'

Paul moved restlessly, but struggled after selfcontrol before the doctor. 'And her name?'

'Oh, hang me! I can't tell you. Never could remember names! They call me "What's-hisname George" about here. Saves waste of brain energy. Anyhow, Miss What's-her-name saved you, my man, from a night in the open, and probably an eternity underground; and as for the child, she has nursed her all through one night, and seems as gay as ninepence for another, though I ordered her a six-hours' rest to-day.'

'And how is the kid?'

'She'll do. Don't you worry about her. And as for Miss What's-her-name, you will have to thank her nicely when you get going again. Too good for her job, of course. Ought to be a society miss, waiting for Mr What's-his-name to turn up, But girls don't fancy cushions nowadays. Mad, mad, the lot of 'em! Myself, when I come across a young lady taking to sport of this kind, I always think that there's a brute of a man somewhere in the background.'

'George,' exclaimed Mrs Brock as she entered the room, 'come out of here this instant! When will you learn sense?' and she domineer-

ingly dragged him from the room.

It was on the following day that Mary discovered that the doctor's gay, active little wife was one of the women whom the world needs.

Janie had been taken off to a hospital, and Dr Brock insisted that Mary should come home with him. It was not long before Mrs Brock, discovering that her visitor had an appalling nervous headache, packed her off to bed.

But neither the lady nor the damaged man

passed restful nights.

It had scarcely needed Mrs Brock's innocent mention of Miss Duncan's name to assure Paul of the truth of his surmise. There was only one woman in all the world who spoke with just that

tone and just that Highland lilt.

With Mary, the thought grew intolerable that Paul might think she had deliberately tracked him down to his retreat. At all costs, she must face the dictatorial doctor, and escape without further explanation. Yet soberer thoughts pulled her up. She was here on business. She had already written her report, and she was in honour bound to await instructions.

'Our great difficulty in accepting your kind offer of help, Miss Duncan, is that we find that voluntary workers are apt to be amateurish,' so she had been told at headquarters. Here was her first real opportunity, and she was keenly

anxious to prove herself professional.

After tossing restlessly until the small hours, she decided that she would inflict herself on the Brocks for a couple of days longer. For this length of time she would be safe, as the artist would certainly not be allowed to leave his room.

CHAPTER XIII.

'MY dear child, it is quite preposterous that you should leave us,' said Mrs Brock two days later, 'merely because the police-court proceedings are put off until Mr Marsland is well enough to appear. What is a week? The

Dowthwaites will certainly be committed to the Assizes. Take a northern holiday until then. Your committee won't expect you back until the case is through.'

'Oh no; only'-

'And such a gloriously clear case for action!' went on Mrs Brock enthusiastically. 'Aren't

you proud of yourself?'

As Mary did not immediately answer, Mrs Brock plunged on: 'Come, what is the hurry? At least you might help me to entertain the artist. One grows rusty in this dale; indeed, I can see that I am boring him already. He doesn't quite get on as we could wish, and we are letting him crawl along to our upstairs den, hoping that a little change may help him to sleep better.'

A merciless crimson swept over Mary, and Mrs Brock suddenly realised that her guest was

genuinely agitated.

'I am sorry if I have suggested anything I shouldn't,' she apologised. 'Only, it struck me that the poor man will certainly want to thank you for what you did for him; and I confess I also wondered whether you would care to read aloud to him, or talk a little. But if you would rather not'——

'Oh,' Mary burst forth, 'I can't imagine what you must think of me for being so unwilling to do a simple kindness! If only I knew what to

do!

'My dear child, I would not force a confidence; but may I not understand?'

'Don't you see, Mrs Brock, I knew him before!'

'Ah!'

'And it's worse than that,' the girl went on. 'He once asked me to marry him, and—and I was horrid!'

'Then,' said Mrs Brock deliberately, 'the

sooner it's over, the sooner to sleep.'

Now she understood the reason of her patient's restlessness, his alertness in listening to sounds, his desire to have a mirror placed so that he could see who passed in and out of the house. The circumstances appealed to her mightily.

'Come,' she continued in a business-like tone, 'you are no coward. I'll give you five minutes' respite, and afterwards you must do as you like.'

The five minutes were used by Mrs Brock in getting her patient across the landing to the doctor's sanctum. Having settled him in an easy-chair and arranged his pillows expertly, she said, 'And now, Mr Marsland, I am sending a lady up to see you. It is quite time you met.'

Somehow her manner told him all.

'What children they are!' she thought indulgently, as she saw the same kind of shy heat rise to the man's cheeks as had risen to the girl's.

'I am not respectable,' he said sensitively.

'You won't be that for weeks.'

'But-does she mind coming?'

'I told her she must come.-Miss Duncan!'

So the doctor's wife called. 'We are quite

ready.

There were a few seconds of feverish heartbeatings, and Mary was at the door. She paused there for a moment, and Mrs Brock passed her and escaped. Then she came hurriedly forward.

'Oh Paul! Poor you!'

He held out his hand, and she took it simply.

'That it should be you!' he said.

'But you don't mind that I am I?'

'Mary!'

But I want so to tell you how sorry I am

that I never wrote to you.'

'And I am sorry that I never heard.' He tightened his grasp of the soft hand. 'But I did not deserve a letter.'

'That is not true,' she said, struggling to keep controlled; 'and I cannot endure to think of all

the priggish things I said to you.'

'They were right—utterly right! And it is good of you to have come to me now. You need not fear that I shall ask you what I asked you then; at least, not now.'

He loosened her hand, and she stepped back

ever so little.

He paused, and there was an anxious silence between them. 'You see, the alarum has sounded in my ears at last; and, God helping me, I don't intend to sleep again.'

Still she did not speak.

'I, too, have seen the Vision, Mary; but just now I must walk alone on the new path, in case I fall.'

'But,' she faltered, 'may we not help each other?'

'No. My mother's last fear was that I might spoil your life; and that, at least, I refuse to do.'

In spite of his wrecked appearance, there was a quiet strength in his manner wholly new.

But'—she clasped and unclasped her hands, then spoke in her quick, impetuous way—'this is nonsense. How are we to help the children? I thought that we might have done so much together!'

Their eyes met—he was kissing her hand passionately. 'Now I shall win through!' he cried. 'Only, Mary, you are sure—sure I shall not harm you?'

'Sure,' she said recklessly.

'Then perhaps you might be merciful.'

'How?

'By coming just a little closer,' he said yearningly.

'I don't see why I should begin by spoiling

you.'

'Great Scott! Sorry!'

'Come in! Come in, doctor!' called Paul boisterously.

'Miss Duncan,' said Dr Brock gravely, 'I understood that you were a good nurse.'

'So I am,' she retorted happily.

'And have you thanked her, young man, for saving your life?'

'Oh!' gasped Paul, 'I forgot.'

GERMANY IN PEACE AND WAR (1900-14).

SINCE my return to England on August 4th the words 'German' and 'Germany' seem to be on the lips of every man, woman, and child; yet if one speaks to these people about this country that interests them so deeply, one is really appalled by their absolute want of real knowledge and grasp of the subject.

I went to live in Germany in January 1900, and resided there continuously until I was driven out, with but three hours' notice (and only allowed to take hand luggage), on August 3rd. I should like, if possible, to do my little toward bringing to the great mass of the British people a true knowledge of Germany as she is, and of the life, aims, ambitions, and unscrupulousness of the German people.

I think the first thing that strikes an Englishman resident in Germany is the thoroughness with which everything is undertaken and completed. I will not attempt to speak here of the German system of educating the children, as time and space forbid; be it sufficient to say that it is the highest perfection of thoroughness, and in every school patriotism and the desire for martial glory and colonial expansion are incul-

cated. Classes, even of the youngest children, male and female, are frequently conducted by their teachers to one of the many monuments, war and other, where they are drawn up and lectured on the subject of the monument; after which, they, singing patriotic songs, are marched to the next monument en routs.

The Kaiser is undoubtedly the hardest-worked man in Germany; even his enemies have to acknowledge this; and no greater example of his foresightedness and determination of character can be given than the way in which he, against great odds, carried through his naval scheme. will be remembered that in the latter days of the 'nineties his great Naval Bill was rejected. Later, when addressing recruits at Kiel, he said something to this effect: 'I look forward to a time, not far hence, when we shall be second to no Power on the seas, as we are second to none on the land.' Then, understanding the nature of his people, and the way to inflame their ambition, he in June 1900 sent a torpedo-boat flotilla up the Rhine; every town, large or small, upon its banks was visited, and by his orders the municipal bodies gave the crews a right royal

welcome. We, who live by the sea and are intimately acquainted with warships, can hardly realise the effect of such a sight upon the farinland population, many of whom had never seen the sea, much less a warship. All went mad with the desire for naval power; all schoolboys were wild to become sailors; the people thirsted for supremacy on the sea. Naval leagues and societies were founded all over the Empire, and when next the Kaiser presented his naval scheme to Parliament it was carried with acclamation. The great scheme, however, was not yet complete. Junior Naval Leagues were formed in conjunction with schools, and the upper classes of boys were, and are, taken every year by their masters on visits, lasting about a week, to all the naval and mercantile harbours, arsenals, and shipbuilding yards, where scientific lectures are given to them by experts. The result of all this is that Young Germany cries with one voice, 'Our future lies on the sea,' and 'We must, and will, have colonial expansion.' I might here mention the general dissatisfaction which prevailed over the peaceful settlement of the Morocco and Balkan questions. A large party, headed by the Crown Prince and the military authorities, cried aloud for war, and throughout the whole land there was always a strong spirit of unrest. The Kaiser, although ambitious, is a far-seeing and clever man; he knew the financial condition of his country, and foresaw the absolute ruin that war would bring upon his teeming millions. This can only be clearly understood when it is known that nearly all businesses in Germany are financed by banks; there are but few manufacturers who are able to carry on their business with their own or their family's capital; hence in war banks withdraw their 'foreign capital,' and wholesale bankruptcy is the result. On the declaration of war with Russia large numbers of factories were immediately closed, and in one town on the Rhine, in one day, I heard of no less than thirty firms becoming bankrupt.

Since the war of 1870 taxation has not been reduced, but has been steadily on the increase, so that in peace we may say the country has been living on a war-taxation level. Naturally there was very much dissatisfaction expressed at this state of things; nevertheless, when they were asked how they would manage to meet expenditure in their next war, the general reply was, 'Oh, we should get a war loan, which our enemy would have to repay with heavy interest, not only with gold, but by territory.' Such a thing as their failure in war never enters their calculation. I once asked an officer, when in friendly conversation with him, what they would do in the event of war with France. 'Oh,' was his reply, 'we should march through Belgium into France.' 'But what about Belgium?' He laughed. 'She could not resist us, but of course would let us go through in a friendly way.' 'If the war were with Britain?' 'Oh, then we should seize

Antwerp or Rotterdam, or both, and use them as a naval base. Nothing would be easier. Failure does not enter the calculations of the War Office staff; we have our orders to "Do," and do we must at all costs.' The present war seems to have proved the military authorities in Berlin not to be infallible.

In peace the German people are the nicest and most kind-hearted that one can imagine; but on the outbreak of war, sad to say, their kindness, civilisation, and culture seem to have been put aside with their civilian clothes, and brutality seems to have come to them with the putting on of their uniforms. On one of the last days of July the Kaiser addressed the crowd from his palace balcony with words to this effect: 'Mv people! I have striven hard in the cause of peace, but it has been to no avail. Now with honour we must draw our swords, with honour we fight, and with honour after victory we will sheathe our swords again, and thus we may expect God's blessing to be with us. And now I ask you, my people, to go to the churches and pray that God may rest with us and ours.' words and sentiments are beautiful, and had a magical effect upon the populace. I often heard in the provinces such expressions as these: 'I have never before loved our Kaiser as now. His speech is grand, and has stirred all Germany. We are as one man; even the Socialists are awakened to a true spirit of enthusiastic patriotism. Our victory is sure; our cause is just. Were these truly the Kaiser's sentiments? That question we must leave with God. I, however, must admit that personally I believe during the Kaiser's absence in Norway things progressed more quickly than he anticipated, and that during this time the warparty got the upper hand to such an extent that the Kaiser, on his return, could no longer keep that peace for which he always maintained he worked with all his soul.

On the proclamation of martial law all foreign newspapers and postal communications were stopped. Thus the country has been kept in absolute ignorance of outside events. Of this I will cite an example. On Monday morning, August 3, 'official' telegrams were posted and circulated in the towns that (1) the Japs had destroyed the whole of the Russian fleet in Eastern waters; (2) the Germans had gained a great victory over the Russians on the Russian frontiers, and had killed or captured over eighty thousand men, and taken many guns, horses, &c. Mark, this was official news. The people were wild in their enthusiasm; towns were decorated, church bells were rung, and people paraded the streets singing patriotic songs. So absolutely are the people kept in ignorance of the real state The only explanation that I can suggest for this wilful perversion of facts is the wish to send the troops off in high spirits, and in this the authorities were very successful; for when waiting for my train in different stations I saw

train after train—composed chiefly of from sixty to seventy large cattle-trucks—of poor men singing lustily, packed like sardines in a box, all going to the front—by the way, many towards Belgium. So warm was it for them in their close confinement that many were stripped to the waist in their vain endeavour to keep cool. People in this country can hardly realise what the great military control of Germany means, and how marvellously the whole male population obeys its summons. The organisation is really wonderful, and far beyond all praise.

Much has been said in our newspapers about the treatment of all foreigners, and from my own experience I may confidently say nothing has been exaggerated. One poor little harmless French art-student I knew was taken from his bedroom on Saturday, August 1, at 5.30 A.M., and told that he was wanted to report himself at the police station, and nothing has been seen or heard of him since. I called several times at the Criminal Bureau to make inquiries about my friend; but all I could get was a shrug of the shoulders, and finally the information, 'He has not been put over the frontier.' Every foreigner is suspected of spying; even I, after my peaceful residence of fourteen years in one town, was not exempt. I saw four French tourists on Monday morning, August 3, on their way to the station. One carried a small portmanteau under his overcoat. The soldiers, with fixed bayonets, who lined the streets called on them to stop. Instead, they very unwisely began to run. A second after four shots rang out; people began to sing patriotic songs; and later I heard that three of the young men had been killed, and one had escaped. An American whom I met on the steamer told me that the day before, as he was looking at the spires of Cologne Cathedral, he had been arrested by two sentries, who, with bayonets against his chest, shouted to him, 'Hands up!' Fortunately for him he could produce his passport. I could give dozens of instances of such, and even worse, brutalities.

I think perhaps this will be a fitting place to compare German treatment of aliens with the way in which they are being treated in Britain. Here they have, in the last days, been under a certain amount of control, but I fear me this is far too mild treatment. It has often been said to me, when speaking of war possibilities, 'We have already a large army of over fifty thousand trained Germans resident in England; they only need a gun to make them a force to be reckoned with. They would of course unite with a landing army.' I fear our authorities have hardly recognised this danger to the full.

Before closing, a word about our consular service. Much has been said in the reports from refugees about the kindness and efficacious assistance they received at the hands of the American consuls in Germany; but until now I have not heard a word about our own consuls' work. Why? For the simple reason that the majority of our consuls in Germany are Germans, with German sympathies and German hatred and jealousy of Britain. Truly, blood is thicker than water; so what could we expect? While acknowledging the American kindness with gratitude, it should not have been necessary. We British aliens should have been able to turn with confidence to one of our own countrymen for protection and assistance.

'OLD MUSTARD-POT.'

By R. W. BURGESS.

MERRY CHRISTMAS indeed! Bah! All the thieves and vagabonds that ought to be in jail or the workhouse showing off their filthy rags in the public streets! By gad! the country's going to the dogs. If I had my way I'd— Eh, what's that! Spare a copper for a night's lodging! Nowhere to sleep to-night! What the deuce has that to do with me, I should like to know? Christmas? Of course it's Christmas, the time when ragged scoundrels like you think you may accost any decent citizen with a pack of whining lies. No offence? I tell you you are offensive, beastly offensive, standing shivering there with half a coat, and no shirt to your back, and your feet sticking out of your boots. No, it's no use walking away; and if you don't stop scowling and muttering I shall call a policeman.

Eh, what? Hitting a man when he's down, am I? I'll teach you to impose on respectable

members of society with your grizzling nonsense. Here's half-a-crown; go and drink yourself into the police court. I warrant the magistrate will see about Christmas lodging for you. None of that, now. Snivelling hypocrisy! Clear out before that policeman gets here, or I shall give you in charge. No, it's not a good night, and I'm not your governor; and what has a Merry Christmas to—

Thank Heaven, he's gone! I should have lost my temper in a minute. Rogues and vagabonds! What are the police about, to let them roam the streets molesting— Eh, what d'ye say, constable? Begging? Now, do I look the sort of man that a beggar would tackle? D'ye think I want a policeman for a nursemaid, after twenty years of border wars in India? 'Old Mustard-Pot' my men called me; and if any lazy sweep of a beggar— Eh, what? Can't stop to talk? Got to regulate the traffic,

have you? Then I wish you'd attend to your duty, instead of poking your long nose into my private concerns.

Here have I been trying to get over to that shop for the last ten minutes; but what with these hooting, stinking man-killers and roaring juggernauts of motor-buses, 'pon my word I don't know what London's coming to. Eh, think I'm a doddering old cripple that wants the traffic stopped, do you? Oh, I see, the old lady wants to get over! Steady, ma'am; give me that parcel. No need to scurry like a frightened hen. Well! I'm—— No manners in these days of Suffragettes. I wasn't going to bite her head off.

This the shop, is it? What's all this stuff doing in a toy-shop? The world's gone crazy! Christmas presents indeed! Think I'm going to buy a safety-razor with seven blades to put in Harry's stocking, I suppose, and a gimcrack coal-scuttle with silver tongs for the girl, instead of a doll's cradle. Perhaps a gold fountain pen with a diamond nib will do for the baby to play with instead of a rattle, eh? Oh, toys upstairs in the 'Bazaar,' are they? How was I to know?

Whew! Thank goodness, that's over! When I was young a toy-shop was a toy-shop, not a 'Bazaar'—an infernal pandemonium on the third floor of a Tower of Babel. Lost my way looking for it, and had to run the gauntlet through an indecent exhibition of women's frills and flummery, with a regiment of shameless hussies grinning at me all the time! 'Bazaar' indeed! A sweltering crowd of redfaced women pushing and shoving and trampling on one's corns, and glaring like insulted Queens of Sheba if one objects to having one's ribs broken by their bony elbows. Crowds of yelling brats all over the place watching blithering idiots working a lot of silly skipjacks and flipperjams, and all the wretched girls driven off their legs trying to serve ten people at once, and keep their temper.

What the children are coming to nowadays Idon't know. When I was in the nursery I got a tin trumpet and a drum and a sword for Christmas—and quite enough, too; and Nancy had a decent, respectable doll, properly dressed, that shut its eyes. Look at the dolls now! Stark models of leering, goggle-eyed lunatics with homicidal mania, that have torn up all their clothes! 'Character' dolls, indeed! Dbad characters! And the prices! It's robbery with violence. Two guineas they charged me for a model engine and rails for the boy, and ten shillings for the depraved monstrosity of a doll that it seems to be the fashion to frighten children with now. Even the fur cat with rolling eyes, that looks as if it had just swallowed the canary, cost five shillings.

Now I suppose I must go and buy something expensive, that they don't want, for Nephew

Henry and his wife. Wonder what she's like? A howling Suffragette, that dresses in green and violet, and walks in procession, assaulting policemen and smashing windows, most likely. That seems the fashionable pastime of young women to-day. Wonder why I was fool enough to promise to spend Christmas with them! Just because my sister must needs get married to an impecunious rat of a curate thirty years ago, and leave a boy unprovided for, whose wife and children I have never seen, why should I spend two miserable days in a poky little villa in a back-street in Brighton?

Children in the house, too; noisy, sticky little brats, I expect. And a baby! What have I to do with babies? Howling, slobbering little nuisances! Young jackanapes! what business had he to get married, I should like to know, earning about enough to keep himself in matches, shovelling money out of a drawer behind a bank

counter? Disgraceful!

Here you are, cabby! What are you fumbling after? Change? I don't want your filthy shilling smeared all over with engine-oil. Take your stinking rattle-trap away before I'm poisoned by the petrol-smoke.—Here, Parsons, take these parcels, and see that a cab is here to-morrow morning in time to catch the eleven o'clock train at Victoria.

What's that? Am I going to see Master Henry? Mind your own business. I suppose you think because I took you on as my servant, instead of having you court-martialled for your devilment twenty years ago, you can pry into my private affairs, and I must satisfy your impertinent curiosity. Eh? Remember him a jolly little chap in knickerbockers? Of course you do. Think my nephew should have been dressed in a ballet-skirt and a string of shells? Yes, yes, I'll give him your message. Not another word.

Eh, who's this? Yes, sir, I am Colonel Peppercorn. My nephew Henry, are you? Surprised you remember me after twenty years. Oh indeed! Knew me at once, did you, when I abused the porter and gave him a shilling! I'd have you know, sir, that I abuse no man; and let me tell you, sir, your meaners have not

improved since I saw you last, an impudent little ten-year-old pirate in knickerbockers, although your father was a parson. What are those porters grinning at —Drive on, cabby.

Now, sir, I want to know why you threw up the army when your mother died? No money? What's that got to do with it? Why wasn't I consulted, as head of the family? But no, you young men nowadays have no respect for your elders, and go your own blundering, headstrong way, and think of nothing but money, money all the time. Caught by some baby-faced minx, all fluffy hair and frills. All right, all right! No need to glare and screw up your fists like

This where you live, is it? Desirable semidetached villa, with six feet of garden in front and lawn twenty feet square behind, a threefoot wide path to the back-door, and thirty-seven other houses just like it in a row. Pretty place

for a nephew of mine to be living in! What's all that racket overhead? Children playing in the nursery, is it? Take these parcels up to them. Perhaps there'll be a little peace and quietness then, until the toys are smashed; and send your wife down to me .-How d'ye do? How d'ye do? So you are the girl that spoilt a good soldier, are you? Headstrong young idiots! Love in a cottage -fantastic sentimental foolery of that sort, I suppose. What right had he to get married without my permission, on nothing a year, and ruin all his prospects? If he had not been a headstrong, quixotic, brainless young fool— Eh, what? Of course he's your husband, but I'd have you know he's also my nephew -my only relation-and you will listen to just whatever I have to say about him. Proud of him, are you? Worked hard, has he? Of course he has, madam. Think a nephew of mine would turn out a hulking, lazy vagabond, sponging on his friends? Marry a dainty little brown-eyed girl, and let her work her fingers to the bone while he hangs around stage doors and billiard saloons, eh?

What's this! What the—— There, there, my dear, that's enough. First time I have been kissed for forty years. Shows pluck, anyhow. Let's have a look at those children of yours now they are quiet. Tell Henry to bring them down.

Hallo! what's this? Soldier boy, eh? Salute with the other hand. That's right. 'Shun! Shoulder arms! Right turn! Quick march! Good man!—Henry, that boy is to be entered for Sandhurst the minute he is old enough. No, sir, there are no 'ifs' about it. What's money got to do with it? Think I'm a pauper, do you? Think I'm going to leave my money to a cats' orphanage? Just because you happen to be my nephew you think you can dictate to me how I am to dispose of my own property,

I suppose. Independent young jackanapes! Where's the girl? Hiding behind her mother's skirts, is she? Afraid to face the guns, eh? Not a bit of it, by Jove! Charged right up to the battery! Want to be kissed, do you? Just like her mother. All right, climb on to my knee if you want to. What's she tugging at my sleeve for! Oh, put my arm round you like that, eh? Designing little minx! That right? Any more orders! Eh, what? Story of the three bears! What theknow any stories. Eh! make haste and begin? Well, well! must do something to stop her fidgeting, I suppose. Let's see. A little boy soldier bear and a little girl bear with blue eyes and brown hair lived in a bear-garden, and a big grizzly bear came in, and the girl bear jumped on him and hugged him—and—and— That's all wrong, is it? Humph! Some silly nonsense her mother has been teaching her in the nursery, I suppose. Children nowadays-What's she squirming after now? Want to get down and fetch your dollies? Off you go, then. Dinner early to-day for the children, is it? Where's the baby? Isn't he coming down to dinner? What's Mary laughing at now? Oh, I see! Nothing to laugh at. What should I know about the feeding of infants?

Usual stodgy mass of food for dinner. I suppose—dry turkey, greasy sausages, bilious pudding, and mince-pie with a nightmare in every bite. No cooks in England nowadays. Why, what's this? Curry! Mary thought I might like it? Some sense in the girl, after all. Well made, too; the rice-grains dry and tender, not glued up into a sticky mass. Wish your cook would give mine a lesson. Made it yourself, did you? Where did you learn to do it? What! born in India? Who was your father? Eh, not Dick Carruthers of the 'Bengal Tigers'? Why, then you are the daughter of Mary Somers! Well, well! I remember—— Sentimental young fool I must have been in those days. Moonlight, snow, and the scent of the Simla pines. Exchanged into the 'Fighting Fifth' when she married your father. Chasing Afridis on the border soon knocked the sentiment out of me and hammered me tough. Died when her baby was born, I recollect, and poor old Dick was invalided home when he lost his

Only sensible thing you ever did, my boy, when you married her daughter! By gad, sir! if you had left Mary in the clutches of that old harridan, governessing her brood of unlicked cubs, I'd—I'd have horsewhipped you. I'd—damn it, sir, I'd have married her myself! What's there to laugh at! I mean it, sir.—Eh, my dear! No, the big grizzly bear did not eat the little brown bear. You finish your dinner, and don't ask questions.—Wish I had the appetite these kiddies have! More turkey, Harry! Where's the pudding going then?

Oh! think you'll get down and jump before it comes in, do you? Young barbarian! You will do exactly as your mother tells you, my lad. Never make a good soldier unless you obey orders. Eh? Yes, you shall be a real soldier one day, go to India, and ride on elephants and shoot tigers if you want to. No more questions. Here comes the pudding, blue flames and crackling holly-leaves.

Wine? Not for me, Henry. Sweet sticky stuff that settles in your joints, and—— Eh, well, just a small glass, Mary—and hang the gout—to drink to the memory of your mother. Might have been mistress of Peppercorn Hall if she hadn't preferred a brainless, penniless subaltern. Yes, yes. I remember he was your father—good soldier, too. Well, here's to your mother and father, my dear, and yours too, Henry, though I never could get on with that parson fellow.

Well, well! bygones are bygones. We'll have the Hall opened again; been shut up these ten years, going to rack and ruin, and the rascally agent swindling me out of half the rents of the farms. Old lace and brocade of your grandmother's to set off Mary's pretty face and figure. Eh, what? And the kiddies. No, sir, I will consider nothing. Who are you, to be raising objections? I say it can be settled at once. It's settled now. You will take your proper place in the county as my heir. Think I want

the family disgraced by a well-set-up young fellow like you, who ought to be riding to hounds and shooting his own pheasants, counting up the greasy coppers from the fried-fish shop and tallow-chandler's in a country bank? Want Mary to grow old and haggard before her time, grubbing along, cooking your dinner and doing housemaid's work, I suppose. No consideration for any one but yourself!

Eh? Generosity be hanged, sir! Nothing to do with it. Think I want all the bother and work of managing a large estate at my time of life, while you shirk all your responsibilities until after I am dead? No, sir. Rather see it let to that jumped-up son of an American pigsticker, perhaps, than trouble yourself with the management of your own future property? There, there, that's enough. No more to be said. You will bring Mary up to town next week, and turn her loose in the dress-shops, while we fix up details with that leather-faced old solicitor.

That suit you, Mary? Eh, what? Tears? Well, well! Queer creatures, women. member when her mother gave me my marching orders. Steady, my dear; steady! That firebrand of a husband of yours will be getting jealous in a minute. Never knew such a girl. That's right, smiling again. No wonder they twist the men round their little fingers. Run along now, and bring the baby down.

SCIENCE AND THE MONTH: ARTS.

THE GUNTHORPE 'HELPLESS' SHIRT.

AS modern artillery is capable of inflicting very severe wounds, any improvement which enables the movement of the sufferer, when lying in bed, to be reduced to the absolute minimum possesses an immense humanitarian value. Such an improvement is the Gunthorpe 'helpless' shirt, which is designed upon commonsense and yet scientific lines. The shirt is modelled in one piece; but, instead of the sides, sleeves, &c. being sewn together, they are secured by tapes. The garment is laid out quite flat, the neck coming in the centre, and the patient is laid upon one half, with his neck in the curve. The other half is then brought over to form the front of the garment, and is held in position around the arms and to the sides of the body by tapes which may be quickly tied. During the whole operation there is no need for the wounded man to move a limb or a muscle. This is the simplest form of utilising this shirt, but it can be applied to any requirement. For instance, there are certain abdominal operations where it is advisable to eliminate the lower half of the back of the shirt; otherwise frequent changing of the garment is necessary. In this

instance, instead of the patient being laid upon the shirt it is laid upon the patient, and the back, which extends beyond the head, may be either folded under the pillow or slipped gently under the shoulders. The extreme end, which is left, can if desired be utilised as a hood, a slot and draw-string being provided for this. The garment is made on liberal lines, so that it may suit either a big or a small man. About three yards of flannel, thirty-six inches wide, are required. The efficiency and advantages of this design of garment have created a favourable impression on surgeons, since it reduces the labour of the nurses and spares the sufferer all exertion and exhaustion.

GERMANY'S HUGE HOWITZERS.

Considerable interest has been aroused by the mammoth engines of destruction which are being employed by the German armies. Terrible tales have been told of the eleven and seventeen inch Krupp weapons; but it may be said, without depreciating the powers of the enemy, that these stories are considerably exaggerated. The existence of these weapons has been known to military experts since the day the first of them appeared on the testing-range of its creators. A

friend of the writer, who has been responsible for many important developments in artillery weapons, and who saw these guns under test upon the Krupp ranges, maintains that neither of these terrible howitzers has yet been used, but that the ten and a half centimètre—four and a quarter inch—howitzers, with which the German army is well equipped, have been mis-The former were employed taken for them. against the Liége, Namur, and Antwerp fortifications with deadly effect. No occasion has yet arisen for the use of the larger weapons, although the eleven-inch gun was being dragged southward, and was to be used for the reduction of the fortifications of Paris. Fortunately, however, the transport proved too difficult, and the guns became stranded in the country along the When the Germans retreated they river Aisne. retired until they reached the lines where these guns had been stalled, and where they had been placed upon emplacements when it was recognised that a German retreat was inevitable. These are the 'Jack Johnsons,' as they are facetiously dubbed by the British soldiers. The heavy siege-gun of such a calibre is too expensive an equipment to be used except in extreme cases. The forty-two centimètre howitzer, which the same informant also saw under trial at the testing-ranges, has a life of only about thirty rounds. The shell weighs nearly a ton, while the firing of a round represents an expenditure of twelve hundred pounds. The weight of the weapon precludes its movement by ordinary systems of haulage, and it can be moved only over a railway. The shell, when fired at a vertical angle of sixty-five degrees, has a range of between eight and ten miles, attains an altitude of about three miles, and travels at a speed of one thousand feet per second upon leaving the muzzle. Its flight may be followed with ease even by the naked eye, while with glasses the action of turning turtle, which occurs when the missile has reached the highest point of its trajectory, is plainly visible. Expert artillerists, who are fully cognisant of the Krupp trend in gun evolution, evince slight regard for this weapon, and emphatically state that 'its bark is worse than its The forty-two centimetre weapon is claimed as the modern wonder of the artillery world; but as a matter of fact the British force is just as powerfully equipped; and when the time arrives for bombarding the fortresses guarding the German frontier, it will be the Germans, as well as other nations, who will be surprised in turn. The field artillery of the British army, taken on the whole, is the most powerful in the world, and it will be found that our siege weapons will fully maintain our claim to pre-eminence in this particular field of human endeavour.

METAL JOINTING.

A new system of metal jointing was brought before the Institute of Marine Engineers recently.

The outstanding feature of the process is that a complete fusion is thereby effected between the metallic surfaces to be joined. So far as its marine applications are concerned, the principal uses are the flanging of pipes, seaming of lead used in refrigerating chambers, and sanitary work generally. The process has been tested severely, and has proved completely satisfactory. In fact, it has been adopted on the Clyde, Tyne, Tees, and Wear. The process is not restricted to small pipes, but is utilised in the ordinary way on pipes up to nine inches in diameter. It is an autogenous process, with the difference that, instead of the fusion being brought about by an intense local heat, it is effected by the action of the amalgaline, as it is called, on the surfaces treated therewith forming an amalgamation between the lead of the flange and of the pipe. The material is used in the form of a metallic ribbon, the five hundredth part of an inch in thickness, virtually made from pure metal. When this is placed between the surfaces of the lead pipe and the flange, and subjected to heat, it fuses. The point of actual fusing is about one hundred and sixty degrees, which is lower than the actual fusing-point of lead; and in fusing, the lead surfaces run together at a lower melting-point than that of the body of the lead. This running together has an autogenous effect, and by intermolecular absorption the minute particles of amalgaline are dissipated into the body of the lead, which by reason of the absorption becomes stronger at the junction than elsewhere.

THE BEET SUGAR INDUSTRY.

The European war has brought home with astonishing vividness the dependence of Great Britain on the Continent for supplies of beet sugar. For many years past strenuous efforts have been made to establish this industry in these islands, but with no tangible results. Now that the Continental sources of supply—Germany and Austria—are cut off the price has risen, and a keen demand for the cane product has The demand, however, is greatly in excess of the supply. The absence of an adequate supply of beet sugar affects certain industries very acutely, especially the jam, cheap confectionery, and inexpensive table delicacy trades, since cheap sugar is essential if these trades are to hold their own. Additional efforts are now being made to establish the beet sugar industry upon a comprehensive basis, and certainly the outlook is attractive. Assuming the sugar content of beet to vary from 17 to 20 per cent., it is estimated that about half-a-million acres of land would be necessary to yield a round million tons of beet sugar per annum. obtain this result would necessitate the raising of about six million tons of beet. no valid reason why this country should not produce every ounce of beet sugar which it

requires; in fact, if the scheme was taken up with sufficient energy and upon the correct lines, Great Britain might become an exporter of this commodity. The raising of beet would not only stimulate agricultural interests, but would influence other callings very materially, such as engineering, which would be called upon to design and manufacture the requisite plant. Further, a new field for employment would be opened. The interests engaged in this campaign reveal another aspect of the industry which is not generally appreciated. Among the many things for which we have relied upon Germany is potash, and the scarcity of this is being felt very acutely at the moment. Sugar beet contains about one-half per cent. of potash, and if 80 per cent. of this were recovered, as is the case in Germany, these islands would be able to supply about twenty-five thousand tons of potash in addition to the six million tons of sugar per annum. Another factor which would arise would be the supply of industrial alcohol, the need of which is also being experienced somewhat keenly at the present moment. If the authorities would lend a sympathetic ear to the calls of commerce, and remove many of the serious restrictions which at present exist, especially in connection with alcohol for industrial purposes, beet sugar production would doubtless be taken up vigorously, the present opportunity to make up leeway being exceptionally favourable to the project.

AN IMPROVED FILE.

A file which has been devised by two British inventors, and is now manufactured by a Midland firm, represents an ingenious attempt to accomplish two operations simultaneously, since it is a combination of the ordinary file and the milling file. The former, as is well known, has an abrasive action on the metal to which it is applied, reduces it in the form of dust, and produces a comparatively smooth surface. But the ordinary file clogs readily, and removes only a small quantity of metal; while the milling file removes the metal in the form of curled shavings, recalling the application of the lathe, by removing a considerable quantity of metal, and, though not clogging readily, leaves the metal with a rough surface. With the combined file both these requirements are met in one operation, and without any of the disadvantages of either tool, while it has a longer life and is easier to manipulate. The tool comprises an ordinary single or double cut file, but on its faces it is grooved in such a manner as to present a series of small triangles. Thus three sets of grooves are formed, one at right angles to the length of the file and two inclined and intersecting, one of these grooves being parallel with the cuts of the file. While these grooves reduce the area of the file coming into contact with the work by 25 per cent., there is this great advantage that during the forward or cutting stroke the filings become lodged in the larger grooves, which are cleared on the return stroke. The grooves may be described as enlarged file-cuts, so that they not only act as a cleaner, but participate in the cutting action, the coarse surface which they leave being smoothed down by the ordinary file-cuts. From experience this tool is found to stand well up to its duty, and works rapidly.

THE COMMERCIAL VALUE OF KIESELGUHR.

Hitherto the value of infusorial earth has been mainly in connection with the manufacture of dynamite and as a medium for filtering water. The former application of this diatomaceous absorbent was discovered by Mr Alfred Nobel, the founder of the modern explosives industry, and of the Nobel Peace Prize Fund. It was brought to his notice at the time he was searching sedulously for a means of rendering nitro-glycerine safe, the subsequent experiments with which resulted in the evolution of the above-mentioned explosive agent. At a later date it was found that when this earth was compressed it became an ideal water-filtering agent, because pressure did not destroy its porous properties, which are so minute as to prevent the passage of the deleterious substances suspended in water. It is a somewhat curious anomaly that while kieselguhr is used in one direction to bring about the destruction of life in the form of a propellant and for shells, in another it is employed for the preservation of existence by protecting us from the insidious attacks of microbic disease conveyed through water. Upon the battlefield both applications are brought into quaint juxtaposition. During recent years, however, this earth has entered into a variety of other industrial operations, thereby enhancing its economic value. It is a first-class non-conductor of heat, and accordingly it is employed as an insulating packing material, being preferred in many instances to asbestos. In the United States it is combined with shell-lac, and the resultant product is found to be an excellent substitute for vulcanite in the making of talking-machine records. In Europe it enters largely into the manufacture of fertilisers, those in a liquid form especially, into the manufacture of water-glass and artificial stone, and into pigments. Among its other spheres of utility may be mentioned the aniline dye industry, paper, sealing-wax, fireworks, Swedish matches, polishing-powders, soaps, papier-mâché, &c. The result is that the demand for this earth is increasing rapidly. Hitherto the greater proportion of the raw material has come from Scandinavia and Germany; but as deposits have been discovered in the United States, particularly in Nevada and California, it is being mined energetically in these two states, the annual output of which is now about five thousand five

hundred tons, representing a market value of nearly eleven thousand pounds.

A RAILWAY KEY.

As is well known, the rails on the British permanent way are partially held in position by the wooden blocks which are wedged between the rail and the chair bolted to the sleeper. These blocks must be kept well driven home; otherwise the line is liable to spring or fly out While the wooden key is so effective. it is subject to the effects of climatic variations; therefore constant vigilance is necessary to keep the line strictly to gauge to prevent derail-Many efforts have been made to prevent these keys working loose, as must ensue under heavy and rapid traffic; but little success has been achieved. The ganger's hammer and persistent patrolling are the most effective means. Recently, however, an engineer has contrived an improvement which is arousing considerable interest among permanent way engineers, who alone probably realise the difficulties of the problem. In this latest invention, while the ordinary wooden key is used, a steel stamping, shaped somewhat like the prongs of a carvingfork, is attached to the key at the side where it bears against the surface of the chair. These two prongs are quite flat and parallel with one another, while they reach from one end of the block to within an inch or so of the opposite end. At one end the prongs merge into a web piece of metal which is attached to the end of Further, rigidity between the key and the steel stamping is obtained by a screw passing through the web piece upon the flat side of the block. The ordinary chair cannot be used with this type of block and key. The chair must have two grooves to receive the prongs of the key. These may be varied in form, the one having a figure in the face of the chair somewhat like a dumb-bell, while in another pattern it is a simple curved grooved path. The block is inserted between the rail and the chair in the usual way, and then is driven home by the ganger's hammer. In so doing the prongs of the keys are forced to follow the path of the grooves on the face of the chair, and in this way are compelled to grip it firmly. In fact, this grip is so tight that the block cannot possibly work loose under the strains and stresses set up by passing traffic, or even those of climatic One might think that driving home the block by means of a hammer, and thereby causing the prongs of the steel key to assume somewhat difficult paths as represented by the grooves in the chair, would cause the prongs to break, but such is not the case. Two leading British railways are subjecting the improvement to rigorous trials, sections of lines at some of the busiest points being so keyed. Six months' experience has served to establish the value of the invention; and, seeing that the improvement does not materially increase the cost of the block, while the grooving of the chair is a simple matter in casting the latter, being previded for in the mould, greater security may be obtained at an insignificant expense. As the average cost of ganging the railways of this country approximates three pounds per mile of track per annum, and the invention offers a means of reducing this expenditure, it is obvious that the utilisation of this locking key is certain to effect a decisive economy in the maintenance of the permanent way.

'ANNIHILITE' EXPLOSIVE SHELLS.

The old saving that 'necessity is the mother of invention' has once more been proved to be true; the urgent need of the British, French, Russian, and allied nations, in their struggle with powerful and unscrupulous foes, has called to their assistance the brightest intellects of their people, in addition to the valour of their fighting-Hitherto unheard-of forces of applied chemical science are making their power felt in a new and terrible manner. The invention of the great French chemist, M. Turpin, has attracted considerable notice, and his 'turpinite' is spoken of with bated breath in the streets of Paris. Utilising, as he has done, a discovery, made some years ago, of the fearful effect of a certain compound of arsenic, his 'turpinite' shells, on exploding, emit a gas which, if the smallest quantity is breathed, produces instant death, causing a stoppage of the heart's functions; no living being in the vicinity of the explosion can escape. use of shells emitting poisonous gases is, however, forbidden by the terms of the Hague Convention, although the German army is ignoring the agreement, since a London illustrated daily paper, at the start of the war, published a picture of the 'poison bomb' used by the Germans. Terrible, however, as the effects of 'turpinite' are, they are eclipsed by the action of the new 'annihilite' shells, which have been, as the Paris paper Le Figaro is aware, placed at the disposal of the French Government by a distinguished English chemist, whose name we are not at liberty to mention at present, and which will be in due course adopted by the British War Office. This new explosive well deserves its name 'annihilite,' as the effects produced by the bursting of these shells are rightly described as anni-In the open field of battle, against dense masses of troops, in a fortress, or on a warship, the explosion of one of these 'annihilite' shells forms a fierce blast of flame some two thousand yards long and from one hundred to two hundred yards in width, which, passing over men, animals, or material, leaves nothing but a scorched and charred mass behind; trenches, fortifications, and other means of defence are of no avail. The atmosphere within the radius of its explosion is all burnt up, owing to its chemical action on the oxygen of the air, which is changed into a consuming fire. It is perhaps too much to hope that the invention of 'annihilite' will mean the stoppage of all wars in the future; but it will undoubtedly help in that direction, and form a bulwark of civilisation against those who would break the peace of the world. But as regards the present war, this fearful and powerful weapon in the hands of the British and French forces will certainly assist them to bring it to a speedy conclusion, as no human being can stand against the terrible effects of 'annihilite.'

RADIUMISING THE SOIL.

The paragraph under this heading in our October issue has elicited hundreds of inquiries for the low-priced radium-bearing substance lignaite, the recent discovery for stimulating the output of fruits, vegetables, and cereals. All inquirers for this substance are asked to write direct to Professor Scammell, M.S.C.I., Mason House, Castle Lane, Hadleigh, Essex. Correspondents must send a stamped and addressed envelope with the inquiry, as in many cases signatures are not distinct.

A HAND-DRYING MACHINE.

An interesting and novel innovation has been introduced into the American Government offices at Washington. Owing to the size of the clerical staff the laundry bill assumed huge dimensions. Linen towels were superseded, from motives of hygiene, by paper towels in the lavatories of the staff; but the consumption of these articles reached enormous proportions, the expense in

time exceeding that of providing and laundrying the textile article. Thereupon the official engineers to the department devised an electrical hand-drying apparatus. This is a cabinet of convenient height provided with a space into which the hands are thrust. After rinsing, the switch of the machine is turned on, and the hands are placed within the cabinet, when a powerful current of warm air plays upon them, and in a few seconds they are quite dry. The hand-drying machine is not only more speedy and cheaper than the linen and paper towels, but the skin undergoes no irritation such as may arise from rubbing.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

A SHEAF OF MEMORIES.

I HAD a golden sheaf of memories, Harvested in the year of love's delight; I clasped it close on many a shadowed night, A fragrant pillow for my sleepless ease.

I buried it at last deep in soft mould,
When Time's rude plough furrowed the world
for me;
Now I may chant my Benedicite.

Now I may chant my Benedicite. Such golden grain immortal seed must hold.

The scent of summer dawns, strange ecstasies
Of youth's vague hopes gather about me yet.
Waking from sleep, sometimes my eyes are wet;
In dreams I hold my sheaf of memories!
C. FARMAR.

Volume IV. of the Seventh Series of Chambers's Journal is now completed, price Nine Shillings.

A Title-page and Index, price One Penny, have been prepared, and may be ordered through any bookseller.

A cloth case for binding the whole of the numbers for 1914 is also ready.

Back numbers to complete sets may be had at all times.

Annual subscription, including postage to any address, either at home or abroad, 9s. 6d.

The January Part of CHAMBERS'S JOURNAL (published about 22nd December) will contain the opening chapters of a brilliant historical romance

ENTITLED

THE BRIGHT EYES OF DANGER, By JOHN FOSTER.

Author of 'The Luck o' the Spey,' 'The Ship of Shadows,' 'The Forgotten Rock,' &c.

This story deals with the period of the Forty-five, and will appeal to all lovers of sound romance. The scene is laid in Edinburgh, and afterwards on Speyside and the Moray Firth seaboard districts that the author knows and describes so well. Its pages are full of incident and adventure, with glimpses of social life, lit up by imaginative power, the glamour of those troubled days being conveyed with the author's individuality and distinction of style.

Also a Novelette, THE DRIVING POWER, by Marian Bower, and other Stories, with the usual popular and instructive articles.

END OF THE FOURTH VOLUME.

CHRISTMAS 1914.

JONAH'S GHOST.

A TALE OF THE SOLOMON ISLANDS.

BY THE REV. ALFRED PENNY.

THE great island of Ysabel—one of the largest in the Solomon Group-lay basking in tropical sunshine; but the noontide glare had passed westward, and shadows were beginning to lengthen. A ship was approaching the shore, and from her foreyard could be seen great tracts of forest rising up from the line of the coast, and spreading over a mountain range which, so far as sight could reach, traversed the island as the backbone divides a herring. Spurs and gullies dropped laterally toward the sea from this ridge, the one becoming a promontory, the other a creek or bay; and some of these inlets had beaches of white sand fringed with coconutpalms, and streams of water flowing out to sea. They appeared to be ideal sites for native villages, and yet they showed no sign of human habitation.

As the ship held on her course, and the distance to the land grew less, dwellings came into sight. Some were clustered on the points of the promontories, and a deep dike had been cut through the capes for the tide to flow between the huts and the land; others could be seen far away among the mountains, clinging to crags or perched on the brink of a precipice; others, again—but these were along the shore—were built in the tops of the highest trees.

Precautions such as these against an enemy's attack were common in the Solomon Islands forty years ago, when every native chief aspiring to distinction was a head-hunter, and lived in constant dread of being hunted.

At the time of the happenings of this story the most famous of these bullying and bullied potentates was the chief of Ysabel—Bera by name. He owned a vast collection of skulls acquired by hunting, and a large number of an even more coveted trophy which he called by a name meaning in English 'live-heads.' were prisoners he had taken in raiding expeditions, and allowed to live till they were required for some special purpose, such as the inaugurating ceremony of a new house, or for his funeral obsequies, or to buy off the attack of a rival head-hunter. For it was a common custom for a raider, if he were strong, to send word to the chief that he was going to attack, saying that the contemplated enterprise would be abandoned if a certain number of captives were given up; and the threatened chief, if he could comply with this condition, usually accepted the offer. The 'live-heads'—the price of peace—were then carried away to serve as ransom when it was their new master's turn to be raided, or for any other purpose for which he might require

their services; but if he just wanted to add to his collection of skulls he only carried away their heads.

At this epoch in Solomon Islands history no portion of the group was protected by the Union-Jack, and not even the first migrant of the flock of planters who have followed the flag had alighted upon these shores. Barring a few beach-combers, who preferred a lazy life among the natives, with the risk of being eaten by their hosts, to working for a living in some civilised country, there was not a white settler on these islands, and the only visitors whose ships approached their shores were men-of-war's men, missionaries, and traders.

CHAPTER I.

THE vessel that was nearing Ysabel belonged to the merchant class. She was a big top-sail schooner called the Dancing Wave; the commodity in which she dealt was 'labour,' the trade name for men and women shipped in the Solomon Islands and carried to the neighbouring colonies to work there; and her skipper was known to the islanders as Captain Jack.

It was soon evident that the Dancing Wave was expected at Ysabel. A canoe paddled out from the shore and posted itself at an opening in a reef that stretched across the mouth of a deep bay, and as the evening closed in and the short twilight began to fall a fire was lighted on the beach. Any skipper bringing his ship into harbour would have been grateful for beacons such as these; but to Captain Jack they had an inner meaning that was doubly welcome. They assured him that the coast was clear of his enemy—a foe he dreaded more than coral-reefs or shipwreck, cannibal chiefs or head-hunters—a British man-of-war.

The moon—a day or two past the full—had risen above the mountains as Captain Jack sculled himself on shore. Natives were fishing from the beach or squatting round fires before their huts, for on moonlit nights they did not trouble to climb to their fastnesses; darkness was essential to a surprise visit from headhunters. A white man was waiting at the landing-place. He was 'on the beach' at Ysabel, a copra trader, and paying a heavy license in trade goods for the chief's protection. He was called Nat, which was probably part of his name, and as he had picked up a smattering of the language of the people, he acted as interpreter to Captain Jack.

'Bera's aloft,' he informed his patron.

'What for?' the skipper growled. He disliked climbing to the cerie places in which the islanders took refuge from their enemies on dark nights; and, knowing their custom, he thought to find Bera in his house on the shore.

Nat did not answer; but he mumbled something as he helped to haul the boat out of reach of the rising tide, and then he led the way toward the bush which grew almost down to high-water mark. The men quickly came to a clearing, in the centre of which a huge tree was standing. The branches had been lopped off for fully a hundred feet from the ground, and the trunk was as big, as bare, and nearly as vertical as a factory chimney. At the top of the tree there were boughs and foliage in abundance, and among this canopy some large structure was visible from below. A ladder hung down from it and reached to the ground.

'Up you go,' said the skipper resignedly, and

Nat led the way.

The ladder, which hung clear of the tree, was made in sections, each about twenty feet long. They were formed of stout poles, across which rungs were lashed at their centres like the bars on a telegraph-post. The sections were joined together partly by ropes of twisted creepers, into which the extremities of the rungs were worked, and which extended the whole length of the ladder, and partly by lashings between the top rung of one section and the bottom rung of the next; but these tie-bands were loose enough to act as hinges, so that the whole structure could be folded section over section and hauled up from above. The ladder did not convey a sense of security to the unaccustomed climber; but Captain Jack's experience on a ship's rigging stood him in good stead. He arrived safely at the top, and after squeezing his way between the beams of a strong scaffolding, he found himself on a long platform fronting a good-size: house. The floor of this veranda was made of bamboos split and woven into a neat pattern, and a pile of stones for hurling down on besiegers was stacked at each end of it; there was also an abundant store of food-coconuts, yams, breadfruit, and a hollowed-out tree-trunk, big as a canoe, filled with water in readiness for a siege. The door of the house opened on to the veranda and a couple of stalwart natives squatted before it. A fire, laid upon a layer of sand, fenced round by a circle of stones, was burning within; and the flame showed the size of the house, big enough to hold a score of men without crowding, and its careful construction. The light also shone upon the bulky figure of an old man, nude but for a loincloth, and squatting upon s raised bedplace. He was chewing betel-nut, and as his jaws munched his eyes stared nervously about him, roving round the house; and sometimes he looked over his shoulder as if the thing he expected to see were behind his

'Tell him I've brought ten heads,' the skipper said to Nat, after waiting in vain for the chief to break silence. 'How many live uns will he give me?'

Nat passed on this question, and Bera answered [Christmas Number.

it himself by holding up one hand with the

fingers and thumb extended.

'I must have six live uns,' the skipper grumbled; but Bera, when he understood the amendment, remained for a time silent. Presently he beckoned to Nat, and the interpreter approached and listened to what he had to say.

'He'll give you five live uns and Yona,' Nat

translated.

'Who's Jonah?' the skipper asked. 'A man or a woman? I'll take any one good for labour.'

'You'll have to get him on board by cunning,'

Nat went on, ignoring the question.

'Ain't Jonah a live un?' Captain Jack asked. 'Them live uns are always jolly glad to go and

keep their heads on.

When Bera had been made to understand what the skipper wanted to know, he had much to say. He spoke rapidly and eagerly, and the interpreter appeared to have some difficulty in understanding his meaning. At length the whispering ceased, and Nat crossed the floor of the house and came to where the skipper was

'It's like this,' he began, while Bera eyed him intently, as though he doubted his honesty or his ability to explain what he had been told to say. 'Yona is what you'd call a medicine-man or a devil-doctor. He sacrifices to ghosts, and they give him power to do all sorts of things—bewitch people, and kill them. Yona's ghost '-

'Jonah's ghost!' cried the skipper, interrupting. 'You ain't such a fool as to hoist in that rot, are you, Nat? Jonah's ghost indeed! Why, I thought Jonah belonged to the mission station, and that was the reason why we had to nab him.

I shouldn't have minded doing that.'

'What's the mission station to do with it?'

Nat asked sulkily.

'I thought they called him Jonah after the chap who was chucked overboard. But you never mean to tell me you're fool enough to

believe that devil talk?'

'It ain't the Bible name Jonah, though it sounds like it,' Nat replied. 'I heard that yarn when I was a kid. The medicine-man is called Yona. E-yo-nah; and Nat mouthed the syllables.

'That be hanged!' said the skipper. 'Jonah's

his name if he comes aboard my ship.'

'There ain't much mission about him,' Nat went on grumbling. 'He's up to every move on the board in ghost tricks, say what you like.'

'You'll make me burst my sides with laughing, Nat,' the skipper said, wiping his eyes with the back of his hand. 'But tell us some more about Jonah.

'Hang me if I would for your fooling,' Nat answered; 'but that old bloke's eye is on me, and he'll want to know why I don't tell you what he said. This devil-doctor you call Jonah has come to the front all at once. Nobody knew he could vélé'-

1914.]

'What's that?' the skipper asked. 'None

of your native talk to me.'

Blest if I know what to call it in English,' Nat answered. 'Not one in fifty devil-doctors can do it proper.'

'Do what?

'Kill a man and leave no mark on him.'

'Rot!'

'It ain't rot; they do it.'

'How?'

'The devil-doctor, so the people say, makes the chap he's going to kill follow him to some quiet place, and when he's got him there he makes him lie down. The chap can't help doing what he's told; the devil-doctor draws him with his eyes like a snake draws the rabbit he's going to swallow. Then, when he's got him down, he bites his throat; but first he puts a pad of native cloth on the chap's neck, and no teethmarks are left on the skin.' And Nat pinched his own windpipe and gurgled in his throat.

'Tst!' the skipper hissed suddenly.

Bera had risen to his feet and was advancing toward the two men across the house. came slowly, staring with a new expression in his eyes, and he stretched out his arms as he approached, opening and closing his hands.

Captain Jack stood up and swore spasmodically; but his voice suddenly ceased, and, covering his face with his hands, he dropped back on

the bedplace.

'Look at him now,' Nat whispered, touching the skipper. And whether it was the voice or the hand, or some other cause, a drowsy feeling that had begun to steal over Captain Jack vanished, and he dropped his hands. Bera lay on his back on the floor, and the firelight showed his coarse face rigid and expressionless as that of a dead man, and his eyes staring aimlessly at the roof.

'He's in a fit,' cried the skipper.

'He's only showing you how the vélé is done,' said Nat; and at this moment Bera got up and went back to his bedplace.

'I'll make him sweat for this,' Captain Jack muttered, wiping his forehead. 'But has Jonah

been trying to vélé him?'

'No; but Bera is afraid he will. You see, Bera killed Yona's father when Yona was a boy, and as soon as Yona grew up he tried to put the evil eye on Bera. Then Bera sent men to bring him Yona's head; but they were found dead, and people say Yona véléd them. That's why Bera stops up here. He says Yona is trying to get at him all the time. His ghost power, he believes, is humming round him now.'

'There's business sticking out of this bunkum,' muttered the skipper. 'You tell Bera this, Nat. I'll have the five live uns he promised in exchange for the ten heads I've got on board; and while Nat translated, Captain Jack held up one hand as Bera had done. 'Then

I'll take Jonah,' the skipper went on, holding up a forefinger. 'And for taking Jonah away,' he continued, 'I'll be paid five more live une,'

and he held up both hands.

Bera paid no attention to his interpreter; the skipper's sign language explained itself. A look of relief spread over his fat face, and he grinned and nodded his head. He only uttered a word, the English of which Nat said was 'dead,' and he explained that it meant 'done'—that the bargain was struck, and that there was no more to be said.

'What a fool I was not to ask for more!' Captain Jack grumbled as he followed Nat down

the ladder.

CHAPTER II.

'WE'LL nab him,' the skipper remarked confidently as he walked to his boat.

'The niggers won't help you,' said Nat.
'Can't you help us?' the skipper asked.

'Give him a drink of grog, and hocus it?'
'He wouldn't touch it,' said Nat positively.

'He always says he doesn't know how to drink

'He hasn't been to Queensland yet!' said the skipper.

'I couldn't offer any one a drink now,' Nat said regretfully. 'I haven't a spot left.'

'Come on board and have a glass,' was the

hospitable rejoinder.

'I'll just run to my store and tell 'em where I'm going,' Nat said eagerly. 'We watch on clear nights, or the niggers would steal my copra and sell it me again. It's past midnight,' he

added, looking up at the moon.

'I'm no good at the blarney game,' the skipper said when Nat came back. 'Wrackman does that. He's my new mate, and he's up to all manner of dodges for getting labour on board. You'd laugh to see him got up as the bishopblack coat, full square hat, and all the rest of the rig; and, my word! he's like him. He's a bit of a swell himself, you know—not like us. The niggers run to him like ducks to a decoy. All we can we catch alive, and them we can't'--- and the skipper finished the sentence by drawing his finger across his throat.

'I didn't know that,' said Nat hurriedly.
'Then you know it now,' said the skipper defiantly. 'But, say, Nat,' he went on in a more conciliatory tone, 'don't let on about Jonah's ghost and Bera's play-acting. man's as scared of spooks as any old woman.

'I'm awake,' said Nat, and he helped the skipper to launch the boat and row to the

schooner.

'I suppose this man Jonah, even if he won't drink grog, chews betel-nut?' Wrackman said when the skipper had told his story. The three men were in the cabin, seated round the

'What native don't?' Nat answered, as he refilled his glass.

'Would Jonah take a betel-nut from you and

chew it?' Wrackman asked.

'He'd want it whole, just as it came off the tree, husk and all, and he'd peel it himself, and burn the husk lest some one should make Mind that, mister,' Nat a charm with it. answered.

'You think no one knows these natives but

yourself,' said Wrackman.

'Your game's plain enough,' said Nat crossly, for Wrackman's superior manner annoyed him. 'You want to hocus a kernel for him same as skipper wanted to hocus his grog; but you can't do it through the husk, for all your cocksureness.'

Wrackman made no reply, but he went to his bunk, and, having opened a locker, he took out of it a small tin box and emptied the contents into his hand. 'Here,' he said, showing two betel-nuts to Nat, 'would Jonah take one oi these, peel off the husk, and chew the kernel?'

Nat fingered the nuts carefully. 'They're all right,' he said at length. 'There's a bit of a scratch on this un, but no one would trouble

about that.'

'I should trouble very much,' Wrackman said. 'That's for me if I must eat one to show they are all right, and that-without the scratch

-is for the man I want to hocus.'

'Wrackman, you're a winner!' cried the skipper approvingly. He had been listening to the foregoing dialogue, not knowing what the mate had in his mind; but now a light broke in upon him. 'That's how you broke one of the needles of our morphia-syringe,' he cried. laughing loudly.

'It comes to this, Nat,' the mate said when order had been restored to the cabin: 'will you give Jonah that betel-nut? And if he wants you to chew the other yourself it won't

hurt you.'

'What'll it do for him?' Nat asked. 'I daren't poison him—not even to please Bera He's got a lot of friends.'

'Send him to sleep.'

'How do you know that?'

'I tried it on one of our labour hands.'

'It'll work, you bet,' said the skipper confidently. 'Will you do it, Nat?'

'What am I going to get?' Nat asked

huskily.

'What are you going to get?' the skipper repeated. 'My favour with Bera-to keep your blooming head on,' he added loudly.

'What price Jonah?' Nat asked. 'Five niggers at forty quid apiece at Maryborough. That's your whack. What's mine?'

For a moment Captain Jack was struck dumb with surprise at what he considered sheer

[Christmas Number.

effrontery. Hitherto Nat had not dared to speak to him other than as one dependent upon his favour.

'Don't you know,' he shouted, 'that at a word from me Bera would have your head?'

'Stow that,' said Nat. 'You'll give me fifty quid, or I don't give that betel-nut to Jonalı.'

'Fifty quid!'cried the skipper, beside himself with rage. 'Not much!'

Nat deliberately finished his glass, and then he filled it again from the bottle on the table. 'A man-of-war was here yesterday,' he said slowly. 'Bera tried to tell you this to-night, but I wasn't such a fool as to pass on what he said. The ship is after you, and she's gone to the other side of the island to look for you The captain told me he would anchor off the mission station for a day or two, and that if you came here I was to send word across the island to him. Give me my price, skipper, or the man-of-war shall know you're here. And I won't know for nothing how Wrackman dresses up as a sham bishop; how you kidnap all you can, and kill all you can't; and how you sell their heads '-

'I'll chuck you overboard if you don't belay

your jaw,' the skipper shouted.

'Will you?' said Nat, and he laughed contemptuously. 'I knew all about Jonah afore you did, and what was sticking out of the job for me. And afore I came on board to-night I wrote a letter-that's why I went to my store -and I gave it to a chap I can trust. If I don't land by sun-up he'll start across the island, and the man-of-war will get what I've writtenonly five words-"Dancing Wave anchored in Bera's bay"—and they'll nab you like a rat in a trap. You chuck me overboard, you murdering ruffian; not much!' and Nat snapped his fingers in the skipper's face.

Captain Jack stormed like a madman, but he could not change the situation or make Nat

lower his terms.

'It's no lie about the man-of-war,' Wrackman whispered. 'A native came off to the schooner while you were on shore, and told me that he had seen the ship.

'I'll settle with you when I get Jonah on board,' the skipper said, gulping down his rage.

'You'll be off then,' said Nat. 'We'll settle

'I'll give you an order on my owners,'

Captain Jack agreed.

'I'll have spot cash,' Nat replied. 'You've got the gold in the ship. You give a sovereign for a recruit to his chief if he wants a quid to hang round his neck.'

'Give it him,' said Wrackman; and the skipper, with much growling, unlocked the

ship's cash-box.

With the first light of dawn Nat went on shore. He carried Wrackman's betel-nuts with him, and the money he had undertaken to earn. 1914.]

CHAPTER III.

THE Dancing Wave was slipping through the water with a light, fair breeze, and the hills and valleys of Ysabel were growing each moment more and more indistinct. A motley throng was on deck, and good temper prevailed among them. The skipper was triumphant at his successful bargain with Bera, and the recruits he had enlisted were equally satisfied with the They were watching the well-known landmarks of their prison-house disappear astern of the ship, and congratulating themselves that their heads were now their own property. The other labourers were discussing the pleasant prospect that lay before them—liberal pay, light work, and a quick return home, with boxes filled with what Captain Jack had glibly called 'all same something everything.' There was, however, one exception to this cheerful rule—a man squatting on deck with his back to the foremast, his eyes glaring to right and left, with an expression that suggested a wild animal caught in a trap. He had been brought on board during the past night, lashed to a stout pole and carried by two men after the manner of a Solomon Islands pig going to a feast; and when his bands were unloosed he had lain on the deck motionless, but breathing heavily. He was just fully awake and conscious of his surroundings. His fellow-passengers paid him no attention; to the greater number he was a stranger, while to those who knew him as a dangerous wizard he was no longer terrible. Ghostly power was limited to the land of the ancestor who had bestowed it upon a descendant, and once on board the Dancing Wave, Jonah was supposed to be cut off from such family influence. Only one man on board showed sympathy with him, and this was It may have been a doctor's interest, watching the effect of a drug upon a patient, or concern for the safety of a valuable passenger lest he should jump overboard; but Wrackman appeared unwilling to let Jonah out of his sight, and when he went down to dinner in the cabin he kept looking up at the skylight as though there were something more attractive on deck than the corned beef and plum-duff on the

At first the skipper did not notice this preoccupation, and talked glibly of his success, and of what he meant to do next; but presently he noticed that the mate remained silent.

'What's up with you?' Captain Jack cried suddenly. 'You haven't been at your old game, have you?' he asked suspiciously.

Wrackman shook his head. 'I broke that

needle,' he said gloomily.

'When you did the The skipper grinned. 'When you did the trick so neatly,' he said. 'A drop for yourself and a drop for Jonah, eh?'

'I never thought of that!' Wrackman cried with a start. 'Before I filled that kernel I'd taken the drug myself. It was in us both, and Nat let him have the husk to make a charm. He's bewitched me, skipper!' he ended with a look of horror.

'Pull yourself together,' the skipper said.
'It's all gammon. What nigger was bedevilled by eating or drinking what some one else had taken? Bera never drinks anything till some one's tasted it to show him it ain't doctored.'

'Then why was Bera afraid of Jonah?'

'He feared he'd vélé him.

'Vele! You never told me this! That's just hypnotism. I've heard about it,' Wrackman exclaimed.

'What if it is?' growled the skipper. 'It's

all humbug.'

'You don't understand,' cried Wrackman wildly. 'Jonah is a mesmerist. I'm afraid of him.'

The skipper laid his great hand on the mate's shoulder and shook him roughly. 'Look here,' he said, 'that drugging is a damnable habit. I didn't know you did it, or I wouldn't have had you as mate; but if you must have a hair of the dog that's bitten you before you go on watch, why, you must;' and Captain Jack went to his locker. 'There,' he said, 'that's what you want. I took the spare needle out of the medicine-chest to balk you, but I won't risk my ship and cargo because you can't get what'll make you a man.'

Wrackman eagerly took what the skipper offered him, and there was a new light in his

eyes.

'There!' said the skipper triumphantly; 'now you're fixed, and you can go on deck and take charge. I'm dead-tired after my night on shore. I'll have a snooze.'

CHAPTER IV.

'THERE'S wind behind this jabble,' Captain Jack growled as he came up the

companion.

The light breeze that was blowing when the skipper went below had died into a calm; but the swell that had been sweeping across the sea all day continued to roll on. The schooner was tossing and tumbling to it, her sails crumpling themselves into strange writhing shapes and flapping loudly, her main boom swinging athwartships, and recovering itself with a shock when the sheet drew taut.

'Wrackman!' the skipper hailed, 'get in that mains'l;' but there was no answer, and no one moved to obey the order. The sun had set, but there was sufficient daylight to distinguish the men on deck—groups of recruits, but no sailors; and the captain shouted again, 'Wrackman! d'you hear me?' but the only

answer was a terrified cry from the Chinese cook.

'Matey stop b'low,' he sobbed from his galley, which was in a deckhouse. 'He makee fine piecey joss all same black boy. Sailor man no like him—me no savee joss. Me Clistian.'

'For God's sake, skipper, bear a hand!' cried a sailor, raising his head above the fo'c'sle hatch. 'There's been a lot of devilry on deck. A nigger's gone overboard, and they'll all be in

the sea if you don't tackle that chap.'

The skipper snatched the cook's lantern and sprang down the main hatch. Every sleepingplace in the recruits' quarters was tenantless; but as he peered into the gloom at the end of the hold he saw a red glow, and noticed a smell of burning. There is no danger that a sailor dreads more than fire; and, fearful of this, Captain Jack rushed toward the light As he held his lantern above his head he saw two figures squatting on the floor opposite to each other. One was white and the other black; they were both naked. The cook's iron bowl was between them—a pair of black feet keeping it from rolling with the motion of the ship-and it contained fire. One of the men, indifferent to the skipper's presence, was blowing the glowing embers with his breath, and deftly fingering the husk of a betel-nut that the fire was consuming; the other stared helplessly at the lantern.

For a moment the skipper stood aghast, and then he yelled, 'Wrackman! Wrackman! are you mad?' But the mate did not answer, and his face was as expressionless as a mask; while the other, raising his head at the shout, showed that he was Jonah, and that he saw he was being watched. The fire glinted on his eyes—two narrow slits of yellow light gleaming between half-closed eyelids. Their expression was inhuman, loathsome, and yet fascinating.

With a hoarse cry, Captain Jack flung up his hands as though to ward off a blow, and his lantern fell with a crash of breaking glass on the iron bowl. As the oil from the shattered lamp flooded the fire a great column of spluttering flame shot up from the sacrifice, and with shriek of agony Jonah leapt to his feet, wildly scratching and tearing at the burning liquid that had splashed his breast and legs. The skipper, swearing roundly, sprang backward, with his beard and hands singed; but he was himself again. Whatever mesmeric influence Jonah had gained over him was gone. One quick glance, and he saw that the fire would burn itself out, that his ship was not in danger, and then he turned like a dog on a rat to the man whom he now knew to be more deadly than fire. Grinding an oath through his clenched teeth, he seized Jonah by his mop of fuzzy hair, and, swinging him to right and left, dragged him, struggling and screaming, up the ladder and across the deck to the bulwark; then, gripping him with both hands, he lifted him above his [Christmas Number.

head and hurled him into the sea, and a great roller, over which the schooner had just climbed -yawing and lurching-carried him with it into the gathering darkness of the night.

CHAPTER V.

THE expected wind came from the old quarter, but it soon began to back and work ahead. Then it freshened, and at length it blew so hard that the skipper had to stow the canvas and bring his schooner bows on to the gale. her main boom lashed amidships, keeping her head to wind, the Dancing Wave rode safely to the heavy sea; but she drifted rapidly astern.

'She's going to leeward like an empty box,' the skipper growled as he looked over the side, trying to judge how fast the vessel was being driven before the storm.

'What about a sea-anchor?' a voice suggested, and, to Captain Jack's amazement, he saw Wrackman, clothed and apparently in his right mind, standing by his side.

'Try it,' he answered gruffly, 'and call the

watch to bear a hand.'

There was a spare boom on deck, and the sailors weighted it with a few fathoms of chain cable, and nailed a topsail along it, having first made fast some iron shackles to the clews. Then they bent guy-ropes to the spar, the ends of which they secured to the foremast, and heaved the whole structure overboard. The power of this sea-anchor was at once apparent, the halfsubmerged boom and trailing canvas checking the drift of the ship and breaking the crests of the waves that would have swept her deck.

'She ain't making more than two knots leeway now,' the skipper said in a relieved

'Where are we?' Wrackman asked vaguely.

'Let's have a look,' the skipper answered,

and he led the way to the cabin.

A chart lay on the table, and the men studied it. 'I sighted the north cape of Mala at sundown,' said Captain Jack. 'It bore north and by east about twenty miles.'

'How far's that from Ysabel?' Wrackman

'Hang it, man! you should know that,' the skipper retorted. 'You were on watch while I was having a snooze.

But Wrackman didn't try to excuse his ignorance; he only stared at the skipper in

'The schooner was doing about four knots when we went down for dinner,' Captain Jack continued, 'and when I came on deck she'd barely steerage-way. When did the breeze drop? That's what I want to know.'

And again the mate did not answer, and the

same astounded look was in his eyes.

1914.]

'What were you doing?' the skipper demanded.

'I don't know,' Wrackman said helplessly.

Captain Jack swore roundly, and struck the table with his fist, as was his wont when he was angry; but then, suddenly, he appeared to change his mind. 'You've taken too much of that cursed drug,' he muttered.

'How far has she drifted?' Wrackman asked,

without noticing the remark.

'She was going to leeward like old blazes before we got that sea-anchor out; but now she can drift till daylight, with plenty of searoom.'

'What then?'

'I shall run for safety if the gale hasn't blown itself out by dawn.'

'Not to Bera's bay?' Wrackman cried.

'Don't be a fool,' said the skipper. 'I know of plenty of snug creeks along that coast; but I'm going to have a drink before I go on deck. Sit down, can't you? The ship's safe enough now.

As they drank their grog Captain Jack set himself to find out what Jonah had done to frighten the sailors and the cook, approaching the subject cautiously by saying that Jonah had gone overboard; but Wrackman could throw no light upon the question, and was indifferent to what he evidently thought was an accident. His memory of his watch on deck was a blank, and he had forgotten his anxiety concerning Jonah's hypnotic power and what he had said about this during dinner. At length Captain Jack gave up the attempt to satisfy his curiosity, and, looking at the cabin clock, he said, 'I shall go on deck now, for I've had a good sleep. You turn in, and you shall relieve me at midnight.'

The boat had been swung inboard on the davits for safety, and the skipper got some shelter from the storm by crouching behind it. From time to time he made his way through the wind and flying foam to the schooner's bows to assure himself that the sea-anchor was secure and that the guy-ropes held, and each time he came back satisfied; the cables were taut as steel bars, holding the ship stubbornly against the gale, and only letting her yield to its fury inch by inch.

As the skipper went back to his shelter after one of these inspections he noticed a luminous

patch on the skylight.

'Wrackman has lighted the lamp to look at the clock,' he muttered, and he lifted the sky-light to ask the time of night. No answer was returned, and the skipper looked down into the cabin. Wrackman was standing on the floor, leaning across his bunk toward the port in the ship's side, and was grasping a marline-spike, which was passed through the ring of the bolt that secured the deadlight, striving with all his might to twist the bolt home.

What the devil are you up to?' the skipper

shouted; and, getting no answer, he ran down

the companion.

The cabin door was fast, and he thundered on it with his fists; but not for some moments did the bolt slide back from its socket and Wrackman appear. He looked as though he

had just awakened from sleep.

'I've had such a rummy dream!' he said, and he began to laugh. 'It was your telling me that Jonah had fallen overboard. I saw his face at the port; it was close to mine as I lay in my bunk. Then the bolt of the deadlight began to turn, and I thought he was coming into the cabin. I suppose I jumped out of the berth, lit the lamp, and got that marline-spike; but I don't remember what I did. Your hammering on the door awoke me, and I found myself heaving at that screw bolt. What rummy things dreams are!'

'Are you awake now?' the skipper asked.

'Awake! You bet I am,' cried Wrackman, 'and ready to go on deck.'

'You ain't afraid of him?' the skipper asked

suspiciously.

'Afraid of him?' Wrackman answered. 'D' ye mean Jonah? Afraid of him now he's dead? Not much! I'm all right,' he added confidently. 'It's twelve o'clock, and my watch on deck.'

'Well, then, I'll turn in for an hour or two,' said the skipper. 'Keep an eye on that seaanchor. It's the ship's life. If the guy-ropes get slack, or shift, call me. D'ye hear?

'Didn't I give you the word to try it?' retorted Wrackman. 'Ain't it my sea-anchor? D'ye think I won't watch it?' and he slipped on his oiled jacket and overalls, and left the cabin.

CHAPTER VI.

A CRY of 'Breakers!' roused Captain Jack from sleep and brought him rushing on There was a flicker of dawn in the sky, but the wind blew as fiercely as ever, and the skipper could make out a jagged line of foam beyond a turmoil of heaving waters astern, and toward this the ship was rapidly drifting. had no time or sea-room to hoist a sail for a desperate effort to claw off a lee-shore; he could only slue his ship's bows on to the reef, to give all hands a better chance of life than if the schooner struck it stern first. Shouting to a sailor to let go the lashings of the main boom, to get the ship's head off the wind, and to another to put the wheel over, he ran forward to cast adrift the sea-anchor and allow the schooner to answer her helm; but, to his fury and amazement, it was gone, and the ends of the guy-ropes, cut through, were lying on the deck.

The Dancing Wave came round to her helm and began to gather way; but huge rollers, hurrying to break up a reef ahead, caught her up and carried her along with them. Now on an even keel, now yawing to port or starboard as her rudder was lifted clear of the water, now heeling over till her yardarm touched the sea, she was swept along. Then came a sudden shock, the crash of breaking timbers, the thud of water falling on deck, and when the wave that had carried the ship to her doom drew back to the sea the schooner was left upon the reef. Roller followed roller, lifting the wreck and throwing her farther shoreward, and carrying away some of those who were clinging to any

handhold they could get on deck.

Captain Jack was the first to go overboard. He was shouting orders till the ship grounded; but a huge wave swept the deck, carrying all before it into the boiling surf upon the reef, and his voice was heard no more. After the wreck had been battered and buffeted till there was hardly a sound plank sticking to her ribs, these onslaughts grew less heavy and less frequent, and hope began to spring up in the hearts of the survivors that the worst was over, and that the tide had turned. When they were sure that this was so, and that the schooner was on an upright keel-hard and fast between coral rocks—they reckoned up their losses by the muster-roll. They were soon certain that the skipper had gone, and then they found that the mate was missing, while some dozen of the recruits did not answer to their names. There were those also who had cuts and bruises and broken bones; but in the joy of finding themselves alive such minor casualties were momentarily forgotten.

Meanwhile the neutral tints of dawn had changed to an amber glow, and each moment the colouring grew more and more intense. Some big land, looming large through the stormwrack that covered it, lay shoreward of the reef. and a mountain-top appeared above a bank of cloud. A wreath of mist like a gossamer veil stretched along the coast and hid the shere.

Suddenly one of the recruits recognised a headland and called it by its name; then some of Bera's 'live-heads' cried out that they saw an object they knew well—a house in a tree on the shore; and then, as the sun rose and broke up the mist, the unlucky castaways knew too well that the reef on which their ship lay wrecked was that at the mouth of Bera's bay.

But impending danger could not keep the exhausted men from longing for their morning coffee; and, finding the galley closed, one of them put his shoulder against the door and burst it open. A figure sprang up from inside the house and rushed on deck; it was the Chinaman, beside himself with terror.

'Plenty devil aboard this ship,' he cried in his shrill voice, beating the air with his hands as though he would fend off something horrible. 'Me go ashore right away.'

[Christmas Number.

'What's up now, Chinky?' a sailor asked.

'Me see him, all same spirit-devil,' said the cook, whispering the words.

'Who?' voices asked.

'Jonah!' the cook gasped.

'Garn!' said a sailor; ''e's overboard. 'E's

dead.

'Me tell no lie,' the Chinaman replied. 'Me see him there!' and he pointed to the deck where Jonah had squatted after he had recovered from his drugged sleep. 'Night no velly dark,' he went on; 'plenty moon behind clouds. look out through galley port'-and one of the restless hands indicated the window in the deckhouse—'and me see him, all same spook. see through him—see ship—see mast. Bimeby matey come on deck. He look this way, he look that;' and the action was imitated. 'He see Jonah! My word! he jump. He draw back. He hold boom—so. He plenty try not to get to Jonah; but no bally fear, he had to go. Then Jonah point, and then he do so '-and the cook began to take off his shirt—'and matey pull off oilers, jumper, everything, and he caper and dance—all same yesterday. Bimeby Jonah speak-me no hear-too much wind; but matey go forward and chop, chop, chop, chop. he come back and try my door; but him fast, and he look through window-eyes all shining all same big dog-and he stretch out his arms to grab me; but me jump back so, till me feel galley fire—see me fingers. Then me see nothing more till—bump, bump, bump—me know the ship was ashore.' And the Chinaman stopped speaking from sheer exhaustion; he had acted every word he had spoken, and the sweat was streaming down his face; but no one broke silence.

'Me look out again,' he continued. 'Skipper stand there; he hold rigging—so. Matey sit here;' and the witness crouched under the bulwarks. 'Big fellow wave curl over ship, and matey spring into it. Me see him naked body through the water, and he seize skipper so '—and the Chinaman gripped his own throat—' both go overboard. Me see them in the white surf—two black head, then one '——

'There's a row on shore,' a sailor interrupted,

pointing to the beach.

A crowd of natives was collected, and they were becoming every moment more excited. Presently they made a rush in the direction of Nat's store, and Nat himself appeared. He was evidently trying to pacify the people; but he did not succeed, for one of them let drive his spear, which, fortunately for Nat, missed its mark. Then the sailors saw a flash, a man fall, and the crowd turn tail and run; and, shooting right and left, Nat came running down to the beach, jumped into a canoe, and began to paddle toward the wreck. The enemy, who had turned, pursued him with stones; but, fearing his pistol, did not venture to follow him.

1914.7

'Where's the skipper?' he gasped as he came alongside the wreck.

'Washed overboard,' several voices answered.

Nat sprang on deck.

'Why did the niggers go for you?' some one asked.

'Jonah's friends want to kill me.'

'Can't Bera help you?'

'He's dead.'

'Dead! Who killed him?'

'Wrackman.'

'Never! He was washed overboard and

drowned, same as skipper.'

'Stow your jaw,' cried Nat, 'and I'll tell you all I know. I was roused this morning by a shout that a ship was on the reef. It was too dark to see what it was; but when it got a bit lighter we made out the Dancing Wave, and I ran to tell Bera that Jonah had come back. Bera was in his tree-house, and just as I got to the ladder I stumbled over something on the ground; it was a man. There was light enough in the clearing to see that his body was white, and that he hadn't a rag on him; and I could feel that he was still warm, and that broken bones were sticking through his skin; but I couldn't see his face. So I struck a match, and I tell you I was scared. It was Wrackman—your mate! D'ye hear me?' and Nat shouted, though the sailors had not uttered a word.

'He was dead,' Nat went on, 'smashed to a pulp. He must have fallen from the tree-house; but what had he been up to there? I climbed the ladder. The two chaps who watch were snoring in front of the house, and there was a snoring sound inside. Bera was lying on his back asleep, I thought; but the fire flickered up, and I saw something glittering at his neck. It was blood; his throat was torn as though a wolf had bitten it, and his breath came through the wound. Then the sound stopped, his body gave a tremble, and he was dead. If I didn't clear out quick this meant death to me,' Nat went on. 'I saw that quick enough. Jonah's friends wanted to kill me yesterday when they found he'd gone, and now Bera's tribe think I've killed him; but, by George! I nearly killed myself. As I stepped off the veranda my foot slipped, and I was all but head-first down the ladder. I had trodden on a bloody footstep, and I saw where Wrackman had slipped.

'They'll hack us to chips if we go ashore,' a

sailor said.

'That's what I've come to tell you,' Nat answered.

'Will they attack us here?' a sailor asked.

'Not in daylight. They won't face our guns,' Nat replied. 'When the tide's up they'll be round us if help don't come.'

'What help?' some one asked.

'There's a man-of-war anchored on the other side of the island,' Nat answered, 'and I've sent to tell 'em what's happened. I'd have gone

myself, you bet; but I had to come and warn you chaps.'

'Let's have a drink,' one of the sailors shouted.

-'Get out the grog, Chinky!'

The sun had mounted into the sky, and the sea was calm. Rollers still broke on the reef, but they were lifting their crests and tumbling over in a slow, deliberate fashion, and their thunder grew less and less as the tide went down.

The wrecked schooner lay on the rocks, clear of the breaking seas, and surrounded by water smooth as glass and blue as the sky. But lumps of coral had begun to appear above the surface of this lagoon, showing that at low-water it would be dry, and the reef bare.

CHAPTER VII.

THE rising tide had almost covered the stranded wreck, and the canoes that had kept out of range all day—while the reef was dry and the ship could be used as a fort—were creeping up to her under cover of the night, waiting to attack their enemies when they had to swim for their lives; but at this critical moment the lights of the cruiser were seen rounding the horn of Bera's bay, and bringing safety to the castaways.

The captain of the man-of-war then turned his attention to making peace between the rival factions on shore—Bera's subjects and Jonah's friends, who Nat declared would certainly fight out their differences if left to themselves. As a Deputy Commissioner of the Pacific—the civil representative of law and order in the Solomon Islands at this time—it was the captain's duty to do this. He expected difficulties, but, to his surprise, he found none. Each day that the

palaver lasted Bera's following melted away, while Jonah's increased by leaps and bounds. And the reason—which no one thought it necessary to explain to the Deputy Commissionerwas this: When the events that had happened on board the Dancing Wave became known, the fame of Jonah's Tindalo, which in English means Jonah's Ghost, was spread far and wide. He was a spirit of extraordinary power and resourcefulness, every one was profoundly convinced, for he had got level, the people said, with all his enemies, and his methods showed exceptional cunning and ability. He had taken possession of a white man and used him as an instrument to kill Bera and avenge his father's murder; and when Captain Jack's body was found, with marks on the throat corresponding to Wrackman's fingers, it was plain that Jonah had employed the same tool to avenge his own death. That he should serve Wrackman out for doctoring his betel-nut, when he no longer required his services, was only to be expected, and it completed the triumph. Of course he had made the storm, every one agreed; but this was a mere bagatelle to him-hardly worth men-Jonah's votaries, who were prepared tioning. henceforth to swear only by his name and trust to his power to rid them of their enemies, soon comprised the whole population of the district. They were willing enough to fight, but there was no one to fight with, and a new chief was chosen -with the Deputy Commissioner's approval from their own party.

The captain of the man-of-war took the credit of this peaceable and satisfactory result in his despatch to the authorities, and he praised Nat, who kept his own counsel, for the satisfactory manner in which he had acted as interpreter; but the real peacemaker was Jonah's Ghost.

THE LAMPLIT HOUR.

Dusk! and the lights of home Smile through the rain; A thousand smiles for those that come Homeward again.

What though the night be drear With gloom and cold, So that there be one voice to hear, One hand to hold?

Here, by the winter fire, Life is our own; Here, out of murk and mire, Here is our throne.

Then let the wild world throng
To pomp and power,
And let us fill with love and song
The lamplit hour.

THOMAS BURKE.

THE CHRISTMAS GUEST.

(From L'Hôte de Noël of Selma Lagerlof.)

By BEATRICE ALLHUSEN.

YEARS ago a band of Bohemians and artists took refuge in an old manor house in the Swedish province of Vermland, and, adopting the title of the Cavaliers of Ekebu, passed their days and nights in a succession of pleasures and adventures that shocked the better-conducted inhabitants of the countryside.

One of the cavaliers was little Ruster, he who could transpose musical airs from one key to another, and in addition was an excellent flute-player. He was of humble birth, poor, and without hearth or home, so that when the hour arrived that dispersed his gay companions his lot was a hard one. No longer for him the chance of a ride or drive, a warm coat, and tempting food. It was now his fate to wander on foot from house to house, his few possessions tied up in a blue-checked handkerchief, his coat buttoned to the chin, so as, if possible, to hide the state of his waistcoat and shirt.

All his wealth he easily carried in his pocket—a flute in pieces, a small bottle of brandy, and a pen. If time would only stand still, and things remain as he remembered them, his talent for copying music would have saved him from disaster; but, alas! day by day the inhabitants of Vermland were less and less interested in the old melodies and beautiful songs of bygone times. In the lofts guitars with faded ribbons and worn-out pegs, hunting-horns with unravelled tassels and tufts, were hidden away, while the dust lay thick on the coffins of violins. As there was less and less demand for the flute and pen of little Ruster, he made greater calls on the bottle, and became a confirmed drunkard.

Though he was received in familiar houses as an old friend, his arrival caused dismay and his departure joy. He brought with him unpleasant memories and a strong smell of brandy; and after a second glass of grog his eyes grew dull, and he began to relate disagreeable stories. He had become a constant dread to the hospitably inclined.

Some days before Christmas he went to Jofdalen, where lived Liliécrona, the celebrated violinist. Liliécrona had also been one of the Cavaliers of Ekebu, and one of those most infatuated by the life of excitement and amusement. But he had settled down, and

since his return to his family had not stirred abroad.

When Ruster arrived in the midst of the preparations for the approaching feast, and asked for work, Liliécrona gave him some music to copy.

'You would have done better,' his wife said, 'to let him go; he will spin it out as long as possible, and it will end in our being obliged to keep him over Christmas.'

'He has got to be somewhere,' Liliécrona retorted. He offered him drinks, and sat with him, going over again stories of the old Bohemian days. In reality, Ruster bored and rather saddened him; but he would not say so, because the memory of their old friendship and his duty as a host were in his eyes equally sacred.

For three weeks the Liliécronas had been making preparations to celebrate Christmas. and the whole family had lived in a feverish All were tired, state of furniture-moving. and their eyes red enough to light candles They had been frozen brewing beer in the malt-house, and in the store-houses salting meat and chopping sausages. But the servants, as well as the mistress, bore the additional work without a murmur, for they knew that when it was done, and the holy night come, a species of soft enchantment would descend on them; that jokes and lively words would pass their lips, and their feet be winged for the dance; and that the old airs and forgotten music would rise up from obscure corners of their memory. And everything would seem delightful!

But little Ruster had come, and mistress, servants, and children alike all felt that their Christmas was spoilt. Ruster's presence weighed on every heart. They feared that Liliécrona, his memories stirred, would find his love of wandering reawakened, and that the great violinist, who at one time could never stay long in one place, would once again be lost to his family. And how he had made himself adored in those two years that they had known the happiness of his presence among them! He was everything, always the soul of the whole house, above all at Christmas.

On that day it was not on a sofa or in his big arm-chair that he sat by the fireside, but on a great platform shining with polish.

1914.]

And there, before his attentive and ravished household, he was by turns musician and storyteller, racing from one adventure to another, galloping across the world and up to the stars. Under his influence all life became great and beautiful and rich, just from the rays of his soul. So they all loved him, as they loved Christmas, the sunshine, and the

But little Ruster had come, and everything was threatened with disaster. All their work would prove useless if the master's mind was wandering from his own hearth. Also, how was it possible to contemplate calmly this drunkard installed at the Christmas table with the pious and honest family whose joy he had

destroyed?

On the morning of Christmas Eve little Ruster, having finished copying his music, spoke vaguely of leaving, although his intention was to remain.

Acting under the influence of the general ill-feeling, Liliccrona replied, also vaguely, that perhaps Ruster would do better to stay where he

was till after Christmas.

But little Ruster was proud and sullen. He twisted his moustache, and pulled at the tuft of hair, like a cockscomb, that rose black as a cloud on the top of his head. What did Liliécrona mean? Did he think that he, Ruster, was in difficulties? Well, Liliécrona was mistaken. He was expected, longed for; in every smithy in the country his bed was ready, his glass already full. He did not know where to begin, so many were the invitations, so much the work awaiting him.

'All right,' said Liliécrona; 'don't let me keep

you.'

After lunch little Ruster borrowed a fur coat and rug, a sleigh was ordered, and the driver advised to whip up his horse, for a snowstorm No one seriously believed that threatened. Ruster would find a welcome under any one's roof; but they chased the unpleasant thought away, so happy were they at their own deliver-

away, so happy were they at their own deliverance. 'He wanted to go,' they said; 'it was he himself who wished it. Now let us be merry.'

But when, towards five o'clock, every one assembled round the tree, prepared to dance, Liliécrona, glum and taciturn, did not seat himself on the platform or take a glass from the punch-bowl. He could not remember a single dance-tune, and his violin was not tuned. They had to dance and sing without him.

Noting this, his wife grew uneasy, and the children began to sulk. Everything was going Christmas Eve was one great failure. The rice stuck to the bottom of the saucepans, the candles flickered and guttered instead of burning, the logs smoked, and puffs of freezing wind made their way into the rooms.

The man who had driven Ruster had not returned. The cook was in tears, and the servants quarrelling.

All of a sudden Liliécrona noticed that the sheaf of corn for the birds had not been put for them in the courtyard, and he complained bitterly of the heartless women who forget the old traditions. But every one knew quite well that it was not of the birds he was thinking, but of little Ruster, and that he was repenting having let him go on Christmas Eve.

Very soon he retired to his own room and shut the door, and they could hear him playing strange airs on his violin, as he used to do long ago when his home became too narrow for him, provocative music full of raillery and stormy

Listening, his wife said, 'To-morrow he will go, if God does not work a miracle to-night. I see that our inhospitality has brought about the very misfortune that we wished to prevent.'

Meanwhile little Ruster hurried through the storm from door to door, asking for work, but nowhere was he required. He was not even asked to get out of the sleigh. Some had their houses filled with guests; others were going away to spend Christmas with friends. It was only with some stretch of politeness his presence could be endured for a day or two in ordinary weeks, but it was impossible on Christmas Eve. The year only gives one, and in the autumn the children begin their preparations to enjoy it. How was it possible to ask such a man to sit at table with their children? And now that he had made himself a slave to drink, they did not know where to put him; the servants' quarters were not good enough, and the visitors' rooms too good.

So little Ruster went on his way, blinded by the snowstorm, his moustaches sorrowfully drooping, his bloodshot eyes scarcely able to distinguish anything. Little by little the fumes of brandy he had drunk disappeared, and he began to be astonished, and ask himself the reason that all this was happening to him. Was it possible that no one wished to receive him? All of a sudden he saw himself as he was-degraded, ruined, a wretched creature that no man was willing to receive under his

'That's the end of me,' he reflected. 'No more music to copy, or flute-playing. No one in the world has the least need of little Ruster,

or the least pity for him.'

The gusts of wind raised columns of snow that whirled in the fields in a giddy dance. Then the wind dropped, and the whirling columns vanished into the hollows of the ditches.

[Christmas Number.

'Just like life,' Ruster said—'a dance, and, directly the dance is over, a fall. And we are nothing then but a wretched snowflake, with lots of other snowflakes on the top of us. But when that moment comes complaints and tears are useless. It's my turn now.

He ceased to feel interest as to where the driver was taking him; it could only be to his death. He did not curse his flute, or those joyous Bohemian days now over and done with; he did not say that it would have been better if he had worked in the fields or mended boots and shoes; he only regretted that he had become a ruined instrument from which joy never again would produce a He accused no one. melody. When the horn is rusty and the guitar cracked they are thrown away.

He felt very small, very lonely, very useless and lost! Cold and hunger were going to kill him on Christmas Eve.

The sleigh stopped; he saw lights; he heard soft voices.

Some one helped him into a very warm room, and gave him boiling-hot tea to drink; while others took off his fur coat and rubbed his frozen fingers; and all the time welcoming words hummed in his ears.

The sound so astonished him that it took him a good quarter of an hour to realise that he was at the Liliécronas'. The driver, tired of rushing from one farm to another in such a storm, had decided that the best thing to be done was to return to the house.

But less than all the rest, Ruster failed to understand the warm welcome that he was receiving. He did not grasp that his hostess, moved with compassion at the thought of his sad drive, and of all the doors that had been closed against him on the afternoon of this great festival, had forgotten her own cares; for Liliécrona, ignorant of Ruster's return, was still shut up in his own room, playing mad, barbaric music on his violin.

Ruster was in the dining-room with the The servants, who generally came children. there on Christmas Eve, had taken refuge in the kitchen against the dullness which had descended on their masters.

Approaching him, 'My husband will play all the evening,' said Liliécrona's wife, 'and I must keep an eye on the supper; the children, therefore, are quite alone. Won't you look after the two youngest?'

Children were a species of the human race to which Ruster was quite unaccustomed. were not to be found under tents or in inns, or at wild drinking debauches, or, indeed, on any of the roads in Bohemia.

He felt very timid, and could think of nothing to say to them. He produced his flute, and 1914.]

allowed them to tap the keys and poke their fingers into the holes. The younger, who was four years old, and the elder, who was six, took a first lesson in flute-playing, and showed themselves greatly interested.

'Here is C,' Ruster said, 'and here is D;' and seizing a sheet of paper, he drew the

musical notes for them.

'No, no,' they cried, 'C is not written like that.' And they ran to fetch their spellingbook.

Then Ruster questioned them about the alphabet.

Some letters they knew; some they didn't. Their acquaintance with them was not very extensive.

Ruster, excited by the game, seated them on his knee, and proceeded to continue their education. The mother, coming and going between the kitchen and the dining-room, listened with

The children laughed, and repeated willingly

their abc.

But little by little Ruster's attention relaxed, his gaiety faded, and the thoughts that had agitated him abroad in the storm returned to his mind. Yes, it was all very nice and delightful, but it would not last. None the less, he was condemned and done with. All of a sudden he covered his face with his hands and began to cry.

Liliécrona's wife advanced quickly. she said, 'I understand. You think that there's nothing more for you to do on earth. Your music brings in nothing, and brandy is ruining you. But all is not lost yet.'

'Oh, but it is!' sobbed the little flute-

player.

'Listen. To teach children to read and write, to sit with them as you have done this evening, is not that something? And who could undertake such a task and not be welcome everywhere? Children are musical instruments, and not less important than flutes and violins. Look at them, Ruster!'

'I dare not,' Ruster murmured, for it really seemed sad to him to look through their lovely

eyes and see their pure souls.

Liliécrona's wife laughed aloud, a good laugh, happy and clear. 'You'll soon get accustomed to it, Ruster. Stay with us this year as schoolmaster.'

Liliécrona, who had heard the laugh, came out of his room. 'What has happened?'

It's only,' his wife replied, 'that Ruster has returned, and I have engaged him to teach the children to read and write.

'You have done that,' he said in a low voice—'really done that? But has he, then, promised?'

'No, he has promised nothing; but he will see for himself that he must avoid certain things, when every day he has to look into the eyes of the children. If it had not been Christmas-time I should have hesitated, or perhaps refused. But if the good God was not afraid to send His little child, His own Son, among us sinners, I think that I also should be able to give my little ones the chance of saving a soul.

Liliécrona made no reply, but all the lines in his face wrinkled and trembled. He leant over his wife, took her hand, and kissed it piously. Then he cried, 'Let all the children come here and kiss their mother's hand.'

And after that there was a very joyous Christmas in the Liliécronas' house.

THE CAVE-PICTURE OF DAVAAR.

Down by where the flowing Clyde Mingles with the ocean wide, And the Island of Davaar Looms beyond the harbour bar, In his home an artist lay Sleeping at the close of day.

As he slept, throughout the night He beheld a wondrous sight: Figures of a motley throng Standing in a cavern long, And above them, raised on high, What attracted every eye.

Twas the form, so marred with woe More than sons of men can know, Of the Saviour on a rood Yielding up His precious blood For a world whose love He sought, Yet a world that loved Him not.

Erelong, when the morning broke, And from sleep the artist woke, He, remembering clearly all, Vowed that on the cavern-wall Painted should the vision be Of Christ's awful agony.

For what formed the scene that night Of the weird, impressive sight Was a place to him well known, Whither ofttimes he had gone, And a place not far away, But out yonder on the bay.

Therefore now within that cave Close beside the ocean wave, Where is heard the fitful cry Of the sea-bird passing by, In that hollow 'cool and deep Where the winds are all asleep,'

On the surface of its wall,
Just as in some frescoed hall,
Painted with an artist's care,
And with colours rich and fair,
Lighted by the sunshine's gleam
Is the picture of the dream.

JOHN OLIVER, M.A., V.D.

SISTERS.

By J. MORTON LEWIS.

CHAPTER I.

THE heat was oppressive even in the clubroom; outside it rose from the ground like a hot sheet thrust into one's face. A mist was gathering from the swamps to the north of Huan Ho.

A group of coolies passed the windows, forgetting even to sing their song of toil, the one which has been handed down from generation to generation. From the native quarters in the distance sounded the tinkle of a bell.

Merrilees turned from the window and took a long pull at an iced drink. 'Phew!' he said; 'if it keeps on like this we shall have trouble.'

His companion nodded. He was a stout little man, whose face was coloured like an old parchment from many years spent in various Chinese stations. It was Gordon who had described Huan Ho as the Creator's first attempt at Hell.

'Seen the new arrival yet?'

Merrilees assumed a sudden interest. 'No. What is he like?'

'Nice chap, I should say—Chalmers. Fresh from England. He'll be along presently with Sanders.'

'Poor devil!' ejaculated Merrilees. 'I wonder how long he'll stand this inferno.'

Gordon grunted and walked directly under the punkah. 'No use grumbling. Remember it's ladies' night. Must put aside personal feelings.'

As he spoke there came the sound of feminine voices. The door opened, and a trio of ladies entered. They were Mrs Marwood and her two daughters. They were all dressed in white.

'Are we first?' said Mrs Marwood as she sank into a cane lounge. 'Well, what have you gentlemen arranged as a surprise for us tonight?'

Gordon bowed towards them on the couch. 'Ah!' he said, 'something new—something from the Old Country.'

The elder of the two girls looked up, a light of interest in her eyes. 'Has the new arrival come? What is he like? What is his name?'

'His name,' said Gordon, 'is Chalmers, and he will be here in a few minutes, so that you may judge for yourself.'

may judge for yourself.'
'Chalmers!' The girl's face flushed faintly, and the look of interest in her eyes deepened.
'Not Dick Chalmers of Barnet?'

1914.]

'I do not know where he comes from, except that he landed in a sampan from the *Nairoca*. If you ladies take so much interest in him I shall feel jealous. I deserve better at your hands.'

Mrs Marwood laughed and touched him lightly on the arm with her fan. 'We were just as interested in you when you came, Mr Gordon.'

'But I am a back-number now, one of the regular sights of Huan Ho, and I must take a rear seat,' Gordon sighed.

Singly and in couples the other Europeans entered. They were not many, considered against the vast hordes of natives gathered in the Chinese quarter and the villages around.

Chalmers was amongst the last to arrive, with Sanders. The elder of the two girls seated on the couch rose at his entry. Her eyes fixed his as he crossed the room to her side. Mentally he was comparing the two sisters—Sibyl, the elder, gay, inclined to taste the best that life had to offer, light and ephemeral compared with the younger, Madge. They had both altered since he had last seen them, but the difference was still evident.

'Mr Chalmers,' said Sibyl, 'we were wondering if it could be you.'

Chalmers bowed over her hand. Acting with the impulsiveness of her nature, she seized his arm. 'Let me introduce you round.'

'Thanks! One moment, though.—Yes, you are Madge, but you have altered. I left when you had only just put up your hair.'

The younger girl smiled. Not strictly beautiful, especially when in comparison with her sister, her face looked wonderfully sweet. 'And you have altered. You are thinner.'

'Hard work, Miss Madge.'

'Then this is not your first post?' said the elder girl, as she led him across the room to introduce him to a group of ladies.

introduce him to a group of ladies.

A few minutes' conversation, a hearty greeting from every one, and the concert commenced. It was the one weekly social function—something to which to look forward, though the songs were old, and had been sung a hundred times, and the piano sadly out of tune.

'You sing ?' said Merrilees.

'A little.' Chalmers realised what would be expected of him—new songs fresh from home, to relieve the jaded minds of those who had spent a long sojourn. China exerts a strange

influence on those who dwell within its shores; Chalmers realised how much as he stood there

that night.

He sat down at the piano and commenced to play. 'You will have to pick the notes,' said a warning voice; 'many have gone home.' Chalmers possessed a moderate voice; but he knew what his audience required, and he gave it to them with an enthusiasm which made up for any technical defects. For an hour he played and sang.

'Bravo!' said one lady enthusiastically as he

rose.

Sanders clapped him on the shoulder. 'You've made friends of all of us for life. And for an hour you brought back England—London—its lights and wonders. Wait till you've been here for five years; you'll know what that means.'

Next day it was Sanders who initiated him into the ways and byways of Huan Ho. He showed him the office where swung the sign of the firm he represented, and the house in which he was to live. 'I'll send a couple of "boys" to set it to rights for you; until you've chosen your own you'll chow with me.' On through a labyrinth they wound their way to the native town. 'Better know it,' said Sanders. The road was a mire. As they left the European quarters farther behind a confusion of sweet odours struck their nostrils. They passed through a maze of narrow streets, with high stone walls, giving access here and there to the fields beyond.

What a myriad of people!' said Chalmers. It was the first thought which had struck him. The hundreds of coolies bearing their loads and singing their eternal song; old women bent double beneath their burdens; young children naked as the day they were born playing amidst the heaped-up garbage, their shrill voices breaking the stillness. Occasionally came the sharp ting-ting of some metal-worker in his hovel, or the harsh, monotonous cry of a hawker vending

his wares.

'Yes,' replied Sanders, 'there are myriads of them. It doesn't do to think how many. How little would turn them!'

The faces of all seemed alike to Chalmers the vacant expression, the narrow slits of shifty

eyes with which they surveyed him.

He came back from the town with mingled feelings. He knew China, but had learned of it only in a large town. Here he seemed transported to the Middle Ages; everything about him spoke of barbarism, of cruelty almost. He commented on the fact to Sanders.

commented on the fact to Sanders.

Sanders nodded. 'It is barbarism. They have the superstitions of ten thousand years ago. Nothing will ever expel it from their minds. You saw Evinson last night—tall man, gray-haired, stooping shoulders? He's got a church down here. Got a few converts; but one day

he'll be murdered. They call him the Jesus man.'

Later Chalmers was to remember that speech.

Sanders jumped from one topic to another with the utmost sparsity of words. 'Met the Marwoods before?'

'Yes, in England, five years ago.'

Sanders nodded. 'They've been here three years.' He looked closely at his companion, as though about to ask him some question. Instead he rose and flung himself down in a deep chair before the open window. The heat was almost unbearable. It hung in a blue vaporous mist over Huan Ho. Of wind there was none, not enough to stir the water on the river, far less inflate the sails of the sampans. From his window came an uninterrupted view of the fields, and through a break in the trees the river itself. Sanders watched it closely. 'We've endured this for over a fortnight. If there isn't rain soon there'll be trouble.'

'Trouble?'

'Yes—plague.'
'It's bad here?'

Sanders laughed. 'The seven plagues of Egypt were deposited at Huan Ho. Going to the picnic this afternoon?'

'Yes.'

'With the Marwoods?'

'They 've asked me.'

Sanders nodded, and again his eyes were inscrutably fixed on those of his companion. It was later, in a conversation with Merrilees, that he allowed himself free speech. 'Yes, he knew them over in England. I suppose she'll play with him as she's done with every man here.' His face darkened. 'I mean to stop it if I can. He's too good to be fooled by that girl.'

Merrilees laughed. 'My friend, "fools rush

in where angels fear to tread."'

A couple of hours later the two men were standing by the Lake of the Sacred Stars. Through a break in the trees the limpid blue of the waters gleamed like a living turquoise. The sound of laughter came to them, and it contrasted harshly with the words they themselves had just spoken. 'Yes,' Merrilees had said, 'two cases, down in the valley.' He paused.

'And the murmur of discontent has risen.'

Merrilees kicked at a loose stone. 'Of course it is all those foreign devils. I was down by Ah Sing's this morning, and a stone struck me on the arm—a sign of the times.'

'And here we are junketing!' Sanders made

a comprehensive sweep with his arm.

'We must keep it up until the end. Outward folly, silent preparations. All that sort of thing.'

'You think it must come?'

'Sooner or later. I have been in Huan Ho [Christmas Number.

ten years; it's been brewing all the time. It's coming now.'

Merrilees trampled the end of his cheroot

underfoot. 'Shall we join the others?'

On the banks of the lake stood Chalmers and the two Marwood girls. A fourth member had just joined them. Reginald Dingley was one of those men who are enigmas to women. Men read them more easily; consequently most of their friends are amongst the opposite sex. He possessed a manner that irritated or carried by storm

'Ah, Miss Sibyl,' he said, 'lost in admiration? Charming, but it palls. Have you ever seen the ruined pagoda?' He pointed to where, in the midst of a clump of trees, showed a brilliant red-and-blue tower. The sun pouring upon it lent a heightened colour, rendering it more florid and barbaric. 'No? Then let me act as cicerone.' The two walked away

together.

For a moment Madge followed them with her cyes; then they travelled to the man at her side. Remembering what had happened in England, she was wondering what he thought—if he was hurt. 'Do you think Sibyl has changed much?' she said, to break the silence.

'In ways, no. She is as young'—he chose his words carefully—' and as irresponsible as ever. What a glorious colour this water is! A fellow was telling me' about it while coming

round in the boat.'

'Isn't it?' She gazed at the reflection of themselves, and coloured as she saw that Chalmers's eyes were fixed upon her. 'Do you know the legend concerning it?'

'No; tell it me.'

'I am rather bad at telling stories. Sibyl would do it better. Once there was a princess, very beautiful and very rich. She had everything that heart could wish save one. She was blind. And she used to pray that eyes might be given to her, that she should be like other women. Her prayer was granted by a voice which bade her go and seek sight. She travelled far until she came to this lake. Being blind, she could not see it, and walked into it, and in her fear she screamed out. Her screams were so loud that a myriad of stars fell from the heavens. A couple rested upon her face, and entered her eyelids, so that she could see like other people; the others fell into the water and changed it to the blue you see it now.' The girl laughed. 'That is all. I have told it very badly.'

'What a beautiful piece of imagery! No nation can be wholly cruel at heart which possesses such beautiful legends as the

Chinese.'

The girl shuddered. 'I do not know. One hears such terrible things. Shall we join Sibyl and Mr Dingley at the pagoda?'

and Mr Dingley at the pagoda?'
'If you like.' Chalmers fell into step beside
1914.]
B

her. 'I was thinking of that legend. How true to life! How we all pray for something we have not got! How far we go to seek it!'

17

'And we are not all so fortunate.' A note in the girl's voice made Chalmers glance quickly

at her

By the time they reached the pagoda voices came to them. A small party stood within. 'Ah!' said Mrs Marwood, 'you have not been here before, Mr Chalmers. To me it is an old pilgrimage—one I always make when I visit the Lake of the Sacred Stars.'

Chalmers looked around him. The pagoda was small and in ruin. The damp had spoiled much of its barbaric beauty. A green lichen almost covered what had once been a gorgeous piece of pottery. As he stood looking, Sibyl left her escort and came and stood on the other side of him. 'Isn't it weird and funny?' she

Sanders, standing a few feet from them, watched the trio. In after days he remembered the scene. At the time he saw only the two sisters, so different in every respect, and between them the figure of Chalmers.

Whilst they were riding home in the cool of the evening he cantered up to Chalmers's

side. 'Busy to-night?' he said.

'Nothing doing.

'Good! Come round to the club. We've got a chin on—Marwood, Merrilees, and a few of us—and we'd like you to be there.'

'I'd like to. Some new entertainment in

the air?'

Sanders looked around to see that no one was within earshot. 'No,' he said; 'a council of war.'

CHAPTER II.

MANY things happened that evening, some which at the time appeared insignificant trifles, yet when counted in relation to that entity called 'life' were of no small measure; for it is of the little things that life is composed.

Chalmers was late in entering the compound of the club. He had found the business affairs

of his firm in a somewhat chaotic state.

At precisely that same moment the two Marwood girls were seated in the drawing-room of their bungalow. 'Dick has improved,' said the elder. She was reclining on a lounge in full range of a mirror which gave her a complete and satisfactory reflection of herself.

Madge put down her book. She had been expecting this moment all the evening, and now that it had come was not sorry. 'Yes.' She chose her words carefully. 'Are you going

to pick up the threads where you dropped them?'

'Then don't play with him as you did

before.'

A glint of anger lit up the other's face.

'What do you mean?'

'You know what I mean. When you met at Barnet he was serious. You amused yourself at his expense. It hurt then. It would hurt more now. And he is too good a man. Some would pass on and forget, but it would alter his whole life.'

Sibyl laughed. 'My dear, what a sermon! One would imagine you were in love with him

yourself.

Madge flushed. For a brief second her eyes rested on her sister's face, and there was that in them which the elder girl did not understand. 'It is not that,' she said; 'but his ideals are so high. He is old-fashioned almost in his admiration for women.'

'You have discovered that?'

'Have not you?'

'My dear child, instinct or something told me years ago when we were all at Barnet.'

'And yet you treated him so badly!'

The hot retort which rose to the elder girl's lips was checked by the entrance of one of the 'boys,' who announced the arrival of Dingley.

'Show him in,' said the elder girl. She spoke languidly, and neglected the vernacular with which the Europeans generally address the natives for their better mutual understanding.

Dingley followed close upon the words. He held the elder girl's hand longer than was absolutely necessary. 'Miss Sibyl, I picked up something of yours on the way back this afternoon. I should have returned it before, but unfortunately it slipped my memory.' He placed a small lace handkerchief on her lap.

lap.
'How good of you to trouble about such a trifle! Sit down, now you are here, and help us to pass away a dull evening. Sing, talk to us;

only do something.

Though the invitation was made a joint one by the elder sister, Madge had said nothing. She was silently watching the two, wondering how it would all end. With unfailing judgment she had taken a full and just measure of the man who had gracefully seated himself. She compared him with Chalmers, who in her girlhood's days had been her idol, one she had never displaced.

'I'm afraid I can't stop long.' Dingley leant

forward in a confidential attitude. 'They 've got a council of war or something up at the club, and they 've asked me to go.'

and they 've asked me to go.'

'That is the worst of being so universally popular, Mr Dingley.' Madge broke silence for

the first time.

The sarcasm was not lost upon her sister. She frowned. 'Then that makes it doubly good of you to come out of your way to bring that trifle back.'

Dingley smiled, disclosing two rows of even white teeth. 'I am more than recompensed.'

Chalmers found some half-a-dozen men seated round the club table when he entered. Mr Marwood was speaking. His eyes were flashing, and his tones wrathful. Sanders softly pulled forward a chair next to his, and Chalmers sat down.

'Confounded impertinence I consider it,' thundered Mr Marwood. 'More than that, revolting, beastly. The bare idea makes me sick. That a child of mine should marry a Chinaman? What have we English done that we should be subjected to such an insult? Li Hang may be fairly civilised so far as natives go, but he's a treacherous hound, a'—— Mr Marwood choked for want of words.

'What did you say?'

'I told him I would rather see Madge dead

at my feet than married to him.'

The gist of the conversation had forced itself upon Chalmers with sickening force. Before him there rose the figure of the tall, almost ascetic-looking girl, one to whom tenderness, civilisation, meant everything. The bare idea was revolting, and it showed itself upon his face, though his speech was calm, dangerously so. 'Then it was Madge he wanted to marry?'

Mr Marwood grunted savagely.

'What did he say when you refused?' It was Sanders who spoke.

'The usual flowery Oriental platitudes, with

many bows.'

'Well, it is over and done with.' Sanders spoke with an assurance he was far from feeling. Five years in China had taught him to read signs which were invisible to other men, and Li Hang was a great man in the neighbourhood of Huan Ho, one who possessed paramount influence over the natives for miles; he was, in fact, little short of a king without the title. Sanders drummed thoughtfully on the table for a moment. 'I expect you've heard,' he said at last, 'that the plague has broken out. I sent one of my boys, Ah Sing, down into the village before I came along. There have been twelve deaths to-day. It's spreading like a fire.'

'That means a full hospital,' said Merrilees.
'Perhaps!' Sanders rapped out the word so sharply that every one looked up at him.

'What do you mean?' a little, thin-voiced man, who had hitherto taken no part in the discussion, chimed in.

[Christmas Number.

SISTERS.

'That we are getting the blame for the visita-You know how superstitious the natives They live in the midst of dirt and superstition. To-night their priests are making a bonfire to burn out the evil spirit.

Outside his own particular business Marwood was a slow-thinking man. 'I don't see' ---- he

'It means riot. We are pitched here amongst God knows how many thousand Chinese.'

'And we must be prepared,' said Chalmers quietly.

Sanders nodded approval.

Dingley had entered during the last few words. There was a smile on his lips, ridicule in the manner in which he spoke. And show

the beggars we are afraid!'

Sanders ignored the tone of the interruption. 'Certainly not. Openly we will go about as usual, but we must be ready. The fact that we have women here demands it. If there is an attack, it will come suddenly, when it is least expected. And if we are scattered in our various houses it will all be over in a few hours. We ought to fortify and provision one house, so that if necessary we can all retreat there. Mind, not a word to the women.'

Dingley yawned. 'All this is very unneces-

sary.'
'You think so?' Sanders spoke sharply. quarter to-day.' He paused. 'They were all converts. And if you go down to the gate of the Eastern Sun you will see the head of one impaled on a pole. I will not go into further details; but you understand Chinese, Dingley, so go down after nightfall and read the notice that is underneath.

It was from Marwood that the first direct 'And which house do you propose help came.

to fortify?'

'My own.'

A chorus of disapproval greeted Sanders's choice.

'For obvious reasons. It is the best strategically. Exposed only on one side. trust my coolies, and as I am single there are no women to disturb by fears which, after all, may prove groundless.'

'And you propose'-

Instinctively Sanders felt that his greatest help would come from the new-comer Chalmers. There was a grateful look on his face as he addressed his reply to him personally. 'To collect quietly all the arms and provisions that we can, without arousing undue suspicion. I will have the defences of the house strengthened. It is fortunate it has a flat roof. That will be a tremendous help to us if the worst comes.'

As he finished speaking the sound of singing came to them from the native quarter. It was borne on the still evening air. Acting on a common impulse, the men crossed to the window.

1914.7

A lurid red light flamed in the sky, and, as though keeping time with the ever-increasing flames, the voices rose higher and higher.

19

'What a fiendish row!' said Dingley. traordinary the natives have no idea of tune. They are charming away evil spirits now, I

suppose?'

Sanders listened intently. There was a pucker on his brow. Of all those present, he was perhaps the one who best understood the ways of the Chinese. As far as was possible to a Western mind, he was in sympathy with them. 'No,' he said quietly, 'that is not a song of intercession. That is a song of vengeance.' intercession.

An hour later he and Chalmers stood in the dining-room of his bungalow. Sanders had left the room for a few moments. When he returned Chalmers looked up. 'I have come to Huan Ho in stirring times,' he said.

Sanders nodded. He was dressed just the same as when at the club, save that he had dis-

carded his coat for a thicker one.

Are you going out?'

'Yes; I am going down to the village. I want to see what is going on. Forewarned, &c.'

'Then I will come with you.'

'It's a bit risky. The natives are in a nasty mood to-night.'

Chalmers gave a little laugh, one which the other understood perfectly.
'I'll be glad of your help,' he continued; 'as

glad as I was at the club to-night.'

'Right! I won't keep you a minute.' Chalmers vanished.

Thus it was that Madge Marwood, sitting at the window, unable to sleep, saw a couple of white-clad figures walk quickly past the com-pound. The figures of both were familiar, and one was the man who was in her thoughts at the moment. She leant farther out of the window to make certain she was not mistaken. 'I wonder why Dick and Mr Sanders are going down to the native quarter,' she said.

The sound of the singing was borne to her on the breeze, and instinctively she connected it with the two men who had passed beneath her window and were now vanishing into the

darkness.

CHAPTER III.

THE two men walked in comparative silence until they left the broader thoroughfare for the narrower roads which led like a maze through the native village. With each step the sound of the singing grew, and once a vivid shriek rent the air. Sanders ground his teeth. 'God knows what devilry they are up to !' he said. The roads were almost deserted. Occasionally they saw some coolie bound in the same direction, and shrank into the shadows until he had passed.

Lights were burning in some of the houses.

A heavy, almost fetid smell filled the air. From one of the hovels they passed came the sound of singing, a man's voice raised in some monotonous chant.

Sanders led the way with the sureness of one who knew it well. He avoided the pitfalls which would have tripped the unwary and made their presence known. Taking his companion's arm, he guided him past the heaps of refuse piled up in all and sundry corners. From one of the windows a dark, cunning face watched them, a smile on its features.

'I hope we are not recognised,' said Sanders. 'Round here to the right. Careful! The road is nothing but mud.'

The sound of singing had increased in volume; so close was it that he could almost distinguish the words. The flames illumined the scene until it was as light as day. Every now and then they caught sight of hurrying figures at the end of the road.

'We shall have to be careful here. A false move, and we are caught like rats in a trap.'

Slowly they crept under the shadow of a house and watched the scene now spread open before them like a panorama. Before a huge bonfire was gathered a vast concourse of natives—men of all ages and grades, from the humble coolie to the priest. In the very centre stood a couple of men dressed in the vestments of priests, and by their side another man unknown to Chalmers.

Sanders nudged him. 'Do you see that tall fellow dressed in purple?'

Chalmers nodded.

'That is Li Hang, the one man we thought we could trust.'

Then it was that the attention of Chalmers was drawn to something else. Impaled on long bamboos were nearly a dozen heads; the firelight shone full upon them, showing their eyeless lids. There was a look of horror frozen on the features of each. 'Look!' he whispered, shuddering.

Sanders followed the direction of his gaze. 'Ah!' he said. He looked closely at the heads.

Suddenly the singing stopped; there was a moment's silence, broken by the confused chattering of many tongues; then Li Hang stepped forward and addressed the crowd. To Chalmers, whose knowledge of the language was not very proficient, the words were meaningless; though he saw that the remarks were greeted with loud tokens of approval, while the look upon the faces of those present grew more fiendish each second.

It was a weird scene, and he was fascinated as he watched it, lost to all remembrance of his companion, until he felt a hand clutch his arm, and heard Sanders whisper, 'We must get away from here while we can.'

The two men hurried back along the shadows. 'What did he say?' asked Chalmers when they had left the noisome road behind them.

'He said what I half-expected, and feared: that the plague was the work of the white men, who had willed that it should come; that it was useless for them to attempt to burn out the fiend of evil by fire until they had first driven out the white men who had caused it to come.'

Chalmers understood thoroughly. 'And those

heads?' he asked.

'They were the heads of the converts, who died with the words of faith upon their lips, most probably. Once a Chinaman has turned Christian, he is even stauncher than before.'

'Then the rising may come any time now?'

'There is no knowing the working of the Oriental mind. It may be postponed for a month; but we must be prepared as soon as possible, for it may come to-morrow—to-night even.'

They hurried back in silence, meeting no one. Those who were not at rest had joined the fanatical crowd in the square. It was not until they were in his house that Sanders broke silence again. 'Thank you for coming.' He gripped the other's hand, and with the grip cemented a friendship that was to last through the years. 'Do you know, each moment of the time we have been out we have carried our lives in our hands.'

The flare was still lighting up the sky when Chalmers looked out of his window; but the voices had died down, and everywhere was only silence. He wondered when it would be broken, when the raucous cries of lust for murder and pillage would commence. The memory of Li Hang as he had seen him came back to him, and in connection the thought of that clean, sweet English girl whom he wished to make his wife.

Chalmers clenched his fists at the bare idea. It filled him with a horrible nausea; with a wild desire to protect the girl, until he felt he could go and mount guard outside her house lest any malevolent hands should be laid upon her during the hours of darkness. The thought passed. He turned away with a smile. Madge was safe for that night at least. Li Hang had other week to do.

A drizzling rain fell during the night, but was succeeded next day by a recurrence of over-powering heat, which did little to check the

ravages of plague.

There was a serious expression on Dr Scott's face when he met Chalmers. 'Very grave,' he said; 'a hundred fresh cases in the last twenty-four hours. It will spread like a scourge. We can do so little to stop it; they will not let us. I was nearly stoned in the native quarter this morning. The women came to their doors and cursed me.' He spoke dispassionately, without anger or reproach. Years spent in China had taught him that disease was not the worst enemy he had to combat. 'There are twenty cases in hospital, and we shall save them, I hope. If they die'—— He shrugged his shoulders.

[Christmas Number.

'I know a little about medicine. If I can help'----

'Thanks! You're very good; but you'll be wanted elsewhere. We're in for a bad time.' The doctor held out his hand. 'And we're tied here, so it's all hands to the pumps—I at the hospital, you behind a gun.' He passed on, pursuing his way to the long, straggling, whitewashed building to which he had given ten years of his life.

Chalmers was passing the Marwoods' bungalow a few minutes later, when a voice called him. Above the cluster of flowering shrubs appeared the head and shoulders of Sibyl. 'Do come in for a few minutes!' she said. 'I am all alone.'

He walked up the path, half-wondering why he did so. Sibyl Marwood was stretched on a bamboo deck-chair. She held a shady hat in her hand by a long ribbon. 'Sit down for a few minutes and chat to me,' she said. 'I heard somebody go by, and wondered who it was.'

She did not excuse the lie to herself, since it came naturally. She wanted to speak to Chalmers, to ask him several questions, and, knowing the hour at which he passed the bungalow, had purposely waited in the garden so that she might not miss him.

For a few moments she carried on a light conversation, fencing for position—the kind of conversation that pleased many men she knew. That might have pleased Chalmers in years gone by, though she realised more and more each moment how he had changed in the five that had elapsed since their last encounter.

'It is strange our meeting here,' she said. Her eyes were fixed upon him, a half-smouldering light in them. Chalmers was good to look upon—not, perhaps, strictly handsome; but he was well and cleanly built, and his face was that of a man to trust. Honest, straightforward purpose shone on it.

'Yes, considering I might have gone to any Chinese town. It was only a cable at the last moment that directed my steps to Huan Ho.

'Perhaps it was Providence?'

'Perhaps.'

It annoyed her that he did not glance in her direction as he made the confession. She was not to know that it was of her sister he was thinking.

'It is nice to meet old friends when least expected.' The girl was studying the point of her shoe. Although she prided herself upon her powers, she felt, somehow, at a loss. This man had in some strange manner passed beyond her understanding. Five years before she had read him as a book, or fancied she had, which is much the same thing. Now his personality seemed hidden. 'Dear old Barnet!' she murmured. 'Dick, I treated you shamefully then.'

For the first time Chalmers glanced in her direction. 'Surely not,' he said. 'If so, I have forgotten. I know I parted without any feeling

of resentment.'

1914.]

The remark angered her, since it was uttered in so casual a tone. A woman hates a man she

cannot rouse from apathy.

Crushing words rose to her lips, but they were stifled without utterance. From somewhere—it seemed the stillness of the air—there sounded a tinkling bell. That was all; but, acting as it did upon the current of Chalmers's thoughts, it startled him. He made a quick step forward as if to peer over the shrubs into that vast expanse of treeland and field, to read that secret which every man wanted to know—what was happening, what was going to happen, amongst those thousands of semi-civilised men.

Sibyl Marwood saw the look which crossed his face, and leapt to her feet. 'Mr Chalmers,' she said, 'why are you all so quiet? What is the matter? Is anything going to happen? Mr Sanders is so busy repairing his house; there is an army of coolies there. I asked Mr Merrilees, and he laughed at me, and said I was fanciful. What is the matter?' There was a look of fear upon her face. She knew enough of China to guess what might happen.

Chalmers pitied her at that moment, in view of what might occur in the future. 'Nothing,' he replied. 'There is nothing to fear. Plague has broken out, and the natives are a bit restless,

that is all.'

'That is what Mr Dingley told me. I asked him, and he said you men were making a lot of fuss about nothing.'

'Indeed we are making no fuss. Everything

is going on as usual, is it not?'

'Yes; but there is something in the air. I don't know what it is, but you are all different.'

Chalmers laughed. 'The heat,' he replied. 'How is Miss Madge?'

Sibyl Marwood possessed the ability to pass from one subject to another like a butterfly. 'Haven't you heard? She's gone to the hospital. She went yesterday.'

'Hospital! She's not ill?'

'Good gracious, no! She's given her services to Dr Scott, nursing the Chinese.' Sibyl Marwood gave a gesture of disgust. 'Ugh! can you imagine it? Horrible, I call it.'

'It's jolly plucky of her,' said Chalmers

enthusiastically. 'She's living there?'

'Yes. She'll come home occasionally for a few days' rest. How she can do it—those dirty, horrible men and women!'

Chalmers had learned much in a few days, and he understood to the fullest extent what had prompted the deed. He was saved from replying by the appearance of Dingley.

Dingley came forward, every action studied as usual. Sibyl Marwood ran to meet him. She did not know whether the man fascinated her, or whether she disliked him; but at that moment she wanted to use him as a foil against Chalmers. 'It is good of you to keep your promise!' she said.

'But I am afraid I am disturbing you.' He looked at Chalmers.

'No,' replied Chalmers; 'I was just going to make my adieus. Mail-day, you know.'

'I never allow that to worry me,' responded Dingley. He seated himself in the vacant chair.

That conversation gave Chalmers food for much reflection as he walked toward his office. His way lay past the hospital. He looked at it, a feeling of admiration for the girl who had voluntarily given her services surging through his mind. A couple of hundred yards farther he saw the figure of a native coming toward him, clad in the most costly of silken garments, rustling as he walked. The two men exchanged a quick glance as they passed. When he had gone by a momentary smile lit up the features of the Chinaman, rendering them, if anything, more crafty and cruel. His eyes narrowed until they became mere slits. 'White devil!' he muttered as he turned in at the gate which gave access to the hospital.

Continuing on his way, Chalmers wondered where he had seen the man before. He had not been long in Huan Ho, but that face was indelibly marked upon his mind. Though it bore the stamp of the Chinese, yet there was something which separated it from the faces he met everywhere. It was as cruel, as cunning—if anything both characteristics were more clearly definedyet it was distinct, a face to be remembered, to be feared. Suddenly recollection came to him. Before his eyes there appeared the scene he had witnessed a few nights ago with Sanders; the singing, shouting crowd, and the leader who had harangued them to such a wild pitch of enthusiasm. It was Li Hang whom he had just passed. He looked back. The road stretched like a ribbon straight and even for nearly a mile, but there was no one in sight. Li Hang had vanished.

The smile was still upon the Chinaman's face as he walked through the hospital grounds. He beckened a Chinese 'boy' to his side.

The youth came, and bowed low before him. Li Hang was a great man. With all the inherent cunning of his race, he possessed the advantage of a European education, having spent many years at Oxford, Heidelberg, and Berne. They had taught him many things, and he enjoyed the confidence of the Europeans, save two men, as well as being revered by his fellowcountrymen to an extent that could not have been much greater had he been a holy man. Long intercourse with the people of the West had taught him to speak three European languages perfectly, as well as to hide his real passions beneath a mask of immobility. Therefore it was with perfect English that he greeted Madge Marwood when she stood before him clad in her nurse's costume. His manner was courtly and gracious; he had learned his part well; nevertheless before he opened his lips his presence had filled the girl with a horrible, unspeakable dread, one which was not entirely resultant upon the wild tales she had heard.

'Miss Marwood,' he said, 'you will honour me by a walk round the grounds. I have much I want to say to you.' His eyes were fixed upon her coolly clad, graceful figure as he spoke. They drank in the rarities of her face.

He fell into step beside her as they walked slowly along the neatly kept paths. The tale he had to tell was much what he had told to Mr Marwood. He spoke of the great wealth he had to offer her, of the position, of all he could do for her, and would. But now it was spoken with a carefully hidden passion, one which filled the girl with horror as she listened.

A dozen times she tried to stop him. At last he gave her opportunity to speak. 'I am sorry,' she said, 'but I cannot marry you.'

It was the answer Li Hang expected. 'I shall ask you again,' he said, speaking quietly; 'perhaps next time you will say "Yes." A man of your country once told me that ladies often change their minds.'

'I shall never change mine.'

Li Hang smiled inscrutably. 'Let me at least hope you will,' he said.

The next moment the girl was alone. Standing transfixed on the spot where he had left her, she watched him walk back. Some dim foreboding of the part she was to play forced itself upon her mind, and her lips moved silently, fearfully, as though asking help of some unknown person.

Late the same afternoon Sanders called at the office, where Chalmers was busy studying a big ledger. Sanders looked worried and careworn.

'Bad news?' asked Chalmers.

'Bad and good. I have heard that some more converts have been killed. Don't know if it's true.'

'And the house?'

'Is nearly ready. I have had all the windows barricaded, and a stockade put round the roof. Thank Heaven the well is all right! Food is being drawn in as fast as possible.'

'I saw Li Hang this morning.'

'That is the man who is at the bottom of all the trouble. A Chinaman who has had a European education is a fiend. Without him we might have averted trouble.'

Chalmers looked out of the window. It all seemed so quiet and peaceful. A sense of rest was over the whole landscape, the idea of bloodshed and riot so far removed. 'I suppose it must come?'

'Yes,' said Sanders. 'It is only a question of when.'

'I was talking to Sibyl Marwood to-day,' Chalmers said, and detailed the conversation.

Sanders's mouth set hard. 'We shall have to be careful of Dingley. He means well, but he's a self-satisfied ass, the sort of fellow who'd [Christmas Number.

23 SISTERS.

fiddle while Rome was burning. I do not believe in meeting trouble half-way.' He paused and looked quickly out of the window. Where a moment before it had been so peaceful, a huge column of smoke was now rising. wonder what that is,' he said. Chalmers rose. 'Where is it?'

Sanders judged the distance. 'I should say it was the square where all the native roads meet. There are a number of houses there, and the church.' He spoke the last words slowly.

The two men looked sharply at one another.

'That is the first building they will attack.' Sanders's eye had caught sight of a rapidly approaching figure. 'The padre!' he said.

The gray-haired figure of Evinson came into The next moment he was standing before His clothes were torn, and blood trickled down his face from a nasty cut. 'They have burned my church,' he said. Though his eyes were dry, there were tears in his voice. He did not think of the wound upon his face, and what had caused it. He thought of nothing save that his church was gone. For nearly a score of years he had worked, growing old in the service. The building, poor though it was, had been built largely at his own expense. It was a monument to a lifetime of hard work and selfdenial; and now it was gone. It flamed skyhigh as a beacon of his failure. 'I did not know whether I should find you here.' His eves were fixed upon Sanders.

Sanders nodded. 'How did you get that cut

on your face?'

'A stone,' said Evinson simply. 'I stood on the steps and spoke to them, and they tried to drive me into the flames with stones.'

'The fiends!' broke in Chalmers.

'It is too late to save the church?' Sanders looked at the old man.

The padre nodded. Now that the danger was past and he stood in the presence of the two younger men, his strength seemed to have snapped. His lip trembled.

'Can you leave these books?' Sanders

pointed to the ledgers.

Chalmers threw them into the safe and locked the door with a snap. He knew what Sanders

'We must get every one into my house. The storm has come.—Padre, are you ready?

The three men emerged into the road and hurried toward Sanders's house. From the native quarter came mingled shouts, voices raised in loud derision.

'While they yell like that we are safe. It is when a Chinaman is quiet that he is dangerous,' said Sanders.

'Have you everything ready?'

Sanders nodded. 'Yes; we can stand a month, I think, if they do not overwhelm us by numbers.'

They stopped at each house on the way, 1914.]

spreading the tidings. 'Will you go to the Marwoods'? You know them?' said Sanders.

Chalmers nodded. It was not a task he liked, since he expected trouble. He entered the garden to find Sibyl idly reading a book in a deck-chair. 'Oh Dick!' she said, then stopped, 'What is the seeing the grim look on his face. matter? What has happened?'

'Is your father inside?'

The girl went white to the lips. She clutched the chair for support. 'Yes. What does that shouting mean?'

'There has been a disturbance amongst the natives. I do not think it is anything serious, but we are all going to Sanders's house.

'They are not going to kill us?' The girl looked terror-stricken. 'You'll save me, won't you, Dick?' In previous days it would have made Chalmers happy that she had appealed to him. Now he saw only a frightened woman, and each moment was precious. There were others to get within the four walls.

'You need have no fear,' he said sharply; 'but please hurry. Every moment is precious.'
Sibyl Marwood fled indoors. He heard her

voice, through the open windows, calling upon her parents.

In a few moments Mr Marwood appeared. 'What is it, Chalmers?' he said. 'Do you mean to say those natives have dared to attack us?'

'They may do so at any moment. Mr Marwood, do please get your wife and daughter to hurry. We must have every one in Sanders's house in a couple of hours.'

For a moment Mr Marwood hesitated. He disliked the authoritative tone in which Chalmers His lips opened to make reply, but instead he turned sharply upon his heel and walked indoors. His voice was plainly audible from the upper floor.

For another half-hour Chalmers paced up and down the garden. The voices had died away in the native quarter, and he remembered Sanders's words. Then the three Marwoods appeared. Each of the women carried a large bundle, obviously containing treasures hastily collected.

Chalmers hurried them out of the gate into the road. Sibyl looked up and down. 'Are we quite safe?' she asked.

'Yes,' said Chalmers, 'if we make haste.' Nevertheless he looked anxiously around more

When they reached Sanders's house they found most of the Europeans already collected there. Smiles of welcome greeted them. 'You can't guess how nicely Mr Sanders has got the house ready for us,' said one young lady, who had come to Huan Ho as a bride not a year before. Gaiety is infectious, and none knew it better than Sanders. Moreover, no one knew better than he what might, within the next few hours, be in store for all those who jested now.

Chalmers felt a sudden rush of pride as he joined the gathering. It was composed mostly of Englishmen and their womenfolk. He laughed and chatted with the rest, keeping the sense of irresponsibility at highest pitch. Sanders nodded approval across a crowded room.

Suddenly Mrs Marwood came to Chalmers's side. 'Mr Chalmers,' she said, 'where is Madge?'

'Hasn't she come in from the hospital?' Mrs Marwood looked almost tearful. My poor child! what will become of her with those awful Chinamen about?' The words were spoken in a high key, and they fell in a moment of silence. Moreover, they increased the silence. All eyes were turned upon the two. A frown crossed Sanders's face. A jarring note had been struck.

'I will go and fetch her,' said Chalmers.

The road was deserted as he left the grounds of Sanders's house. A few minutes' brisk walk

brought him to the hospital.

Madge came toward him clad in the white costume she had worn earlier in the morning, when she had interviewed Li Hang. The result of that rencontre was still visible in the pallidness of her face.

'Miss Madge, you have been doing too much; you look tired. But I am going to take you away from it for a little while.

'Take me away! What do you mean?'

Briefly Chalmers explained.

The girl shook her head. His solicitations pleased her. 'I am sorry,' she said, 'but my place is here.'

In vain Chalmers expostulated and pleaded. A personal appeal which made her eyes shine and brought the colour to her cheeks still left her firm. She laid a hand caressingly on his arm. 'Mr Chalmers, you would be the last to advise me to leave my post of duty. You know it.'

He looked at her admiringly, and the idea came to him. 'Yes, Madge, I should. your post of duty lies at the house, not here. Before many days, hours perhaps, we shall need nurses there. Fighting may start at any moment, and we shall want some one to look after the women, as well as after the men who are wounded. I think your place lies there.'

For a moment she hesitated. Her eyes rested upon his face, as though trying to read his thoughts. Chalmers stood before her, apparently stern and grim. In those few moments he had learned many things, but he could not speak of

them at such a time.

'Do you mean it?' she said.

'With all my heart. May I trust you with something? We haven't told the other women, but we are in for a bad time, and we shall want all the help we can get.'

'Very well, then, I will come. I won't keep

you long.

With mixed feelings, Chalmers waited, pacing

up and down the path, a prey to thoughts that as yet had hardly taken definite shape. He was thankful that Madge was coming to shelter, that she would be under his personal protection. Though they still floated nimbus-like in his mind, greater thoughts, hopes, ambitions had not tormented him. He had suffered by one woman, this girl's sister, and his heart had been dead, his belief in women shaken, until it was to be reawakened, blossoming into the one love of his life by circumstances of which he had not had the remotest idea. It is so love comes to a man, not by a slow, delicate growth, but by a sudden bursting forth into flower. A sudden danger-who knows what ?- may bring to life that which has lain dormant, unknown, in the soul.

She reappeared, still clad in white, but her little nursing-cap was replaced by a large Panamá hat, adorned with a single light-blue ribbon.

'I have not kept you long?' she said.

She cast one longing glance at the whitewashed building before she stepped into the road.

It was hot-overpoweringly hot-with hardly a breath of wind, not even enough to set the bamboos swaying. The buzz of insect life was everywhere, the air heavy with the scent of flowers. Over all was peace, not the quietness of an English village, but the magical quiet of a Chinese town.

She looked around. 'I can hardly believe there is trouble,' she said, 'it is so calm.'

Chalmers nodded. His eyes wandered to the fields which stretched away on their right hand, and they were deserted; no longer were they dotted with the wide brown hats, each of which betokened some coolie hard at work, but empty and silent save for the drone of insect life.

The hospital lay over a mile from Sanders's They had covered half the distance, chatting together with the freedom of old On their left stretched a camphorgrove, and, beyond, delicate green fields and hillocks broken by a network of pink paths. Chalmers's eyes were fixed on the camphorgrove. He fancied he saw something movesomething white. He crossed quickly, so that he stood between the girl and that side of the road.

'Why did you do that?' she asked.

The answer came, not from Chalmers, but from amidst the camphor-grove. A volley of stones assailed them, and a chorus of voices. 'Foreign devil!' they shouted; 'white man big devil!' The stones fell around them. Some struck Chalmers; one cut his cheek nearly to the bone. He laid his hand on the girl's arm for a second. 'Don't hurry,' he said warningly.
'All right.' She felt no fear, only exhilaration

that he and she were facing this danger together and alone. She glanced up at his face; it was

set firm. The grip had gone from her arm, and she saw the blue gleam of a revolver in his hand.

He raised the weapon and a sudden volley rang out. It spat viciously once, twice, three times. There was the sound of scurrying feet, a scream of pain, then silence.

'Stay a moment!' It was all the work of a second. He had leaped the narrow hedge, and she saw him bending beside a figure.

'Is he badly hurt?' she asked when he came

back.
'Shot through the leg. He will do all right

when they come back for him.'

'As a nurse' ---- she began.

'As a woman you will come on with me.' He took her arm and led her for a couple of hundred yards. Then it was she noticed he was wounded.

'You are hurt!' she said anxiously.

His one worry was to get her back safely. Anything might happen now. 'A mere scratch.' He smiled whimsically. 'It is so big wars are started.'

'You could not help it. It was that poor man or you.'

'Yes; they had a couple of hundredweight of

stones ready.'

Chalmers found the little garrison in a different mood from when he had left it little over an hour before. The first sense of gaiety was gone as they realised for what purpose they were there. Sanders made an efficient chief. To each he allotted some small duty, so that they might have something to do. The men took it in turn to keep a continual watch upon the roof. Arms and ammunition lay ready stacked.

Mrs Marwood hurried forward as they entered, a cup of tea in her hand. 'Thank goodness you are safe, child!' she said. She saw the wound on Chalmers's face, and nearly dropped the cup. Her sympathy was overpowering. 'This comes of your joining that horrid hospital.'

'I am sorry!' said the girl simply. 'Let me

dress it for you.'

Chalmers demurred. 'You will want some rest after our excitement. I will go and bathe it.'

The girl watched him walk away. There was a strange light in her eyes; admiration glowed in them, and much else. She was just beginning to realise that fact which forces itself upon women with varying depth according to their nature.

A few yards and Chalmers encountered Sanders. Briefly he told what had occurred. 'I am sorry, but I had to fire, or they would have beaten us down.'

'It will make no difference.' Sanders looked around. 'I think we are prepared for them. It will be a bad time, though.'

No one realised that better than Chalmers. 'Is there anything we can do to get help?'

'Nothing. I have sent a "boy" off—one I 1914.]

can trust as much as we can trust any of them now—and told him to be ready to give news to the first ship that passes. He is to cruise around in a sampan. But there isn't a boat due for ten days.'

Later that afternoon Chalmers found himself alone with Sibyl Marwood. Moments of danger bring out the true character of people. Though she had dressed herself carefully to please the many men around her, Chalmers saw the look almost of fear on her face. He would have hurried by to perform some duty, but she laid a hand on his arm. 'Dick, I want to thank you for saving Madge's life to-day.' Her eyes were eloquent. Be it to her credit, she cared for him more at that moment than she had ever done before.

Chalmers felt embarrassed. 'I did nothing,' he said hastily; 'any man here would have done as much.'

'You risked your life for hers.' The girl spoke feelingly, and there was a tremor in her voice. 'It was awfully brave. I can't tell you how I admire you for it.' Neither noticed the white-clad figure which had paused at the door for a moment, and then hurried on, a look of pain in her eyes.

Madge went straight up to the room she shared with her mother and sister. It was empty. She walked to the window and looked out across to where the waters of the river were flowing by, a dark bronze in the sunset; past the lush green paddy-fields, the clusters of majestic bamboo, and the small disused pagoda. There was a look of pain on her face. She had seen that which had broken rudely upon her dream; truly one which had been of her own making, but the shattering was none the less painful.

It was Chalmers who first noted the absence of the padre. He drew Sanders aside.

A worried look crossed the elder man's face. 'He was here early this afternoon, because I spoke to him. I will see where he is.'

Inquiries proved he had talked of going into the village. He had spoken on the subject to both Merrilees and Dingley.

'Didn't you try to stop him?' said Sanders irritably.

Dingley made a gesture. 'What was the use, my dear fellow, once the padre had made up his mind?'

'Didn't you realise it was sending a man to his death?' Sanders walked away sharply, afraid to trust himself to say more.

Dingley watched him with an amused smile. 'The responsibility of looking after us is telling upon Sanders,' he said banteringly 'to Sibyl Marwood a few minutes later.

She shrugged her shoulders. She hated Sanders; moreover, she feared him. His presence always acted upon her as a restraint. 'He is much as usual, is he not?' she replied.

Dingley laughed. 'Neatly put, Miss Sibyl. I suppose you cannot change the spots on a leopard.'

'You were right,' said Sanders a little later.
'He has gone down to the village, to the ruins

of his church.'

Chalmers looked quickly at him. 'He is in danger, of course. Some one will have to go down.'

Sanders nodded. 'I am going in a few minutes.'

Chalmers had been sitting down. He had just come in from a couple of hours' sentry duty on the roof, but he rose. 'I'll go,' he said quietly. 'You're wanted here more than I. Besides, I saw a photo of a girl in your room one day; she is waiting for you. Well, there's no one waiting for me.'

'I can't let you do it,' said Sanders.

Chalmers possessed a quiet, insistent way. 'Got another revolver?' he asked. 'I'll take a couple—automatic if possible. They're so effective.'

Five minutes, and he had quietly slipped out. Sibyl Marwood, standing upon the roof talking to the man on sentry, saw him. 'Is that Mr Chalmers?' she asked.

Her companion, Graham, a young Englishman, looked over the sandbags. Chalmers was swinging out of the gate on to the high-road. 'I believe it is,' he said.

The white-clad figure left his side abruptly, rushed down the flight of wooden stairs, and sought out Sanders. 'Was that Mr Chalmers who left the house just now?' she asked.

who left the house just now?' she asked.
'It was,' said Sanders. The meeting, the excitement of the girl, surprised him, and he felt at a loss for words.

'Where is he going?'

'To the native village. Mr Evinson is down there somewhere, and he has gone to find him.'

'You let him go!' The girl looked at him passionately. She regarded Chalmers with a sense almost of ownership, as she had done once before, when she had sent him away, his faith in womenkind destroyed.

'He wished to take the risk. Some one had to; we shall all have to take risks during the next few days.'

next lew days,

Sanders was perplexed as to the cause of the sudden feeling. What had prompted it? Had

he misjudged her, after all?

Sanders was a man who worshipped women. He placed them upon pedestals as the Maker's best creation. Sibyl Marwood rose high in his estimation at that moment, to fall still deeper a second later. A step sounded, and Dingley appeared, nattily dressed, and with his usual air of refined boredom. 'Are you coming on the roof, Miss Sibyl? It's a glorious evening for a stroll.'

The girl flashed him a glance from her eyes,

one which did not escape Sanders. 'Yes,' she said, 'I should love to.'

'It will be your turn to do sentry,' said

Sanders sharply.

Dingley nodded sulkily. He would have liked to refuse, but he feared Sanders with a fear as great as that of the girl at his side, although of a different nature, since it was physical.

It was nearly midnight before Chalmers and the padre returned, footsore and weary. A wave of relief ran through the house when it was known they were both safe. The padre was loved for his simple, kindly nature, and Chalmers had won his way into the affection of all in a short time.

Both men were reticent. To the many questions poured upon them they returned evasive answers—the padre with a deprecatory smile, Chalmers with a quiet reticence which refused further questioning.

Dingley smiled. 'A lot of fuss about nothing,' he confided to Sibyl. 'The way in which they have returned shows there is nothing to fear.'

Had he known what was passing between Sanders and the two men at that moment he would not have felt so easy in his mind. Perhaps, also, he would have kept silent.

The three men were seated in a small room, barely furnished, Sanders with his legs dangling

from a table.

'Yes,' he said, 'I have heard of the Brother-hood of the Sacred Lily. What do you know about it?'

'They held a meeting to-night.' Chalmers paused. 'From what I understood—I'm not much good at Chinese—they're going to attack us. The men passed beneath an arch of swords, and bowed before some fellow dressed in purple velvet. I saw afterwards who he was.'

'Li Hang?' said the padre.

'Yes.'

The padre nodded. 'I am not a man of wrath, or I would kill that man.'

'You saw all this! How?' Sanders's eyes were fixed upon Chalmers.

'I bribed a coolie to show me where they met. It is a building right in the centre of the village. There is a smaller place next to it, a joss-house. I climbed on to the roof, and lay beneath a window which opened right on to the chamber of ceremonies.'

A brave man himself, Sanders admired bravery in others. He looked upon the stern-faced Englishman before him, admiration plainly written on his face. 'Do you know what it would have meant if they had caught you?'

'A revolver-shot. I'd choose that before any of their little entertainments. They are coming to attack us'——

'Yes!' interposed Sanders.

'At midnight, when the waters shall have reached the bridge, whatever that may mean.'

Sanders thought for a moment. Then he [Christmas Number.

SISTERS. 27

leapt to his feet. 'It means to-night,' he said sharply. 'When the river reaches the bridge means high-tide. They're flood-tides now. You know the bridge by the ruined pagoda?'

Both men nodded.

'No boat could pass under it to-night.' He drew out his watch. 'It's nine o'clock.'

Chalmers had not been back an hour before the tale had got abroad. Sanders had meant that it should.

'And you did all that—for us!' Sibyl Marwood spoke enthusiastically, and her eyes shone.

'I have done what any man here would have done.—Coming, Sanders.—Excuse me, Sibyl.'

He was stopped for a moment by the younger sister. 'Is it true?' she asked. 'I wish I were a man, so that I could do as much.'

Chalmers smiled. He would rather have had those few words than all the other congratulations together. 'Your turn will come soon, Madge,' he said.

Sanders was already busy upon his preparations. 'I shall take ten men on to the roof,' he said; 'the other five I shall leave below, under your charge, in case the natives break into the grounds. Are you willing?'

'Of course.'

'Then you'd better take a little rest. You've done enough for three men already to-day.'

Chalmers shook his head. 'I shall go back and help the men to keep the social ball rolling. Mustn't let the women get nervous.'

Rumours had already preceded him. Questions poured upon him. Instinctively the women turned to him, more perhaps than to any of the other men.

'We may have a little trouble to-night; so we are preparing, that is all. Half the battle, you know.'

He watched how the women received the news. With very few exceptions they heard it in a manner which made him proud that he was of their race.

From Sibyl there came a low sound, one which grated on his ear; half-sigh, half-exclamation, it spoke in a way which no one could fail to understand. Here was a woman who was afraid. She crossed to Chalmers and clutched his coatsleeve. 'Dick,' she said, 'you won't let them hurt me?'

A few feet away stood Madge. She bit her lip as the words fell from her sister. Then came another thought, driving out all else. She had called him 'Dick.' She had looked into his eyes as only she could look into the one man's. Madge turned away; there was bitterness in her heart. Then she remembered; it had only been a dream, one of her own weaving. She could not expect he would have chosen her, when the more brilliant and vivacious Sibyl was near.

She was aroused by the sound of breaking glass; the scream of a woman, her sister; then Chalmers's voice: 'Help me, you fellows! We must draw those shutters.'

1914.]

CHAPTER IV.

A FEW minutes before midnight the rioters came—a vast, mighty horde. No one would have thought that the native village could harbour so many. They came in silence, until the stillness was broken by a gunshot.

Chalmers was on the roof at the time. It was he who had first noticed the vast, silent, white-clad army. He pointed it out to Sanders. 'I must go below,' he said. He marshalled the women into a room upon the first floor, chatting and laughing the while.

Madge was the last to enter. It seemed as though she hung back. 'God keep you safe—for'—she paused—'for Sibyl.'

Chalmers's reply was drowned in a volley from the roof, and the next second she had gone and the door was shut. Then he found the men clustered in a group in the hall.

'The fun's started, Chalmers,' said one. As they stood in their white ducks, with coats off and shirt-sleeves rolled above their elbows, they looked a determined little band.

From without came the hoarse cries of the natives, punctuated by volleys from the roof. It was a hard task those six men had, inasmuch as they had to wait, unable even to see the course events were taking, guided only by the firing and the shouts of the howling mob. For half-an-hour they stood it, resting impatiently on their guns. No message had come to them from those on the roof.

Then Chalmers took them into the diningroom and swung aside the shutters. The sight reduced them to silence, even as it dumbfounded Before the house there was a sight that would have done justice to any masked ball. Save for the firing and the angry shouts, it looked a mad carousal of folly. The whole scene was brilliant with the lights from hundreds of flares. Before the walls stood a mob of white-robed figures, lust and hatred on the face of each. They had run up scaling-ladders, and the strenuous efforts of all those on the roof were needed to prevent an entry. From those behind the storming-party came a strange variety of missiles -shot from guns (some modern, others so antique that they were a source of danger to those who fired them), stones, spears, naphthaflares slung on to the roof and against the walls from the ends of long bamboo poles.

Suddenly Chalmers threw open the windows. He saw a mob, and each moment it was getting more and more beyond the control of those upon the roof, and behind him were half-a-dozen men spoiling for a fight. A dozen natives had scaled the walls simultaneously; when the rifles barked out there were a few screams, and the men vanished.

Chalmers would have made a splendid soldier. He was one of those born for the service. In a second he had realised the position; and, leaving minute instructions with those behind him, he

disappeared.

Knowing that each moment was precious and might bring defeat, he rushed to the back of the house. There, in a small room, were a couple of dozen or more small kegs. He lifted one, swung it on to his shoulder, unlocked and opened a door which led into the grounds at the back of the house, and in a second he had vanished into the night. He walked quickly through the grounds, laboriously climbed the wall, and dropped on to the ground on the other side. There for a moment he reconnoitred. The night was dark, and a thick sulphurous smoke hung like a cloud in the air. Through it he could faintly see the white figures hurrying to and fro. The light from their flares showed only faintly until he approached nearer. He crossed the road and climbed the low hedge on the other side. Then, crouching low, he hurried along with his precious burden. Nearer he came, until the scene was brilliant again, and he was directly behind the mob. He could see their Their voices rose in one mingled shout. He bent still lower as he set about his work.

Care was necessary, and speed also. Each second might bring detection, and detection spelt a horrible death, at the thought of which he shuddered. Added to this was another The bullets from the roof spat angrily about him. One whistled past his ear with a vicious note. He smiled as he heard it. It was

at least merciful.

After prising the lid off the cask he pushed it through the hedge, so that it pointed directly upon the back of the mob. Taking a fuse from his pocket, he laid it deep into the contents of the keg, and lighted it. Then he hurried away on all-fours.

To Sanders upon the roof the minutes dragged slowly. The fire from his small party was horribly insufficient to stop the mob beneath. Even aided by the shots from the men in the rooms below, it did little save add to the fury of those outside the walls.

The rifles were hot in the hands of those who held them; and though a Union-Jack, relic of some past festivity, floated on the roof to spur them on, it needed little to show him that unless something unexpected happened it would not be an hour before the defence was broken down. He shuddered as he thought of the women in his care, and his face grew white and drawn.

Up on the roof were a couple of native 'boys,' faithful though their elders had deserted. Sanders beckoned to one. 'Ask Mr Chalmers to step up here for a moment, he said in Cantonese. He felt the necessity for advice, for some one to turn to at such a moment. So he paced up and down until the 'boy' returned with his message. Mr Chalmers had vanished, disappeared, gone like a wraith of blue

'Where the devil can he have gone?' muttered Sanders angrily, as he looked down upon the mob beneath.

As if in answer to his question there was a blinding flash, and a cloud of flame rushed up to meet him; a dull, heavy roar; a wild chorus of shrieks from those below, like the cries of tormented souls; then a chorus which slowly died

away in faint moans.

He staggered back beneath the shock. When he had recovered sufficiently to look over the barricade again, a strange sight met his gaze. The smoke still hung heavy; the air was poisonous with fumes; but the Chinese had gone, though he could dimly see a few white-clad figures flying terror-stricken down the road; those who remained lay still and silent.

He rushed forward and seized the hand of the nearest person. No matter that it was Dingley. 'Man,' he cried, 'we're saved!'

'Who could have done it?' asked Dingley. Rapidly Sanders put two and two together. 'Chalmers is missing,' he said.

CHAPTER V.

THEY had gathered the women together again in the long dining-room. Tongues were busy. Danger was past for that night, and every one chattered from very relief. They made a strange company — the women white and tidy; the men in their shirt-sleeves, just as they had come from the roof, powder and dirt on their hands and faces. And there was one question upon every one's lips: 'Who had done it?'

The door opened, and there entered a man dirtier than the others. His face was grimy with the marks of powder, and his coat torn. He stopped apologetically on the threshold, and would have retreated had not Sanders rushed forward and seized him by the arm. 'This is the man!' he said.

In a moment they had clustered round Chalmers, while he stood in their midst flushing like a child detected in some misdeed.

'Dick, I am so proud of you!' said the girl. They stood alone in a corner of the room. From somewhere that seemed far away, though it was only a few feet, came the voices of the others. Chalmers felt fear at that moment as he had not felt it a couple of hours before.

'I am glad I knew you in the old days,' she went on. 'It makes me feel that you are more to me than to the others.' Sibyl Marwood was not one who could analyse her own feelings. Had she been able to do so she would have said at that moment that she loved this man whom she had sent out of her life five years

SISTERS. 29

Still Chalmers made no reply. He was wondering many things. He was a man of implicit honour, and he wondered whether the foolish boyish vows, born all in the passion of a moment, which he had made so long ago, still held him bound to the girl at his side. The thought worried him. If they did, he was prepared to fulfil them now, though it was she who had broken them at the time. He did not see what might have decided him.

In the shadow of a curtain stood another girl, sister of the one who was by his side. Her eyes were fixed upon the couple, and there was a look of utter weariness in them; for the third time she had received the answer to her dreams. Of course he cared for Sibyl. It was natural. He had cared for Sibyl in the old days, and what was she in comparison that she could hope to win him from her more brilliant sister? She turned away to utter a commonplace reply to some remark of Sanders.

It was not for another hour that Chalmers had an opportunity to speak to her. 'Do you remember what you said to me at the door?' he asked.

The girl fought down the reply that rose to her lips. 'Some foolish words, I expect,' she answered. 'I am as excitable as a child. And it has been an exciting night, hasn't it?'

Chalmers looked at her as though hardly understanding what she said. 'It has been exciting in many ways,' he replied slowly.

She felt his eyes upon her, and steadfastly thrust behind her out of the way in a corner of her mind the words she would have liked to speak.

That night, tired out though he was physically, Chalmers lay on the outside of his bed. His mind was restless and worried. He thought of Sibyl Marwood, and what her every action implied; whether he should take up the threads where she had dropped them five years ago. From her his thoughts wandered to the younger sister; and, though he did not know it, the look in his sleepless eyes changed. They grew softer. She perplexed him even more. as he would he could not reconcile the words she had spoken earlier in the evening with those which had dropped from her lips not a couple of hours before. The first had spurred him to the deed which men called great; the others filled him with regret. Why had she spoken them? Had he unintentionally offended her? He sighed as he thought of the strange tangle that life presented. Presently his eyes closed; utter physical exhaustion overcame the restlessness of his mind and forced him to sleep. was a smile upon his lips. 'Madge!' he murmured once. His arms stirred. 'Madge!'

In another room, where the two girls slept with their mother, Madge lay, her eyes as open as his had been. She saw a red morning dawn, 1914]

and listened to the regular breathing of her sister with thoughts that were rebellious. She could sleep so peacefully because she was happy in the love of the one man. Her heart ached, not so much at her own loss—she had grown to realise that that must be—but at the thought whether or not her sister was worthy of the man. Madge prayed that she might be; that Sibyl would love and tend him, as she herself would have done had she been chosen. So it was that she, like Chalmers, learned that night of the strange tangle life could be.

CHAPTER VI.

WITHIN a week Madge found other things to occupy her thoughts. Though Chalmers's ruse had been temporarily successful, in less than twenty-four hours the natives had returned in redoubled force. For seven days the little garrison had fought unceasingly through the hours of darkness, snatching what rest they could in the daytime. In those nights they learned what no book could have taught them of the cunning of the Eastern mind. Li Hang and his followers had tried a dozen plans, all clever, mostly diabolical, to bring them to submission. They had even tried to undermine the house and blow it up with gunpowder. They had flung naphtha-soaked bombs against the walls in the hope of burning it. Under cover of heavy firing, a few of their number had entered the grounds, even to the house itself, in an endeavour to poison the well with the bodies of plague-stricken rats. One morning the garrison had awakened, after a strenuous night's fighting, to find four sightless heads upon bamboo poles peering over the walls. They were the heads of four of Sanders's servants, one little more than a boy. How they had fallen into Li Hang's hands no one knew, though the manner of their death was too horrible to bear thought.

It was Sanders and Chalmers who saw them first. The two men rushed into the grounds, regardless that there might be an ambush, knowing only that the women must not see them. They took them down and buried them, sick with the sight. That was on the eighth morning. Two of the largest rooms had been converted into wards, and half the small garrison were wounded. Sanders himself had a fleshwound in his left arm. The padre had been knocked senseless. He recovered to babble of his little church, and preach sermons to those in the beds around him.

Madge had been on duty all night, and it had been a strenuous one for all. The walls had been scaled, and only a sudden onslaught by the gallant little handful of men had saved the house. She was walking in the garden. At

her feet flowed the river. She was lost to sight bushes. It was a glorious morning. The air from a dozen flowers mingled in her nostrils.

Suddenly the bushes parted, and a white-clad figure stood before her. She started back in

fright.

'You need have no fear,' said a reassuring voice. There was a smile upon Li Hang's face.

'You!' she said. 'What are you doing here?'

'I came to speak with you.'

'Don't you understand you will be killed if

you are seen?'

Though the passion shone in his eyes with a force that made the girl feel faint, Li Hang's voice was modulated. 'I would take that risk for you,' he said.

'But you did not know I should be here.'

'I willed that you should come, since I wanted

you.'

The girl was afraid of him. Strong-minded though she was, she felt he exerted some tremendous influence over her. What it exactly was she could not have explained, but the thought of it made her afraid. 'Why do you want to speak to me?' she forced herself to say.

'You remember what I said to you when you

were so good nursing the sick at the hospital?'
'I told you "No" then; do you think I shall say "Yes" now'—she pointed towards the house—'when I think of those who have been wounded because of you, of the vile deeds, the horrors of the past week?'

'They might have been worse-far worse.' Li Hang made a gesture indicative of many things. 'The house would have fallen but for

'But for you?'

'Do you think we could not take it? A double attack by water and land, and it could not stand for a couple of hours. You have much to thank me for.' He came a step nearer. 'And now I have come for my reward. I ask you again. If you say "Yes" I will take my men away; the English people, your friends, shall be safe. If not?

'If not?' said the girl. Her lips were dry.
'It will fall to-night. And your friends I cannot save.'

'You mean I am to be the price of their lives? If I give myself to you they will be saved?'

Li Hang bowed. 'To celebrate the honour you have done me.' For the first time passion vibrated in his voice. 'You shall have everything you want, my beautiful flower. Your life shall be one long dream of happiness.'

'How do I know you will keep your promise?' 'I swear it by my ancestors, by my hope of

joining them.'

'When do you want your answer?'

'Now.' Li Hang came near.

But she waved him back. 'Listen. To-night, if I agree, I will wave a handkerchief from the roof. You will see it because I will wave it at the full moon. If it is "Yes" I will be here at this spot an hour later.'

She turned sharply on her heel and walked away. Her step was steady until she reached the house. Then she tottered up to her room, thankful that it was empty. Flinging herself down on the bed, she gave way to a misery too deep for tears. She rocked her whole body in an agony of horror. Her soul revolted against the enormity, the degradation, of the idea, until she felt physically sick. A dozen times she went through it all in her mind. If she agreed, Dick would be saved. He could go away with Sibyl, and they could live their life of happiness together. Of what lay before herself she would not, could not, think. On the other hand, if she refused, Dick and all of them must die. She shuddered as she thought of the death that would be theirs. 'God,' she murmured once, 'kill me. Take the choice out of my hands that way.'

She remained in her room until late in the morning, and when she arose it was to write a long letter. It was one which filled many sheets, and cost her much to write. When she had fastened down the envelope she placed it in the bosom of her dress.

With a strength of purpose at which she would have marvelled in others, she flung all thoughts behind her for the rest of the day. Until nightfall the hours were hers, and she had her patients to look after.

It was whilst she was in the sickroom that Dingley found time to have a few words with Sibyl. There was a smile of self-satisfaction on his face. He felt he had done something brilliant. 'If it is to be "Yes," he said, 'let me know. I have arranged with a bootman. These johnnies would do anything for money, if only Sanders and a few of the others had the sense to know it. He will have a sampan here at midnight. We can get away to the open water, and stay until a boat picks us up. It Will you? He will only be for a few hours. was standing close to the girl; his arms went round her, and he rained hot, passionate kisses upon her face. 'You know how I want you!'

Like her sister, Sibyl Marwood was tom between two decisions: whether she should remain and share death with the man she fancied she loved, or seek life and freedom with the man who fascinated her. It spoke eloquently of her character that now she was with Dingley, his arms about her, his kisses still warm upon her lips, the image of the other man gradually

faded from her mind.

'I cannot tell you now,' she said; 'but you will have the sampan there ready?

'Then it will be "Yes"?' There was passionate eagerness in the man's voice.

SISTERS.

To temporise, the girl answered in the affirmative.

Regularly each night an attack was waged against the house. By eleven o'clock the fighting had commenced. The little garrison had taken up its position on the roof, in their frantic endeavours to ward off the fanatical mob without.

It was nearly midnight, a clear brilliant night. Madge shuddered as she saw how brilliant was the moon. There was no doubt Li Hang would see.

Chalmers, kneeling against the rampart, rifle in hand, was suddenly aware she was standing by his side. 'Madge,' he said, 'you mustn't stop here. Go below. It's no place for women.'

Don't send me away,' she pleaded. 'I couldn't stop indoors. I've had a tiring day, and it's so hot in there. Let me stop with you.'

'Poor little girl! you're overdoing it.' There was a note of tenderness in Chalmers's voice.

'You'll let me stay? I could help you to load the guns.'

'Then you must lie down where you can't be seen.' Chalmers drew her down to his side. She quivered at the touch of his hand upon her arm.

'Is this where you are every night?' she said when she had steadied her voice. It had become hallowed ground to her.

Chalmers laughed. 'Unless the general has other orders for me.' His rifle spat out, and a man in the act of scaling the wall fell back with

Madge watched it all with fascinated eyes. Though horror had frozen her heart and numbed her senses, she felt a temporary happiness; she was near the man she loved—she realised how much now. And the remembrance of those brief moments would be a help in the awful days that lay before her.

'How do you think it will all end?' she sked once.

'Oh, they will get sick of this game in time, and then we shall make a sortie, and the fun will be over.' Chalmers lied fluently, cheerfully, so that she might not know the horrible truth—that the food was running short, and each hour might bring defeat and death.

You really mean it?' She clutched his arm, and her eyes looked searchingly into his face.

'Of course I do,' he responded cheerfully. She might have believed him. She was even fighting out in her own mind whether, after all, the handkerchief should fly, whether Li Hang had not lied, and she should take her chance with the rest near the man she loved, when

with the rest near the man she loved, when Sanders came behind them. He did not see the girl.

'Chalmers,' he said in a low voice, so that no

one else might hear, 'another hour of this and it will all be over. We've lost three men. Foster's dead, and Clarkson and Granby wounded. A dozen of the fiends got into the grounds and 1914.]

tried to fire the house. I discovered it only in time. They're dead now.'

It was then he saw the girl. 'Miss Marwood,' he said, 'what are you doing here?'

'I would come. It's cooler than indoors, and I've been helping Dick.'

She knew the truth now. The moment had come for her choice, and she made it willingly, since she had had that half-hour alone with Chalmers. She rose and took out her handkerchief. For a moment it fluttered above the rampart. The next she had wiped her forehead with it. Just for a second she felt faint. 'I think I'll go below now.'

'You should,' said Chalmers.

She hesitated. His face was upturned toward her. It didn't matter; she was going from him; he would not see her again—Li Hang would see to that. She stooped down and kissed him passionately on the lips. 'Good-bye, dear,' she said.

The next moment she had vanished.

Chalmers watched her, the blood coursing through his veins. There was a glad look in his eyes. He made a movement as if to follow her, and then remembered every rifle was wanted now. His absence for a few moments might make all the difference. And if they were saved they had all their lives in which he could tell her of his love. If he had only known! He murmured her name as he fired his next shot, and a bullet winging on its way to a man's death carried with it a man's pæan of love.

CHAPTER VII.

SANDERS had moved away, leaving Chalmers alone with the girl. He had seen her hurry down the staircase, and still he kept aloof. The little he had seen told him his friend would wish to be alone. Suddenly he crossed to the side of Chalmers. As if by magic the firing had ceased, the mob before the house was melting away, and already many of them were only dark shadows. Wondering, he drew Chalmers's attention to the fact. 'What can it mean?' he asked. 'Another hour and they had us beaten. Surely it is not some infernal trick of theirs—a piece of cunning to draw us from our stronghold.'

'We won't be drawn,' said Chalmers shortly. There was another person who had watched the dissolution of the attacking force. The girl turned away from the window. For a moment she stood in the middle of the room. It had become hallowed ground since she had met Chalmers there every day, and to a certain extent had shared the routine of daily life. With a shudder she remembered. Li Hang had kept his part of the bargain; now had come the time for her to fulfil hers.

Her face was set and white as she walked through the grounds. There, on the outskirts, where the water showed a pale blue in the moonlight, stood Li Hang. Moored against the bank was a large sampan. To Madge, as she stepped aboard, it seemed that the blue eyes painted on the prow smiled upon her cruelly, lustfully.

'You have come,' said Li Hang. He could barely disguise his passion. He had played for high stakes—the soul of a woman—and he

had won.

He gave a sharp command to the twelve coolies. The oars dipped in the water, the wavelets lapped against the prow of the sampan, and the shore receded.

Madge took a last look at the house. The windows twinkled friendly eyes upon her, until a bend in the river hid them from sight. could not have analysed her feelings at that moment. Her power of reasoning was gone; her very heart was dead, turned to stone. was a mist, out of which there sounded the creaking of the long sweeps, which took upon themselves fantastic notes; now it was a voice of mockery, now one soft and low, voicing the name of the man she loved-'Dick! Dick!'until she thought she should go mad.

Li Hang sat silent beside her in the stern of the sampan. Presently he touched her arm. 'See,' he said—'if you had not kept your word.' The river had broadened; its banks were hung with trees to the water's edge. Lining the shore on either side was a fleet of black war-junks, their red-and-white eyes gleaming balefully upon

the girl.

They had gone another mile, when the rowers ceased work; the creaking of the sweeps stopped also, and the sampan glided toward the shore.

Looking up, the girl saw a scintillation of lights sparkling through the trees. The thrumthrum of a banjo came out to them.

Li Hang rose, and, stepping ashore, offered in his hand. Welcome to the house where her his hand. you will reign as queen!'

Madge followed him like one in a dream. They passed beneath flowering shrubs, up a winding path, across a small arched bridge, beneath which tinkled a clear stream, into the

The room was furnished in true Chinese fashion, and opened direct on the grounds. Hang pointed to a low couch in a corner of the 'You will rest,' he said. 'I have other work to see to now.' With the entry into his house his tone changed. He was the master, she there to do his bidding. An awful feeling of revulsion seized her. The price was too much to pay. She looked around like a caged animal, feeling one, and that she must escape—anywhere -even to the river, since it spelt peace.

Li Hang was watching her. 'It is useless to attempt to escape,' he said. 'Your friends shall be safe, I swear to you. And you could not go a dozen yards before you would be stopped.'

She heard the door close behind him, and sank on to the couch he had indicated. buried her face in her hands, and her whole frame shook convulsively.

The letter Madge had written in farewell reached her sister's hands a few minutes after she had left the house. Sibyl tore open the Astonishment grew as she read on. Once her face hardened. It was when she read her sister's confession of her love for Chalmers. She laughed harshly. Those few words had told her more plainly than all that had gone before the state of her own feelings toward him. A woman is not kind when she is fighting for the man she wants. So Sibyl Marwood hid the letter in the bosom of her dress when she had finished reading it.

It was midnight when she read it. another sampan glided up to take the place of the one which had borne her sister away.

Dingley came upon her suddenly. He was beside her before she was aware of his presence.

'Are you ready?' he asked. He spoke passionately, his arms outstretched.

'Not yet,' she pleaded; 'not yet. Give me a little while. The sampan can wait?'

'Until you are ready. But the longer it is the more danger of our not getting away. The dawn rises early, and we must be in open water before it is daylight.'

'Very well,' replied Sibyl, 'I will let you know soon.' She hurried away to find Chalmers. Now that she realised, she wanted to be near him, to make sure of him. No thought of the part her sister had played—of the sacrifice she had made that they might be spared to come together-entered her mind. Yet she would have waxed indignant had any one asserted in her presence that she was selfish.

She sought Chalmers in vain. There was still much the little garrison had to do. The Chinese had retired, but for what purpose! The men were not to know the price to be paid for their freedom. So, from past experience, they judged it to be only a forerunner of another more desperate, perhaps more cunning, attack.

An hour was to elapse before she saw him again, and then she was to stand before him in all the nakedness of her soul.

She wandered from room to room; the chatter, even the very presence, of the other women irritated her. She hated those who were married inasmuch as they were possessed by the men of their choice. She even wandered in the grounds. so as to be alone with her thoughts.

Suddenly she came face to face with her father. His face was white and worried. 'Have you seen Madge?' he asked.

For a moment she hesitated. A voice prompted her to deny all knowledge, to destroy the letter; [Christmas Number.

SISTERS. 33

but fear held her. On a wild impulse she tore the letter from her dress. 'Read that,' she said. Her voice was high-pitched and strained.

Mr Marwood took it. His eyes dilated as he ad. His hand shook. 'My God!' he cried. 'My poor Madge! what have you done !-Sibyl, you have not told your mother?'

'No.'

She must know nothing of this. Madge loved

Chalmers! Where is he?'
'I do not know.' Sibyl Marwood could have ecreamed aloud.

Mr Marwood left her hurriedly. In a couple of minutes the two men returned. Chalmers was reading the letter. He read it through in The girl studied his face, but could silence. glean nothing.

'And she cared for me all along!' he said when he had finished. The quietness of his

tones surprised them both.

'Have you spoken to her?' asked Mr Marwood. His voice was stern; his eyes searched Chalmers's face as intently as his daughter's, though for a different reason. Everything was a mystery to him, and, manlike, he misjudged the cause.

'No,' said Chalmers; 'I did not know until to-night that she cared for me, when she came on to the roof to say good-bye. She must have meant it for that. I thought at the time it was only good-night.' His face, his manner, had been quiet only because the blow had stunned him. Now his eyes shone. 'But I love her so much that I am going to her. I will either bring her back or else we shall die together.'

Mr Marwood was reduced to silence.

For a moment the girl stood like a stone. felt frozen. Then she blazed forth. 'You love her!' she cried. 'Dick, you shall not go to her. It is too late.' She rushed forward and flung her arms around his neck. She was oblivious of everything save that she loved him, that he was going from her, and she must make a last appeal to hold him. 'You will be killed if you go to her! It is too late. Stay with me in

The men stood abashed. Chalmers gently disengaged her arms. Truth was forcing itself upon him, a hideous truth. He would have spared the girl, but he must know. 'When did

you get this letter?' he asked.

She shrank from him. 'Why do you ask?' 'Because I must know. When did you get

'An hour ago; perhaps a couple.' She passed her hand across her forehead. 'I do not know. I have lost knowledge of time.'

'A couple of hours ago! Oh my God!' For a moment Chalmers gave way to grief. He covered his face with his hands.

It was only for a moment; but when he released them the girl was gone. Now that her secret was known, now that she had played her last card and lost, she wanted to get away from his 1914.]

searching eyes, from the contempt she read in them, from the knowledge that she had lost him. She ran into the arms of Dingley.

me away!' she gasped.

'In the sampan? Come, dearest; it is ready.' 'Anywhere! I do not mind where, so long as it is away from here.'

In a state akin to madness she rushed upstairs and packed a few clothes, leaving behind her a couple of hastily scribbled lines. They hurried through the gardens, and if anything it was she who was the more impetuous. She wanted to get away from it all.

The sampan glided from the shore, as had glided the one which bore Madge. Thus it was the two sisters left the house that night from causes as diverse as the course which they chose.

Leaving Mr Marwood, Chalmers sought out Sanders. As briefly as possible he detailed what had occurred. He spoke quietly but hurriedly, since there was not a moment to lose.

There was a mist in Sanders's eyes when he had finished.

d finished. 'I shall come with you,' he said. Chalmers shook his head. 'I must go alone. It is useless to sacrifice a life. Besides'—his voice broke for a second-'I do not know what I shall find.' He held out his hand. 'Good-bye. I shall be back in a couple of hours with Madge, or not at all.'

Sanders took his hand in silence. The next moment he was alone.

Chalmers hurried along the road. He took advantage of no shelter; he needed none. That night he was invincible. He was going to save the woman he loved. He realised now how much he loved her. The thought of those awful hours when he had delayed through ignorance made him mad. It drove him to greater speed. He must get to Li Hang's house and know the worst. He drew a revolver as the thoughts flashed through his mind.

Now walking, now running, he hurried along, past lush, green paddy-fields; past camphor-groves and groves of tall and stately bamboos bowing majestically in the wind; through the native village, with its lights and voices; past the ruins of the padre's church. Now the river shone by his side in the moonlight, and he was walking on the shore; now it was lost to sight amidst the foliage. Once a native voice chanting some song broke the silence. The sound maddened him. He could have throttled the man, stamped the life out of him, since he was of the fiendish, accursed race. Instinct guided his feet along paths where in daylight he would have faltered. Her name broke from his lips in agonised tones as he rushed onward.

At the entrance to Li Hang's house he paused. There were lights in several of the rooms. One in a window on the upper floor maddened him. He raised his revolver to fire at it, to put it out, so that there might be darkness. Then he remembered.

He crept round to where he fancied he heard voices. A servant stepped out of the shadows

and stood in his path, spear in hand.

Chalmers leapt upon him. Before the man could utter a sound he had felled him to the ground with the butt-end of his revolver. He left the man senseless, and sped onward to where a light beckoned him, and the sound of voices. His heart leapt as he heard Madge's voice. There was a note of pleading in it.

He had come to the long open windows. For a moment he crouched in the shadow in the shelter of a creeper. It hid him from view, but the light pouring out of an open window fell

full upon his face.

He saw the two figures in the room—the woman he loved and Li Hang. There was a look of fear upon her face. She was speaking rapidly, pleadingly, a note of terror in her voice. The look upon the Chinaman's face turned him dizzy, even as it made him mad with anger. He saw Li Hang advance upon Madge, saw her shrink from him against the wall, overturning a small table as she crouched.

Li Hang's hands had almost despoiled her by their touch, when Chalmers rushed into the room.

The look of terror upon the girl's face turned to one of unutterable joy as she called upon him

by name, her arms outstretched.

Li Hang wheeled round sharply. He was too late. A cry rose to his lips, but it was stifled by a pair of hands which held his throat in an iron grasp. He beat the air impotently; his tongue lolled out. Then he sank on his knees, the vicelike grip still at his throat. His face blackened, he gave a last gasp, then there was silence.

Chalmers rose to his feet. 'Madge,' he said;

'my dear Madge!'

No other word was needed. She came to him with a little sigh of joy, of unutterable happiness. For a moment Chalmers held her at arm's-

length. His gaze wandered from her face to the dead man and back again.

'No, no; you were in time,' she said, and

hid her face again on his shoulder.

For a few moments he let it stay there. Then he gently disengaged her. 'Are you strong enough to come back now? We must get away before he is discovered.' His voice was wonderfully gentle. The wisdom of the ages is granted to some men in a few hours.

'I am ready to go anywhere with you, Dick.' She shuddered. 'Take me away from this.'

He led her through the gardens, along the mud-dried roads, now as fragrant as 'the precious garden,' to where their friends awaited them, wondering what had happened, how it had all ended. Tears of joy were coursing down the faces of some of the men when they entered—a joy too deep for words. It was best expressed in the hands which Sanders silently held out, one to each.

The golden-red dawn of a Chinese morning was streaming in when Sanders and Chalmers sat together chatting in the former's little study.

'There will be trouble over this,' said Chalmers.
'I am afraid I have come as a stormy petrel.'

'Pooh!' Sanders blew a cloud of cigar-smoke. 'We have beaten them off before, and they have lost the master-mind now.'

As he spoke there came the faint reverberation of a gun. He leapt to his feet. 'Listen! We're saved! There's a warship in the bay. Heaven knows what nationality; but that boy I sent down has told them, and we're saved.'

Within a couple of hours they came—two score of English blue jackets, led by an officer, young and enthusiastic.

Chalmers and the girl together watched them arrive. 'Sec,' said Chalmers, 'our trouble has gone with the darkness of the night. There only remains the day—our day.'

TO US WHO KNOW THE END.

To us who know the End, life's long road lies
Winding for ever upward to the light!
And though black mists ereep up to blur the sight
Of that celestial glory, though our eyes—
Poor, foolish, tear-dimmed eyes—scarce see God's skies,
And weary feet, slow stepping through the night,
Hold on so hardly to the road of Right
Which climbs unto the land where e'en Death dies;
Yet there is joy upon the toilsome way,
And words of cheer and comfort from one Friend,
And bubbling springs of water when the day
Has drained our hearts of courage. Love can send
Such strange, sweet strengthenings to us who say
Unto our fainting souls, 'I know the End!'

KATE MELLERSH.

REMORSE.

T was a hot July day in northern Switzerland, one of those days which redden the cheeks of apples and melt the hard hearts of pears, and not infrequently incline elderly people to an afterdinner siesta. This had been the effect upon both Herr Schwarzmeier and his wife, one of whom was nodding in his arm-chair, while the other, scorning pretence, had frankly stretched

herself upon a sofa.

Both Grete and her guest Gusti agreed that the inside of the house, with its lowered venetian blinds and its drowsily buzzing flies, was extremely dull. Outside it would no doubt be hotter, but could scarcely help being more amusing; having come to which conclusion, Gusti, being the leading spirit, took her hostess by the hand, and, tiptoeing past the arm-chair in which snored Grete's grandfather, they both gained the open air with a gasp of deliverance.

Not that there was very much to do even out here, since to race up and down the veranda would have been to call down upon one's own head angry protestations from abruptly awakened slumberers, and before the shadeless stretch of gravelled courtyard even eight-year-old enterprise somewhat faltered. To be sure, from beyond that sun-baked desert there smiled green-tinted shade, showing invitingly from between the curiously wrought iron bars of an ancient gateway; but that was alien ground, the garden entrance of neighbours who were 'summering' in the mountains, very much to the disgust of Grete, who only last week had regretfully watched the departure of a small troop of playfellows. She looked wistfully across, pleasant experience having taught her that it was not only leaves that grew upon the branches behind that iron gate. Grandmamma had very strict ideas on the subject of trespassing even on acquaintances' ground; but then she was so fast asleep.

'I wonder if the gate is locked,' she specu-

lated aloud.

'Supposing we try!' suggested the practical

A minute later they stood at the entrance of

the forbidden paradise.

'Not locked! They must have forgotten!' exulted Gusti, as the heavy handle yielded to

the pressure of small fingers.

'I am sure they would not mind!' said Grete, by way of a sop thrown to conscience, as the threshold was crossed.

It was more of a miniature orchard than a garden, an ill-kept but luxurious tangle of fruittrees, around whose feet dishevelled-looking strawberry-plants crawled; while against the high 1914.]

enclosing walls raspberries flung their arms, as though in the endeavour to scale it. There was not much to look for on either of these, which, before the exit of the Sellheim family, had been exhaustively and conscientiously plundered, and with no too squeamish regard to the exact state of maturity; but some late cherries still dangled overhead, and some early peaches looked almost

'Supposing we try!' said Gusti again; and Grete dumbly acquiesced, though not without another brief wrestle with conscience. But, after all, one has to do something for the enter-

tainment of one's guests.

'I'm sure they would not mind,' she repeated as she held down a branch for Gusti to reach a promising-looking peach. From between the leaves she looked up somewhat awe-stricken at the green-shuttered windows in the tall yellow house that towered above, dead and silent in the summer sunshine, against a background of snowcapped mountains; then cast a glance around her as though half-expecting to see the astral bodies of Lina and Fanny, or of the tiny yellowhaired Mizzi, lurking in the green shadows.

'Peaches don't keep, nor cherries either,' she remarked. 'We won't touch the apples or the pears, because these will still be good when they

all come home.'

'And, besides, they're not ripe,' completed

'How about the plums?'

The plums, alas! were as green as the lizards sunning themselves on the top of the wall, with scarcely a bluish blush here and there to distinguish them from their own leaves, and hard as the pebbles under foot.

'Tiresome things!' said Gusti, having ad-

ministered divers ineffectual pinches.

'They'll be ripe when Lina and Fanny come back,' calculated Grete; 'and then I know they'll give me some.'

'Greedy thing, to think only of yourself! They won't give me any, because I'll be away

at school by that time.'

'I'll send you those they give me-really I will-or at least half of them. One can send

plums by post, can't one?'

'You might try, at any rate,' said Gusti, true to her usual method of solving difficulties. 'And you needn't make the parcel too small when you're about it. I once heard some one say that to send five kilos doesn't cost more than to send one, so it would be a waste to send less than five. And of course it's only the really good ones that are worth the carriage—good, fat plums like that one up there on the tip of the branch. Isn't it just going to be a beauty? Oh Grete, I've got such a splendid idea!'

'About the plums?'

'Yes, about just that plum in particular. Let's make a mark upon it; and when the plums are ripe you must manage to be present at the gathering, and must get hold of that plum. You know what tree it is, and it's on that big branch that grows toward the wall, quite at the tip. You can't miss it if we make a proper mark; and then you'll send it to me, wrapped up in silver paper, so that I'll know it from the others. It will be so exciting to see it again when I'm in that horrid school.'

'Oh Gusti, you are clever!' exclaimed the admiring Grete, to whose tender imagination so far-fetched and complicated an idea could, of

course, not fail to appeal.

'Promise that you'll do it!'

'Of course I promise. But how are we to make a mark? The rain would wash away pencil.'

'No, pencil won't do, of course; nor ink either. It must be something more solid. Let's think.'
For a full minute they both did so intensely.

'A piece of twine tied round the stalk?' suggested Grete.

'That might be noticed.'

'Or a cross cut into it with a penknife?'

'I fancy that might spoil the plum. Oh Grete, I think I've got it! A pin run into it quite deep, with only the head looking out. Nobody will notice that, and it will stand the rain. I've got a pin in my sash.'

'Gusti, you are really too clever!' breathed Grete, while already her resourceful friend was

searching for the pin.

'I'm a year older,' said Gusti modestly.

'There!' she presently pronounced, when with firm little fingers she had pushed the pin into the hard flesh of the plum up to its tiny glass head, while once more Grete held down the branch. 'If any one sees it he'll think it's a dewdrop. Mind you remember the exact place! Hadn't we better make a chart of it?'

'What's a chart?'

'A sort of plan they make of hidden treasures. They always do it in books.'

'But we haven't got any paper.'

'I've got a pocket-book. I got one on my birthday, and I don't mind tearing out a page. Yes, I think that's best.'

The consultation over the chart was somewhat ardent, and evolved such results as: 'Plum 26 on branch 7 (counting from top) of tree 2 (countink from wall), one-half yard higher than Grete's head.' This was supplemented by a rough drawing of something which purported to be a tree, but which an unprejudiced observer would have been more likely to take for a discarded broom, besides a rich trimming of arrows pointing about in various directions.

'There! that will do!' decided Gusti, as she

straightened herself from her squatting position. 'You can't miss it now. It will be so exciting to see what happens to the pin; and of course it's a dead secret; otherwise it's no fun.'

it's a dead secret; otherwise it's no fun.'
'Of course!' echoed Grete with another
furtive glance at the shuttered windows. Was
there really nobody spying upon this secret
pact?

'But now let's get back quickly before

grandmamma awakes!"

In the first days of September the green shutters in the tall yellow house opened once more to let in sunlight and let out the voices and laughter of children. Every moment of Grete's leisure was now spent in the walled garden, not so much enjoying the society of Lina and Fanny and that of their two boisterous brothers, as anxiously watching the tree on which hung the marked plum. Since that surreptitious visit in Gusti's company she had not again set foot within the orchard, whose gate had been locked by some busybody. It had, therefore, been impossible to watch the progress of the plum, or judge of how the pin agreed with its constitution. Even now the issue remained dark, since the unwatched moment necessary for an investigation had not yet presented itself. Grete had to content herself with knowing that no wholesale gathering of plums had yet begun, though it was impending, for already the branches were beginning to bend under their purple load. Frau Sellheim was famous for her jams, and the particularly sweet plums of this tree were yearly destined to garnish the store-room. All depended upon Grete's being on the spot at the critical moment and taking possession of the branch in question, which tactfully offered assistance should make quite feasible. Yet the thing was not quite so simple as it had appeared in July. The nearer the great moment approached the more feverishly did Grete study the carefully treasured 'chart, without, however, seeing her way out of the difficulties starting up on all sides. For, in the first place, owing to new shoots and denser foliage, the mere look of the tree had changed considerably during the last eight weeks, so that branch No. 7 had become more difficult to identify, particularly as branches which, on the day of the pact, had been half a yard above Grete's head had now sunk by their own weight to almost the level of her shoulders. And the plums in ripening had grown so dreadfully like each other; and there were some on the ground, dropped before their time. Supposing the plum was among these! Perhaps one of the worm-eaten ones being pecked at by the hens! What a disastrous end to the beautiful secret! What a disappointment for Gusti-poor Gusti!-who had already started for her distant school!

But it was on the day itself that bewilderment reached its height. Lina had indeed faithfully kept her promise of summoning Grete; but amid the joyful pillaging of branches, from which the

boys pulled the plums in handfuls, while even little Mizzi insisted on holding one of the baskets into which they rained, how was she to keep the chart in her head, and act accordingly? In vain did Grete's finger surreptitiously feel along the skin of each plum that seemed likely; no round little point met her touch. Had it perhaps grown so deep into the ;plum as no longer to protrude? Here was a new and unforeseen contingency with which Grete's brain did not feel able to grapple; or was this, after all, not the right branch?

'I think that's all,' cut in Frau Sellheim's cheerful voice to these anguished reflections.

The baskets were full and the branches stripped. The marked plum had escaped her for ever. The moment of realisation was so poignant that before the eyes of her astonished friends Grete burst into tears.

'Dear me, child, have you hurt yourself?' asked Frau Sellheim, while Fanny and Lina put affectionate arms around her.

'No, no; only I—I've lost something,' sobbed Grete.

'Lost what?' came in chorus.

But Grete had recovered herself in time to salve the pact. The name of the object lost was not to be extracted from her.

'Don't bother her,' said good-natured Frau Sellheim. 'I know another way of drying tears. Here's a basket of plums to take home, Grete. Tell your grandmother that that's my thanks for your diligent help.'

Grete quickly dried her eyes. Might not a kind Providence have arranged that the plum should be among these? Before handing them over to her grandmother she resolved to submit each to an exhaustive examination.

The result of the examination, which took place in a retired spot, was another blank. There now remained no doubt. The marked plum was lost, traceless in an ocean of its own kind.

And yet the pin could not have vanished. What had happened to it? Grete uttered a sudden, sharp exclamation. She had pictured to herself some one biting into that plum and pricking his or her lip, or gashing the tongue upon the pin. Or, worse still, not pricking the lip, but actually swallowing the pin!

That night Grete had bad dreams; and next day, during the siesta hour, she wrote a letter to her friend:

'Dearest Gusti,—I don't know how to begin, because I'm so unhappy. I know you'll say it's all my fault, and perhaps it is; but what could I do? The plums are all gathered, and I couldn't find the one with the pin, though I found the branch again—at least I think it was the right branch. And, oh Gusti! I'm so wretched! It is dreadful not to be able to send you the plum; and there's another thing that frightens me; for just supposing that Lina or Fanny or Conrad ate the plum and swallowed 1914.]

the pin! What would happen? Would they die? And would we be murderers, and be hanged? Please write quickly and tell me.—Your miserable GRETE.'

To which in due time there came answer:

'Dear Grete,—Don't be a goose. Of course it's a pity about the plum, and I can't understand how you couldn't find it out, since you have the chart. But it's stupid to be unhappy about things that can't be helped. Besides, I don't mind it as much as I thought I should, because school is really a much nicer place than I expected, and I've made a lot of nice friends already, some of them bigger than I, and it makes one feel quite grown-up. I'm beginning to think that that affair with the pin was very stupid and childish, and I can almost laugh at it now. Of course we're not murderers. You always exaggerate things. You told me yourself that Frau Sellheim makes jam of the plums, and of course she has to cut them open for that-I've seen mother do it-and she'd be sure to find the pin; and what does it matter if she wonders how it came there? And if she doesn't find it, that just means that it was in one of the fallen plums, and that a hen has eaten it, which wouldn't matter, as all hens get killed in time. At any rate, whatever you do, be sure to hold your tongue. I shouldn't like any one to know how childish I was only two months ago, and things do get round so funnily sometimes. And it would be very provoking if it got to Irma Fekete's or Mella Weisshappel's ears. We sometimes have great fun together.'

(Two pages of rapture over the novelty of

school life, followed by a P.S.)

'P.S.—Of course even though you can't send the plum with the pin, that's no reason why you shouldn't send other plums. Mella gave me some excellent apples lately which she got from home, and Irma some grapes; the plums would do beautifully to give in return.'

This letter, by suggesting a favourable solution, had a relatively soothing effect upon Grete's mind, particularly as a week had now passed since the gathering, and all the inmates of the tall yellow house seemed to be enjoying their normal health.

'Do you eat many plums?' she had asked once or twice.

'Oh, a fair number,' answered Conrad, to whom one of these questions was addressed. 'Yesterday I think it was forty.'

'And you feel quite well?' asked Grete with a spasm of terror at her heart.

Conrad stared. 'Of course I do. What are forty plums? I've eaten as many as sixty at a go.'

'Has your mother made all the jams yet?' Grete questioned Lina on the day she got Gusti's letter. 'Very nearly all.'

'And-and has she said nothing?'

'Yes. She said that there are fewer worms in the plums this year than last.'

'Then she does cut them open?'

'Yes, to take out the stones; but only those for the jam; those for the compôte are cooked whole.'

Grete retired into a corner in order to think this over. The hopes attaching to the treatment of jam plums were annihilated by this revelation concerning the compôtes, since in one of these whole plums the murderous pin might at this moment be still sticking. The old terror had

risen again full-grown.

Of course there was one way out of it: to confide in her grandparents, and get them to warn Frau Sellheim of the danger lurking in her household. But to do this implied having to confess the raid performed in July; and Frau Schwarzmeier was far too forbidding an old lady to make confession easy, and grandpapa far too much in awe of her to be of any use in such a matter. Besides, there was that solemn pledge of secrecy given to Gusti. No, clearly there was nothing for it but to bear the load of one's black secret in silence, and put one's hope in Providence or in guardian angels. It was now that Grete's prayers took on a complexion of fervour hitherto lacking. To each separate guardian angel of each single individual did she personally address herself. 'Please, dear angel, keep Lina from eating compôte!' 'Dear angel of Fanny, don't let her swallow the pin!' Such was the tenor of the petitions which rose daily from the side of a small white bed. And it would almost seem that they had found a hearing, for week after week passed without anything dreadful happening-in fact, without anything happening at all.

Already the prayers were growing more mechanical and Grete's flagging appetite returning, when one morning Frau Schwarzmeier appeared late at breakfast, and said to her grandchild in an even sharper tone than usual, 'Mind you don't go across to the Sellheims' to-day.

One of the children is ill.'

With a clatter Grete's spoon dropped on to her plate, as, wide-eyed, she stared at her grandmother. 'Ill?' she repeated stupidly.

'Yes, ill! Is that a reason to stare like a new-born calf? I'm sure those children run wild enough to catch anything agoing.'

'Who is it?' Grete managed to ask with dry

lips.

'The little one-Mizzi.'

'And what is the matter with her, granny?'
Frau Schwarzmeier reflected for a moment.
'She has got a sore throat.'

'And how'-

'That's enough questions,'came tartly. 'It's time you were at your scales. Finish your breakfast and run off.'

'I've finished my breakfast, please, granny;

I'm not hungry to-day.'

'Bless the child! is it Mizzi's illness that has taken away her appetite? I always said she was a mere bundle of nerves—the new sort they make nowadays. Well, well, get off to your scales, but mind not a step across the yard, and not a word exchanged with any of the Sellheims!'

Grete walked out of the room, feeling rather like a drunken man; and, sinking down upon the music-stool, she covered her face with her hands. A sore throat! That meant, of course, that the pin had stuck there. Would they get it out in time, or would it choke her? And little Mizzi, too; the smallest and most delicate of them all! Oh, what had her guardian angel been about?

That day another letter was written:

'Dearest Gusti,—It has happened, after all, and it is little Mizzi who has got the pin in her throat. She is very ill. The doctor has been here twice to-day, and I am not allowed to go over. Oh Gusti, what are we to do? If she dies I think I shall die too. Oh, please write soon, and say your prayers hard!'

To Grete the four or five days that followed were one long nightmare. It would have been difficult to decide which was more unbearable, lesson-time or play-time. Perhaps the lessons were almost preferable, since they forced her thoughts at least temporarily to desist from the one subject which obsessed them; while playtime consisted now in watching the tall yellow house across the courtyard, and glueing her eyes to the window behind which she knew little Mizzi to be tossing in fever. The most agonising moment of the day was that of the doctor's arrival. During the interval between his appearance and disappearance it became quite impossible to think of anything else, even in presence of the music-master. If circumstances allowed it she would study the doctor's face as he came out of the house opposite, and endeavour to draw conclusions from his expression.

'Whoever would have thought that the child would take it so much to heart?' commented Frau Schwarzmeier to her husband. 'She has quite gone off her food.'

On the sixth of these agonising days, and before an answer had come from Gusti, another much-blotted little note was despatched:

'It is all over, Gusti; Mizzi is dead, and it is our fault. I heard the cook say to the postman that she had choked. Of course that was the pin. Oh, what are we to do? Ought we to go to the police ourselves? I think people sometimes do that, and I would rather tell the police than granny. Tell me quickly what to do.

Your unhappy Grette.'

This time the answer came by return, and the handwriting alone was enough to show that even Gusti's robust optimism had received a severe shock:

DEAREST GRETE'—said the straggling lines, penned surreptitiously in the shelter of a desklid-'your letter has made me quite ill. I did not want to believe it at first, but I suppose it must have been the pin, after all. Dear darling little Mizzi! like a live wax doll, and now she is a dead one. But it is all my fault, not yours; it was my idea, you know; you only agreed. If I could make her alive again by being hanged I swear to you I would; but since it would be no use I don't see the object. I've been thinking about it, and I've come to the conclusion that there is no sense now in telling the police or your grandmother or anybody. It seems to me that the only thing to do is to do penance somehow. I don't quite know how, but I shall think about it and write again. I must stop now, because the class mistress is coming.'

The correspondence between the two who shared the guilty secret was not the only one occasioned by the vagrant pin. Here are some specimens:

From Frau Schwarzmeier (Wyl) to Frau Brunner (Zurich).

'My DEAR AGNES,—Aware as I am of the kindly interest which you take in your goddaughter's welfare, I think it best to tell you that Grete is giving cause for anxiety. Ever since the death of one of our neighbours' children she has been in a state of mind which completely baffles me. She always was an impressionable little thing; but the cause here does not seem to me to be in proportion to the effect, Mizzi Sellheim having been far too young to be a real playfellow. At the news of her death Grete was seized with such a convulsion of weeping that she had to be put to bed; and on the day of the funeral she was in such a state that I sent for Dr Braun, though he couldn't discover anything wrong. But the strangest part of all is the persistence of the impression. She neither eats nor sleeps as she ought, and is visibly losing flesh. Dr Braun is of opinion that a thorough change of surroundings is the only thing to dispel this morbid state of mind. That is why I am writing to-day. If you could arrange to have her for a few weeks, I fancy that a dose of town sights might effect a cure by chasing off whatever fancies may be possessing her.'

'IDEAREST GRETE,—I have been thinking about it hard, and also reading up things, and I find that the real old penitents used to wear sack-cloth and ashes, which I'm afraid won't do for us. The next best thing to that is hair shirts 1914.]

and scourging one's self. Dry peas in one's shoes are said to be an excellent way of working The hair shirt and the scourges off one's sins. would also be very difficult to manage, as they would be found out; and, besides, I don't know what sort of shops one gets them at; but I think the peas are quite possible, and also I think we ought to do something with a pin; that would be so appropriate. Supposing we each always carry a pin about with us and prick ourselves with it at least once a day at a given hour-for instance, the hour at which little Mizzi died; only, I hope it wasn't in the night, because I don't think I could keep awake. But I think that's a splendid idea. Write to me at once about the hour.'

From Mademoiselle Loti, Principal of the Ladies' School at Lucerne, to Frau Mannstein, St Gall.

'Honoured Madame,-In answer to your inquiries regarding the progress made by your daughter Gusti, as well as her conduct generally, I am somewhat at a loss what to say. She began by taking to school life most kindly, as well as to her studies, though her great liveliness of temperament made her somewhat difficult of control. Lately, however, and quite abruptly, her character seems to have undergone a complete transformation. Her gaiety has vanished, making her indeed much more easy of management, but with it, unfortunately, the interest in her studies seems to have evaporated. I hesitate to say so, but certain symptoms seem almost to point to an access of religious fanaticism. Not content with the usual devotions practised, she has been seen to steal off to the chapel during the recreation hours, and has been surprised dragging herself along upon her knees, after the fashion of medieval penitents. Also, one of the servants tells me that repeatedly while she was cleaning her shoes dry peas have fallen out of them. Apparently they did not get there by mere chance, for when questioned, Gusti seemed confused and could give no clear

'Of course all this may mean nothing more than a passing fancy, such as I have frequently observed in children of that age, yet I feel it my duty to mention the matter.'

'Auntie,' said Grete one day, after she had been for about a week in her godmother's house, 'why did you say this morning that granny ought to have sent me to you sooner, before little Mizzi died?'

That she was able to pronounce the name without bursting into tears might be taken as the first symptom of improvement, wrought by the Zurich atmosphere.

Frau Brunner, who was an ideal representative of the 'fair, fat, and forty' type, in which the Swiss city abounds, looked up from the cup of coffee in which she was luxuriously dipping a slice of toast.

'Because diphtheria is dreadfully catching, my dear, and you were living next door to the Sellheims.

'What is diphtheria?'

'It is a-well, it's something you get in your throat, a sort of skin that grows there, and that ends by choking you.'

'But it doesn't grow there of itself, does

it?'

'Not unless you get the infection.'

'Or if you swallow something? I thought perhaps,' added Grete quickly, meeting her godmother's astonished eyes, 'that you might get it if you swallowed something by mistake—something hard, I mean; for instance, a needle or a pin. You might die of that, mightn't you?'

'I suppose you might; but that has nothing to do with diphtheria.'

'And did Mizzi really die of diphtheria?'

'Yes, certainly. Didn't you know that?'

'And of nothing else—really?'

'There was nothing else wanted. Diphtheria kills hundreds of children yearly, though they do make a vast fuss about that new serum.

For a minute Grete sat quite still, then said, with a deep catch in her breath, 'Why didn't granny tell me that?'

'Did you ever ask her?'

'No, I didn't. I didn't dare to,' added Grete

'Funny brat!' laughed Frau Brunner as she finished her toast.

Grete slept badly again that night; but it was not remorse that kept her awake; it was It could not yet be called certainty, since 'diphtheria' was far too vague a conception to give concrete impressions. People who did not know about the pin might easily make mistakes. Still, this new idea opened a door to the prospect of finding that perhaps, after all, one was not a murderess. Grete resolved at once to do two things: firstly, to write to Gusti to-morrow; and, secondly, to lose no opportunity for gaining information concerning this mysterious illness that choked you.

The letter went off next day, and produced

an even greater effect than had been intended. In the reply that promptly came, Gusti literally jumped at the chance of escape thus offered.

'Of course, if it was diphtheria, then it's all right,' she wrote. 'I mean that it is not our fault, though it is just as sad for poor Mizzi.'

That same day the penitential peas were shaken out of Gusti's shoes, and the expiatory pin was discarded for good and all. It was only a week later that Mademoiselle Loti had the satisfaction of reporting to Frau Mannstein that her daughter had recovered both her gaiety and her interest in study.

Grete did not get off so easily as that. was very slowly indeed that the hope in her mind became a certainty, while the surviving doubt gave to her budding mind a certain colouring of gravity which was to remain through

'You cannot have shed so many tears over your little sister as I did!' It was Grete who said it to Lina Sellheim one autumn day when they were eating plums together in the walled

garden.

The skirts of both girls were down to their ankles now, and their hair on the tops of their They had begun by eyeing each other mistrustfully; for, in the ten years past, circumstances—her grandmother's death among them -had drifted Grete away from this provincial nook, making strangers of the old playfellows. But, little by little, the atmosphere worked; for, although the fruit-trees staggered against each other like so many crippled veterans, and had grown beards of lichen, neither the tall yellow house, nor the green shutters, nor, least of all, the snow-crowned mountains of the background, had changed in the interval.

Presently Grete and Lina were laughing together over the story of the pin, which had never been told before, but which to-day had

grown ripe for the telling.

'Though I hope I shall never commit a real crime,' said Grete as she furtively wiped her eyes-for it was not laughter alone which the reminiscence provoked—'I shall not go to my grave without knowing the taste of remorse.'

A POWER ABOVE.

THE rose-flush'd morn, the evening's tender gray, The foam of blossom on a thorny spray,
The singing wind whose every breath is sweet,
The humble daisy curtsying at my feet,
The wonder of a bird's swift, tireless wings, The charm and mystery of growing things, All prove to me there is a Power above Whose grace is infinite, whose name is Love. E. MATHESON.

THE PROFESSOR'S DIAMONDS.

By T. W. SPEIGHT.

CHAPTER I.

T was Professor Van Hoogen's eightieth birthday, and the one day of the year on which he dined at the, to him, preposterous hour of seven o'clock. On all other days dinner at Hill Crest was served at noon, as had been the custom when he was a Leyden student sixty years before, and he had never seen any valid reason for changing it. It was to serve the convenience of his brother Anton, who made a point of dining and sleeping at the Crest on the Professor's birthday, that the dinner-hour was thus postponed.

For the last half-dozen years the Professor's home had been at the metropolitan suburb of Highgate. He had fallen in love with, and had bought the lease of, Hill Crest, a two-storied, red brick domicile of the Georgian era, containing about a dozen rooms, standing secluded in its own grounds, and thus securing to its owner the absolute quietude lacking which he found

it impossible to prosecute his researches.

Professor Van Hoogen's name was a familiar and esteemed one in scientific circles both at home and abroad. He had devoted his life to researches and experiments in mineralogy, and in a lesser degree to geology; and in his younger days he had travelled extensively in the prosecution of his studies. He was a little wisp of a man, somewhat frail-looking, but on the whole carrying his fourscore years lightly. There was nothing austere about him. He was always cheerful and sweet-tempered, with a certain engaging, almost boyish, simplicity of manner which he had brought with him from his native village on the Scheldt, and which the world, with its many elbows and its rude rubs, had left unimpaired.

With the Professor, who had never married, lived his great-niece, Anna Vosmer, who had been born and brought up in England. Anna, who was now twenty years old, had lost both her parents while still a schoolgirl, since when her home had been at Hill Crest. With her uncle's cordial consent, she had just become engaged to a young electrical engineer, Roger Denaby by name, and to-day's birthday-dinner was to be regarded in the light of a formal

recognition of their betrothal.

A chill and threatening October evening closed in. The curtains were drawn, the electric bulbs flashed out, and a cheerful fire burned in the grate of the cosy drawing-room at Hill Crest. Roger Denaby arrived in good time, having walked over from his lodgings half a mile away. 1914.]

After greetings were over, the Professor, with fine consideration, left him and Anna together. He was nearly sure that he heard the sound of a kiss as he was shutting the door. He chuckled softly to himself. 'Oh the happy time!' he murmured.

Anna Vosmer was a tall, fair, slender girl, with hazel eyes which beamed with vivacity and good humour, and with a charming smile that came and went on the slightest provocation. She was dressed in white, and her only ornament was a necklace of pearls with a sapphire clasp. She crossed to the hearth when her uncle had left the room, and sank into an easychair. Denaby promptly followed, and stood looking down at her, an elbow resting on the chimneypiece. The love-light shone in his eyes; for him she was the fairest being on earth.

'I wonder how soon I may venture to speak to your uncle about our marriage?' he said. 'I know of no reason why our courtship need be a

protracted one.'

The girl looked up with startled eyes. 'I hope you won't think of doing anything of the kind for a long time to come.'

Why not, pray?'

'Because, Mr Audacious, I shall never agree to leave uncle, and I hope he will live for many

Denaby twisted the ends of his moustache. 'With all my heart I hope the same as you do. He's a dear old boy, and I'm afraid that having to part from you would be a severe wrench to him.'

'It is one which I have no intention of inflicting upon him.'

'I am the last man to wish you to do so. For all that, our courtship need not be a very long one.'

'What do you mean?'

'As you know, this house is larger than your uncle's requirements. Several of its rooms, I've heard you say, are unoccupied and have never been used. What, then, more simple, when you and I are made one, than for me to shift my few belongings over here and become your uncle's tenant? There's plenty of room, and I should incommode nobody. What say you, Miss Anna Vosmer?' He was regarding her with the utmost placidity.

Anna sprang to her feet, a fine rush of colour in her cheeks. 'Who ever heard of such a preposterous and impudent suggestion?' she exclaimed. Then, as her eyes met his, her lips

curved into a smile. 'But you are only trying to tease me. How silly of you!'

'No; I'm quite serious—honour bright!'

But at this moment the Professor entered. 'Five minutes past seven,' he said as he glanced at his watch. 'But punctuality is a virtue never cultivated by Anton.' Hardly had he spoken before there was a knock and a ring at the front-door. 'Ah, here he is!' he exclaimed; and with that he went out into the hall, where greetings were exchanged between the brothers which lacked nothing of cordiality on the Professor's part. Then they entered the drawing-room together.

Anton Van Hoogen, who was his brother's junior by fifteen years, was a short, podgy man, who looked as if he were over-addicted to the pleasures of the table. He had fairly good features; but their expression was at once mean and crafty, and his small greenish-gray eyes had the frosty glint of one whose interests never radiated beyond himself and his own petty concerns. If you had chanced to inquire what his profession or business was, you would have been told that he called himself a 'general dealer,' whatever that term might imply. He wore his evening clothes as if unused to them, and there was a pervading air of shabbiness, almost of mustiness, about him. To Anna it was a standing wonder how the same parents could have brought into the world two sons so widely dissimilar in every respect. To her seeming there was an unfathomable gulf between the brothers. Needless to say, Anton Van Hoogen was profoundly antipathetic to her fresh and glowing sympathies.

'My brother, Mr Anton Van Hoogen—Mr Roger Denaby,' said the Professor by way of introducing them. The two men bowed. Each on the instant conceived an aversion for the other. 'When you and Mr Denaby meet next, brother,' continued the Professor, 'he will probably have become a member of the family, seeing that he and my dear niece have just

become engaged.'

'Is that so?' said Anton, as his eyes met Denaby's with a malevolent gleam in them. 'Permit me to congratulate you, sir. You are a very fortunate young man.'

'My own opinion exactly, sir,' was the cool

rejoinder.

'I suppose I ought to congratulate my niece, but marriage is such a lottery!—How do you do, my dear? It's upwards of four months since I was last at the Crest, and, 'pon my word, in the interval you have blossomed like one of my brother's pet roses.' He spoke smilingly, but his voice had a covert sneer in it. It was a very limp hand that his fingers clasped for a moment.

Dinner was announced a minute later.

The talk at table was chiefly between the Professor and Denaby, both of whom were

interested in the ever-changing problems of aviation. Anton was too intent on his food either to listen or talk. It was evident to both the young folk that he was restless and nervously ill at ease. But his venomous thoughts were busy. To-day, more clearly than ever before, the conviction forced itself upon him that when Felix should die-and he couldn't in reason expect to live much longer—he would bequeath everything he possessed, and he must be worth several thousands, to his chit of a niece. It was outrageous; more, it was positively wicked. Was his brotherly affection, then, a thing of the past and clean dead? There had been a time when—but that was long ago. Since then something had occurred which he preferred not That Felix had forgiven him was to recall. what few brothers would have done. How he hated that girl!

By this time the weather had changed for the worse. Heavy rain was falling, and while they sat at the table the lightning began to flash and quiver, and the thunder to roll its great chariots across the sky. Before long the Professor said to Denaby, 'You cannot go home, my friend, through weather like this. We must put you up for the night, and you can leave as early as you like after breakfast. Occasionally a friend or two drop in upon me from the outside world from which I have so long been a deserter, and we always keep a couple of beda in readiness for such birds of passage.' He looked inquiringly at Anna.

'The rooms are in readiness, as they always

are,' she said.

Denaby's objections were easily overruled.

On the table were two kinds of wine, both of which Anton did not fail to sample liberally; and within his reach was a bottle of champagne, which he deftly uncorked when dessert had been brought in and the servant was gone 'Charge your glass, sir, and then charge my niece's,' he said to Denaby as he passed him the bottle. Then he filled his own glass and rose to his feet.

Anna guessed what was coming; nor was she mistaken. It was the same little speech, almost word for word, that she had listened to or several anniversaries. It abounded with sentimental platitudes, and wound up with the timeworn tag, 'Let brotherly love prevail!'

Then he nodded meaningly to Anna and

Denaby, who stood up, glass in hand.

'I drink to the health of the best of brother and the best of men. That he may live to enjoy many happy and prosperous years is, I feel sure, the heartfelt wish of all of us,' Anton concluded, and emptied his glass at a gulp.

'Dear uncle, my love and all good wishes,'

said Anna, with brimming eyes.

'Your health, sir,' said Denaby simply as he bowed and drank.

The Professor replied in a few appropriate

words not untinged with emotion.

Presently they returned to the drawing-room, where, on the centre table, more wine had been placed, together with an assortment of glasses, a squat earthenware bottle of spirits, lemons, sugar, and a box of cigars.

'I have still a few bottles of the old Schiedam left that you have sampled before,' said the Professor to Anton, 'so help yourself, and I'll join you presently. But first I'll ring for hot water. As for our brace of lunatics, they can doubtless amuse themselves at the piano.'

The 'lunatics' asked for nothing better. They would be virtually alone, and to be in such close propinquity, and able, unheard, to whisper sweet nothings to each other, was felicity enough for

the time being.

So the two elders settled themselves comfortably with their toddy before them, the Professor smoking a mild tobacco in his big china pipe, and Anton a cigar. The latter's first tumbler did not last him long, and presently he helped himself to another. By now his nervous restlessness was no longer so noticeable. The Professor was in a garrulous mood, and inclined to be reminiscent, recalling to his brother's recollection scenes and incidents of their boyhood's days in their humble home in a village on the banks of the Scheldt—how he, Felix, used to carry his little brother on his back to and from school, how he taught him to skate, and so on.

Anton—who cared nothing for such senile prattle, but felt constrained to humour the old man, listening with one ear, and now and then giving vent to a short, rasping laugh—had other matters to occupy his mind. It was his intention in the morning to ask his brother for a loan—that was what he termed it—of a hundred pounds; but, with the recollection of a certain unpleasant episode of a dozen years before still fresh in his memory, he was doubtful how Felix would receive his request.

At length the Professor paused while he charged and lighted his pipe afresh, and Anton seized the opportunity to divert the talk into another channel. 'By the way,' he began, 'do you still continue to shut yourself up for as many hours a day in that mouldy laboratory

as you used to do?'

'Mouldy, do you call it! Well, well! How many happy hours have I not spent there! But I really think that before long I may perhaps feel inclined to shorten my working hours a little—just a little.'

'Oh, I shall be so glad!' It was Anna who spoke. She had turned on the music-stool, and

was facing her uncle.

The Professor laughed in his gentle way. 'I know, my dear, that you would fain make an idle man of me, but at my time of life it is no easy task to break through the fixed habits of years.' His face suddenly became grave. 'Some 1914.]

six or eight months ago I received from my friend Professor Magson a tiny package, the contents of which consisted of a very minute sample of a lately discovered substance which, in his accompanying note, he described as being an emanation of certain black oxide deposits at present found only in a few widely scattered It was my friend's firm belief that places. the substance in question possessed most uncommon powers of radio-energy; and, his health having broken down, he was desirous that I should experiment on it with that end in view; but he omitted to state the particular line of research to which he was wishful that my experiments should be directed. He promised to write me more fully in the course of a few days, but in less than a week he was dead. Since then I have been like a man groping in a twilit cavern for something, without knowing exactly what, which I failed to find, but which I had an intuitive assurance was there. At length a ray of light pierced the obscurity, and now at last, after months of close application, my search after a dimly guessed at truth has been crowned with success. Yesterday morning witnessed my final experiment. The result was all, and more than all, I had hoped for.' A faint colour tinged his faded cheeks for a few moments when he ceased speaking.

'You will have heaps of leisure now, uncle dear,' said Anna; 'we shall be able to take our long-deferred holiday on the Continent.' She

was radiant.

'My child! fancy me at my age gallivanting about the Continent! But come, all of you, into the laboratory. I have something to show you.'

CHAPTER IL

THE three followed the Professor across the hall into the laboratory, a sacred place never invaded by any of the household save Anna, who lighted the big Dutch stove in cold weather, and was occasionally allowed to indulge in a little sweeping and dusting under her uncle's supervision.

The Professor, having shut the door, switched on the light and indicated with a gesture the only two chairs in the room. Without heeding him, his brother advanced a few steps, halted, and stared around. Never had he been in any place even remotely resembling it, so crowded was it with a jumble of queer-looking objects, among which no sort of order seemed to exist. Here were retorts, siphons, blowpipes, and Leyden jars, together with flasks and bottles of sundry shapes and sizes, to specify but some of the unfamiliar objects over which Anton's gaze wandered curiously. In one corner was a gal-

vanic battery, and in another a small furnace,

at present dead and cold.

Meanwhile the Professor had crossed to a tall cabinet, and, opening one of the drawers in which were arranged a varied assortment of duly labelled mineralogical specimens, he took something out of it, and going back to his brother, he held out his right hand, on the palm of which rested two small objects, in size somewhat larger than an ordinary coffee-bean. 'Take these,' he said, 'examine them, and then oblige me with your opinion of them.'

Anton took them on his own palm, peered at them, turned them over and over, and held them up to the light. 'To me they seem nothing more than two bits of clouded glass of no

possible value to anybody.'

'For all that, they are real diamonds, but of a very inferior water, and, as you may observe, only partly cut. They came to me from South Africa.' Then taking back the two stones, he opened his left hand and displayed two others nearly similar in size to the first two. 'Now examine these, and tell me what you make of them.'

His brother took the second pair, but no examination was needed to convince him that he held on his palm a couple of superb gems, such as, it seemed to him, might well have graced a royal diadem. When he held them up to the light, turning them this way and that, they flashed and scintillated with a myriad rainbow tints, and seemed to hold within themselves a spark of some magic fire struck out by gnomes in the bowels of the earth. 'They are simply magnificent,' he said, with an indrawing of his breath, as he gave them back. 'No less a word is applicable to them.' He could not help wondering to what all this was the prelude.

The Professor chuckled. 'And yet only a little while ago this second pair were in all respects counterparts of the first pair. Not even an expert could have detected the slightest difference between them.' He handed the stones

to Denaby to examine.

'Is that indeed so?' said Anton with an inflection of satire in his voice. To himself he added, 'What a nincompoop he must take me for!'

'It is as I say. By means of the secret process, on the details of which I have been experimenting for the last six months, I have been enabled to effect the transformation. The main factor in the process consists of a powerful radio-active current, an emanation of the mineral substance of which I have already spoken, which has only recently been brought within the range of practical physics, but in my humble opinion is destined to be the means of achieving far more amazing results than any of us gropers after truth have yet more than vaguely adumbrated, some of them, one may hope, tending to the alleviation of sundry of the bodily ills with

which our poor humanity is afflicted. Mine has been merely the idle experiment of a curious man. But I have reason to know that there are younger and far more capable brains than mine at work day after day, basing their researches on the as yet only partially developed properties of the mysterious substance which in my case has been productive of so singular a result.'

Anton was regarding him with puzzled eyes; he could make neither head nor tail of his

brother's rigmarole.

Denaby had drunk in every word; the subject was one that appealed to both his imagination and his intelligence. 'Three hundred years ago, sir, such a discovery would have led to your being burnt as a wizard,' he said as he gave back the diamonds, which Anna had examined with wondering interest.

'May I ask, brother, whether you have taken any steps towards ascertaining the value of your wonderful gems?' Anton spoke with a covert

sneer. He was still incredulous.

'Yes; as a matter of simple curiosity I caused them to be submitted to an expert in such baubles.'

'And the result?'

'Was an offer of four hundred pounds each for them.'

Anton was conscious of a sudden rush of blood to his head. 'Then they are worth another hundred each at the very least,' was his first thought. Aloud, after a pause, he said, 'But is it not your intention to dispose of them?'

'Certainly not. I have never dreamed of

such a thing.'

His brother stared at him as though he doubted the evidence of his ears.

'No, my dear Anton,' continued the Professor, 'I have no intention of perpetrating a fraud on a gullible public.'

'A fraud, Felix! I fail to follow you.'

'What but a fraud would it be to offer for sale as diamonds of the first water stones of an altogether inferior quality, which, although the process they have been submitted to by me may lend them a fictitious value, are intrinsically unchanged from what they were before?'

Anton's expression betrayed the disgust he felt. 'It is a point of view which I'm afraid few persons except yourself would care to adopt,' he said with a note of contempt in his voice.

The Professor laughed. 'No, no, Anton, you take too low a view of poor human nature. I decline to believe that plain commonplace honesty is such a rare commodity as apparently you would make it out to be.'

Anton felt as though he could shake the life out of his brother. 'From what you say am I to infer that you intend to submit no more

stones to your secret process?'

'There is no reason why I should do so. I have proved to my own satisfaction that my [Christmas Number.

theory—developed through what a long series of experiments only myself knows—has achieved the issue for which I was all along aiming. It is an issue of no particular value to anybody, and as soon as I have proved to my old friend Professor Manders—whom I expect on a visit about a fortnight hence, and who scouted my experiments as those of a visionary—that my convictions with reference to some of the possibilities of radio-activity were more than the baseless speculations of a dreamer—as soon as I have done this I shall destroy the two "faked" diamonds by grinding them into powder.'

'Oh the old imbecile!' Anton groaned under his breath.

'From what you have stated, sir, I gather that you have no intention of giving your discovery to the world, say in the shape of a paper to the Royal Society or some other learned body?' It was Denaby who spoke.

The Professor shook his head. 'Most assuredly I have no such intention. My secret will die with me. Cannot you conceive that in the hands of unscrupulous men it might work untold harm, while, unfortunately, it would open up no channel of usefulness or benefit to others? No, there must be no heir to it. To me it has been merely a scientific discovery, the prosecution of which from one progressive experiment to another has afforded me infinite gratification. Now that it has fulfilled the purpose I set before myself, I have no further use for it.'

CHAPTER III.

IT was close upon midnight when the Professor's housekeeper showed Denaby to his room. 'At what hour, sir, would you like breakfast?' she asked, as she switched on the electric light.

'Will eight o'clock be too early for you?'

'Not at all, sir. It will be ready for you to the minute.' Then she bade him good-night, and went.

Denaby felt in no humour for bed. His brain was too excited for sleep to woo him yet awhile. He stripped off his coat, necktie, and collar, changed his boots for a pair of slippers, and sank into an easy-chair. How should he occupy himself for the next hour or two? He glanced around, but there were no books in the room. Presently he bethought himself that he would write an overdue letter to his sister, who lived in the country, and was his senior by a dozen years. She knew already about his love affair, and now he would tell her the glad news that his engagement was an accomplished fact. He could depend upon a response from her by return of post, brimming over with sympathy and good wishes. He had his fountain pen with him, so he tore a couple of leaves out of 1914.]

his pocket-book, moved the little table nearer the lamp, and began to write. He heard the hall clock strike one before he had come to an end.

He rose, stretched himself, and drew up the venetian blind. The storm had passed over, there was a clear sky, and a three-quarter moon was shining full into the room. Sleep seemed still far from him. He turned out the lamp, found a comfortable position on the cushioned window-seat, and ventured to light a cigarette. The hour, the moonlight, the brooding silence that seemed as if it must be listening for something, so intense was it, all conduced to a meditative mood. As he sat and smoked, his thoughts were a lover's thoughts; they fluttered round Anna as if they were birds drawn thither by her beauty and unable to keep away from her. Was she asleep and perchance dreaming of him? he wondered. Or was she lying in her little bed with eyes as wide open as his own? If he could but have wafted a kiss to her lips! What a fortunate fellow he was, he told himself once more, and a happy one to boot!

In another room which opened out of the same corridor Anton Van Hoogen was presumably sleeping the sleep of the just. When he had locked the door he flung himself, just as he was, on the bed, and in less than two minutes The mixture of drinks he had was fast asleep. imbibed was enough to bemuse his faculties for the time being, but not enough to intoxicate him, for he was a seasoned vessel. At the end of an hour he awoke suddenly and sat up. For half-a-minute he stared about him like a dazed man, lost to a sense both of time and place. Then in a flash he recognised the room as being one he had slept in on previous visits to the Crest, and at once his memory took up its dropped threads, and all the evening's happenings came freshly to him. He rolled off the bed, shook himself, and sat down to think.

At once his thoughts reverted to the question of the likelihood or otherwise of his brother advancing the hundred pounds he had made up his mind to ask for, and he wanted it very badly indeed. It was true that to-night Felix had been even more effusive and brotherly than he ordinarily was when they met; still, he had doubts, grave doubts, how his application would be received. He hoped, and had made his arrangements accordingly, to be well on his way to the Continent in less than twenty-four hours, there to meet a confederate, and to make, by the Bremen or Hamburg route, a hurried exodus for New York.

It had been Anton's fate to become mixed up with a gang of long firm swindlers, not as one of the more active spirits, but merely as receiver and vehicle for the disposal of the fraudulently acquired property; but that fact would make no difference in the eyes of the police. News had reached him from a secret source that the

authorities were on the track of the gang, and that most likely there would be several arrests within the next few hours; so he had turned all his possessions available at so scant a notice into ready money, and had a thin wad of bank-notes in his breast-pocket. None the less, he hungered for his brother's hundred pounds.

Before long his thoughts veered round to the amazing story told by his brother about the sophisticated diamonds. Had any one other than Felix been the author of it he would have set him down as at once a liar and a cheat, but he knew Felix too well to think that of him for a moment. Whatever he stated to be a fact was a fact. Besides, had not he, Anton, both seen and handled the stones! However inconceivable such a transformation might seem, he could not discredit the evidence of his own senses.

It was a train of thought which insensibly urged him on to more personal considerations such as at first had not appealed to him. He was under the same roof as the diamonds! The recollection that such was the case flashed suddenly upon him; and, following close upon it, came the darkly tempting thought, 'If I had but one of these magic stones I should be a richer man by five hundred pounds. If it would sell for that sum in England, it would fetch no less in New York.' His brain was in a turmoil. He sprang to his feet and began to pace the room with feverish strides. 'And, after all, it would not be like an ordinary robbery,' he told himself; 'in point of fact, it would be no robbery at all. Did not Felix—the old imbecile! -say that in the course of a few weeks he purposed grinding the diamonds to powder? I should merely be appropriating what is neither of use nor value to him, but is of infinite importance to me. I can get clear away while the house still sleeps, and whether I take one of the stones or leave it, Felix and I will never meet after to-night.' He sat down again, his brain by now clear and collected. His purpose stared him in the face, and he did not shrink from it. His mind was definitely made up.

He sat without stirring till the hall clock struck two. Then he rose and exchanged his boots for a pair of slippers. Opening the door noiselessly, he stood listening for fully a minute; but the silence was profound. Then he lightly crossed the corridor, and, after pausing for a few seconds at the stairhead, descended step by step into the hall, where a ray of moonlight shining through the oriel window filtered the darkness. With nerves aquiver and heart that hammered in his ears, he crossed the hall swiftly to the laboratory door and turned the handle. A moment later he was inside and the door pushed to behind him. It was something of a shock to him to find one of the electric bulbs over the Professor's writing-table still alight, but he con-

cluded that it had inadvertently been left burning. He was unaware that the Professor, being troubled with insomnia, not infrequently came down in the middle of the night and pottered about among his chemicals and specimens till the desire for sleep lured him back to bed. Anton need not have brought his match-box.

It was not a pleasant place to be in at that time of night, with its weird paraphernalia; and as Anton glanced around a shiver ran down his spine. But he was there for a desperate purpose, and the sooner it was over and done with the better. He had not failed to notice where Felix deposited the diamonds after they were given back to him by Denaby—to wit, in one of a nest of drawers in a tall cabinet devoted to mineral specimens from all quarters of the world. 'And the silly old josser doesn't even take the precaution of locking them up!' he said to himself contemptuously.

After a last glance round he crossed to the cabinet and pulled open the third drawer from the bottom, where, among an assortment of labelled specimens, the two faked diamonds scintillated in their nest of cotton-wool. His intention had been to purloin one only, but as his eyes gloated upon the stones the lust of acquisition gripped him. For the space of some seconds he hesitated; then he drew a deep breath, and, plunging his hand into the drawer, he withdrew it an instant later with both

diamonds in his grasp.

Denaby's alert ears, as he reclined at ease on the window seat, were suddenly startled by the faint sound of stealthy footsteps in the corridor outside his door. He put down his legs off the seat, sat up, and listened more intently. But the sound was gone almost as soon as heard. Still, that his ears had not deceived him he felt positive. It was now two o'clock. Who could be wandering about the house at that untimely hour? There had been several burglaries of late in various London suburbs. It seemed to him almost a duty owing to his host that he should strive to penetrate the mystery. Had anything by ill-fortune happened to the Professor?

He hesitated no longer, but opened the door noiselessly and stepped outside. A moment later he was standing at the stairhead and peering down into the moonlit hall. He was just in time to discern a figure, which he recognised as that of Anton Van Hoogen, cross the hall, and, after hesitating for some seconds, open the laboratory door and vanish inside. At once Denaby decided that it was his duty to inform the Professor of what he had seen.

He judged that his host's room was the one next his own, because earlier in the night he had heard him coughing. Going up to it, he tapped lightly on one of the panels, but there was no response. Then he opened the door and stepped softly into the room. The lamp had been turned down, but there was enough light

to reveal the Professor lying asleep on the bed. Denaby had not made a sound, but the old man was a light sleeper, and the mere fact of there being another presence than his own in the room sufficed to awake him. He opened his eyes and fixed them on Denaby, but without evincing the slightest surprise at finding him there.

I have taken the liberty of disturbing you, sir,' said the young man in a guarded voice, 'because Mr Anton Van Hoogen has just now gone downstairs and shut himself in the laboratory, and it seems to me only right that you

should be told.'

The Professor sat up in bed. 'Is that so? Anton in the laboratory! What can he be doing there at this hour? I must satisfy myself. Possibly he is walking in his sleep, as I rememper he used to do when a boy. Yes, I must satisfy myself.'

Denaby slipped out of the room.

Two minutes later the Professor emerged, clad in a gray dressing-gown, and with slippered feet.

Denaby's first impulse had been to return to his own room, but he felt uneasy, being doubtful as to what might happen next; so he followed in the Professor's wake as the latter went downstairs, apparently oblivious of his presence.

As Anton, grasping the diamonds, withdrew his hand from the drawer, a slight noise caused him to turn his head with a start. in the open doorway, stood his brother, gazing fixedly at him. So confounded and taken aback was the intruder by the apparition that his knees seemed to give way under him, and in the effort to save himself from falling he strove to clutch the open drawer, but missed it; instead, his fingers came in contact with an exposed live wire that supplied the house with electricity. On the instant his frame stiffened, and with outflung arms, without a cry or a sound of any kind, he fell to the floor as if shot through the brain.

The Professor—who in his youth had taken a medical degree—with a cry of horror went quickly forward and bent over the fallen man, and a brief examination sufficed to convince him that his brother was not past hope of resuscitation, as he had at first feared. 'I don't think the shock was a very severe one, and he will probably come round before long,' he said to Denaby, who, after lingering in the background, had now come forward. 'Give me that decanter of water off the table, and then fetch the bottle of spirits and a teaspoon from the other room.

Ten minutes later Anton Van Hoogen opened his eyes, raised himself into a sitting posture, and stared vaguely about him. Then his brother helped him to his feet, and Denaby brought up a chair. He was still in a half-dazed condition.

'Open your hand,' said the Professor to him in an imperative tone, and mechanically he obeyed. There lay the diamonds. As his brother took them he said, 'So you were bent on becoming a common thief! I did not imagine you had sunk

so low as that.' He spoke with a mixture of sorrow and contempt.

But by now Anton was himself again. deprivation of the diamonds had acted on him like a reflex shock. His teeth came together with a vicious snap, and he glared at his brother as if about to spring at his throat. 'A common thief, eh?' he snarled. 'I was merely about to help myself to something on which you set no value, and the loss of which you wouldn't feel. To call such an action that of a common thief is the rankest rot. But you were always a crackbrained fool, Felix, and old age has brought you no common-sense.' His fingers were working spasmodically; his chest rose and fell visibly. If Felix had not been his brother he would have felled him to the earth.

But Felix dismissed what he had said with a wave of his hand. 'Several years ago, when you forged my name to an acceptance for two hundred pounds, to save you from prison I met the bill and forgave you. But this attempt of yours to-night I will not forgive. This is not a roof for such as you. Within the next few minutes you and I will have parted for ever. have no wish ever to see your face again.' He spoke in cold, passionless tones. The expression of his features had so hardened and changed that he seemed almost like another man.

Denaby looked and marvelled.

'With all my heart, my admirable brother, I reciprocate your wish. My bag and boots are upstairs. With your permission I will go and fetch them.'

While Anton was gone the Professor put back the diamonds into the drawer. 'Their lustre is beginning to fade,' he murmured, 'as I half-expected it would do before long.' Then, at his request, Denaby unlocked and unbolted the front-

When Anton came back he seemed to have quite recovered his equanimity. While putting on his boots a certain suggestion had come to him which changed the whole current of his thoughts. Felix was waiting in the hall, where the light had been turned on. As Anton passed him he stared at the stern, impassive face with a mocking smile and a flick of his thumb and finger. Then, as he took his overcoat and hat off the stand, he said, 'So long, Felix; and may you live to repent your to-night's treatment of your only brother!'

Denaby held open the door for him. They heard his jeering laugh as he paused outside to put on his overcoat. In the eastern sky the

dawn was lifting a tardy eyelid.

When Denaby turned after fastening the door the Professor laid a hand on each of his shoulders. 'My boy,' he said, 'I think it will be as well to say nothing to Anna, at any rate for the present, of to-night's happenings.'

'I quite agree with you, sir, and you may rely

upon my silence.'

1914.]

As the old man went slowly upstairs his eyes were heavy with tears.

Denaby did not leave the Crest as early as he had intended, but stayed and breakfasted with the Professor and Anna. When the housekeeper brought in the tea, addressing her master with the familiarity of an old servant, she said, 'Mr Anton, sir, quite startled Charlotte the kitchenmaid early this morning when he knocked at the back-door five minutes after she had got downstairs, and, telling her he had left his watch

behind in his bedroom, pushed past her into the house. He was back in two minutes, leaving by the way he had come. It seemed to me as well, sir, that you should be told.'

The Professor and Denaby glanced at each other. 'You are quite right, Mrs Merla, to tell me. My brother was always of a forgetful

turn.'

When the housekeeper had left the room the Professor got up from the table, and, without a word, proceeded to the laboratory.

The two diamonds were gone!

LIFE'S LOVELINESS.

THINK lovely thoughts, that every day be blest;
Look thou for God, nor fancy Him concealed;
Along earth's common way the flowers and grass
Will breathe His name to thee when thou shalt pass.
To thy divinest self He stands revealed,
His conquering power through love made manifest.

Speak lovely words, to fall like sunlight rays,
That youth may be so long, and age but brief,
To add to joy in life a little more,
And take some misery out of earth's vast store.
So shalt thou walk with gladness and not grief,
Planting a hope in all the thorny ways.

Do lovely deeds, of brotherhood the bond;
Each burden nobly lifted, and each task,
Each day's plain duty, teaches thee to bless
The friendless lives brave in their loneliness,
Ere yet they near the Shadows and the Mask,
And those untrodden paths that stretch beyond.

Thoughts, words, and deeds! To stand for truth in all!
This is the creed that counts. Unflinching toil,
Staunch fortitude, and strength of patience born;
Securely treading though the way be worn,
Fronting the light, nor fearing to recoil,
Facing the right, nor looking back to fall.
